# Where I am from?

# Bordeaux

# IMS-Lab

# Strategy of IMS

## Fields of expertise

2 → Expertise

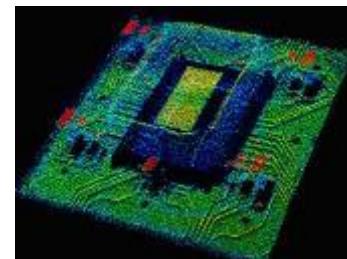

### ➤ Established

- Compact modelling and RF-characterization
- RFIC design
- IC reliability

### ➤ Emerging

- Bioelectronics
- Organic electronics

# Biographical Summary

## Prof. Thomas Zimmer

- **Education**
  - 1983 – 1989 University Study, Physics, University Würzburg, Germany
  - 1990 – 1992 Ph.D. Student at University Bordeaux 1
- **Professional Life**
  - 1989-1990 Research employee, Fraunhofer Institute of Erlangen, Germany
  - 1992-1993 Research employee – Adera, France
  - 1993 Assistant Professor (MdC), University of Bordeaux 1
  - 2003 Professor, University of Bordeaux
- **Degrees**
  - 1989 Master Degree in physics, University of Würzburg, Germany
  - 1992 PhD: University of Bordeaux
  - 2001 Habilitation: University of Bordeaux
- **Further Professional Activities**
  - 2002 Cofounder of the company XMOD Technologies
  - 2008 Senior Member of the IEEE
  - 2008 – 2015 Head of the research group Nanoelectronics at the IMS Lab
  - 2012 TPC chair of the ESSDERC conference
  - 2013 Organizer of Open Bipolar Workshop at the BCTM
  - 2014 Organizer of THz-Workshop at the ESSDERC/ESSCIRC
  - 2015 Organizer of the Workshop “SiGe for mmWave and THz” at the European Microwave Week
  - 2015 Organizer of the Seminar “ SiGe-THz devices: Physics and reliability ” in Bordeaux

# Acknowledgement

- Bertrand Ardouin (XMOD Technologies)
- Christian Raya (PhD, PostDoc, now with XMOD Technologies)
- Peter Baureis (Professor, FH Würzburg, Germany)
- Arnaud Curutchet (Associate Professor, IMS - Bordeaux)

# Impact of SiGe on Radar Sensors

# Impact of BiCMOS on Automotive Radar Market

# What comes next?

- In Europe each year about 1.3 million traffic accidents cause:
  - More than 40.000 fatalities
  - Economic damage of more than 200 billion € per year
- Human error is involved in over 90% of accidents
- Automotive radar help drivers to
  - Maintain a safe speed
  - Keep a safe distance
  - Avoid overtaking in critical situations
  - Safely pass intersections
  - Avoid crashes with vulnerable road user
  - Reduce severity of an accident
  - Drive more efficiently

# Mobile data traffic growth until 2019

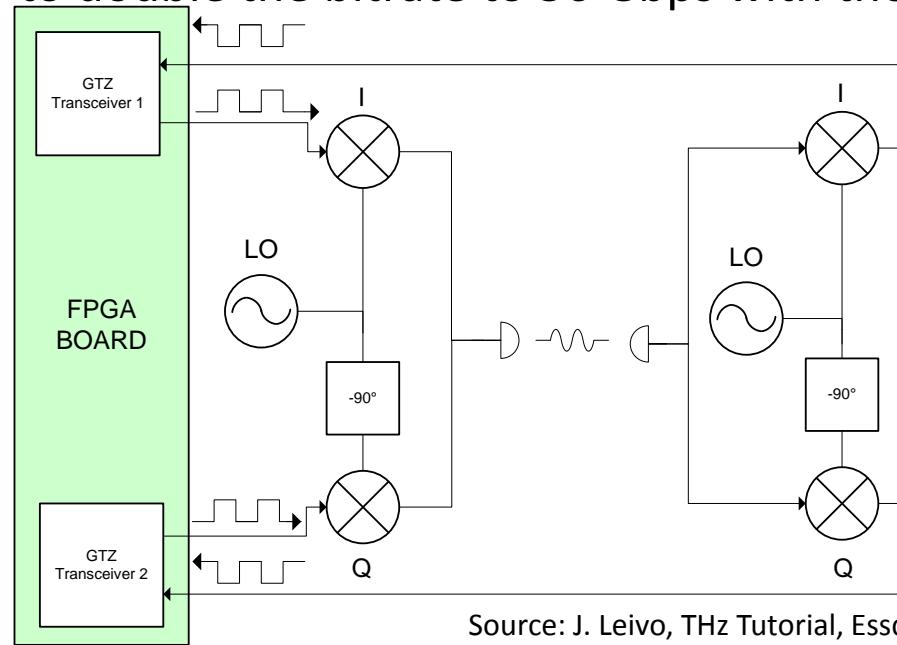

source: Cisco VNI study

=> Need of high data transfer rate

# Application: Toward 100Gbit/s

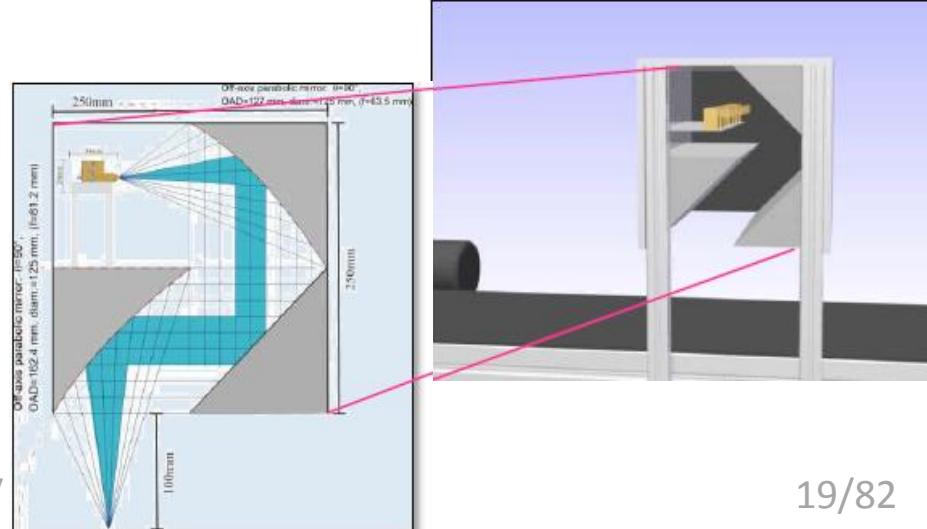

- 56 Gbps Short Range Communication with FPGA and SiGe-transceivers
  - Xilinx Virtex 7 FPGA has high speed transceivers that are capable of generating baseband signals with bitrates up to 28 Gbps
  - Use QPSK with IQ-mixer to double the bitrate to 56 Gbps with the same bandwidth

Source: J. Leivo, THz Tutorial, Essdenc 2016

# Application: THz Image scanner for material and product testing

- Wideband 240GHz imaging system with excellent spatial resolution
  - 3D-imaging system using coherent THz-TX and –RX for synthetic aperture radar imaging (reflection imaging)
  - Specific Imaging system setup and Image generation
  - Integration of 32 Rx + 32 Tx Modules at 240 GHz
  - Aiming for horizontal and vertical imaging in reflection
- => Non Destructive Control

# Application: THz image scanner for security

Millimeter-wave technology  
for **security scanner**  
(airport, railway station etc.)

