

8th CEWM Central European Workshop of Myrmecology - September 27-29, 2019 - Regensburg, Germany

Diversity of the myrmecophilous communities associated with the ectatommine ant genus *Ectatomma*

Jean-Paul Lachaud & Gabriela Pérez-Lachaud

The genus *Ectatomma* F. Smith

- ✓ Hunting ants which prey on a diversity of arthropods, scavenge on dead prey, and exploit sugar sources.
- ✓ As for the majority of poneromorph and ectaheteromorph ants, they are aggressive and considered as poor candidates for associations with possible guests.
- ✓ The genus contains few species (15 valid + 3 cryptic), exclusively neotropical but widely distributed. Some of them are considered as dominants.
- ✓ In the last decades various cases of associated invertebrates have been occasionally reported during the nest excavation of various *Ectatomma* species.
- ✓ Until now, no systematic, exhaustive review of the associations with the genus *Ectatomma* had been attempted.

Methods

- ✓ We evaluated the organisms present within the nests or attended by the foragers through exhaustive colony sampling and observations of two species of *Ectatomma* (*E. tuberculatum* and *E. brunneum*) and one species complex (*E. ruidum*) over more than thirty five years of colony sampling.
- ✓ We revised as much literature as we could find on all the species of this genus.

1. Parasitoids of *Ectatomma*

- Only reports for which true primary parasitoidism has been proven (or highly suspected) have been considered.
- We found at least 28 associations involving parasitoids from 3 classes of invertebrates (Insecta, Arachnida, Nematoda) belonging to, at least, 23 different taxa from 5 families in 5 orders: Diptera - Hymenoptera - Coleoptera - Mesostigmata - Mermithida.

1. Parasitoids of *Ectatomma*

9. Parasites

- 7 associations involving parasites from 3 classes (Insecta, Alphaproteobacteria, Sordariomycetes) belonging to 5 different taxa from 4 families in 3 orders: Thysanoptera - Rickettsiales - Hypocreales.

9. Parasites

Taxon	Associate	Host	Target	References
Insecta: Thysanoptera: Heterothripidae	<i>Aulacothrips minor</i>	<i>E. ruidum</i>	outside nest (indirect)	Cavalleri et al. 2010
Alphaproteobacteria: Rickettsiales: Anaplasmataceae	<i>Wolbachia</i> spp.	<i>E. brunneum</i> <i>E. edentatum</i> <i>E. tuberculatum</i>	all stages all stages all stages	Werren et al. 1995; Baccaro 2009; Marchesin et al. 2015
Sordariomycetes: Hypocreales: Cordycipitaceae	<i>Beauveria bassiana</i>	Unidentified sp.	adults	Quevillon & Hughes 2018
Sordariomycetes: Hypocreales: Ophiocordycipitaceae	<i>Ophiocordyceps australis</i> <i>Ophiocordyceps</i> sp.	<i>E. tuberculatum</i> <i>E. tuberculatum</i>	adults adults	Baccaro et al. 2014 https://pbase.com/ctranter/image/144565029

10. Potpourri

- 14 associations involving organisms from 3 classes of invertebrates (Arachnida, Diplopoda, Insecta) belonging to, at least, 7 different taxa from 7 families in 4 orders: Mesostigmata - unknown Diplopoda order - Coleoptera - Phasmida.

10. Potpourri

Insecta: Phasmida: Diapheromeridae	<i>Calynda bicuspis</i>	<i>E. brunneum</i>	eggs dispersion	Windsor et al. 1996

Conclusions

- ✓ Despite the reduced number of species concerned, the small size of their colonies, and their aggressiveness, the genus *Ectatomma* exhibits an amazing variety of associates ranging from facultative mutualists to true primary parasitoids, fungi and bacteria.
- ✓ A conservative list of 194 species belonging to 49 families from 18 orders are involved in, at least, 263 associations.
- ✓ 48% of them concern trophobiotic associations with Hemiptera, but most of the associates are rare, specific, and exhibit specialized biology and a wide range of interactions.
- ✓ Out of the 18 species of *Ectatomma* reviewed (15 valid + 3 undescribed cryptic species), less than a third part has been studied. It is likely that such communities might be much more important than previously expected and that numerous new associations are still waiting for being discovered.
- ✓ Considering the risks of biodiversity degradation (habitat loss and habitat fragmentation), it is urgent to perform detailed inventories of the numerous species poorly studied until now and to improve our knowledge on the other, better known species.
