# STABILIZATION OF A RIGID BODY MOVING IN A COMPRESSIBLE VISCOUS FLUID

ARNAB ROY AND TAKÉO TAKAHASHI

*Université de Lorraine, CNRS, Inria, IECL, F-54000 Nancy, France*

ABSTRACT. We consider the stabilizability of a fluid-structure interaction system where the fluid is viscous and compressible and the structure is a rigid ball. The feedback control of the system acts on the ball and corresponds to a force that would be produced by a spring and a damper connecting the center of the ball to a fixed point  $h_1$ . We prove the global-in-time existence of strong solutions for the corresponding system under a smallness condition on the initial velocities and on the distance between the initial position of the center of the ball and  $h_1$ . Then, we show with our feedback law, that the fluid and the structure velocities go to 0 and that the center of the ball goes to  $h_1$  as  $t \rightarrow \infty$ .

**Keywords.** Fluid-structure interaction, compressible Navier-Stokes system, global solutions, stabilization.

## 1. INTRODUCTION AND MAIN RESULT

Let  $\Omega \subset \mathbb{R}^3$  be a bounded domain with  $C^4$  boundary occupied by a fluid and a rigid body. We denote by  $\mathcal{B}(t) \subset \Omega$ , the domain of the rigid body and we assume it is an open ball of radius 1 and of center  $h(t)$ , where  $t \in \mathbb{R}_+$  is the time variable. We suppose that the fluid domain  $\mathcal{F}(t) = \Omega \setminus \overline{\mathcal{B}(t)}$  is connected.

---

*Date:* October 13, 2019.

The fluid is modeled by the compressible Navier-Stokes system whereas the motion of the rigid body is governed by the balance equations for linear and angular momentum. We also assume the no-slip boundary conditions. The equations of motion of fluid-structure are:

$$\frac{\partial \rho}{\partial t} + \operatorname{div}(\rho u) = 0 \quad t > 0, x \in \mathcal{F}(t), \quad (1.1) \quad \{\text{continuity}\}$$

$$\rho \left( \frac{\partial u}{\partial t} + (u \cdot \nabla) u \right) - \operatorname{div} \sigma(u, p) = 0 \quad t > 0, x \in \mathcal{F}(t), \quad (1.2) \quad \{\text{momentum}\}$$

$$m \ell' = - \int_{\partial \mathcal{B}(t)} \sigma(u, p) N \, d\Gamma + w \quad t \geq 0, \quad (1.3) \quad \{\text{linear:}\}$$

$$J \omega' = - \int_{\partial \mathcal{B}(t)} (x - h(t)) \times \sigma(u, p) N \, d\Gamma \quad t \geq 0, \quad (1.4) \quad \{\text{angular}\}$$

$$h' = \ell \quad t \geq 0, \quad (1.5)$$

$$u(t, x) = 0 \quad t > 0, x \in \partial \Omega, \quad (1.6) \quad \{\text{boundary}\}$$

$$u(t, x) = \ell(t) + \omega(t) \times (x - h(t)) \quad t > 0, x \in \partial \mathcal{B}(t), \quad (1.7) \quad \{\text{boundary}\}$$

$$\rho(0, \cdot) = \rho_0, \quad u(0, \cdot) = u_0 \quad \text{in } \mathcal{F}(0), \quad (1.8)$$

$$h(0) = h_0, \quad \ell(0) = \ell_0, \quad \omega(0) = \omega_0. \quad (1.9) \quad \{\text{initial}\}$$

In the above equations,  $\rho = \rho(t, x)$  and  $u = u(t, x)$  represent respectively the density and the velocity of the fluid and the pressure of the fluid is denoted by  $p$ . We assume that the flow is in the barotropic regime and we focus on the isentropic case where the relation between  $p$  and  $\rho$  is given by the constitutive law:

$$p = a \rho^\gamma,$$

with  $a > 0$  and the adiabatic constant  $\gamma > \frac{3}{2}$ . The Cauchy stress tensor is defined as:

$$\sigma(u, p) = 2\mu \mathbb{D}(u) + \lambda \operatorname{div} u \mathbb{I}_3 - p \mathbb{I}_3,$$

where  $\mathbb{D}(u) = \frac{1}{2} (\nabla u + \nabla u^\top)$  denotes the symmetric part of the velocity gradient ( $\nabla u^\top$  is the transpose of the matrix  $\nabla u$ ) and  $\lambda, \mu$  are the viscosity coefficients satisfying

$$\mu > 0, \quad \lambda + \mu \geq 0.$$

Here  $\ell$  and  $\omega$  are the linear and angular velocities of the rigid body,  $N(t, x)$  is the unit normal to  $\partial \mathcal{B}(t)$  at the point  $x \in \partial \mathcal{B}(t)$ , directed to the interior of the ball and  $m, J$  are the mass and the moment of inertia of the rigid ball respectively. The formulae for  $m$  and  $J$  are

$$m = \frac{4}{3} \pi \rho_{\mathcal{B}}, \quad J = \frac{2m}{5} \mathbb{I}_3,$$

where  $\rho_{\mathcal{B}} > 0$  is the constant density of the rigid ball.

Finally,  $w$  (in (1.3)) is our control that we take as a feedback control:

$$w(t) = k_p(t)(h_1 - h(t)) - k_d \ell(t), \quad (1.10) \quad \{\text{feedback}\}$$

where  $k_d \geq 0$  and  $k_p(t) \geq 0$  are well-chosen so that

$$\lim_{t \rightarrow \infty} h(t) = h_1,$$

whereas the velocities of the fluid and of the rigid ball go to 0:

$$\lim_{t \rightarrow \infty} u(t) = 0, \quad \lim_{t \rightarrow \infty} \ell(t) = 0, \quad \lim_{t \rightarrow \infty} \omega(t) = 0.$$

In literature, this type of control is known as Proportional-Derivative (PD) controller generated by a spring and a damper. The spring-damper is connected from the center of the ball to the fixed anchor point  $h_1$  and it is attracting the ball towards the point  $h_1$ .

In order to give the precise statement of stabilization (Theorem 1.2), we first need a global in time existence result for (1.1)–(1.10) with (1.10). Such a result in the case without control is given in [1] by adapting a method introduced in [13].

Here we will prove again this existence result, with the same approach but with a special attention to the estimates on  $h(t)$  and with some modifications in the proof of [1] due to the feedback law (1.10).

In order to state our result we introduce  $\bar{\rho}$  the mean-value of  $\rho_0$ :

$$\bar{\rho} = \frac{1}{|\mathcal{F}(0)|} \int_{\mathcal{F}(0)} \rho_0(x) dx. \quad (1.11) \quad \{\text{mean va}$$

Note that, from equation (1.1) and Reynold's Transport Theorem, we obtain

$$\int_{\mathcal{F}(0)} \rho_0(x) dx = \int_{\mathcal{F}(t)} \rho(t, x) dx.$$

For  $0 \leq T_1 < T_2 \leq \infty$ , we introduce the following space:

$$\begin{aligned} \widehat{\mathcal{S}}_{T_1, T_2} = \{ & (\rho, u, \ell, \omega) \mid \rho \in L^2(T_1, T_2; H^3(\mathcal{F}(t))) \cap BC^0([T_1, T_2]; H^3(\mathcal{F}(t))) \cap H^1(T_1, T_2; H^2(\mathcal{F}(t))) \\ & \cap BC^1([T_1, T_2]; H^2(\mathcal{F}(t))) \cap H^2(T_1, T_2; L^2(\mathcal{F}(t))), \\ & u \in L^2(T_1, T_2; H^4(\mathcal{F}(t))) \cap BC^0([T_1, T_2]; H^3(\mathcal{F}(t))) \cap H^1(T_1, T_2; H^2(\mathcal{F}(t))) \\ & \cap BC^1([T_1, T_2]; H^1(\mathcal{F}(t))) \cap H^2(T_1, T_2; L^2(\mathcal{F}(t))), \\ & \ell \in H^2(T_1, T_2), \quad \omega \in H^2(T_1, T_2) \}. \end{aligned} \quad (1.12) \quad \{\text{solution}$$

Here  $BC^k$  are the functions of class  $C^k$  bounded with bounded derivatives. We set

$$\begin{aligned} \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{T_1, T_2}} = & \|\rho - \bar{\rho}\|_{L^\infty(T_1, T_2; H^3(\mathcal{F}(t)))} + \|\rho - \bar{\rho}\|_{H^1(T_1, T_2; H^2(\mathcal{F}(t)))} + \|\rho - \bar{\rho}\|_{W^{1, \infty}(T_1, T_2; H^2(\mathcal{F}(t)))} \\ & + \|\rho - \bar{\rho}\|_{H^2(T_1, T_2; L^2(\mathcal{F}(t)))} + \|u\|_{L^2(T_1, T_2; H^4(\mathcal{F}(t)))} + \|u\|_{L^\infty(T_1, T_2; H^3(\mathcal{F}(t)))} + \|u\|_{H^1(T_1, T_2; H^2(\mathcal{F}(t)))} \\ & + \|u\|_{W^{1, \infty}(T_1, T_2; H^1(\mathcal{F}(t)))} + \|u\|_{H^2(T_1, T_2; L^2(\mathcal{F}(t)))} + \|\ell\|_{H^2(T_1, T_2)} + \|\ell\|_{W^{1, \infty}(T_1, T_2)} \\ & + \|\omega\|_{H^2(T_1, T_2)} + \|\omega\|_{W^{1, \infty}(T_1, T_2)}, \end{aligned} \quad (1.13) \quad \{\text{notatio}$$

and for  $T > 0$

$$\|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{T, T}} = \|\rho_0 - \bar{\rho}\|_{H^3(\mathcal{F}(T))} + \|u_0\|_{H^3(\mathcal{F}(T))} + |\ell_0| + |\omega_0|.$$

Since we are working with regular solutions of (1.1)–(1.10), we need to introduce the following compatibility conditions at initial time:

$$u_0(y) = \ell_0 + \omega_0 \times (y - h_0) \text{ for } y \in \partial\mathcal{B}(0), \quad u_0 = 0 \text{ on } \partial\Omega, \quad (1.14) \quad \{\text{finalco}$$

$$-\frac{1}{\rho_0} \operatorname{div} \sigma(u_0, p_0) = 0 \text{ on } \partial\Omega, \quad (1.15) \quad \{\text{finalco}$$

$$\begin{aligned}
& - \left( \omega_0 \times (\omega_0 \times (y - h_0)) \right) - \frac{1}{\rho_0} \operatorname{div} \sigma(u_0, p_0)(y) \\
& = \frac{1}{m} \left[ \int_{\partial \mathcal{B}(0)} \sigma(u_0, p_0) n \, d\Gamma - k_d \ell_0 \right] + \left[ J^{-1} \int_{\partial \mathcal{B}(0)} (x - h_0) \times \sigma(u_0, p_0) n \, d\Gamma_x \right] \times (y - h_0)
\end{aligned} \tag{1.16}$$

for  $y \in \partial \mathcal{B}(0)$ ,

where

$$p_0 = a\rho_0^\gamma.$$

Finally, we introduce the following notation

$$\Omega^0 := \{x \in \Omega ; \operatorname{dist}(x, \partial \Omega) > 1\}.$$

Our hypotheses on  $k_p$  and  $k_d$  are the following ones:

$$k_p \in C^1(\mathbb{R}_+, [0, 1]), \quad k_p(0) = 0, \quad k_p > 0 \text{ in } (0, \infty), \quad k_p \equiv 1 \text{ in } [T_I, \infty), \quad 0 \leq k'_p < \frac{k_d}{2T_I^2} \tag{1.17}$$

for some  $T_I > 0$ .

**Theorem 1.1.** *Assume that  $\Omega^0$  is non empty and connected. Let  $h_1 \in \Omega^0$  and  $\bar{\rho} > 0$ . Assume  $w$  is given by the feedback law (1.10) with  $(k_p, k_d)$  satisfying (1.17). There exists  $\delta > 0$  such that for any*

$$h_0 \in \Omega^0, \quad \rho_0 \in H^3(\mathcal{F}(0)), \quad \rho_0 > 0, \quad u_0 \in H^3(\mathcal{F}(0)), \quad \ell_0, \quad \omega_0 \in \mathbb{R}^3, \tag{1.18}$$

satisfying the compatibility conditions (1.14)–(1.16) with

$$\|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \leq \delta, \tag{1.19}$$

the system (1.1)–(1.10) admits a unique strong solution  $(\rho, u, \ell, \omega) \in \widehat{\mathcal{S}}_{0,\infty}$ ,  $h \in L^\infty(0, \infty)$ . Moreover, there exist  $C, \eta > 0$  such that

$$\|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,\infty}} + \|\sqrt{k_p}(h_1 - h)\|_{L^\infty(0,\infty)} \leq C \left( \|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \right), \tag{1.20}$$

$$\operatorname{dist}(h(t), \partial \Omega) > 1 + \eta \quad (t \geq 0). \tag{1.21}$$

We are now in a position to state our stabilization result.

**Theorem 1.2.** *With the notations and assumptions of Theorem 1.1, the solution  $(\rho, u, h, \ell, \omega)$  of (1.1)–(1.10) satisfies*

$$\lim_{t \rightarrow \infty} \|\rho(t, \cdot) - \bar{\rho}\|_{H^2(\mathcal{F}(t))} = 0, \quad \lim_{t \rightarrow \infty} \|u(t, \cdot)\|_{H^2(\mathcal{F}(t))} = 0, \tag{1.22}$$

$$\lim_{t \rightarrow \infty} h(t) = h_1, \quad \lim_{t \rightarrow \infty} \ell(t) = 0, \quad \lim_{t \rightarrow \infty} \omega(t) = 0. \tag{1.23}$$

During the last two decades, there has been a considerable interest in fluid-structure interaction problems involving moving interfaces. Broadly speaking, these types of models can be classified into two types: either the structure is moving inside the fluid or the structure is located at the boundary of the fluid domain. Since in this article we are interested in studying the motion of body inside the compressible fluid domain, below we mention related works from the literature concerning this case only.

The global-in-time existence (up to contact) of weak solutions for compressible viscous flow (for  $\gamma \geq 2$ ) in a bounded domain of  $\mathbb{R}^3$  interacting with a finite number of rigid bodies has been studied by Desjardins and Esteban [6]. In [9], Feireisl established the global existence result (for  $\gamma > 3/2$ ) regardless of possible collisions of several rigid bodies or a contact of the rigid bodies with the exterior

boundary. Regarding strong solutions, the existence and uniqueness of global solutions for small initial data have been achieved in [1] in the Hilbert space framework by Boulakia and Guerrero as long as no collisions occur. Their work is based on a method proposed in [13] for a viscous compressible fluid (without structure). In a  $L^p$ - $L^q$  setting, the authors in [12] proved the existence and uniqueness of local-in-time strong solutions for the system composed by rigid bodies immersed into a viscous compressible fluid and in [11], the authors establish the global in time existence up to contact.