The security scanner automatically detects  
potentially **dangerous objects**:

- under clothing
- or on the body,

whether they are rigid, flexible, fluid, metallic or non-metallic.

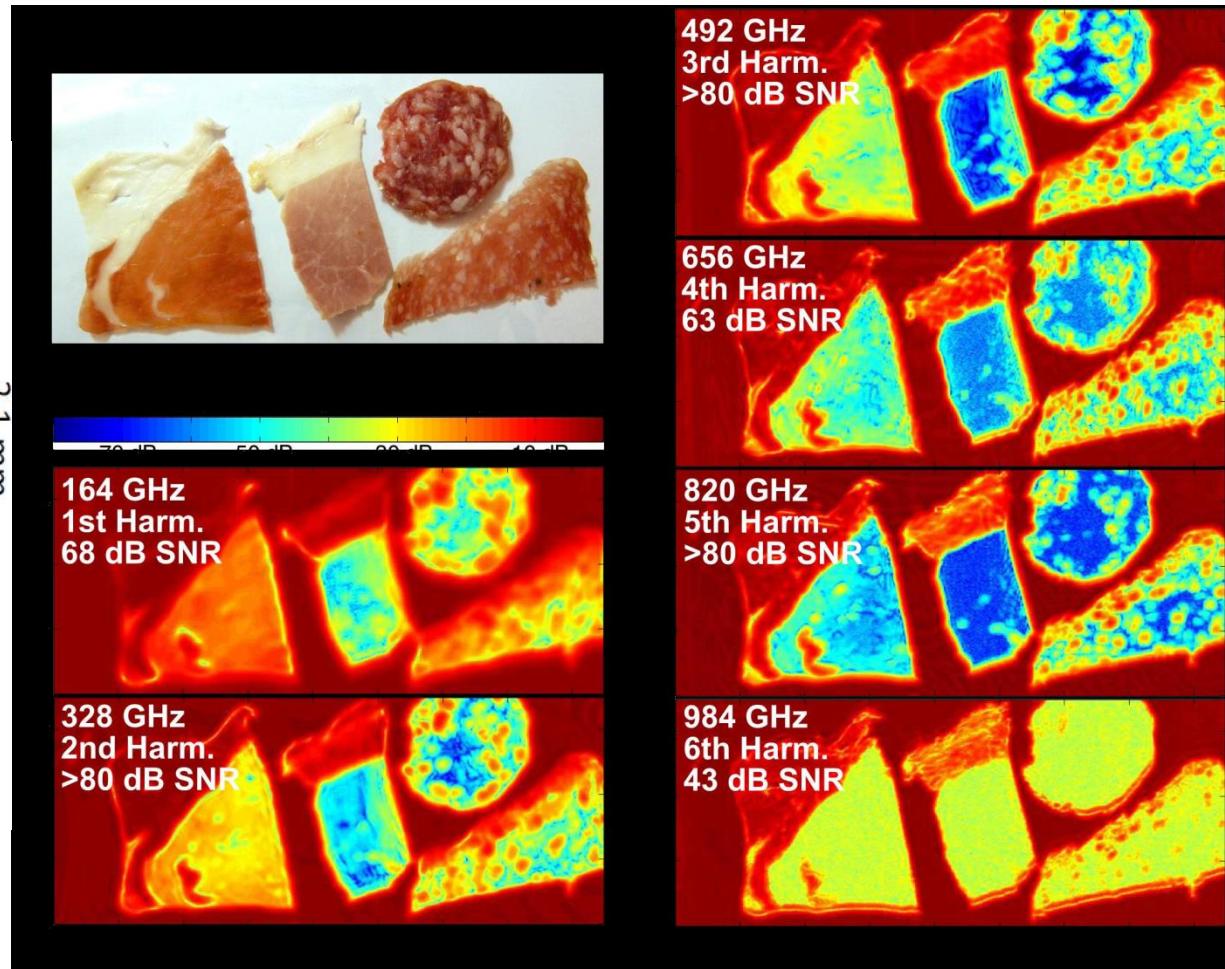

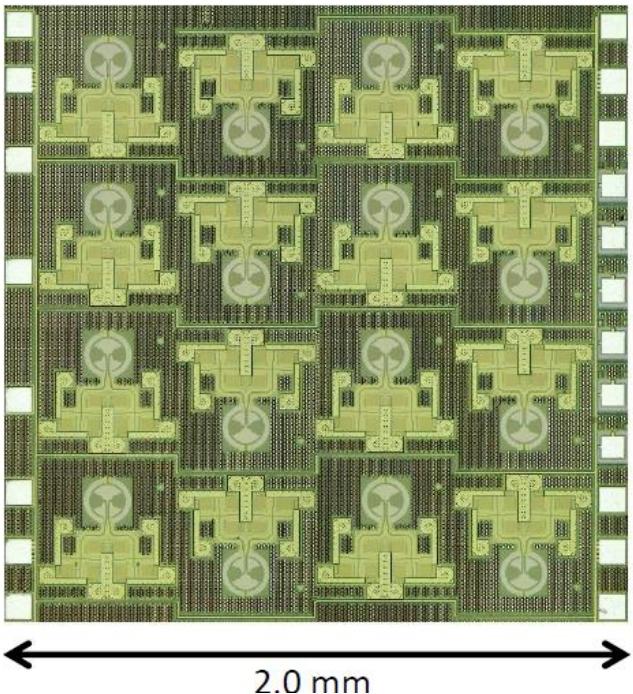

If the scanner reports an alarm,  
the **location of the object is marked**  
on an avatar, a symbolic graphic of the human body.

# Application: THz image scanner for health

Source: U. Pfeiffer, DOT7 WS 2015

# System demonstrator IC

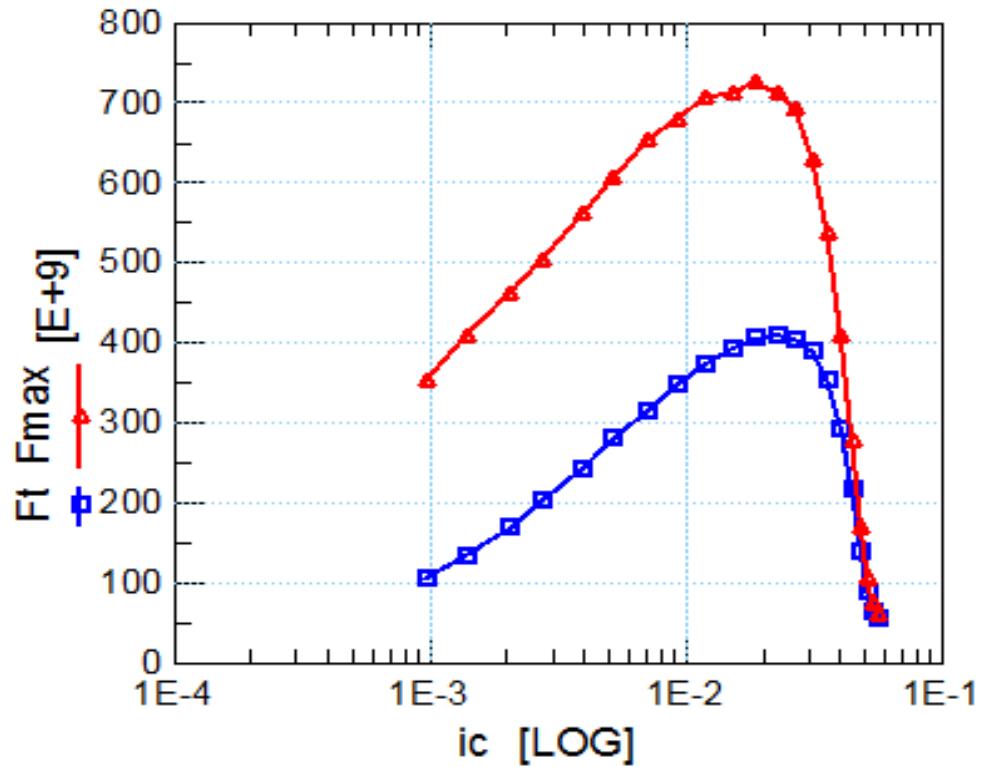

- Single-chip 94 GHz up-conversion and receiver in 0.13  $\mu$ m Bi-CMOS, integrated in ST 9MW technology (230/280,  $f_t/f_{max}$ ).

