HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Nucleotide sequence of hamster glyceraldehyde-3-phosphate dehydrogenase mRNA

Sylvie Vincent and Philippe Fort*

Laboratoire de Biologie Moléculaire, URA CNRS 1191 – Université Montpellier II, Place E.Bataillon CP 012, F-34095 Montpellier Cedex 5, France

Submitted April 12, 1990

EMBL accession no. X52123

Glyceraldehyde-3-phosphate dehydrogenase (GAPDH, EC 1.2.1.12) mRNA level quantitation is widely used as an invariant control for gene expression analysis. Only three vertebrate GAPDH cDNAs have been hitherto isolated: human (1), rat (2) and chick (3). In order to get a probe for RNase-mapping experiments on hamster (*Cricetulus griseus*) mRNAs, we constructed a cDNA library in pBluescript KSII (Stratagene) from CCL39 cell line (adult lung fibroblastic cells). A full-length cDNA encoding GAPDH was then isolated. DNA sequence was determined on both strands and processed using BISANCE package (CITI2, Paris). The sequence spans 1266 nucleotides, and exhibits a high degree of identity to each of the previously

known vertebrates sequences. Northern blot analysis (not shown) revealed the presence of a single mRNA species expressed from hamster GAPDH multigenic family (4).