Let us mention some works related to the large time behavior of fluid-structure interaction system. In [17], the authors analyze the fluid-structure model in one space dimension where the fluid is governed by the viscous Burgers equation and the solid mass is moving by the difference of pressure at both sides of it. They obtain that the asymptotic profile of the fluid is a self-similar solution of the Burgers equation and the point mass enjoys the parabolic trajectory as  $t \rightarrow \infty$ . An extension of this work in several space dimensions is obtained in [14] for the heat equations in interaction with a rigid body. Their result is that as  $t \rightarrow \infty$ , the fluid solution behaves as the fundamental solution of the heat equation and the ball goes to infinity in bidimensional case whereas the ball remains in a bounded domain in three dimension. Regarding the long-time behavior of a moving particle inside a Navier-Stokes fluid, the authors in [10] consider in particular the case of a ball falling over an horizontal plane and show that the velocity of the fluid goes to zero and the particle reaches the bottom of the container asymptotically in time. In [7], the authors analyze the case of a rigid disk immersed into a two-dimensional Navier-Stokes equations filling the exterior of the structure domain. They restrict to the case of a solid and a fluid with the same density and for the linear case.

Finally, let us mention two works using a control supported on the rigid body: [5] in the 1d case for a Burgers-particle system and [16] in the 3d case for a rigid ball moving into a viscous incompressible fluid. The main difference between this study and the two previous references come from the fact that in our case we need to deal with stronger solutions than in the incompressible case. In particular, to avoid compatibility conditions at  $t = 0$  that involve the feedback control  $w$ , we take here  $k_p$  depending on time with  $k_p(0) = 0$ .

The plan of the paper is the following. In Section 2, we establish the local-in-time existence of solutions for the system (1.1)–(1.10). We then obtain a priori estimates in Section 3 to prove Theorem 1.1. Finally Section 4 is devoted to the asymptotic analysis of the solutions in order to prove Theorem 1.2.

**Notation.** For any  $a \in \mathbb{R}^3$ , we set

$$\widehat{\mathcal{B}}(a) = \{x \in \mathbb{R}^3 \mid |x - a| < 1\}, \quad \widehat{\mathcal{F}}(a) = \Omega \setminus \widehat{\mathcal{B}}(a).$$

In particular,

$$\mathcal{B}(t) = \widehat{\mathcal{B}}(h(t)), \quad \mathcal{F}(t) = \widehat{\mathcal{F}}(h(t)).$$

In this article, to shorten the notation, we write  $H^m$  and  $L^2$  instead of  $H^m(\mathcal{F}(0))$  and  $L^2(\mathcal{F}(0))$ .

Assume  $\mathfrak{X}$  is Banach space. We need to consider a particular norm for  $H^m(0, T; \mathfrak{X})$  if  $m \in \mathbb{N}^*$  and if  $T \in \mathbb{R}_+^*$ .

$$\|f\|_{H_{\infty}^m(0, T; \mathfrak{X})} = \|f\|_{H^m(0, T; \mathfrak{X})} + \|f\|_{W^{m-1, \infty}(0, T; \mathfrak{X})}. \quad (1.24)$$

Using the Sobolev embedding, this norm is equivalent to the usual one, but the corresponding constants depend on  $T$  and that is the reason why we introduce such a notation.

Assume  $\mathfrak{X}_1$  and  $\mathfrak{X}_2$  are Banach spaces. We also introduce the following spaces

$$H^m(0, T; \mathfrak{X}_1, \mathfrak{X}_2) = L^2(0, T; \mathfrak{X}_1) \cap H^m(0, T; \mathfrak{X}_2) \quad (m \geq 1).$$

In the case  $T \in \mathbb{R}_+^*$ , we also need to introduce the following norm for the above space:

$$\|f\|_{H_{\infty}^1(0, T; H^2, L^2)} = \|f\|_{L^2(0, T; H^2)} + \|f\|_{L^{\infty}(0, T; H^1)} + \|f\|_{H^1(0, T; L^2)}, \quad (1.25)$$

{HmX}

{infinite}

$$\|f\|_{H_\infty^2(0,T;H^4,L^2)} = \|f\|_{L^2(0,T;H^4)} + \|f\|_{L^\infty(0,T;H^3)} + \|f\|_{H^1(0,T;H^2)} + \|f\|_{W^{1,\infty}(0,T;H^1)} + \|f\|_{H^2(0,T;L^2)}. \quad (1.26)$$

Using interpolation results, we see again that the corresponding norm is equivalent to  $H^1(0,T;H^2)$  but the corresponding constants depend on  $T$ .

## 2. LOCAL IN TIME EXISTENCE OF SOLUTIONS

In order to prove Theorem 1.1, we first prove the existence and uniqueness of strong solutions of system (1.1)-(1.10) for small times. More precisely, we show in this section the following result:

**Theorem 2.1.** *Let  $h_1 \in \Omega^0$  and  $\bar{\rho} > 0$ . Assume  $w$  is given by the feedback law (1.10) with  $k_d \in \mathbb{R}$  and  $k_p \in H_{loc}^1([0, \infty))$ . There exist  $\delta_0, C_*, T_* > 0$  such that for any*

$$h_0 \in \Omega^0, \quad \rho_0 \in H^3, \quad u_0 \in H^3, \quad \ell_0, \quad \omega_0 \in \mathbb{R}^3, \quad (2.1)$$

satisfying the compatibility conditions (1.14)-(1.16) with

$$\|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \leq \delta_0, \quad (2.2)$$

the system (1.1)-(1.9) admits a unique strong solution  $(\rho, u, \ell, \omega) \in \widehat{\mathcal{S}}_{0,T_*}$ ,  $h \in L^\infty(0, T_*)$  and

$$\|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T_*}} + \|h_1 - h\|_{L^\infty(0,T_*)} \leq C_* \left( \|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \right). \quad (2.3)$$

**2.1. Lagrangian change of variables.** Firstly, we use a Lagrangian change of variables to rewrite the system (1.1)-(1.10) in a fixed spatial domain: let introduce the flow  $X(t, \cdot) : \mathcal{F}(0) \rightarrow \mathcal{F}(t)$  defined by

$$\begin{cases} \frac{\partial X}{\partial t}(t, y) = u(t, X(t, y)), \\ X(0, y) = y. \end{cases}$$

Due to the boundary conditions, we have

$$X(t, y) = \begin{cases} h(t) + Q(t)(y - h_0) & \text{if } y \in \partial\mathcal{B}(0), \\ y & \text{if } y \in \partial\Omega, \end{cases}$$

where  $Q(t) \in SO(3)$  is the rotation matrix associated to the angular velocity  $\omega$ :

$$Q' = \mathbb{A}(\omega)Q, \quad Q(0) = \mathbb{I}_3.$$

For any  $\omega \in \mathbb{R}^3$ ,  $\mathbb{A}(\omega)$  is the skew-symmetric matrix:

$$\mathbb{A}(\omega) = \begin{pmatrix} 0 & -\omega_3 & \omega_2 \\ \omega_3 & 0 & -\omega_1 \\ -\omega_2 & \omega_1 & 0 \end{pmatrix}.$$

If  $u$  is regular enough,  $X$  is well-defined and  $X(t, \cdot)$  is a  $C^1$ -diffeomorphism from  $\overline{\mathcal{F}(0)}$  onto  $\overline{\mathcal{F}(t)}$  for all  $t \in (0, T)$ . We denote by  $Y(t, \cdot)$  the inverse of  $X(t, \cdot)$  and we consider the following change of variables

$$\tilde{u}(t, y) = Q(t)^\top u(t, X(t, y)), \quad \tilde{\rho}(t, y) = \rho(t, X(t, y)) - \bar{\rho}, \quad (2.4)$$

$$\tilde{h}(t) = h(t) - h_1, \quad \tilde{\ell}(t) = Q(t)^\top \ell(t), \quad \tilde{\omega}(t) = Q(t)^\top \omega(t). \quad (2.5)$$

Note that now we have

$$X(t, y) = y + \int_0^t Q(s) \tilde{u}(s, y) ds, \quad \forall y \in \overline{\mathcal{F}(0)}. \quad (2.6)$$

Under the change of variables (2.4)-(2.5), the system (1.1)-(1.9) is transformed as follows:

$$\frac{\partial \tilde{\rho}}{\partial t} + \rho_0 \operatorname{div} \tilde{u} = F_1(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) \quad \text{in } (0, T) \times \mathcal{F}(0), \quad (2.7) \quad \{\text{reform:}\}$$

$$\frac{\partial \tilde{u}}{\partial t} - \frac{\mu}{\rho_0} \Delta \tilde{u} - \frac{\lambda + \mu}{\rho_0} \nabla (\operatorname{div} \tilde{u}) = F_2(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) \quad \text{in } (0, T) \times \mathcal{F}(0), \quad (2.8) \quad \{\text{reform:}\}$$

$$m \tilde{\ell}' = F_3(\tilde{\rho}, \tilde{u}, \tilde{h}, \tilde{\ell}, \tilde{\omega}, Q) \quad \text{in } (0, T), \quad (2.9) \quad \{\text{reform:}\}$$

$$J \tilde{\omega}' = F_4(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) \quad \text{in } (0, T), \quad (2.10) \quad \{\text{reform:}\}$$

$$\tilde{h}' = Q \tilde{\ell}, \quad Q' = Q \mathbb{A}(\tilde{\omega}) \quad \text{in } (0, T), \quad (2.11) \quad \{\text{reform:}\}$$

$$\tilde{u} = \tilde{\ell} + \tilde{\omega} \times (y - h_0) \quad \text{on } (0, T) \times \partial \mathcal{B}(0), \quad (2.12) \quad \{\text{reform:}\}$$

$$\tilde{u} = 0 \quad \text{in } (0, T) \times \partial \Omega, \quad (2.13) \quad \{\text{reform:}\}$$

$$\tilde{\rho}(0, \cdot) = \rho_0(\cdot) - \bar{\rho}, \quad \tilde{u}(0, \cdot) = u_0(\cdot), \quad \text{in } \mathcal{F}(0), \quad (2.14) \quad \{\text{reform:}\}$$

$$\tilde{h}(0) = h_0 - h_1, \quad \tilde{\ell}(0) = \ell_0, \quad \tilde{\omega}(0) = \omega_0, \quad Q(0) = \mathbb{I}_3. \quad (2.15) \quad \{\text{reform:}\}$$

In the above equations,  $F_1, F_2, F_3, F_4$  are defined in the following way:

$$F_1(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) = -(\tilde{\rho} + \bar{\rho}) \nabla \tilde{u} : \left[ ((\nabla Y(X))Q)^\top - \mathbb{I}_3 \right] - (\tilde{\rho} + \bar{\rho} - \rho_0) \operatorname{div} \tilde{u}, \quad (2.16) \quad \{\text{F1}\}$$

for  $i = 1, 2, 3$ :

$$\begin{aligned} (F_2)_i(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) &= -(\tilde{\omega} \times \tilde{u})_i + \frac{\mu}{\tilde{\rho} + \bar{\rho}} \sum_{p,l,m} \frac{\partial^2 \tilde{u}_i}{\partial y_m \partial y_l} \left( \frac{\partial Y_m}{\partial x_p}(X) \frac{\partial Y_l}{\partial x_p}(X) - \delta_{mp} \delta_{lp} \right) \\ &+ \frac{\mu}{\tilde{\rho} + \bar{\rho}} \sum_{p,l} \frac{\partial \tilde{u}_i}{\partial y_l} \frac{\partial^2 Y_l}{\partial x_p^2}(X) + \mu \Delta \tilde{u}_i \left( \frac{\rho_0 - (\tilde{\rho} + \bar{\rho})}{\rho_0(\tilde{\rho} + \bar{\rho})} \right) + \frac{\lambda + \mu}{\tilde{\rho} + \bar{\rho}} \sum_{p,l} \frac{\partial \tilde{u}_p}{\partial y_l} \frac{\partial^2 Y_l}{\partial x_p \partial x_i}(X) \\ &+ \frac{\lambda + \mu}{\tilde{\rho} + \bar{\rho}} \sum_{p,l,m} \frac{\partial^2 \tilde{u}_p}{\partial y_m \partial y_l} \left( \frac{\partial Y_m}{\partial x_p}(X) - \delta_{mp} \right) \frac{\partial Y_l}{\partial x_i}(X) + \frac{\lambda + \mu}{\tilde{\rho} + \bar{\rho}} \sum_{p,l} \frac{\partial^2 \tilde{u}_p}{\partial y_p \partial y_l} \left( \frac{\partial Y_l}{\partial x_i}(X) - \delta_{li} \right) \\ &+ (\lambda + \mu) [\nabla (\operatorname{div} \tilde{u})]_i \left( \frac{\rho_0 - (\tilde{\rho} + \bar{\rho})}{\rho_0(\tilde{\rho} + \bar{\rho})} \right) + a \gamma (\tilde{\rho} + \bar{\rho})^{\gamma-2} \sum_{j,l} Q_{ji} \frac{\partial \tilde{\rho}}{\partial y_l} \frac{\partial Y_l}{\partial x_j}(X), \quad (2.17) \quad \{\text{F2}\} \end{aligned}$$

$$\begin{aligned} F_3(\tilde{\rho}, \tilde{u}, \tilde{h}, \tilde{\ell}, \tilde{\omega}, Q) &= -m(\tilde{\omega} \times \tilde{\ell}) - \int_{\partial \mathcal{B}(0)} \left[ \mu \left( Q \nabla \tilde{u} (\nabla Y(X)) + (Q \nabla \tilde{u} (\nabla Y(X)))^\top \right) \right. \\ &\quad \left. + \lambda (Q \nabla \tilde{u} (\nabla Y(X)) : \mathbb{I}_3) - a(\tilde{\rho} + \bar{\rho})^\gamma \right] n \, d\Gamma - k_p Q^\top \tilde{h} - k_d \tilde{\ell}, \quad (2.18) \quad \{\text{F3}\} \end{aligned}$$

$$\begin{aligned} F_4(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) &= - \int_{\partial \mathcal{B}(0)} (y - h_0) \times \left[ \mu \left( Q \nabla \tilde{u} (\nabla Y(X)) + (Q \nabla \tilde{u} (\nabla Y(X)))^\top \right) \right. \\ &\quad \left. + \lambda (Q \nabla \tilde{u} (\nabla Y(X)) : \operatorname{Id}) - a(\tilde{\rho} + \bar{\rho})^\gamma \right] n \, d\Gamma. \quad (2.19) \quad \{\text{F4}\} \end{aligned}$$

Here  $n(y) = Q(t)^\top N(t, x)$  is the unit normal to  $\partial \mathcal{B}(0)$  at the point  $y \in \partial \mathcal{B}(0)$ , directed to the interior of the ball.