- 8x frequency up-conversion + down-converting mixer

# World record of SiGe HBT (IHP)

- SiGe heterojunction Bipolar Transistors operating at a maximum oscillation frequency of 700 GHz
- THz-Applications
  - Automotive radar
  - 100Gbit/s data rate
  - Non-destructive control
  - Security scanner
  - THz imaging for health

Max oscillation freq  $f_{max}$  and transition freq of a SiGe HBT transistor fabricated at IHP.  
Measurements done at IMS Lab, Bordeaux.

# Off-wafer calibration and 4 standards deembedding

## Review of calibration techniques

SoA methods 1/1

Acronym	Number of Standards	Error model	Analytical solution	Electrical Hypothesis	Standards width	Wide band
SOLT	4	12 terms	Yes	6 (magnitude and phase of all standards)	Constant	Yes
LRRM	4	8 terms	No	0	Constant	Yes
SSST	4 or 7	8 terms	Yes	6 (magnitude and phase of all standards)	Constant	No
TRL	3	8-12 terms	Yes	1 (REFLECT symmetry+2 length)	Not constant	No
TRM	3	8 terms	Yes	2 (magnitude and phase of match)	Constant	No
LS1S2	3	8 terms	No	0 (+1 length)	Not constant	No

### For off-wafer calibration

Direct analytical solution

→ faster, easily implementable, no optimization step

Constant width

→ no probe manipulation (higher accuracy)

