HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Annotating sign language using a dedicated glvph system.

Background

The problems about the existing systems: on one hand, we have glyptic systems (Hamnosys, Sign Writing) that are difficult to read or to write, on the other hand, we have phonological systems that are too linear.

Purpose of this project

Design a typeface for the annotation of SL respectful of the phonology of SL, of design rules, readable at several levels (parameter, sign), writeable, searchable (in ELAN framework) and allowing a gestural annotation.

Why Eccarius & Brentari?

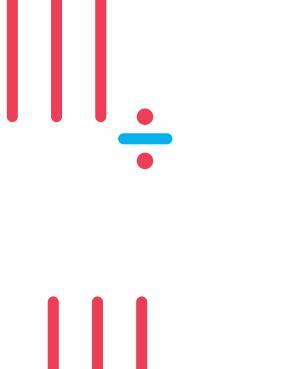

The corpus of Eccarius & Brentari (2008) covers 237 handshapes of 9 SL (Hong Kong, Japanese, British, Swedish, Israeli, Danish, German, Swiss German and American) and its level of selection represents the most economical way.

multi-lingual sign language graphemic system table										
ECCARIUS & BRENTARI CONFIGURATIONS	FINGERS						THUMBS			
	^ Spread				Unspread		k Stacked	x Crossed	T Opposed	T- Unopposed

Annotating sign language using a dedicated glyph system (the project Typannot)

Boutet, Doan, Danet, Bianchini, Renulard & Gogueli

Few systems are able to annotate sign language (SL) : Stokoe Notation System, HamNoSys, SignWriting, BTS. Either they are based on symbols representing SL specific parameters — difficult to write, or they are based on linear alpha numerical arbitrary encodings. The question of annotation is widely debated and remains an essential requirement for linguistic analysis whether in the form of ID-gloss or shape description. Typannot aims at giving better typographic tools by creating a dedicated glyph system that allows users to annotate the SL parameters in an iconic way thanks to the expertise of linguists, type designers and a roboticist.

We will present the concepts and the rules behind our glyptic system and show how we are able to design 237 handshapes glyphs allowing their annotation in 10 SL (based on Eccarius & Brentari 2008). The components and the rules are limited, organized in order to maximize the system economy and learning curve, both in writing and reading (G. Noordzij 2006).

This glyptic system can annotate the other manual parameters allowing combination of handshapes, movements and location. The orientation can be deduced from information inscribed in each glyptic unit. The design of this typeface is based at least on a graphematic description of a panel of 240 signs (Bickford 2005) for 4 SL. Those three graphematic levels once unified in a common writing space should open new perspectives in researching a writing system aimed at the deaf community. This typographic system will reach a phonological level of representation in order to qualify as a viable transcription of SL.

A low-cost motion capture system (Weichert et al 2013) will be used to enrich the glyphs adding more information than configuration as speed, acceleration and orientation. We are also considering the latest font format (OpenType) to allow dynamic font features like contextual glyph replacement.