**2.2. Analysis of a linear problem.** In this section, we want to study the existence and regularity of the solution of the following linear system:

$$\frac{\partial \tilde{\rho}}{\partial t} + \rho_0 \operatorname{div} \tilde{u} = f_1 \quad \text{in} \quad (0, T) \times \mathcal{F}(0), \quad (2.20)$$

$$\frac{\partial \tilde{u}}{\partial t} - \frac{\mu}{\rho_0} \Delta \tilde{u} - \frac{\lambda + \mu}{\rho_0} \nabla (\operatorname{div} \tilde{u}) = f_2 \quad \text{in} \quad (0, T) \times \mathcal{F}(0), \quad (2.21)$$

$$m \tilde{\ell}' = f_3 \quad \text{in} \quad (0, T), \quad (2.22)$$

$$J \tilde{\omega}' = f_4 \quad \text{in} \quad (0, T), \quad (2.23)$$

$$\tilde{u} = \tilde{\ell} + \tilde{\omega} \times (y - h_0) \quad \text{on} \quad (0, T) \times \partial \mathcal{B}(0), \quad (2.24)$$

$$\tilde{u} = 0 \quad \text{on} \quad (0, T) \times \partial \Omega, \quad (2.25)$$

$$\tilde{u}(0, \cdot) = u_0(\cdot) \quad \text{in} \quad \mathcal{F}(0), \quad (2.26)$$

$$\tilde{\rho}(0, \cdot) = \tilde{\rho}_0 \quad \text{in} \quad \mathcal{F}(0), \quad (2.27)$$

$$\tilde{\ell}(0) = \ell_0, \quad \tilde{\omega}(0) = \omega_0. \quad (2.28)$$

We introduce the following set for  $T > 0$ :

$$\begin{aligned} \mathcal{S}_T = \left\{ (\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}) \mid \tilde{\rho} \in H^1(0, T; H^3) \cap C^1([0, T]; H^2) \cap H^2(0, T; L^2), \tilde{u} \in H^2(0, T; H^4, L^2), \right. \\ \left. \tilde{\ell} \in H^2(0, T), \tilde{\omega} \in H^2(0, T), \tilde{u} = 0 \text{ on } \partial \Omega, \tilde{u} = \tilde{\ell} + \tilde{\omega} \times (y - h_0) \text{ on } \partial \mathcal{B}(0), \tilde{\rho}(0) = \tilde{\rho}_0, \right. \\ \left. \tilde{u}(0) = u_0, \tilde{\ell}(0) = \ell_0, \tilde{\omega}(0) = \omega_0 \right\}, \quad (2.29) \end{aligned}$$

equipped with the norm

$$\begin{aligned} \|(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega})\|_{\mathcal{S}_T} := & \|\tilde{\rho}\|_{H_\infty^1(0, T; H^3)} + \|\tilde{\rho}\|_{W^{1, \infty}(0, T; H^2)} + \|\tilde{\rho}\|_{H^2(0, T; L^2)} + \|\tilde{u}\|_{H_\infty^2(0, T; H^4, L^2)} \\ & + \|\tilde{\ell}\|_{H_\infty^2(0, T)} + \|\tilde{\omega}\|_{H_\infty^2(0, T)}. \end{aligned}$$

We recall that the norms  $\|\cdot\|_{H_\infty^1(0, T; H^3)}$ ,  $\|\cdot\|_{H_\infty^2(0, T)}$  are defined in (1.24) and  $\|\cdot\|_{H_\infty^2(0, T; H^4, L^2)}$  is defined in (1.26). The space  $\mathcal{S}_T$  is similar to  $\widehat{\mathcal{S}}_{T_1, T_2}$  defined by (1.12) except that here  $\mathcal{F}(t)$  is replaced by  $\mathcal{F}(0)$  and we add the boundary and initial conditions.

Since  $\bar{\rho} > 0$ , there exists  $\delta_0 > 0$  such that (2.2) implies

$$\rho_0 \geq \frac{\bar{\rho}}{2} > 0.$$

In that case, the system (2.20)–(2.28) is well-posed:

**Proposition 2.2.** *Let us assume  $\bar{\rho} > 0$ , (2.2) with  $\delta_0$  as above and*

$$\begin{aligned} (\tilde{\rho}_0, u_0, \ell_0, \omega_0) \in H^3 \times H^3 \times \mathbb{R}^3 \times \mathbb{R}^3, \quad f_1 \in L^2(0, T; H^3) \cap C([0, T]; H^2) \cap H^1(0, T; L^2), \\ f_2 \in H^1(0, T; H^2, L^2), \quad f_3 \in H^1(0, T), \quad f_4 \in H^1(0, T) \end{aligned}$$

with

$$u_0 = \ell_0 + \omega_0 \times (y - h_0) \text{ for } y \in \partial \mathcal{B}(0), \quad u_0 = 0 \text{ on } \partial \Omega, \quad (2.30)$$

$$f_2(0) + \frac{\mu}{\rho_0} \Delta u_0 + \frac{\lambda + \mu}{\rho_0} \nabla (\operatorname{div} u_0) = 0 \text{ on } \partial \Omega, \quad (2.31)$$

$$f_2(0) + \frac{\mu}{\rho_0} \Delta u_0 + \frac{\lambda + \mu}{\rho_0} \nabla (\operatorname{div} u_0) = m^{-1} f_3(0) + J^{-1} f_4(0) \times (y - h_0) \text{ for } y \in \partial \mathcal{B}(0). \quad (2.32)$$

Then the system (2.20)–(2.28) admits a unique solution  $(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}) \in \mathcal{S}_T$ . Moreover, there exists  $C_L > 0$  (nondecreasing with respect to  $T$ ) such that

$$\begin{aligned} \|(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega})\|_{\mathcal{S}_T} \leq C_L & \left( \|f_1\|_{L^2(0,T;H^3)} + \|f_1\|_{L^\infty(0,T;H^2)} + \|f_1\|_{H^1(0,T;L^2)} + \|f_2\|_{H^\infty(0,T;L^2,H^2)} \right. \\ & \left. + \|f_3\|_{H^\infty(0,T)} + \|f_4\|_{H^\infty(0,T)} + \|\tilde{\rho}_0\|_{H^3} + \|u_0\|_{H^3} + |\ell_0| + |\omega_0| \right). \end{aligned} \quad (2.33) \quad \{\text{est:lin}\}$$

*Proof.* We solve (2.20)–(2.28) like a cascade system: first, (2.22)–(2.23) admits a unique solution  $(\tilde{\ell}, \tilde{\omega})$  with

$$\|\tilde{\ell}\|_{H^\infty(0,T)} + \|\tilde{\omega}\|_{H^\infty(0,T)} \leq C \left( \|f_3\|_{H^\infty(0,T)} + \|f_4\|_{H^\infty(0,T)} + |\ell_0| + |\omega_0| \right). \quad (2.34) \quad \{\text{est:bod}\}$$

Next, we solve equation (2.21) with the boundary and initial conditions (2.24)–(2.26). First we consider a lifting operator  $\mathcal{R}$ , such that for any  $a, b \in \mathbb{R}^3$ ,  $\mathcal{R}(a, b) \in C^\infty(\mathbb{R}^3)$  satisfies

$$\mathcal{R}(a, b) = \begin{cases} a + b \times (y - h_0) & \text{on } \partial\mathcal{B}(0), \\ 0 & \text{on } \partial\Omega. \end{cases}$$

Then  $\tilde{v} = \tilde{u} - \mathcal{R}(\tilde{\ell}, \tilde{\omega})$  satisfies

$$\begin{cases} \frac{\partial \tilde{v}}{\partial t} - \frac{\mu}{\rho_0} \Delta \tilde{v} - \frac{\lambda + \mu}{\rho_0} \nabla (\operatorname{div} \tilde{v}) = F = f_2 + \frac{\mu}{\rho_0} \Delta \mathcal{R}(\tilde{\ell}, \tilde{\omega}) + \frac{\lambda + \mu}{\rho_0} \nabla (\operatorname{div} \mathcal{R}(\tilde{\ell}, \tilde{\omega})) - \mathcal{R}(\tilde{\ell}', \tilde{\omega}'), \\ \tilde{v} = 0 \quad \text{on } (0, T) \times \partial\mathcal{F}(0), \\ \tilde{v}(0, \cdot) = \tilde{v}_0 = u_0 - \mathcal{R}(\ell_0, \omega_0) \quad \text{in } \mathcal{F}(0). \end{cases}$$

By using a standard Galerkin method (see [8, Chapter 7, Theorem 1, p.354]) and by using the regularity result of Lamé operator (see, for instance, [4, Theorem 6.3-6, p.296]), under the condition that  $\partial\mathcal{F}(0)$  is of class  $C^4$ , we can show the following result: if

$$F \in L^2(0, T; H^2) \cap H^1(0, T; L^2), \quad \tilde{v}_0 \in H^3 \cap H_0^1,$$

with the condition

$$F(0, \cdot) + \frac{\mu}{\rho_0} \Delta \tilde{v}_0 + \frac{\lambda + \mu}{\rho_0} \nabla (\operatorname{div} \tilde{v}_0) = 0 \quad \text{on } \partial\mathcal{F}(0), \quad (2.35) \quad \{\text{13:38}\}$$

then there exists a unique solution  $\tilde{v} \in H^2(0, T; H^4, L^2)$  with the estimate

$$\|\tilde{v}\|_{H^\infty(0,T;H^4,L^2)} \leq C \left( \|F\|_{H^\infty(0,T;L^2,H^2)} + \|\tilde{v}(0)\|_{H^3} \right).$$

We note that condition (2.35) is equivalent to (2.31) and (2.32). We can use the relation  $\tilde{u} = \tilde{v} + \mathcal{R}(\tilde{\ell}, \tilde{\omega})$  and the above estimate of  $\tilde{v}$  to deduce the following estimate of  $\tilde{u}$ :

$$\|\tilde{u}\|_{H^\infty(0,T;H^4,L^2)} \leq C \left( \|f_2\|_{H^\infty(0,T;L^2,H^2)} + \|f_3\|_{H^\infty(0,T)} + \|f_4\|_{H^\infty(0,T)} + \|u_0\|_{H^3} + |\ell_0| + |\omega_0| \right). \quad (2.36) \quad \{\text{reg:u}\}$$

Now, with the help of equation (2.20) satisfied by  $\tilde{\rho}$ , we obtain

$$\begin{aligned} \|\tilde{\rho}\|_{H^\infty(0,T;H^3)} + \|\tilde{\rho}\|_{W^{1,\infty}(0,T;H^2)} + \|\tilde{\rho}\|_{H^2(0,T;L^2)} \leq C & \left( \|f_1\|_{L^2(0,T;H^3)} + \|f_1\|_{L^\infty(0,T;H^2)} + \|f_1\|_{H^1(0,T;L^2)} \right. \\ & \left. + \|\tilde{u}\|_{L^2(0,T;H^4)} + \|\tilde{u}\|_{L^\infty(0,T;H^3)} + \|\tilde{u}\|_{H^1(0,T;H^1)} + \|\tilde{\rho}_0\|_{H^3} \right). \end{aligned} \quad (2.37) \quad \{\text{est:flu}\}$$

Thus, we have proved the existence of solution in appropriate space for the system (2.20)–(2.28). Thanks to (2.34), (2.36) and (2.37), we have also obtained our required estimate (2.33).  $\square$

15:29

**2.3. Estimates of the nonlinear terms.** For  $T > 0$  and  $R > 0$ , we define the following subset of  $\mathcal{S}_T$ :

$$\mathcal{S}_{T,R} = \left\{ (\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}) \in \mathcal{S}_T \mid \|(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega})\|_{\mathcal{S}_T} \leq R \right\}. \quad (2.38) \quad \{\text{ball fo}\}$$

In what follows,  $R$  is fixed and the constants that appear can depend on  $R$ .

Assume  $(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}) \in \mathcal{S}_{T,R}$ . Then there exists a unique solution  $(\tilde{h}, Q) \in H^3(0, T)$  of the following equations

$$\begin{cases} \tilde{h}' = Q\tilde{\ell} & \text{in } (0, T), \\ Q' = Q\mathbb{A}(\tilde{\omega}) & \text{in } (0, T), \\ Q(0) = \mathbb{I}_3, \quad \tilde{h}(0) = h_0 - h_1, \end{cases} \quad (2.39) \quad \{\text{13:43}\}$$

and we can then define  $X$  by (2.6). From (2.38), there exists  $C = C(R) > 0$  such that

$$\begin{aligned} \|Q\|_{H^3(0,T)} &\leq C, \quad \|Q - \mathbb{I}_3\|_{L^\infty(0,T)} \leq CT, \\ \|\tilde{h}\|_{L^\infty(0,T)} &\leq |h_0 - h_1| + CT^{1/2}. \end{aligned} \quad (2.40) \quad \{\text{est:h}\}$$

In particular, taking  $\delta_0$  small enough in (2.2), there exists  $T_1 = T_1(R, \delta_0, \text{dist}(h_1, \partial\Omega)) > 0$  and  $c_1 > 0$  such that

$$\text{dist}(\widehat{\mathcal{B}}(\tilde{h}(t) + h_1), \partial\Omega) \geq c_1 > 0 \quad \forall t \in [0, T_1]. \quad (2.41) \quad \{\text{12:07}\}$$

From now on, we assume  $T \leq T_1$  and the constants may depend on  $T_1$ .

Combining (2.6) and (2.38), we also deduce

$$\|\nabla X - \mathbb{I}_3\|_{L^\infty(0,T;H^3)} \leq CT^{1/2}. \quad (2.42) \quad \{\text{inverse}\}$$

In particular, using the embedding  $H^3(\mathcal{F}(0)) \hookrightarrow W^{1,\infty}(\mathcal{F}(0))$  and (2.41), there exists  $T_2 \leq T_1$  such that  $X : \mathcal{F}(0) \rightarrow \widehat{\mathcal{F}}(\tilde{h}(t) + h_1)$  is invertible and its inverse is denoted by  $Y$ .