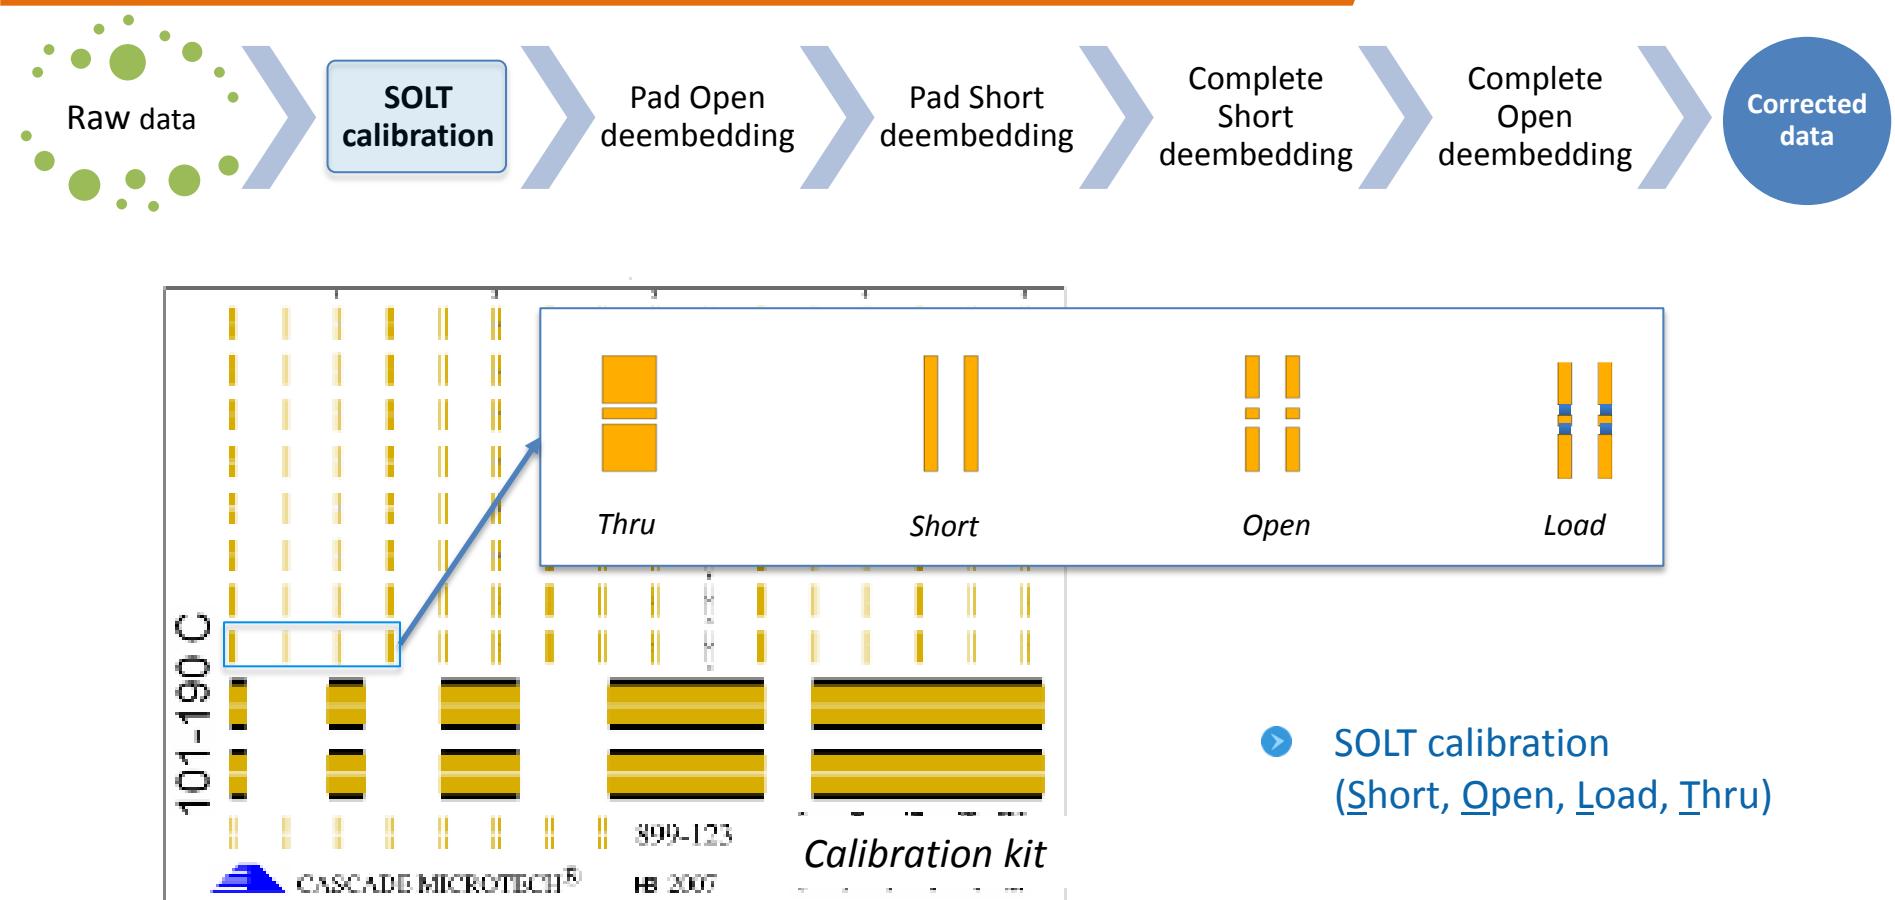

Wide band

→ measurement between 0,1GHz and 110GHZ

# Off-wafer calibration and 4 standards deembedding

## SOLT calibration

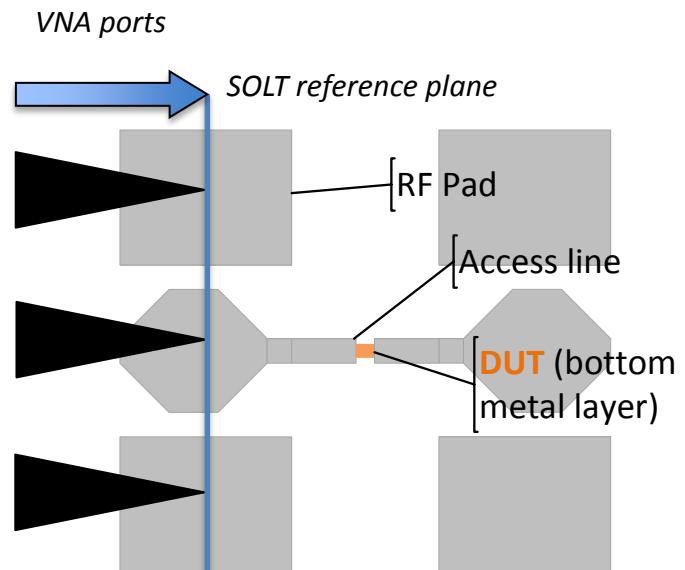

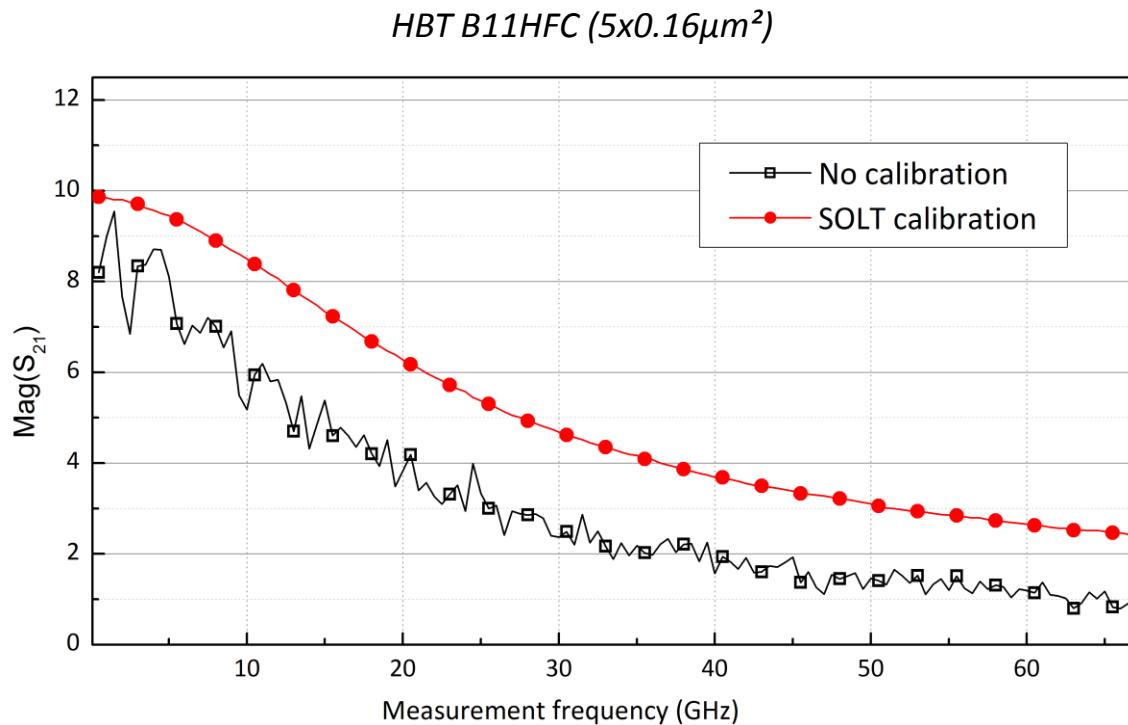

## Off-wafer calibration 1/8

# Off-wafer calibration and 4 standards deembedding

## SOLT calibration: Results

Off-wafer calibration 2/8

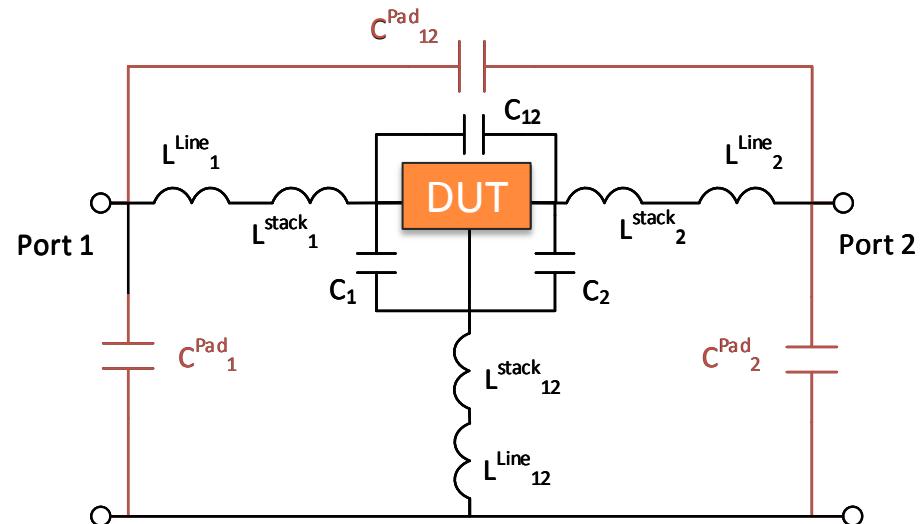

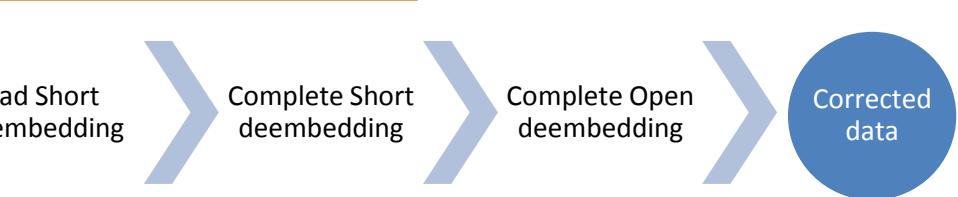

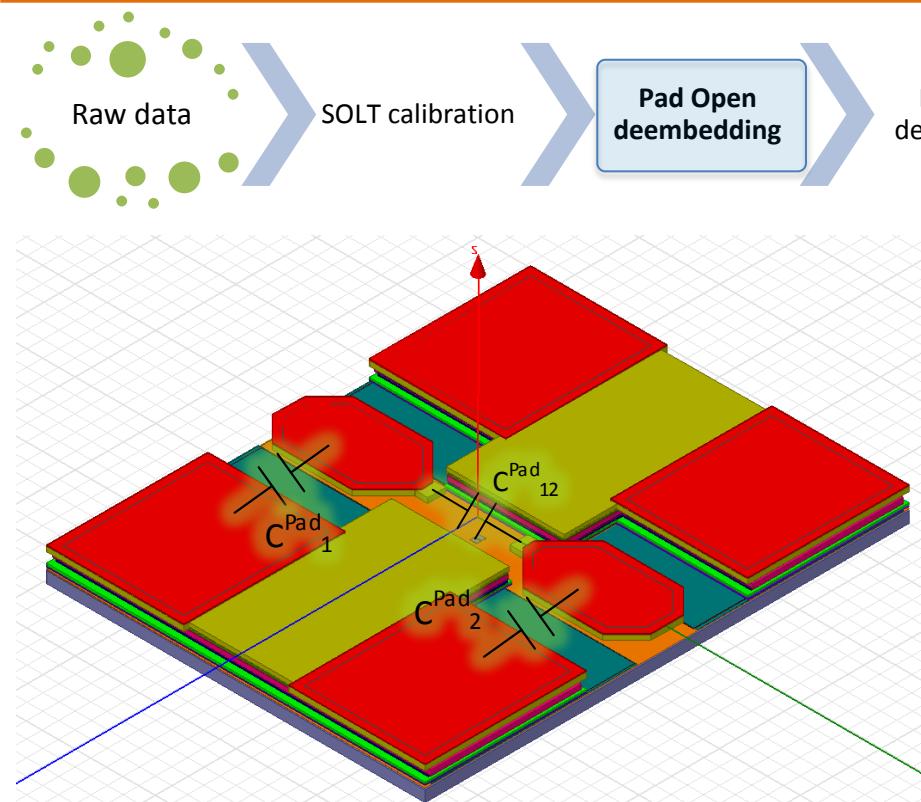