In the same spirit, using the initial condition on  $\tilde{\rho}$  (see (2.29)), we have

$$\|\tilde{\rho} + \bar{\rho} - \rho_0\|_{L^\infty(0,T;H^3)} \leq T^{1/2}R. \quad (2.43) \quad \{\text{15:06bi}\}$$

Using the embedding  $H^3(\mathcal{F}(0)) \hookrightarrow L^\infty(\mathcal{F}(0))$  and (2.2) with  $\delta_0$  small enough, there exists  $T_3 \leq T_2$  such that

$$\frac{\bar{\rho}}{2} \leq \tilde{\rho} + \bar{\rho} \leq \frac{3\bar{\rho}}{2}. \quad (2.44) \quad \{\text{15:06}\}$$

In particular, combining this with (2.38), for any  $\alpha \in \mathbb{R}$ ,

$$\|(\tilde{\rho} + \bar{\rho})^\alpha\|_{L^\infty(0,T;H^3)} \leq C, \quad \left\| \int_{\partial\mathcal{B}(0)} (\tilde{\rho} + \bar{\rho})^\gamma nd\Gamma \right\|_{H^1(0,T)} \leq CT^{1/2}. \quad (2.45) \quad \{\text{rhoalph}\}$$

From the above construction and assuming  $T \leq T_3$ , we can define the terms  $F_1, F_2, F_3, F_4$  by (2.16)-(2.19). To estimate these terms, we first give some estimates of  $X$  and  $Y$ :

**Lemma 2.3.** *Assume  $(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}) \in \mathcal{S}_{T,R}$ . There exists a positive constant  $C$  depending only on  $R, \mathcal{F}(0)$  such that, for all  $0 < T \leq T_3$ ,*

$$\|\nabla Y(X) - \mathbb{I}_3\|_{L^\infty(0,T;H^3)} \leq CT^{1/2}, \quad (2.46) \quad \{\text{x-6}\}$$

$$\left\| \frac{\partial^2 Y_l}{\partial x_p \partial x_i}(X) \right\|_{L^\infty(0,T;H^2)} + \left\| \frac{\partial}{\partial t}(\nabla Y(X)) \right\|_{L^\infty(0,T;H^2)} + \left\| \frac{\partial}{\partial t} \left( \frac{\partial^2 Y_l}{\partial x_p \partial x_i}(X) \right) \right\|_{L^\infty(0,T;H^1)} \leq C. \quad (2.47) \quad \{\text{x-3}\}$$

lem:estX

*Proof.* From (2.42) and the fact that  $L^\infty(0, T; H^3)$  is an algebra, we deduce (2.46). This yields in particular that

$$\|\nabla Y(X)\|_{L^\infty(0, T; H^3)} \leq C. \quad (2.48) \quad \boxed{\{18:04\}}$$

Writing

$$\frac{\partial}{\partial y_m} \left( \frac{\partial Y_l}{\partial x_i}(X) \right) = \sum_p \frac{\partial^2 Y_l}{\partial x_p \partial x_i}(X) \frac{\partial X_p}{\partial y_m}$$

and using (2.48), we deduce the estimate on  $\frac{\partial^2 Y_l}{\partial x_p \partial x_i}(X)$ .

From the expression (2.6), we have  $\frac{\partial}{\partial t}(\nabla X(t, \cdot)) = Q(t)\nabla \tilde{u}(t, \cdot)$ , and using

$$\frac{\partial}{\partial t}(\nabla Y(X)) = -\nabla Y(X) \frac{\partial}{\partial t}(\nabla X)\nabla Y(X),$$

we obtain the estimate of the second term in (2.47).

Finally, we write

$$\frac{\partial}{\partial y_m} \left[ \frac{\partial}{\partial t} \left( \frac{\partial Y_l}{\partial x_i}(X) \right) \right] = \sum_p \frac{\partial}{\partial t} \left( \frac{\partial^2 Y_l}{\partial x_p \partial x_i}(X) \right) \frac{\partial X_p}{\partial y_m} + \sum_p \frac{\partial^2 Y_l}{\partial x_p \partial x_i}(X) \frac{\partial}{\partial t} \left( \frac{\partial X_p}{\partial y_m} \right)$$

and from the previous estimate, we have

$$\left\| \frac{\partial}{\partial y_m} \left[ \frac{\partial}{\partial t} \left( \frac{\partial Y_l}{\partial x_i}(X) \right) \right] \right\|_{L^\infty(0, T; H^1)} + \left\| \sum_p \frac{\partial^2 Y_l}{\partial x_p \partial x_i}(X) \frac{\partial}{\partial t} \left( \frac{\partial X_p}{\partial y_m} \right) \right\|_{L^\infty(0, T; H^1)} \leq C.$$

Thus, using (2.48), we deduce the estimate of the last term in (2.47).  $\square$

Next we give some properties on  $F_1, F_2, F_3, F_4$ .

$\boxed{\text{lip:F1}}$

**Proposition 2.4.** *There exist  $\alpha > 0$  and a positive constant  $C$  depending on  $R, k_p, k_d, \bar{\rho}$  and the other physical parameters, and on  $\mathcal{F}(0)$  such that, for all  $0 < T \leq T_3$ , for all*

$$(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}), (\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1), (\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2) \in \mathcal{S}_{T, R},$$

$$\|F_1(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q)\|_{L^2(0, T; H^3) \cap L^\infty(0, T; H^2) \cap H^1(0, T; L^2)} \leq CT^\alpha,$$

$$\|F_2(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q)\|_{H_\infty^1(0, T; L^2, H^2)} \leq C \left( T^\alpha + \|\omega_0 \times u_0\|_{H^1} + \|a\gamma\rho_0^{\gamma-2}\nabla\rho_0\|_{H^1} \right),$$

$$\|F_3(\tilde{\rho}, \tilde{u}, \tilde{h}, \tilde{\ell}, \tilde{\omega}, Q)\|_{H_\infty^1(0, T)} \leq C \left( T^\alpha + |\omega_0 \times \ell_0| + |\ell_0| + \|\rho_0 - \bar{\rho}\|_{H^1} + \|u_0\|_{H^3} \right),$$

$$\|F_4(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q)\|_{H_\infty^1(0, T)} \leq CT^\alpha,$$

and

$$\begin{aligned} \|F_1(\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1, Q^1) - F_1(\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2, Q^2)\|_{L^2(0, T; H^3) \cap L^\infty(0, T; H^2) \cap H^1(0, T; L^2)} \\ \leq CT^\alpha \|(\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1) - (\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2)\|_{\mathcal{S}_T}, \end{aligned}$$

$$\|F_2(\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1, Q^1) - F_2(\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2, Q^2)\|_{H_\infty^1(0, T; L^2, H^2)} \leq CT^\alpha \|(\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1) - (\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2)\|_{\mathcal{S}_T},$$

$$\|F_3(\tilde{\rho}^1, \tilde{u}^1, \tilde{h}^1, \tilde{\ell}^1, \tilde{\omega}^1, Q^1) - F_3(\tilde{\rho}^2, \tilde{u}^2, \tilde{h}^2, \tilde{\ell}^2, \tilde{\omega}^2, Q^2)\|_{H_\infty^1(0, T)} \leq CT^\alpha \|(\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1) - (\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2)\|_{\mathcal{S}_T},$$

$$\|F_4(\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1, Q^1) - F_4(\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2, Q^2)\|_{H_\infty^1(0, T)} \leq CT^\alpha \|(\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1) - (\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2)\|_{\mathcal{S}_T}.$$

where  $Q, Q^1, Q^2, \tilde{h}, \tilde{h}^1, \tilde{h}^2 \in H^3(0, T)$  are given by (2.39).

*Proof.* Using the definition (2.16) of  $F_1$ , (2.43), (2.29), (2.38), (2.46) we have the following estimates

$$\begin{aligned} \|F_1\|_{L^2(0,T;H^3)} &\leq C\|(\tilde{\rho} + \bar{\rho})\|_{L^\infty(0,T;H^3)}\|\nabla\tilde{u}\|_{L^2(0,T;H^3)}\|((\nabla Y)Q)^\top - \mathbb{I}_3\|_{L^\infty(0,T;H^3)} \\ &\quad + C\|(\tilde{\rho} + \bar{\rho} - \rho_0)\|_{L^\infty(0,T;H^3)}\|\operatorname{div}\tilde{u}\|_{L^2(0,T;H^3)} \leq CT^\alpha, \end{aligned}$$

$$\begin{aligned} \left\|\frac{\partial F_1}{\partial t}\right\|_{L^2(0,T;L^2)} &\leq C\|(\tilde{\rho} + \bar{\rho})\|_{L^\infty(0,T;H^3)}\left\{\left\|\nabla\frac{\partial\tilde{u}}{\partial t}\right\|_{L^2(0,T;L^2)}\|((\nabla Y)Q)^\top - \mathbb{I}_3\|_{L^\infty(0,T;H^3)}\right. \\ &\quad \left. + \|\nabla\tilde{u}\|_{L^2(0,T;H^3)}\left\|\frac{\partial}{\partial t}((\nabla Y(X))Q)^\top\right\|_{L^\infty(0,T;H^2)}\right\} \\ &\quad + CT^{1/2}\left\|\frac{\partial\tilde{\rho}}{\partial t}\right\|_{L^\infty(0,T;H^2)}\|\nabla\tilde{u}\|_{L^\infty(0,T;H^2)}\|((\nabla Y(X))Q)^\top\|_{L^\infty(0,T;H^3)} \\ &\quad + C\|\tilde{\rho} + \bar{\rho} - \rho_0\|_{L^\infty(0,T;H^3)}\left\|\operatorname{div}\frac{\partial\tilde{u}}{\partial t}\right\|_{L^2(0,T;H^1)} \leq CT^\alpha, \quad (2.49) \end{aligned}$$

{time de

$$\begin{aligned} \|F_1\|_{L^\infty(0,T;H^2)} &\leq C\|\tilde{\rho} + \bar{\rho}\|_{L^\infty(0,T;H^3)}\|\nabla\tilde{u}\|_{L^\infty(0,T;H^2)}\|((\nabla Y)Q)^\top - \mathbb{I}_3\|_{L^\infty(0,T;H^3)} \\ &\quad + C\|\tilde{\rho} + \bar{\rho} - \rho_0\|_{L^\infty(0,T;H^3)}\|\operatorname{div}\tilde{u}\|_{L^\infty(0,T;H^2)} \leq CT^{1/2}. \end{aligned}$$

Let us now estimate the  $L^2(0, T; H^2)$  norm of  $F_2$ . Here we only estimate some terms in (2.17), the other terms can be estimated similarly. Using (2.45), (2.29), (2.38), (2.46), (2.47),

$$\begin{aligned} &\left\|\frac{1}{\tilde{\rho} + \bar{\rho}}\frac{\partial^2\tilde{u}_i}{\partial y_m\partial y_l}\left(\frac{\partial Y_m}{\partial x_p}(X)\frac{\partial Y_l}{\partial x_p}(X) - \delta_{mp}\delta_{lp}\right)\right\|_{L^2(0,T;H^2)} \\ &\leq C\left\|\frac{1}{\tilde{\rho} + \bar{\rho}}\right\|_{L^\infty(0,T;H^3)}\left\|\frac{\partial^2\tilde{u}_i}{\partial y_m\partial y_l}\right\|_{L^2(0,T;H^2)}\left\|\frac{\partial Y_m}{\partial x_p}(X)\frac{\partial Y_l}{\partial x_p}(X) - \delta_{mp}\delta_{lp}\right\|_{L^\infty(0,T;H^2)} \leq CT^\alpha, \end{aligned}$$

$$\begin{aligned} \left\|\frac{1}{\tilde{\rho} + \bar{\rho}}\frac{\partial\tilde{u}_i}{\partial y_l}\frac{\partial^2 Y_l}{\partial x_p^2}(X)\right\|_{L^2(0,T;H^2)} &\leq CT^{1/2}\left\|\frac{1}{\tilde{\rho} + \bar{\rho}}\right\|_{L^\infty(0,T;H^3)}\left\|\frac{\partial\tilde{u}_i}{\partial y_l}\right\|_{L^\infty(0,T;H^2)}\left\|\frac{\partial^2 Y_l}{\partial x_p^2}(X)\right\|_{L^\infty(0,T;H^2)} \\ &\leq CT^\alpha, \end{aligned}$$

$$\begin{aligned} &\left\|(\tilde{\rho} + \bar{\rho})^{\gamma-2}\frac{\partial\tilde{\rho}}{\partial y_l}\frac{\partial Y_l}{\partial x_j}(X)\right\|_{L^2(0,T;H^2)} \\ &\leq CT^{1/2}\|(\tilde{\rho} + \bar{\rho})^{\gamma-2}\|_{L^\infty(0,T;H^2)}\left\|\frac{\partial\tilde{\rho}}{\partial y_l}\right\|_{L^\infty(0,T;H^2)}\left\|\frac{\partial Y_l}{\partial x_j}(X)\right\|_{L^\infty(0,T;H^2)} \leq CT^\alpha. \end{aligned}$$

For the estimate of the  $H^1(0, T; L^2)$  norm of  $F_2$ , we also only give the estimates the  $L^2(0, T; L^2)$  norm of some terms of the time derivative  $F_2$ . Again, the other terms can be estimated similarly.

First, we write

$$\begin{aligned} & \frac{\partial}{\partial t} \left[ \frac{1}{\tilde{\rho} + \bar{\rho}} \frac{\partial^2 \tilde{u}_i}{\partial y_m \partial y_l} \left( \frac{\partial Y_m}{\partial x_p}(X) \frac{\partial Y_l}{\partial x_p}(X) - \delta_{mp} \delta_{lp} \right) \right] \\ &= - \frac{1}{(\tilde{\rho} + \bar{\rho})^2} \frac{\partial \tilde{\rho}}{\partial t} \frac{\partial^2 \tilde{u}_i}{\partial y_m \partial y_l} \left( \frac{\partial Y_m}{\partial x_p}(X) \frac{\partial Y_l}{\partial x_p}(X) - \delta_{mp} \delta_{lp} \right) \\ &+ \left( \frac{1}{\tilde{\rho} + \bar{\rho}} \right) \frac{\partial^3 \tilde{u}_i}{\partial t \partial y_m \partial y_l} \left( \frac{\partial Y_m}{\partial x_p}(X) \frac{\partial Y_l}{\partial x_p}(X) - \delta_{mp} \delta_{lp} \right) + \left( \frac{1}{\tilde{\rho} + \bar{\rho}} \right) \frac{\partial^2 \tilde{u}_i}{\partial y_m \partial y_l} \frac{\partial}{\partial t} \left( \frac{\partial Y_m}{\partial x_p}(X) \frac{\partial Y_l}{\partial x_p}(X) \right), \\ & \frac{\partial}{\partial t} \left[ \frac{1}{\tilde{\rho} + \bar{\rho}} \frac{\partial \tilde{u}_i}{\partial y_l} \frac{\partial^2 Y_l}{\partial x_p^2}(X) \right] = - \frac{1}{(\tilde{\rho} + \bar{\rho})^2} \frac{\partial \tilde{\rho}}{\partial t} \frac{\partial \tilde{u}_i}{\partial y_l} \frac{\partial^2 Y_l}{\partial x_p^2}(X) + \frac{1}{\tilde{\rho} + \bar{\rho}} \frac{\partial^2 \tilde{u}_i}{\partial t \partial y_l} \frac{\partial^2 Y_l}{\partial x_p^2}(X) \\ &+ \frac{1}{\tilde{\rho} + \bar{\rho}} \frac{\partial \tilde{u}_i}{\partial y_l} \frac{\partial}{\partial t} \left( \frac{\partial^2 Y_l}{\partial x_p^2}(X) \right). \end{aligned}$$

**1/f est}** Using (2.45), (2.29), (2.38), (2.46), (2.47), we deduce that the above terms is estimated in  $L^2(0, T; L^2)$  by  $CT^\alpha$ .

Finally, to obtain the  $L^\infty(0, T; H^1)$  estimate of the term  $F_2$ , we use the following inequality [15, Lemma 4.2]:

$$\sup_{t \in (0, T)} \|F_2(t)\|_{H^1} \leq C \left( \|F_2\|_{L^2(0, T; H^2)} + \|F_2\|_{H^1(0, T; L^2)} + \|F_2(0)\|_{H^1} \right),$$

and since

$$\|F_2(0)\|_{H^1} \leq \|\omega_0 \times u_0\|_{H^1} + \|a\gamma\rho_0^{\gamma-2}\nabla\rho_0\|_{H^1},$$

we deduce the result for  $F_2$ .

It remains to estimate  $F_3$  and  $F_4$ . We only consider  $F_3$ , the analysis for  $F_4$  is the same. From (2.18), we can see that the time derivative of  $F_3$  involves the following terms (and similar ones)

$$\begin{aligned} & (\tilde{\omega} \times \tilde{\ell})', \quad (k_p Q^\top \tilde{h})', \quad k_d \tilde{\ell}', \quad \int_{\partial B(0)} \left( Q' \nabla \tilde{u} \nabla Y(X) + Q \nabla \frac{\partial \tilde{u}}{\partial t} \nabla Y(X) + Q \nabla \tilde{u} \frac{\partial}{\partial t} \nabla Y(X) \right) n \, d\Gamma \\ & - a\gamma \int_{\partial B(0)} (\bar{\rho} + \tilde{\rho})^{\gamma-1} \frac{\partial \tilde{\rho}}{\partial t} n \, d\Gamma. \end{aligned}$$

Almost all the terms can be estimated in a direct way in  $L^2(0, T)$  by using (2.40), (2.45), (2.29), (2.38), (2.46). We have nevertheless to take care of

$$\int_{\partial B(0)} Q \nabla \frac{\partial \tilde{u}}{\partial t} \nabla Y(X) n \, d\Gamma.$$

For this term, we use standard interpolation result (see, for instance, [2, Lemma A.5]) to obtain

$$\left\| \nabla \frac{\partial \tilde{u}}{\partial t} \right\|_{L^{8/3}(0, T; H^{1/4})} \leq C \left\| \nabla \frac{\partial \tilde{u}}{\partial t} \right\|_{L^\infty(0, T; L^2)}^{1/4} \left\| \nabla \frac{\partial \tilde{u}}{\partial t} \right\|_{L^2(0, T; H^1)}^{3/4},$$

where  $C$  is independent of  $T$ . Using a trace result and (2.29), (2.38), we deduce an estimate of  $F_3'$  in  $L^2(0, T)$  of the form  $CT^\alpha$ . To end the estimate of  $F_3$ , we use that

$$\|F_3\|_{L^\infty(0, T)} \leq |F_3(0)| + T^{1/2} \|F_3\|_{H^1(0, T)}.$$

We have the following estimate:

$$\left| \int_{\partial\mathcal{B}(0)} (\bar{\rho} + \tilde{\rho}(0))^\gamma n \, d\Gamma \right| = \left| \int_{\partial\mathcal{B}(0)} \rho_0^\gamma n \, d\Gamma \right| = \left| \int_{\partial\mathcal{B}(0)} (\rho_0^\gamma - \bar{\rho}^\gamma) n \, d\Gamma \right| \leq C \int_{\partial\mathcal{B}(0)} |\rho_0 - \bar{\rho}| \, d\Gamma.$$

Thus,

$$|F_3(0)| \leq C (|\omega_0 \times \ell_0| + |\ell_0| + \|\rho_0 - \bar{\rho}\|_{H^1} + \|u_0\|_{H^3}).$$

The estimates for the differences can be done in a similar way and we thus skip the corresponding proof.  $\square$

#### 2.4. Proof of Theorem 2.1.

*Proof.* We are going to establish the local in time existence of (2.7)-(2.19). In order to do this we use a fixed-point argument.

Assume  $\bar{\rho} > 0$ ,  $\delta_0$  satisfying the smallness assumptions introduced in the above section and let us consider  $(\rho_0, u_0, h_0, \ell_0, \omega_0)$  satisfying (2.1), (2.2). Recall that from (2.44), we have  $\frac{\bar{\rho}}{2} \leq \rho_0 \leq \frac{3\bar{\rho}}{2}$  and thus, using Sobolev embeddings, there exists  $C_1 > 0$  depending on  $\bar{\rho}, \delta_0$  and the geometry such that

$$C \left( \|\omega_0 \times u_0\|_{H^1} + \|a\gamma\rho_0^{\gamma-2}\nabla\rho_0\|_{H^1} + |\omega_0 \times \ell_0| + |\ell_0| + \|\rho_0 - \bar{\rho}\|_{H^1} + \|u_0\|_{H^3} \right) \leq C_1 \tilde{\delta}_0 \quad (2.50) \quad \{\text{est:F20}\}$$

where  $C$  is the constant appearing in Proposition 2.4 and where we have set

$$\tilde{\delta}_0 = \|\rho_0 - \bar{\rho}\|_{H^3} + \|u_0\|_{H^3} + |h_1 - h_0| + |\ell_0| + |\omega_0| \leq \delta_0.$$

We now fix  $R > 0$  as

$$R = 2C_L C_1 \tilde{\delta}_0, \quad (2.51) \quad \{\text{radius}\}$$

where  $C_L$  is the continuity constant in estimate (2.33). We take  $T \leq T_3$ , where  $T_3 = T_3(R)$  is the time obtained in the above section.

Let us define the following mapping

$$\mathcal{N} : \mathcal{S}_{T,R} \rightarrow \mathcal{S}_{T,R} \quad (2.52) \quad \{\text{10:12}\}$$

$$(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}) \mapsto (\hat{\rho}, \hat{u}, \hat{\ell}, \hat{\omega}). \quad (2.53)$$

For  $(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}) \in \mathcal{S}_{T,R}$ , we define  $X$  by (2.6),  $\tilde{h}$  and  $Q$  by (2.39) and  $F_1, F_2, F_3, F_4$  by (2.16)-(2.19). Then  $(\hat{\rho}, \hat{u}, \hat{\ell}, \hat{\omega})$  is the solution of

$$\frac{\partial \hat{\rho}}{\partial t} + \rho_0 \operatorname{div} \hat{u} = F_1(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) \quad \text{in } (0, T) \times \mathcal{F}(0), \quad (2.54) \quad \{\text{fixedpo}\}$$

$$\frac{\partial \hat{u}}{\partial t} - \frac{\mu}{\rho_0} \Delta \hat{u} - \frac{\lambda + \mu}{\rho_0} \nabla (\operatorname{div} \hat{u}) = F_2(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) \quad \text{in } (0, T) \times \mathcal{F}(0), \quad (2.55) \quad \{\text{fixedpo}\}$$

$$m \hat{\ell}' = F_3(\tilde{\rho}, \tilde{u}, \tilde{h}, \tilde{\ell}, \tilde{\omega}, Q) \quad \text{in } (0, T), \quad (2.56) \quad \{\text{fixedpo}\}$$

$$J \hat{\omega}' = F_4(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) \quad \text{in } (0, T), \quad (2.57) \quad \{\text{fixedpo}\}$$

$$\hat{u} = \hat{\ell} + \hat{\omega} \times (y - h_0) \quad \text{on } (0, T) \times \partial\mathcal{B}(0), \quad (2.58) \quad \{\text{fixedpo}\}$$

$$\hat{u} = 0 \quad \text{in } (0, T) \times \partial\Omega. \quad (2.59) \quad \{\text{fixedpo}\}$$

$$\hat{\rho}(0, \cdot) = \rho_0(\cdot) - \bar{\rho}, \quad \hat{u}(0, \cdot) = u_0(\cdot) \quad \text{in } \mathcal{F}(0), \quad (2.60) \quad \{\text{fixedpo}\}$$

$$\hat{\ell}(0) = \ell_0, \quad \hat{\omega}(0) = \omega_0. \quad (2.61) \quad \{\text{fixedpo}\}$$

In order to show that  $\mathcal{N}$  is well-defined, we apply Proposition 2.2 to the above system. First we note that (1.14)–(1.16) yield the compatibility conditions (2.30)–(2.32). More precisely, the first condition is exactly condition (1.14). Using the expression of  $F_2$  in (2.17), we have

$$\left[ F_2(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) \right] (0, \cdot) = -\omega_0 \times u_0 + \frac{1}{\rho_0} \nabla p_0,$$

where  $p_0 = a\rho_0^\gamma$ . Thus, (1.15) yields the second condition.

On the other hand, using the expressions of  $F_3$  and  $F_4$  in (2.18) and (2.19), we have

$$\left[ F_3(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) \right] (0, \cdot) = -m(\omega_0 \times \ell_0) - \int_{\partial\mathcal{B}(0)} \sigma(u_0, p_0) n \, d\Gamma - k_d \ell_0,$$

$$\left[ F_4(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega}, Q) \right] (0, \cdot) = - \int_{\partial\mathcal{B}(0)} (y - h_0) \times \sigma(u_0, p_0) n \, d\Gamma.$$

These expressions of  $F_3(0, \cdot)$  and  $F_4(0, \cdot)$  show that (1.16) gives the third condition (2.32). We thus deduce from Proposition 2.2 the existence and uniqueness of  $(\hat{\rho}, \hat{u}, \hat{\ell}, \hat{\omega}) \in \mathcal{S}_T$ . Combining (2.33), Proposition 2.4, (2.50) and (2.51), we obtain

$$\|(\hat{\rho}, \hat{u}, \hat{\ell}, \hat{\omega})\|_{\mathcal{S}_T} \leq \frac{R}{2} + CT^\alpha.$$

In particular, taking  $T$  small enough, we deduce that  $\mathcal{N}$  is well defined.

Next we show that  $\mathcal{N}$  is a contraction. Let  $(\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1), (\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2) \in \mathcal{S}_{T,R}$ . For  $j = 1, 2$ , we set  $\mathcal{N}(\tilde{\rho}^j, \tilde{u}^j, \tilde{\ell}^j, \tilde{\omega}^j) := (\hat{\rho}^j, \hat{u}^j, \hat{\ell}^j, \hat{\omega}^j)$ . Using Proposition 2.2 and Proposition 2.4, we obtain

$$\|(\hat{\rho}^1, \hat{u}^1, \hat{\ell}^1, \hat{\omega}^1) - (\hat{\rho}^2, \hat{u}^2, \hat{\ell}^2, \hat{\omega}^2)\|_{\mathcal{S}_T} \leq CT^\alpha \|(\tilde{\rho}^1, \tilde{u}^1, \tilde{\ell}^1, \tilde{\omega}^1) - (\tilde{\rho}^2, \tilde{u}^2, \tilde{\ell}^2, \tilde{\omega}^2)\|_{\mathcal{S}_T}.$$

Thus  $\mathcal{N}$  is a contraction in  $\mathcal{S}_{T,R}$  for  $T$  small enough.

Finally, using (2.51) and (2.39), we deduce

$$\|(\tilde{\rho}, \tilde{u}, \tilde{\ell}, \tilde{\omega})\|_{\mathcal{S}_T} + \|h_1 - h\|_{L^\infty(0,T)} \leq C\tilde{\delta}_0 = C\left(\|\rho_0 - \bar{\rho}\|_{H^3} + \|u_0\|_{H^3} + |h_1 - h_0| + |\ell_0| + |\omega_0|\right)$$

that yields (2.3).  $\square$

### 3. GLOBAL IN TIME EXISTENCE OF SOLUTIONS

**3.1. A priori estimates.** We have already established a local-in-time existence result in Theorem 2.1. In order to obtain the global in time existence of the solutions, we need an appropriate a priori estimates. We recall that  $\|\cdot\|_{\tilde{\mathcal{S}}_{0,T}}$  is introduced in (1.13). We also introduce the following notation to shorten the notation: for  $Z = L^p$  or  $Z = W^{k,p}$ , we set:

$$\begin{aligned} W_T^{k,\infty}(Z) &= W^{k,\infty}(0, T; Z(\mathcal{F}(t))), & H_T^k(Z) &= H^k(0, T; Z(\mathcal{F}(t))), & \text{for } k = 1, 2, \\ W_T^{0,\infty}(Z) &= L_T^\infty(Z) = L^\infty(0, T; Z(\mathcal{F}(t))), & H_T^0(Z) &= L_T^2(Z) = L^2(0, T; Z(\mathcal{F}(t))). \end{aligned}$$

The main tool to prove the global in time existence of the solutions is the following proposition:

**Proposition 3.1.** *Let  $h_1 \in \Omega^0$  and  $\bar{\rho} > 0$ . Assume the feedback law (1.10) with  $(k_p, k_d)$  satisfying (1.17). There exist  $\varepsilon_0, C_0 > 0$  with  $\varepsilon_0 \leq \delta_0$  such that if  $(\rho, u, h, \ell, \omega)$  is a solution of system (1.1)–(1.10) with*

$$\|(\rho, u, \ell, \omega)\|_{\tilde{\mathcal{S}}_{0,T}} \leq \varepsilon_0, \tag{3.1}$$

solution

proposition est

{smallne

then the following estimate holds:

$$\|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}} + \|\sqrt{k_p}(h_1 - h)\|_{L^\infty(0,T)} \leq C_0 \left( \|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \right). \quad (3.2)$$

*Proof.* The proof follows closely the idea of [1, Proposition 8]. We only repeat some parts of the proof to estimate  $(h_1 - h)$ . We define

$$\rho^*(t, x) = \rho(t, x) - \bar{\rho}$$

and we rewrite (1.1)-(1.9) as follows

$$\left\{ \begin{array}{ll} \frac{\partial \rho^*}{\partial t} + u \cdot \nabla \rho^* + \bar{\rho} \operatorname{div} u = f_0(\rho^*, u, h, \omega) & t \in (0, T), x \in \mathcal{F}(t), \\ \frac{\partial u}{\partial t} - \operatorname{div} \sigma^*(u, \rho^*) = f_1(\rho^*, u, h, \omega) & t \in (0, T), x \in \mathcal{F}(t), \\ \bar{m} \ell' = - \int_{\partial \mathcal{B}(t)} \sigma^*(u, \rho^*) N \, d\Gamma + \bar{k}_p (h_1 - h(t)) - \bar{k}_d \ell(t) + f_2(\rho^*, u, h, \omega) & t \in (0, T), \\ \bar{J} \omega' = - \int_{\partial \mathcal{B}(t)} (x - h) \times \sigma^*(u, \rho^*) N \, d\Gamma + f_3(\rho^*, u, h, \omega) & t \in (0, T), \\ h' = \ell & t \in (0, T), \\ u(t, x) = 0, & t \in (0, T), x \in \partial \Omega, \\ u(t, x) = \ell(t) + \omega(t) \times (x - h(t)), & t \in (0, T), x \in \partial \mathcal{B}(t), \\ \rho^*(0, \cdot) = \rho_0 - \bar{\rho}, \quad u(0, \cdot) = u_0 \quad \text{in } \mathcal{F}(0), \\ h(0) = h_0, \quad \ell(0) = \ell_0, \quad \omega(0) = \omega_0, \end{array} \right. \quad (3.3)$$