- Better performances
- Smoother curve

- Reference plane : VNA ports
- RF probes

# Off-wafer calibration and 4 standards deembedding

Method PO/PS/CS/CO

Off-wafer calibration 3/8

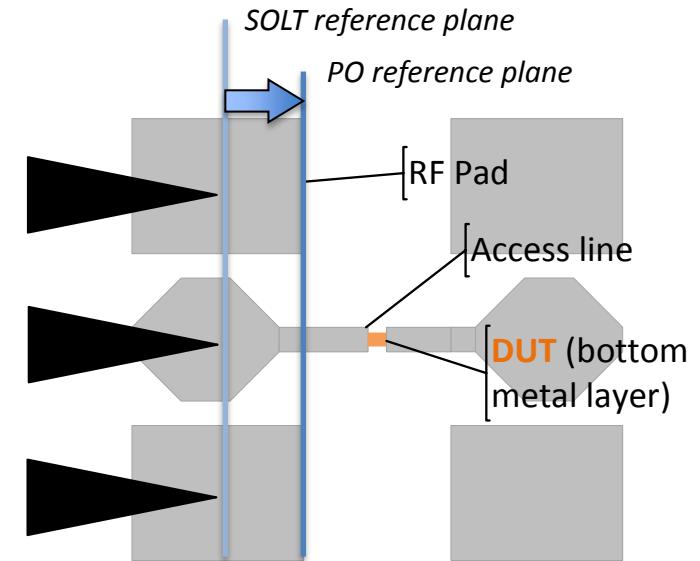

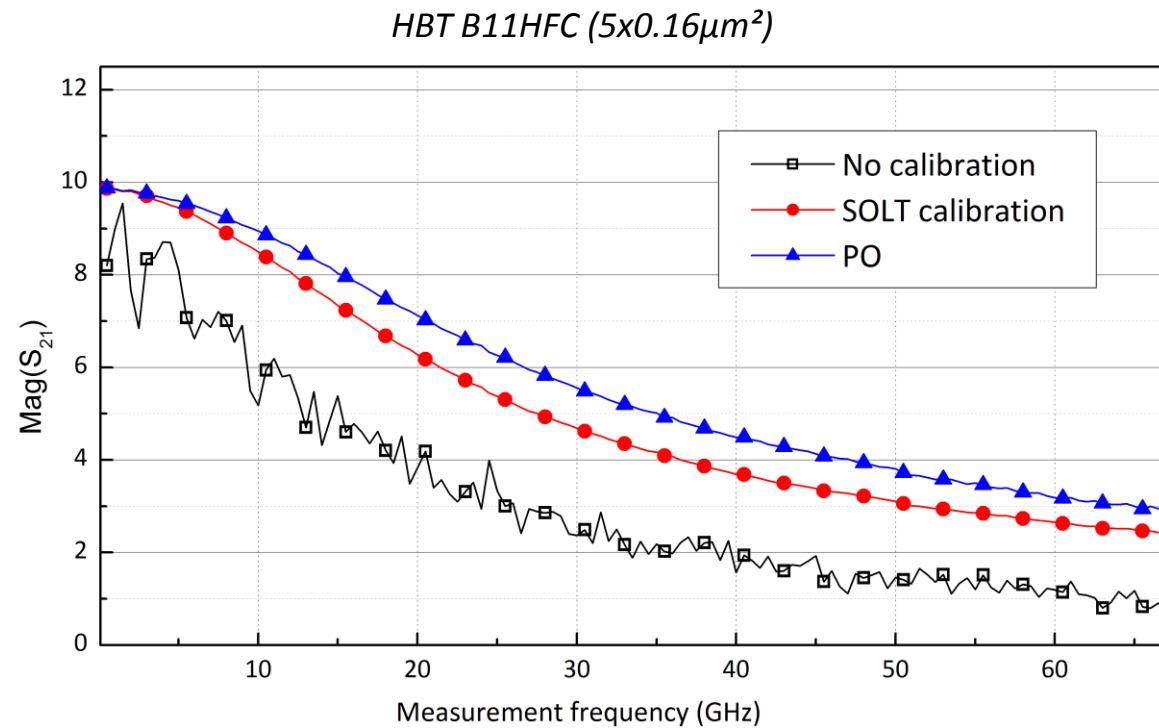

Remove capacitance of RF pad

# Off-wafer calibration and 4 standards deembedding

Method PO/PS/CS/CO

Off-wafer calibration 4/8

- Better performances at high frequencies
- Reference plane → beginning of access line