In the above system (3.3)

$$\bar{m} = \frac{m}{\bar{\rho}}, \quad \bar{J} = \frac{J}{\bar{\rho}}, \quad \bar{k}_p = \frac{k_p}{\bar{\rho}}, \quad \bar{k}_d = \frac{k_d}{\bar{\rho}}, \quad \bar{\mu} = \frac{\mu}{\bar{\rho}}, \quad \bar{\lambda} = \frac{\lambda}{\bar{\rho}},$$

$$\sigma^*(u, \rho^*) = 2\bar{\mu} \mathbb{D}(u) + \bar{\lambda} \operatorname{div} u \mathbb{I}_3 - p^* \rho^* \mathbb{I}_3, \quad p^* = a\gamma \bar{\rho}^{\gamma-2},$$

and

$$\left\{ \begin{array}{l} f_0(\rho^*, u, h, \omega) = -\rho^* \operatorname{div} u, \\ f_1(\rho^*, u, h, \omega) = -(u \cdot \nabla) u - \left( \frac{1}{\bar{\rho}} - \frac{1}{\rho^* + \bar{\rho}} \right) \operatorname{div} (2\bar{\mu} \mathbb{D}(u) + \bar{\lambda} \operatorname{div} u \mathbb{I}_3) \\ \quad + (p^* - a\gamma(\rho^* + \bar{\rho})^{\gamma-2}) \nabla \rho^*, \\ f_2(\rho^*, u, h, \omega) = - \int_{\partial \mathcal{B}(t)} \left( p^* \rho^* - \frac{a(\rho^* + \bar{\rho})^\gamma}{\bar{\rho}} \right) N \, d\Gamma, \\ f_3(\rho^*, u, h, \omega) = - \int_{\partial \mathcal{B}(t)} (x - h) \times \left( \left( p^* \rho^* - \frac{a(\rho^* + \bar{\rho})^\gamma}{\bar{\rho}} \right) N \right) \, d\Gamma. \end{array} \right.$$

We take  $\varepsilon_0$  small enough in (3.1) so that

$$\rho^* + \bar{\rho} \geq \frac{\bar{\rho}}{2}.$$

After some calculations (that we skipped here), we obtain

$$\|f_0\|_{L_T^2(H^3)}^2 + \|f_0\|_{L_T^\infty(H^2)}^2 + \|f_0\|_{H_T^1(L^2)}^2 + \|f_1\|_{L_T^2(H^2)}^2 + \|f_1\|_{L_T^\infty(H^1)}^2 + \|f_1\|_{H_T^1(L^2)}^2 \\ + \|f_2\|_{H^1(0,T)}^2 + \|f_3\|_{H^1(0,T)}^2 \leq C \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^4,$$

and

$$\begin{aligned} & \left\| \frac{\partial \rho^*}{\partial t}(0, \cdot) \right\|_{L^2}^2 + \left\| \frac{\partial u}{\partial t}(0, \cdot) \right\|_{H^1}^2 + |\ell'(0)|^2 + |\omega'(0)|^2 \\ & \leq C \left( \|\rho_0 - \bar{\rho}\|_{H^2}^2 + \|u_0\|_{H^3}^2 + |\ell_0|^2 + |h_0 - h_1|^2 + \|f_0\|_{L_T^\infty(L^2)}^2 + \|f_1\|_{L_T^\infty(H^1)}^2 + \|f_2\|_{L_T^\infty}^2 + \|f_3\|_{L_T^\infty}^2 \right). \end{aligned}$$

In particular, if we can show

$$\begin{aligned} & \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^2 + \|\sqrt{k_p}(h_1 - h)\|_{L^\infty(0,T)}^2 \leq C \left( \|f_0\|_{L_T^2(H^3)}^2 + \|f_0\|_{L_T^\infty(H^2)}^2 + \|f_0\|_{H_T^1(L^2)}^2 + \|f_1\|_{L_T^2(H^2)}^2 \right. \\ & + \|f_1\|_{L_T^\infty(H^1)}^2 + \|f_1\|_{H_T^1(L^2)}^2 + \|f_2\|_{H^1(0,T)}^2 + \|f_3\|_{H^1(0,T)}^2 + \left\| \frac{\partial \rho^*}{\partial t}(0, \cdot) \right\|_{L^2}^2 + \|\rho_0 - \bar{\rho}\|_{H^3}^2 + \left\| \frac{\partial u}{\partial t}(0, \cdot) \right\|_{H^1}^2 \\ & \quad + \|u_0\|_{H^3(\mathcal{F}(0))}^2 + |h_0 - h_1|^2 + |\ell'(0)|^2 + |\ell_0|^2 + |\omega'(0)|^2 + |\omega_0|^2 + \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^3 \\ & \quad \left. + \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^4 \right), \quad (3.4) \end{aligned}$$

{require}

then

$$\begin{aligned} & \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^2 + \|\sqrt{k_p}(h_1 - h)\|_{L^\infty(0,T)}^2 \leq C \left( \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^3 + \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^4 \right. \\ & \quad \left. + \|\rho_0 - \bar{\rho}\|_{H^3}^2 + \|u_0\|_{H^3}^2 + |h_0 - h_1|^2 + |\ell_0|^2 + |\omega_0|^2 \right). \end{aligned}$$

The condition (3.1) with  $\varepsilon_0$  small enough combined with the above relation yields (3.2). The proof of (3.4) is done below.  $\square$

The proof of (3.4) (that is necessary to finish the proof of Proposition 3.1) is done in a precise way in [1, Section 4] in the case  $k_p = 0$  and  $k_d = 0$ . The presence of the corresponding terms only changes the two lemmas on time regularity (Lemma 13 and Lemma 14 in [1]). Here we state these two lemmas in our case and give the idea of their proofs with a particular attention to the feedback term. Then using these two lemmas and the elliptic results [1, Section 4], we can deduce (3.4) and thus end the proof of Proposition 3.1.

ime reg1

**Lemma 3.2.** *Let  $k=0,1$ . For every  $\varepsilon > 0$ , there exists a constant  $C > 0$  such that*

$$\begin{aligned} & \|\rho^*\|_{W_T^{k,\infty}(L^2)} + \|u\|_{H_T^k(H^1)} + \|u\|_{W_T^{k,\infty}(L^2)} + \|\ell\|_{W^{k,\infty}(0,T)} + \|\ell\|_{H^k(0,T)} + \|\omega\|_{W^{k,\infty}(0,T)} \\ & \quad + \|\sqrt{k_p}(h_1 - h)\|_{L^\infty(0,T)} \leq \varepsilon \left( \|\rho^*\|_{H_T^k(L^2)} + \|\ell\|_{H^k(0,T)} + \|\omega\|_{H^k(0,T)} \right) \\ & \quad + C \left( \|f_0\|_{H_T^k(L^2)} + \|f_1\|_{H_T^k(L^2)} + \|f_2\|_{H^k(0,T)} + \|f_3\|_{H^k(0,T)} \right. \\ & \quad \quad \left. + \|\rho_0 - \bar{\rho}\|_{L^2} + \|u_0\|_{L^2} + |h_1 - h_0| + |\ell_0| + |\omega_0| \right) \\ & \quad + \left\| \frac{\partial \rho^*}{\partial t}(0, \cdot) \right\|_{L^2} + \left\| \frac{\partial u}{\partial t}(0, \cdot) \right\|_{L^2} + |\ell'(0)| + |\omega'(0)| + \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^{3/2} + \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^2. \quad (3.5) \end{aligned}$$

{sup-nor}

*Proof of Lemma 3.2. Case  $k = 0$ .* We multiply equation (3.3)<sub>1</sub> by  $p^* \rho^* / \bar{\rho}$ , (3.3)<sub>2</sub> by  $u$ , (3.3)<sub>3</sub> by  $\ell$  and (3.3)<sub>4</sub> by  $\omega$ :

$$\begin{aligned}
& \int_{\mathcal{F}(t)} \left( \frac{p^*}{2\bar{\rho}} |\rho^*|^2 + \frac{|u|^2}{2} \right) dx + \int_0^t \int_{\mathcal{F}(s)} (2\bar{\mu} |\mathbb{D}(u)|^2 + \bar{\lambda} |\operatorname{div} u|^2) dx ds \\
& \quad + \frac{\bar{m}}{2} |\ell|^2 + \frac{\bar{J}}{2} |\omega|^2 + \frac{\bar{k}_p}{2}(t) |h_1 - h(t)|^2 + \bar{k}_d \int_0^t |\ell|^2 ds \\
& = \int_0^t \int_{\mathcal{F}(s)} (f_0 p^* \rho^* / \bar{\rho} + f_1 \cdot u) dx ds + \int_0^t (f_2 \cdot \ell + f_3 \cdot \omega) ds \\
& \quad + \int_0^t \int_{\mathcal{F}(s)} \left( \frac{p^*}{2\bar{\rho}} |\rho^*|^2 \operatorname{div} u + \operatorname{div} \left( \frac{|u|^2 u}{2} \right) \right) dx ds \\
& \quad + \int_0^t \frac{\bar{k}_p'}{2}(s) |h_1 - h(s)|^2 ds + \int_{\mathcal{F}(0)} \frac{p^*}{2\bar{\rho}} |\rho_0 - \bar{\rho}|^2 dy + \int_{\mathcal{F}(0)} \frac{|u_0|^2}{2} dy + \frac{\bar{m}}{2} |\ell_0|^2 + \frac{\bar{J}}{2} |\omega_0|^2. \quad (3.6) \quad \boxed{\text{express}}
\end{aligned}$$

Following standard calculation, we have

$$\int_0^t \int_{\mathcal{F}(s)} \left( \frac{p^*}{2\bar{\rho}} |\rho^*|^2 \operatorname{div} u + \operatorname{div} \left( \frac{|u|^2 u}{2} \right) \right) dx ds \leq C \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^3. \quad (3.7) \quad \boxed{\text{1-RHS3-}}$$

It only remains to estimate

$$\begin{aligned}
\int_0^T \frac{\bar{k}_p'}{2}(s) |h_1 - h(s)|^2 ds & \leq \int_0^{T_I} \frac{\bar{k}_p'}{2}(s) |h_1 - h(s)|^2 ds \\
& \leq \|\bar{k}_p'\|_{L^\infty(0,T)} \left( T_I |h_1 - h_0|^2 + \int_0^{T_I} \left( \int_0^s \ell(z) dz \right)^2 ds \right). \quad (3.8) \quad \boxed{\text{est:spr}}
\end{aligned}$$

By using Hölder's inequality and (1.17), we obtain

$$\int_0^T \frac{\bar{k}_p'}{2}(s) |h_1 - h(s)|^2 ds \leq C |h_1 - h_0|^2 + \frac{\bar{k}_d}{2} \int_0^T |\ell|^2 ds. \quad (3.9) \quad \boxed{\text{1-RHS4-}}$$

Combining (3.6), (3.7), (3.9) and Young's inequality, we deduce the result for  $k = 0$ .

Case  $k = 1$ . By differentiating (3.3) with respect to  $t$ , we obtain:

$$\left\{ \begin{array}{l} \frac{\partial}{\partial t} \left( \frac{\partial \rho^*}{\partial t} \right) + (u \cdot \nabla) \frac{\partial \rho^*}{\partial t} + \bar{\rho} \operatorname{div} \frac{\partial u}{\partial t} = G_0 \\ \frac{\partial}{\partial t} \left( \frac{\partial u}{\partial t} \right) - \operatorname{div} \sigma^* \left( \frac{\partial u}{\partial t}, \frac{\partial \rho^*}{\partial t} \right) = G_1 \\ \bar{m} \ell'' = - \int_{\partial \mathcal{B}(t)} \sigma^* \left( \frac{\partial u}{\partial t}, \frac{\partial \rho^*}{\partial t} \right) N \, d\Gamma + [\bar{k}_p(h_1 - h(t))]' - \bar{k}_d \ell'(t) + G_2 \\ \bar{J} \omega'' = - \int_{\partial \mathcal{B}(t)} (x - h) \times \sigma^* \left( \frac{\partial u}{\partial t}, \frac{\partial \rho^*}{\partial t} \right) N \, d\Gamma + G_3 \\ h' = \ell \\ \frac{\partial u}{\partial t}(t, x) = 0, \\ \frac{\partial u}{\partial t}(t, x) = \ell'(t) + \omega'(t) \times (x - h(t)) + G_4, \end{array} \right. \quad \begin{array}{l} t \in (0, T), x \in \mathcal{F}(t), \\ t \in (0, T), x \in \mathcal{F}(t), \\ t \in (0, T), \\ t \in (0, T), \\ t \in (0, T), \\ t \in (0, T), x \in \partial \Omega, \\ t \in (0, T), x \in \partial \mathcal{B}(t). \end{array} \quad (3.10)$$

{full sy

where

$$\left\{ \begin{array}{l} G_0 = \frac{\partial f_0}{\partial t} - \left( \frac{\partial u}{\partial t} \cdot \nabla \right) \rho^*, \quad G_1 = \frac{\partial f_1}{\partial t}, \quad G_2 = \frac{\partial f_2}{\partial t} - \int_{\partial \mathcal{B}(t)} \ell \cdot \nabla (\sigma^*(u, \rho^*) N) \, d\Gamma, \\ G_3 = \frac{\partial f_3}{\partial t} - \int_{\partial \mathcal{B}(t)} \ell \cdot \nabla ((x - h) \times (\sigma^*(u, \rho^*) N)) \, d\Gamma + \int_{\partial \mathcal{B}(t)} \ell \times (\sigma^*(u, \rho^*) N) \, d\Gamma, \\ G_4 = -(\ell \cdot \nabla) u. \end{array} \right.$$