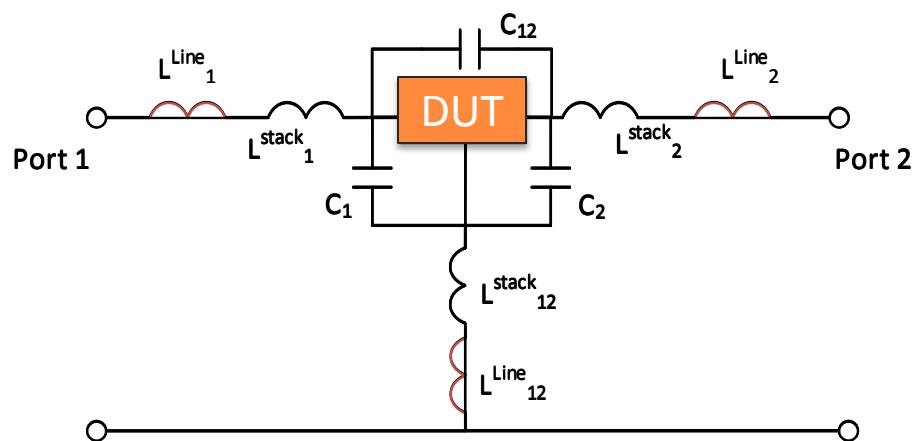

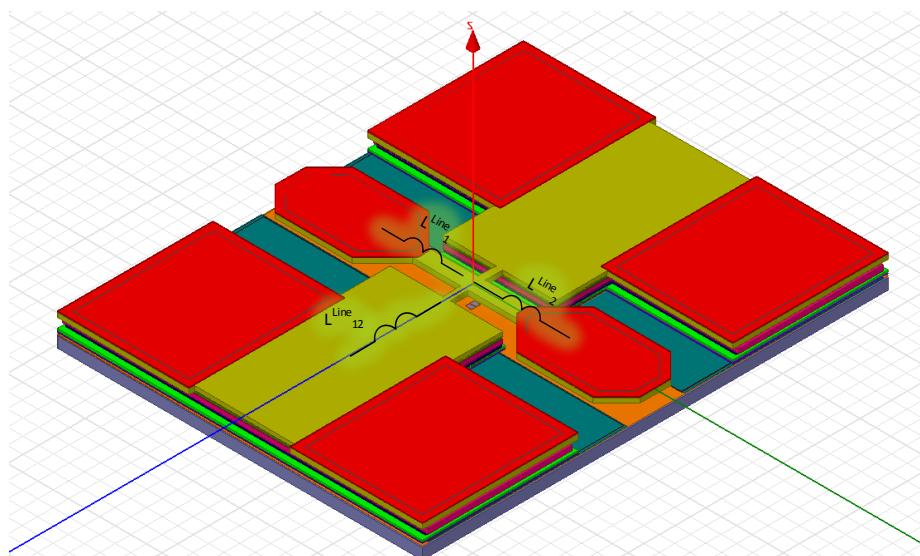

*Test structures dimensions*

- Pitch =  $100 \mu\text{m}$
- $L_{PAD} = 80 \mu\text{m}$
- $L_{LINE} = 30 \mu\text{m}$