As in the first case, we multiply equation (3.10)<sub>1</sub> by  $\frac{p^*}{\bar{\rho}} \frac{\partial \rho^*}{\partial t}$ , equation (3.10)<sub>2</sub> by  $\frac{\partial u}{\partial t}$ , equation (3.10)<sub>3</sub> by  $\ell'$ , and equation (3.10)<sub>4</sub> by  $\omega'$ . After some computations, we find

$$\begin{aligned} & \int_{\mathcal{F}(t)} \left( \frac{p^*}{2\bar{\rho}} \left| \frac{\partial \rho^*}{\partial t} \right|^2 + \frac{1}{2} \left| \frac{\partial u}{\partial t} \right|^2 \right) dx + \int_0^t \int_{\mathcal{F}(s)} \left( 2\bar{\mu} \left| \mathbb{D} \left( \frac{\partial u}{\partial t} \right) \right|^2 + \bar{\lambda} \left| \operatorname{div} \frac{\partial u}{\partial t} \right|^2 \right) dx \, ds \\ & \quad + \frac{\bar{m}}{2} |\ell'(t)|^2 + \frac{\bar{J}}{2} |\omega'(t)|^2 + \bar{k}_d \int_0^t |\ell'(s)|^2 \, ds \\ & = \int_0^t \int_{\mathcal{F}(s)} \left( G_0 \frac{p^*}{\bar{\rho}} \frac{\partial \rho^*}{\partial t} + G_1 \cdot \frac{\partial u}{\partial t} \right) dx \, ds + \int_0^t (G_2 \cdot \ell' + G_3 \cdot \omega') \, ds + \int_0^t \int_{\partial \mathcal{B}(s)} G_4 \cdot \sigma^* \left( \frac{\partial u}{\partial t}, \frac{\partial \rho^*}{\partial t} \right) N \, d\Gamma \, ds \\ & \quad + \int_0^t \int_{\mathcal{F}(s)} \frac{p^*}{2\bar{\rho}} \left| \frac{\partial \rho^*}{\partial t} \right|^2 \operatorname{div} u \, dx \, ds + \int_0^t \int_{\partial \mathcal{F}(s)} \frac{1}{2} \operatorname{div} \left( \left| \frac{\partial u}{\partial t} \right|^2 u \right) dx \, ds \\ & \quad + \int_0^t [\bar{k}_p(s)(h_1 - h(s))]' \cdot \ell'(s) \, ds + \int_{\mathcal{F}(0)} \left( \frac{p^*}{2\bar{\rho}} \left| \frac{\partial \rho^*}{\partial t} \right|^2(0) + \frac{1}{2} \left| \frac{\partial u}{\partial t} \right|^2(0) \right) dy + \frac{\bar{m}}{2} |\ell'(0)|^2 + \frac{\bar{J}}{2} |\omega'(0)|^2. \end{aligned} \quad (3.11)$$

{express

We have the following estimates as in [1, Lemma 13]:

$$\begin{aligned}
& \|G_0\|_{L_T^2(L^2)}^2 + \|G_1\|_{L_T^2(L^2)}^2 + \|G_2\|_{L^2(0,T)}^2 + \|G_3\|_{L^2(0,T)}^2 + \|G_4\|_{L_T^2(L^2(\partial\mathcal{B}(t)))}^2 \\
& \quad + \int_0^t \int_{\mathcal{F}(s)} \left( \left| \frac{\partial \rho^*}{\partial t} \right|^2 \operatorname{div} u + \operatorname{div} \left( \left| \frac{\partial u}{\partial t} \right|^2 u \right) \right) dx ds \\
& \leq C \left( \left\| \frac{\partial f_0}{\partial t} \right\|_{L_T^2(L^2)}^2 + \left\| \frac{\partial f_1}{\partial t} \right\|_{L_T^2(L^2)}^2 + \left\| \frac{\partial f_2}{\partial t} \right\|_{L^2(0,T)}^2 + \left\| \frac{\partial f_3}{\partial t} \right\|_{L^2(0,T)}^2 \right. \\
& \quad \left. + \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^3 + \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^4 \right) \quad (3.12) \quad \boxed{\{19:32\}}
\end{aligned}$$

It only remains to estimate the term coming from the feedback:

$$\begin{aligned}
\int_0^t [\bar{k}_p(s)(h_1 - h(s))]' \cdot \ell'(s) ds &= \int_0^t \bar{k}_p'(s)(h_1 - h(s)) \cdot \ell'(s) ds - \int_0^t \bar{k}_p(s)\ell(s) \cdot \ell'(s) ds \\
&= \int_0^t \bar{k}_p'(s)(h_1 - h(s)) \cdot \ell'(s) ds + \int_0^t \frac{\bar{k}_p'}{2}(s)|\ell(s)|^2 ds - \frac{\bar{k}_p}{2}(t)|\ell(t)|^2,
\end{aligned}$$

and proceeding as in (3.8), we have the following estimates

$$\int_0^t [\bar{k}_p(s)(h_1 - h(s))]' \cdot \ell'(s) ds \leq C \left( |h_1 - h_0|^2 + \int_0^T |\ell(s)|^2 ds \right) + \frac{\bar{k}_d}{2} \int_0^T |\ell'(s)|^2 ds. \quad (3.13) \quad \boxed{\{2-RHS8\}}$$

We can estimate  $\|\ell\|_{L^2(0,T)}^2$  with (3.5) for  $k = 0$ . With this remark and combining (3.11), inequality (3.13) and the above estimates we deduce (3.5) for  $k = 1$ .  $\square$

ime reg2

**Lemma 3.3.** *Let  $k = 0, 1$ . There exists a constant  $C > 0$  such that*

$$\begin{aligned}
& \left\| \frac{\partial \rho^*}{\partial t} \right\|_{H_T^k(L^2)} + \|u\|_{W_T^{k,\infty}(H^1)} + \left\| \frac{\partial u}{\partial t} \right\|_{H_T^k(L^2)} + \|\ell'\|_{H^k(0,T)} + \|\omega'\|_{H^k(0,T)} \\
& \leq C \left( \|\rho^*\|_{W_T^{k,\infty}(L^2)} + \|u\|_{H_T^k(H^1)} + \|\ell\|_{W^{k,\infty}(0,T)} + \|\ell\|_{H^k(0,T)} + \|\sqrt{\bar{k}_p}(h_1 - h)\|_{L^\infty(0,T)} \right. \\
& \quad + \|f_0\|_{H_T^k(L^2)} + \|f_1\|_{H_T^k(L^2)} + \|f_2\|_{H^k(0,T)} + \|f_3\|_{H^k(0,T)} \\
& \quad + \|\rho_0 - \bar{\rho}\|_{L^2} + \left\| \frac{\partial \rho}{\partial t}(0, \cdot) \right\|_{L^2} + \|u_0\|_{H^1} + \left\| \frac{\partial u}{\partial t}(0, \cdot) \right\|_{H^1} + |h_1 - h_0| \\
& \quad \left. + |\ell_0| + |\ell'(0)| + |\omega_0| + \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^{3/2} + \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0,T}}^2 \right). \quad (3.14) \quad \boxed{\{est:tim\}}
\end{aligned}$$

*Proof of Lemma 3.3. Case  $k = 0$ .* We multiply equation (3.3)<sub>1</sub> by  $\frac{\partial \rho^*}{\partial t}$ , (3.3)<sub>2</sub> by  $\frac{\partial u}{\partial t}$ , (3.3)<sub>3</sub> by  $\ell'$  and (3.3)<sub>4</sub> by  $\omega'$ . After standard computations, we find

$$\begin{aligned}
 & \int_0^t \int_{\mathcal{F}(s)} \left( \left| \frac{\partial \rho^*}{\partial t} \right|^2 + \left| \frac{\partial u}{\partial t} \right|^2 \right) dx ds + \int_{\mathcal{F}(t)} (2\bar{\mu}|\mathbb{D}(u)|^2 + \bar{\lambda}|\operatorname{div} u|^2) dx + \int_0^t (\bar{m}|\ell'|^2 + \bar{J}|\omega'|^2) ds \\
 & \quad + \bar{k}_d |\ell(t)|^2 - 2 \int_0^t \bar{k}_p (h_1 - h) \cdot \ell' ds \\
 & \leq C \left( \int_0^t \int_{\mathcal{F}(s)} |\operatorname{div}((2\bar{\mu}|\mathbb{D}(u)|^2 + \bar{\lambda}|\operatorname{div} u|^2) u)| dx ds + \int_0^t \int_{\mathcal{F}(s)} \left( p^* \rho^* \operatorname{div} \frac{\partial u}{\partial t} - \bar{\rho} \frac{\partial \rho^*}{\partial t} \operatorname{div} u \right) dx ds \right. \\
 & \quad + \int_0^t \int_{\mathcal{F}(s)} \left| \frac{\partial \rho^*}{\partial t} \right| |(u \cdot \nabla \rho^*)| dx ds + \int_{\mathcal{F}(0)} |\nabla u_0|^2 dx + \bar{k}_d |\ell_0|^2 \\
 & \quad \left. + \int_0^t \left( \int_{\mathcal{F}(s)} (|f_0|^2 + |f_1|^2) dx + |f_2|^2 + |f_3|^2 \right) ds + \int_0^t \int_{\partial \mathcal{B}(s)} G_4 \cdot \sigma^*(u, \rho^*) N d\Gamma ds \right). \quad (3.15) \quad \boxed{\text{express}}
 \end{aligned}$$

The terms in the right-hand side of (3.15) can be estimated as in Lemma 14 in [1]. We only estimate

$$- \int_0^t \bar{k}_p (h_1 - h) \cdot \ell' ds = -\bar{k}_p(t) (h_1 - h) \cdot \ell(t) + \int_0^t \left( \bar{k}_p'(h_1 - h) \cdot \ell - \bar{k}_p |\ell|^2 \right) ds \quad (3.16) \quad \boxed{\text{for arn}}$$

and thus

$$\left| - \int_0^t \bar{k}_p (h_1 - h) \cdot \ell' ds \right| \leq C \left( |h_1 - h_0|^2 + k_p |h_1 - h|^2 + |\ell|^2 + \int_0^t |\ell(s)|^2 ds \right).$$

Case  $k = 1$ . We multiply (3.10)<sub>1</sub> by  $\frac{\partial^2 \rho^*}{\partial t^2}$ , (3.10)<sub>2</sub> by  $\frac{\partial^2 u}{\partial t^2}$ , (3.10)<sub>3</sub> by  $\ell''$  and (3.10)<sub>4</sub> by  $\omega''$ . Following the proof of Lemma 14 in [1], we find

$$\begin{aligned}
& \int_0^t \int_{\mathcal{F}(s)} \left( \left| \frac{\partial^2 \rho^*}{\partial t^2} \right|^2 + \left| \frac{\partial^2 u}{\partial t^2} \right|^2 \right) dx ds + \int_{\mathcal{F}(t)} \left( 2\bar{\mu} \left| \mathbb{D} \left( \frac{\partial u}{\partial t} \right) \right|^2 + \bar{\lambda} \left| \operatorname{div} \frac{\partial u}{\partial t} \right|^2 \right) dx \\
& \quad + \int_0^t \left( \frac{\bar{m}}{2} |\ell''|^2 + \frac{\bar{J}}{2} |\omega''|^2 \right) ds + 2\bar{k}_d (|\ell'(t)|^2 - |\ell'(0)|^2) \\
& \quad - \int_0^t \bar{k}'_p(s) (h_1 - h(s)) \cdot \ell''(s) ds + \int_0^t \bar{k}_p(s) \ell(s) \cdot \ell''(s) ds \\
& \leq C \left( \|\rho^*\|_{W_T^{1,\infty}(L^2)}^2 + \|u\|_{H_T^1(H^1)}^2 + \|\ell\|_{W^{1,\infty}(0,T)}^2 + \|\ell\|_{H^1(0,T)}^2 \right. \\
& \quad + \|f_0\|_{H_T^1(L^2)}^2 + \|f_1\|_{H_T^1(L^2)}^2 + \|f_2\|_{H^1(0,T)}^2 + \|f_3\|_{H^1(0,T)}^2 \\
& \quad + \|\rho_0 - \bar{\rho}\|_{L^2}^2 + \left\| \frac{\partial \rho}{\partial t}(0, \cdot) \right\|_{L^2}^2 + \|u_0\|_{H^1}^2 + \left\| \frac{\partial u}{\partial t}(0, \cdot) \right\|_{H^1}^2 \\
& \quad \left. + |\ell_0|^2 + |\ell'(0)|^2 + |\omega_0|^2 + \|(\rho, u, \ell, \omega)\|_{\mathcal{S}_{0,T}}^3 + \|(\rho, u, \ell, \omega)\|_{\mathcal{S}_{0,T}}^4 \right). \quad (3.17) \quad \boxed{\text{express}}
\end{aligned}$$

We estimate the additional term due to the feedback:

$$\begin{aligned}
& \left| \int_0^t (-\bar{k}'_p(s) (h_1 - h(s)) \cdot \ell''(s) + \bar{k}_p(s) \ell(s) \cdot \ell''(s)) ds \right| \\
& \leq C \left( |h_1 - h_0|^2 + \int_0^T |\ell(s)|^2 ds \right) + \frac{\bar{m}}{4} \int_0^t |\ell''(s)|^2 ds, \quad (3.18) \quad \boxed{\text{derivat}}
\end{aligned}$$

and this allows us to prove this case.  $\square$

### 3.2. Proof of Theorem 1.1.

*Proof.* We combine Theorem 2.1 and Proposition 3.1 to establish our result. Note that we can take  $\delta_0$  small enough in Theorem 2.1 so that (2.2) yields

$$h_0 \in \Omega^0 \text{ and } \rho_0 > 0.$$

Since  $h_1 \in \Omega^0$ , there exists  $\eta > 0$  such that

$$\operatorname{dist}(h_1, \partial\Omega) > 1 + 2\eta.$$

We can assume that  $\delta_0 \leq \eta$  where  $\delta_0$  is the constant in (2.2).

Let us fix

$$\delta = \min \left( \delta_0, \frac{\varepsilon_0}{C_*}, \frac{\varepsilon_0}{C_0 \left( 1 + \frac{C_*}{\sqrt{k_p(T_*)}} \right)}, \frac{\eta \sqrt{k_p(T_*)}}{C_0} \right), \quad (3.19) \quad \boxed{\text{choice}}$$

where the constants  $\delta_0$ ,  $C_*$  are appeared in Theorem 2.1,  $\varepsilon_0$ ,  $C_0$  are introduced in Proposition 3.1. Since  $(\rho_0, u_0, h_0, \ell_0, \omega_0)$  satisfies (1.18)-(1.19) and  $\delta \leq \delta_0$ , we can apply Theorem 2.1 to obtain the existence of solution of system (1.1)–(1.10) in  $(0, T_*)$  and

$$\|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0, T_*}} + \|h_1 - h\|_{L^\infty(0, T_*)} \leq C_* \left( \|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \right).$$

In particular, from (1.19) and (3.19),

$$\|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0, T_*}} + \|h_1 - h\|_{L^\infty(0, T_*)} \leq C_* \delta \leq \varepsilon_0 \leq \delta_0. \quad (3.20) \quad \{00:23\}$$

Thus  $\text{dist}(h(t), \partial\Omega) > 1 + \eta$  for  $t \in [0, T_*]$  and Proposition 3.1 gives

$$\|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0, T_*}} + \|\sqrt{k_p}(h_1 - h)\|_{L^\infty(0, T_*)} \leq C_0 \left( \|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \right). \quad (3.21) \quad \{\text{useapri}\}$$

Using that  $(\rho, u, h, \ell, \omega)$  is solution of (1.1)–(1.10), one can check that

$$(\rho(T_*, \cdot), u(T_*, \cdot), h(T_*), \ell(T_*), \omega(T_*))$$

satisfies the compatibility conditions (1.14)–(1.16) and, from (3.20), we have

$$\|(\rho(T_*, \cdot), u(T_*, \cdot), \ell(T_*), \omega(T_*))\|_{\widehat{\mathcal{S}}_{T_*, T_*}} + |h_1 - h(T_*)| \leq \delta_0.$$