# Off-wafer calibration and 4 standards deembedding

Method PO/PS/CS/CO

Off-wafer calibration 5/8

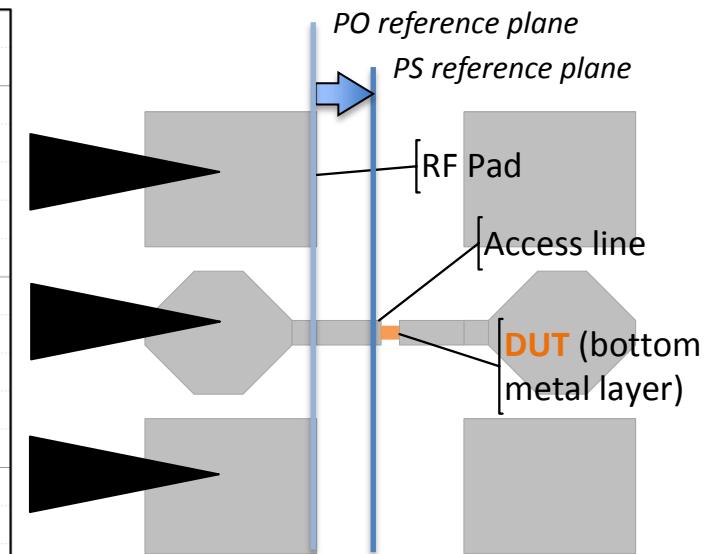

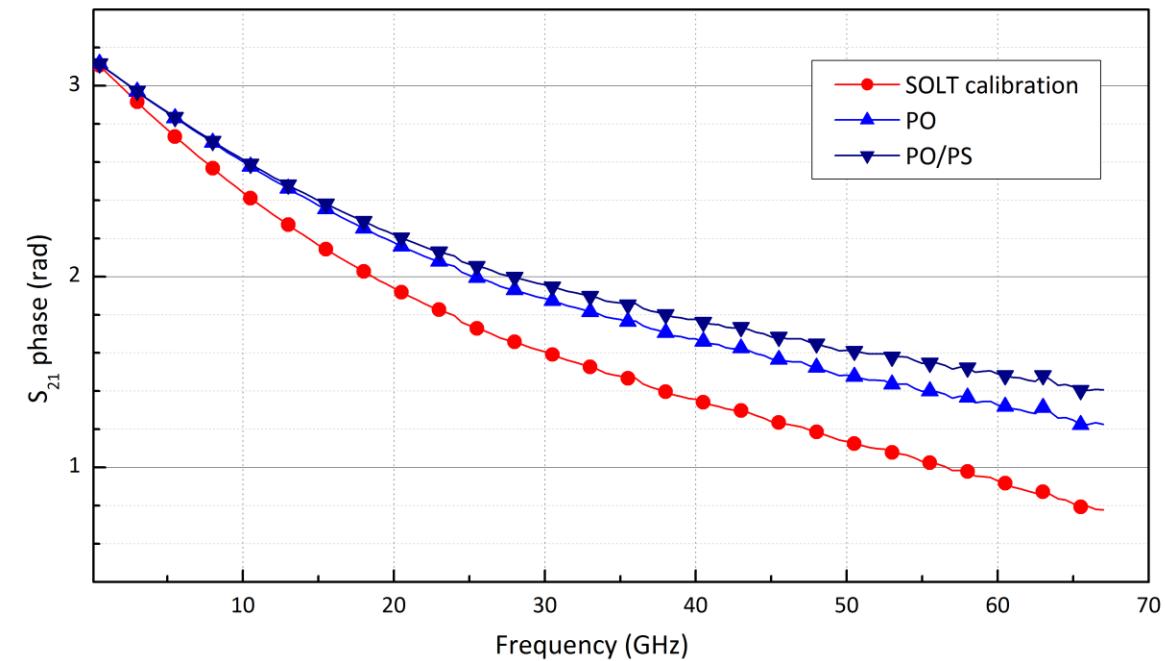

Remove inductance of access line

# Off-wafer calibration and 4 standards deembedding

Method PO/PS/CS/CO

Off-wafer calibration 6/8

## Test structures dimensions

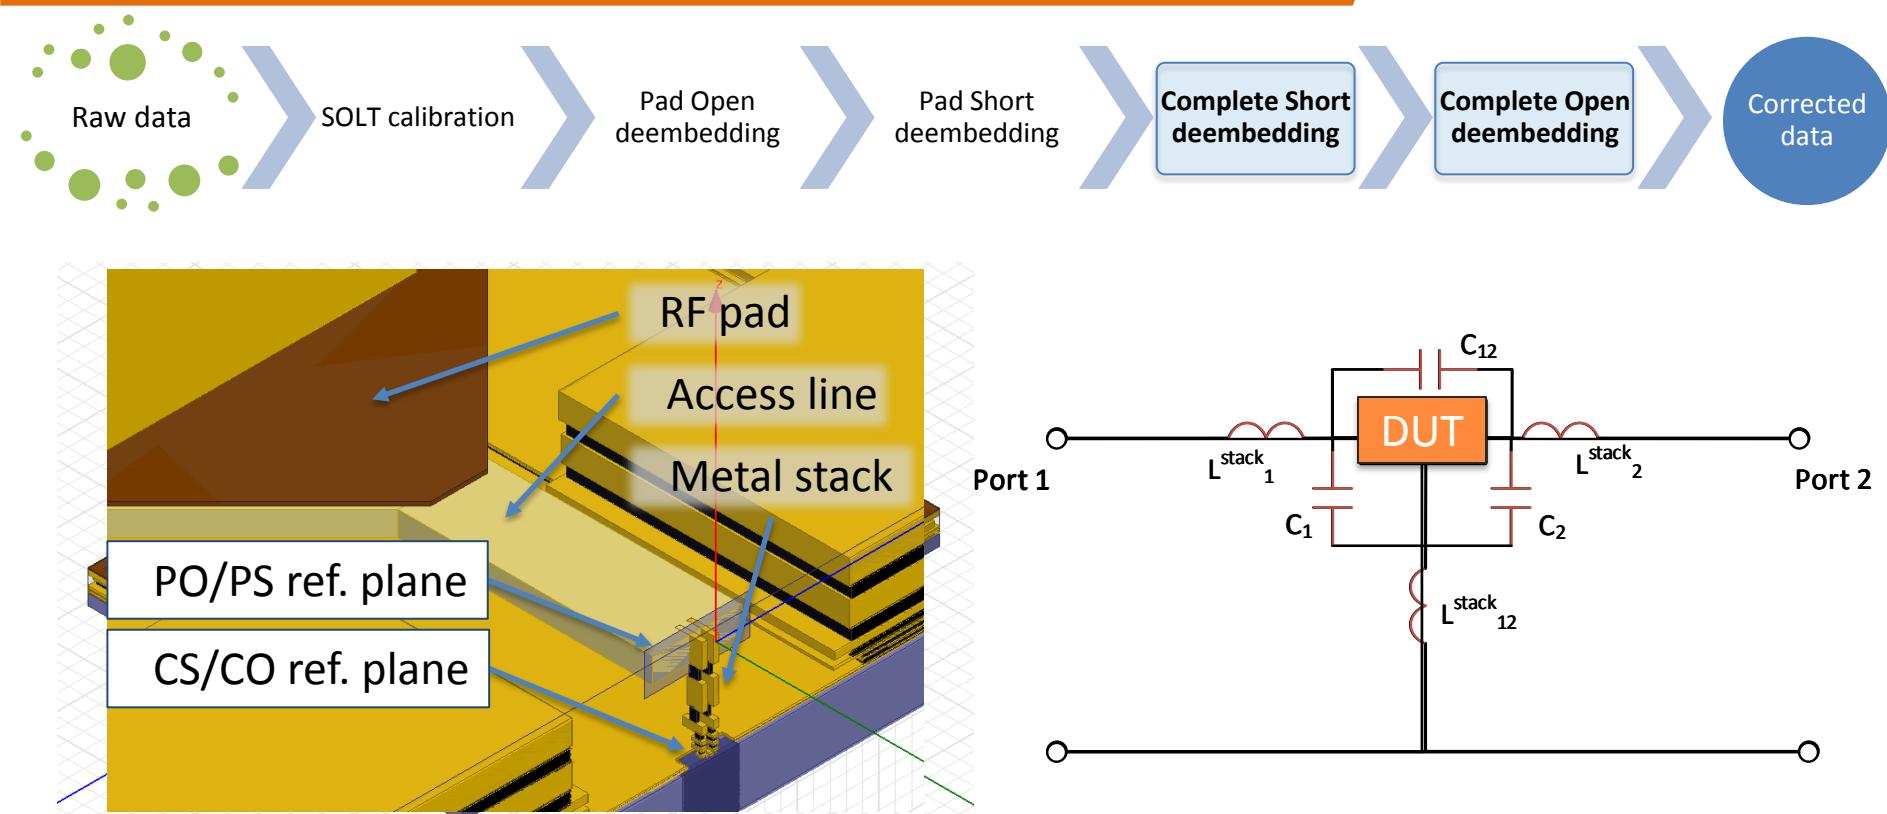

- Pitch =  $100\mu\text{m}$
- $L_{PAD} = 80\mu\text{m}$
- $L_{LINE} = 30\mu\text{m}$