We can thus apply again Theorem 2.1 to extend our solution on  $(T_*, 2T_*)$  and using (3.21), we find

$$\begin{aligned} \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{T_*, 2T_*}} + \|\sqrt{k_p}(h_1 - h)\|_{L^\infty(T_*, 2T_*)} \\ \leq C_* \left( \|(\rho(T_*, \cdot), u(T_*, \cdot), \ell(T_*), \omega(T_*))\|_{\widehat{\mathcal{S}}_{T_*, T_*}} + |h_1 - h(T_*)| \right) \\ \leq \frac{C_* C_0}{\sqrt{k_p(T_*)}} \left( \|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \right). \end{aligned} \quad (3.22) \quad \{00:56\}$$

Thus, combining (3.21) and (3.22), and using (3.19), we obtain

$$\begin{aligned} \|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0, 2T_*}} + \|\sqrt{k_p}(h_1 - h)\|_{L^\infty(0, 2T_*)} \leq C_0 \left( 1 + \frac{C_*}{\sqrt{k_p(T_*)}} \right) \left( \|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \right) \\ \leq C_0 \left( 1 + \frac{C_*}{\sqrt{k_p(T_*)}} \right) \delta \leq \varepsilon_0. \end{aligned}$$

Applying Proposition 3.1, we deduce

$$\|(\rho, u, \ell, \omega)\|_{\widehat{\mathcal{S}}_{0, 2T_*}} + \|\sqrt{k_p}(h_1 - h)\|_{L^\infty(0, 2T_*)} \leq C_0 \left( \|(\rho_0, u_0, \ell_0, \omega_0)\|_{\widehat{\mathcal{S}}_{0,0}} + |h_1 - h_0| \right). \quad (3.23) \quad \{\text{useapri}\}$$

In particular  $\text{dist}(h(t), \partial\Omega) > 1 + \eta$  for  $t \in [T_*, 2T_*]$ . Moreover, from (3.22) and (3.19),

$$\|(\rho(2T_*, \cdot), u(2T_*, \cdot), \ell(2T_*), \omega(2T_*))\|_{\widehat{\mathcal{S}}_{2T_*, 2T_*}} + |h_1 - h(2T_*)| \leq C_0 \frac{C_*}{\sqrt{k_p(T_*)}} \delta \leq \varepsilon_0 \leq \delta_0.$$

Then, we repeat the argument on  $[jT_*, (j+1)T_*]$ ,  $j \in \mathbb{N}^*$  and we use that  $k_p$  is non-decreasing to conclude the proof.  $\square$

## 4. PROOF OF THEOREM 1.2

behavior

This section is devoted to the proof of Theorem 1.2. First, from Theorem 1.1, we have

$$\rho - \bar{\rho} \in H^1(0, \infty; H^2(\mathcal{F}(t))), \quad u \in H^1(0, \infty; H^2(\mathcal{F}(t))), \quad \ell, \omega \in H^2(0, \infty)$$

so that ([3, Corollary 8.9, p.214]),

$$\lim_{t \rightarrow \infty} \|\rho(t, \cdot) - \bar{\rho}\|_{H^2(\mathcal{F}(t))} = 0, \quad \lim_{t \rightarrow \infty} \|u(t, \cdot)\|_{H^2(\mathcal{F}(t))} = 0, \quad \lim_{t \rightarrow \infty} \ell(t) = 0, \quad \lim_{t \rightarrow \infty} \omega(t) = 0. \quad (4.1)$$

{solid b

In the rest of the section, we show  $\lim_{t \rightarrow \infty} h(t) = h_1$  that completes the proof of Theorem 1.2. In order to do this, we need the notion of weak solutions for the problem (1.1)-(1.9). First, we extend  $\rho$  and  $u$  in  $\mathbb{R}^3$  by the formula

$$\rho = \begin{cases} \rho \text{ in } \mathcal{F}(t), \\ \frac{3m}{4\pi} = \rho_{\mathcal{B}} \text{ in } \mathcal{B}(t), \\ 0 \text{ in } \mathbb{R}^3 \setminus \Omega. \end{cases} \quad u = \begin{cases} u \text{ in } \mathcal{F}(t), \\ \ell(t) + \omega(t) \times (x - h(t)) = u_{\mathcal{B}} \text{ in } \mathcal{B}(t), \\ 0 \text{ in } \mathbb{R}^3 \setminus \Omega. \end{cases}$$

Then we consider the following notion of weak solutions (see [9]).

ksol: def

**Definition 4.1.** A triplet  $(\rho, u, h)$  is a weak solution to (1.1)-(1.9) on  $(0, T)$  if

$$\rho \geq 0, \quad \rho \in L^\infty(0, T; L^\gamma(\Omega)) \cap C([0, T]; L^1(\Omega)), \quad u \in L^2(0, T; H_0^1(\Omega)), \\ u = \ell(t) + \omega(t) \times (x - h(t)) \text{ in } \mathcal{B}(t), \quad h' = \ell,$$

$$\int_0^T \int_{\mathbb{R}^3} \left[ \rho \frac{\partial \phi}{\partial t} + (\rho u) \cdot \nabla \phi \right] dx dt = 0,$$

$$\int_0^T \int_{\mathbb{R}^3} \left[ b(\rho) \frac{\partial \phi}{\partial t} + (b(\rho)u) \cdot \nabla \phi + (b(\rho) - b'(\rho)\rho) \operatorname{div} u \phi \right] dx dt = 0,$$

for any  $\phi \in C_c^\infty((0, T) \times \mathbb{R}^3)$  and for any  $b \in C^1(\mathbb{R})$  such that  $b'(z) = 0$  for  $z$  large enough;

$$\int_0^T \int_{\mathbb{R}^3} \left[ (\rho u) \cdot \frac{\partial \phi}{\partial t} + (\rho u \otimes u) : \mathbb{D}(\phi) + a\rho^\gamma \operatorname{div} \phi \right] dx dt$$

$$= \int_0^T \int_{\mathbb{R}^3} (2\mu \mathbb{D}(u) + \lambda \operatorname{div} u \mathbb{I}_3) : \mathbb{D}(\phi) dx dt + \int_0^T w \cdot \ell_\phi dt, \quad (4.2)$$

{continu

for any  $\phi \in C_c^\infty((0, T) \times \Omega)$ , with  $\phi(t, y) = \ell_\phi(t) + \omega_\phi(t) \times (y - h(t))$  in a neighborhood of  $\mathcal{B}(t)$ ; for a.e.  $t \in [0, T]$ , the following energy inequality holds:

$$\int_{\Omega} \left( \frac{\rho(t, x)}{2} |u(t, x)|^2 + \frac{a}{\gamma - 1} \rho^\gamma(t, x) \right) dx + \int_0^t \int_{\Omega} (2\mu |D(u)|^2 + \lambda |\operatorname{div} u|^2) dx dt \\ \leq C \left( \int_{\{\rho(0) > 0\}} \left( \frac{1}{2} \frac{|q(x)|^2}{\rho(0, x)} + \frac{a}{\gamma - 1} \rho^\gamma(0, x) \right) dx + \int_0^t w \cdot \ell dt \right);$$

and

$$\rho(0, \cdot) = \rho_0, \quad (\rho u)(0, \cdot) = q, \quad h(0) = h_0.$$

We now state a result on the weak compactness of the set of weak solutions to the problem (1.1)-(1.9) obtained in [9, Theorem 9.1].

**Theorem 4.2.** *Let  $(\rho_n, u_n, h_n)$  be a sequence of weak solutions to (1.1)-(1.9) on  $(0, T) \times \Omega$  with the initial condition  $(\rho_{0,n}, u_{0,n}, h_{0,n})$  and forcing term  $w_n$  for each  $n \geq 1$ . Assume that  $\{w_n\}$  is a sequence of bounded and measurable functions such that*

$$w_n \rightarrow w \text{ weakly } * \text{ in } L^\infty(0, T),$$

along with

$$\rho_{0n} \rightarrow \rho_0 \quad \text{in } L^\gamma(\mathbb{R}^3), \quad (4.3) \quad \{\text{freisel}\}$$

$$\rho_{0n} u_{0n} = q_n \rightarrow q \quad \text{in } L^1(\mathbb{R}^3), \quad (4.4) \quad \{\text{freisel}\}$$

where  $\rho_0, q$  satisfy the following compatibility conditions

$$q = 0 \text{ a.e. on the set } \{x \in \Omega \mid \rho_0 = 0\}, \quad \frac{|q|^2}{\rho_0} \in L^1(\Omega). \quad (4.5) \quad \{\text{compati}\}$$

Moreover, let

$$\int_{\{\rho_{0n} > 0\}} \left( \frac{1}{2} \frac{|q_n|^2}{\rho_{0n}} + \frac{a}{\gamma-1} \rho_n^\gamma(0) \right) dx \rightarrow \int_{\{\rho_0 > 0\}} \left( \frac{1}{2} \frac{|q|^2}{\rho_0} + \frac{a}{\gamma-1} \rho_0^\gamma \right) dx \quad (4.6) \quad \{\text{compati}\}$$

and

$$h_{0n} \rightarrow h_0. \quad (4.7) \quad \{\text{compati}\}$$

Then there is a subsequence such that

$$\begin{aligned} \rho_n &\rightarrow \rho \quad \text{in } C([0, T]; L^1(\mathbb{R}^3)), \\ u_n &\rightarrow u \quad \text{weakly in } L^2(0, T; H_0^1(\Omega)), \\ h_n &\rightarrow h \quad \text{uniformly in } (0, T). \end{aligned}$$

where  $(\rho, u, h)$  is a weak solution of the problem (1.1)-(1.9) on  $(0, T) \times \Omega$  with the initial conditions  $(\rho_0, q, h_0)$ .

With the help of above result, we can now prove Theorem 1.2.

*Proof of Theorem 1.2.* From (1.21), there exist  $h^* \in \Omega^0$  and  $\{t_n\} \subset \mathbb{R}_+^*$  such that

$$t_n \rightarrow \infty, \quad \lim_{n \rightarrow \infty} h(t_n) = h^*.$$

Define

$$\rho^* = \mathbb{1}_{\widehat{\mathcal{F}}(h^*)} \bar{\rho} + \mathbb{1}_{\widehat{\mathcal{B}}(h^*)} \rho_{\mathcal{B}}.$$

Writing

$$\rho(t_n, \cdot) - \rho^* = [\rho(t_n) - \bar{\rho}] \mathbb{1}_{\mathcal{F}(t_n)} + \bar{\rho} [\mathbb{1}_{\mathcal{F}(t_n)} - \mathbb{1}_{\widehat{\mathcal{F}}(h^*)}] + \rho_{\mathcal{B}} [\mathbb{1}_{\mathcal{B}(t_n)} - \mathbb{1}_{\widehat{\mathcal{B}}(h^*)}],$$

and using (4.1), we deduce

$$\begin{aligned} \rho(t_n, \cdot) &\xrightarrow{t_n \rightarrow \infty} \rho^* \quad \text{in } L^\gamma(\mathbb{R}^3), \\ \rho(t_n, \cdot) u(t_n, \cdot) &\xrightarrow{t_n \rightarrow \infty} 0 \quad \text{in } L^1(\mathbb{R}^3), \\ \rho(t_n, \cdot) |u(t_n, \cdot)|^2 &\xrightarrow{t_n \rightarrow \infty} 0 \quad \text{in } L^1(\mathbb{R}^3). \end{aligned}$$

We set

$$\rho_{0n} = \rho(t_n), \quad u_{0n} = u(t_n), \quad h_{0n} = h(t_n),$$

that satisfy (4.3), (4.4), (4.5), (4.6) and (4.7) with  $\{\rho_{0n} > 0\} = \{\rho_0 > 0\} = \Omega$ . We also define

$$\rho_n(t, x) = \rho(t + t_n, x), \quad u_n(t, x) = u(t + t_n, x), \quad h_n(t) = h(t + t_n), \quad \ell_n(t) = \ell(t + t_n),$$

that is a weak solution to (1.1)-(1.9) in the sense of Definition 4.1 (since it is a strong solution) with initial conditions  $(\rho_{0n}, u_{0n}, h_{0n})$  and with

$$w_n(t) = k_p(t)(h_1 - h_n(t)) - k_d \ell_n(t).$$

From Theorem 1.1, we have that

$$w_n \rightharpoonup \widehat{w} \text{ weakly } * \text{ in } L^\infty(0, T).$$

Thus, we can apply Theorem 4.2 and we deduce that up to a subsequence for  $T > 0$ :

$$\begin{aligned} \rho_n &\rightarrow \widehat{\rho} \quad \text{in } C([0, T]; L^1(\mathbb{R}^3)), \\ u_n &\rightarrow \widehat{u} \quad \text{weakly in } L^2(0, T; H_0^1(\Omega)), \\ h_n &\rightarrow \widehat{h} \quad \text{in } L^\infty(0, T), \end{aligned} \tag{4.8} \quad \boxed{\{B\}}$$

with  $(\widehat{\rho}, \widehat{u}, \widehat{h})$  is a weak solution of (1.1)-(1.9) such that

$$\widehat{\rho}(0, \cdot) = \rho^*, \quad (\widehat{\rho}\widehat{u})(0, \cdot) = 0, \quad \widehat{h}(0) = h^*,$$

and with

$$\widehat{w}(t) = k_p(t)(h_1 - \widehat{h}(t)) - k_d \widehat{\ell}(t).$$

Moreover up to a subsequence,

$$\int_0^T \|\mathbb{D}(u_n(t, \cdot))\|_{L^2(\Omega)}^2 dt = \int_{t_n}^{t_n+T} \|\mathbb{D}(u(t, \cdot))\|_{L^2(\Omega)}^2 dt \xrightarrow{n \rightarrow \infty} 0.$$

The above limit and (4.8) yield

$$\mathbb{D}\widehat{u} = 0 \text{ in } (0, T) \times \Omega.$$

Thus, we deduce that  $\widehat{u} = 0$  in  $(0, T) \times \Omega$ . In particular, we have  $\widehat{h}'(t) = 0, \forall t \in (0, T)$ . This gives,

$$\widehat{h} = h^* \text{ in } (0, T).$$

Consequently, (4.2) gives

$$\int_0^T \int_{\mathbb{R}^3} a(\widehat{\rho})^\gamma \operatorname{div} \phi \, dx \, dt = \int_0^T k_p(h_1 - h^*) \cdot \ell_\phi \, dt,$$

for all  $\phi \in C_c^\infty((0, T) \times \Omega)$ , with  $\phi(t, y) = \ell_\phi(t) + \omega_\phi(t) \times (y - h(t))$  in a neighborhood of  $\mathcal{B}(t)$ . Then we take

$$\operatorname{div} \phi = 0, \quad \phi(t, \cdot) = (h_1 - h^*)\zeta(t) \text{ in } \mathcal{B}(t), \quad \text{with } \zeta \in C_c^\infty((0, T)),$$

so that

$$\int_0^T |h_1 - h^*|^2 k_p(t) \zeta(t) \, dt = 0, \quad \forall \zeta \in C_c^\infty((0, T)).$$

Since,  $k_p \neq 0, h^* = h_1$ . □