- No significant modification in gain
- Reference plane → end of access line

# Off-wafer calibration and 4 standards deembedding

Method PO/PS/CS/CO

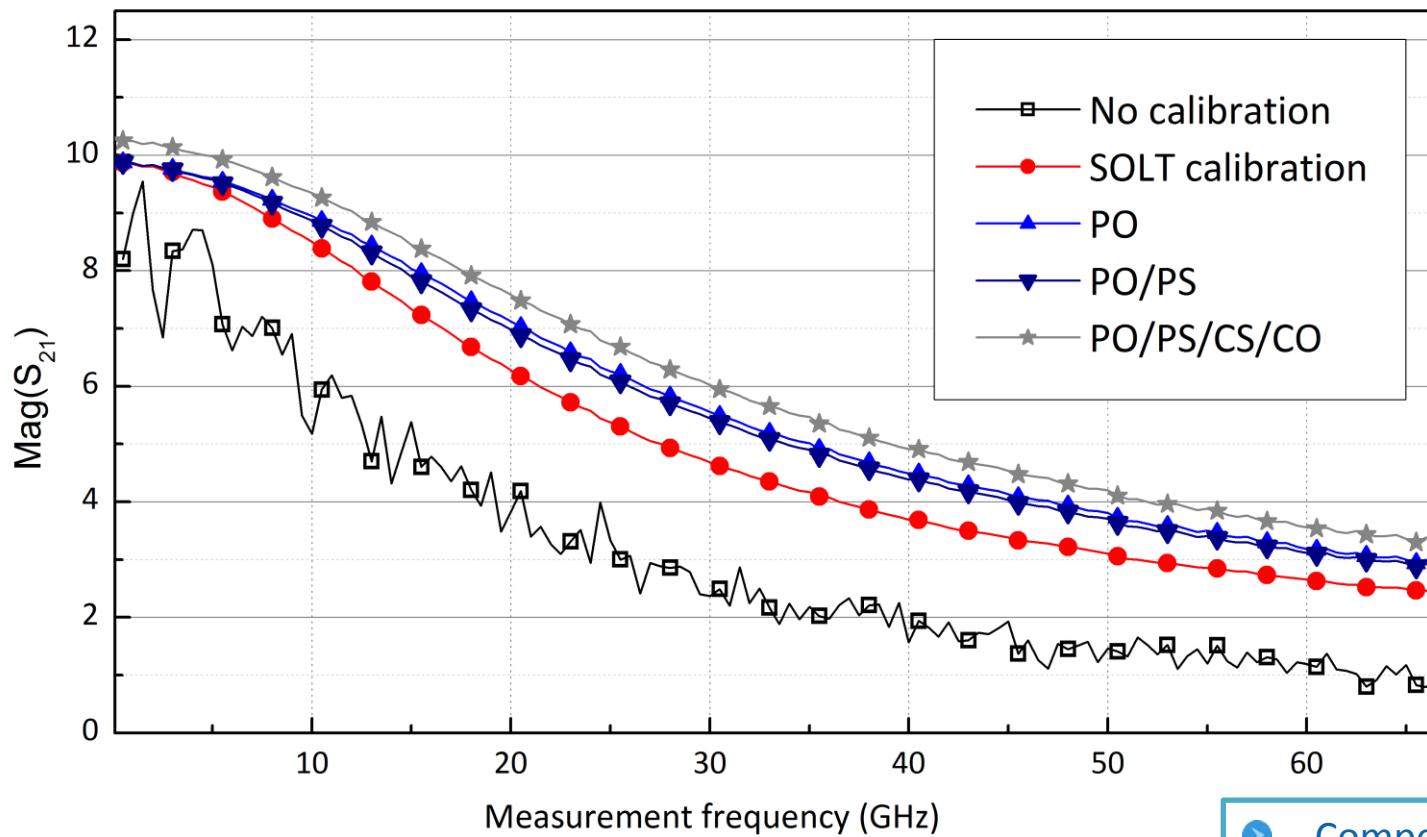

Off-wafer calibration 7/8

# Off-wafer calibration and 4 standards deembedding

Method PO/PS/CS/CO

Off-wafer calibration 8/8

Component only  
Reference plane → DUT contacts

# Outline

I. Context

II. State of the Art of calibration and deembedding

Off-wafer calibration and 4 steps deembedding

On-wafer calibration and deembedding

III. Issues and proposed improvements

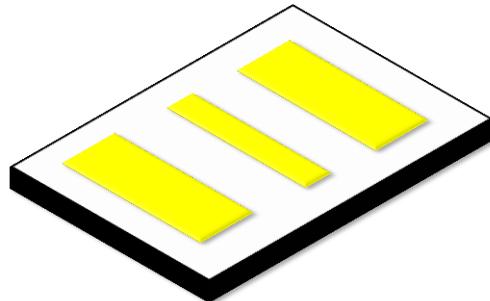

IV. Beyond 100GHz

V. Conclusion

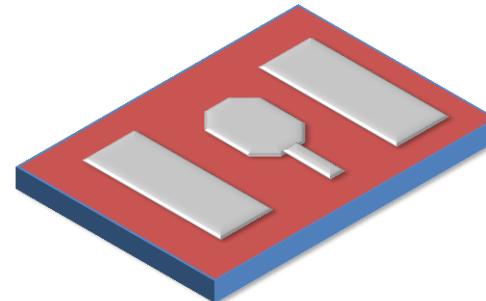

# On wafer calibration

Why ?

SoA methods 1/2

≠

- The calibration kit environment is very different from the silicon one (DUT).

Calibration kit	Silicon wafer
Alumina substrate	Silicon substrate
Rectangular pad	Hexagonal pad
Gold metallization	Aluminum metallization

- The environment is different, error is introduced in measurement
  - The solution is on-wafer calibration !

# State Of the Art methods

## Review of calibration techniques

SoA methods 2/2

Acronym	Number of Standards	Error model	Analytical solution	Electrical Hypothesis	Standards width	Wide band
SOLT	4	12 terms	Yes	6 (magnitude and phase of all standards)	Constant	Yes
LRRM	4	8 terms	No	0	Constant	Yes
SSST	4 or 7	8 terms	Yes	6 (magnitude and phase of all standards)	Constant	No
TRL	3	8-12 terms	Yes	1 (REFLECT symmetry+2 length)	Not constant	No
TRM	3	8 terms	Yes	2 (magnitude and phase of match)	Constant	No
LS1S2	3	8 terms	No	0 (+1 length)	Not constant	No

### For on-wafer calibration

Analytical solution

→ Faster, easily implementable

Few Electrical Hypothesis

→ Less sensitive to variation process

→ Few constraints on the standards accuracy

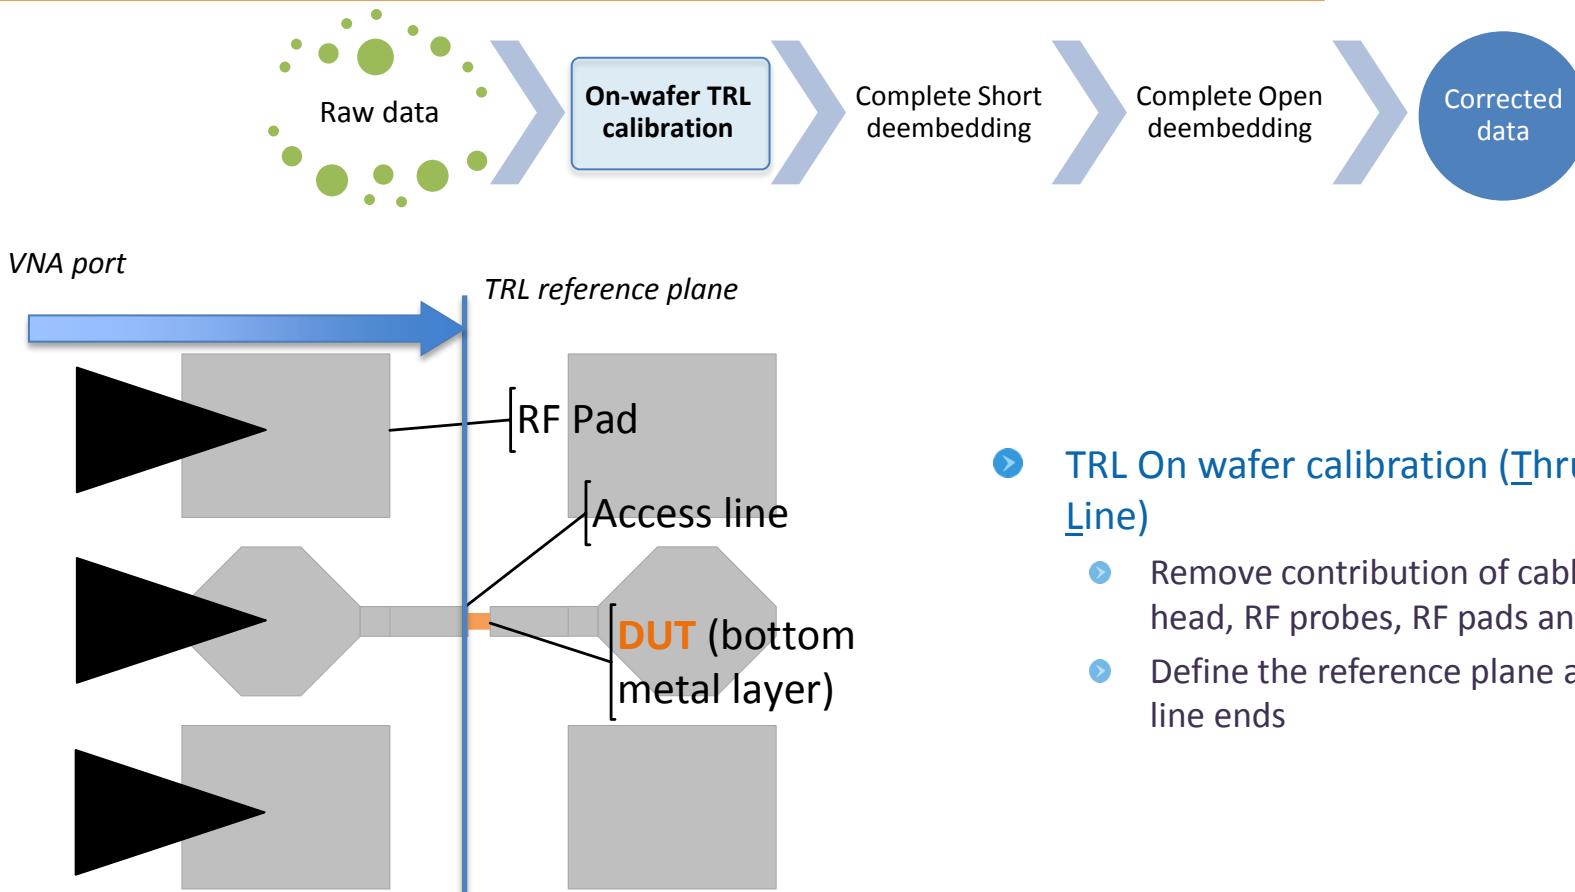

Standard 50Ω Match

→ Very hard to make in mmwave and THz range

# On-wafer TRL calibration and deembedding

## On-wafer TRL calibration

On-wafer calibration 1/4

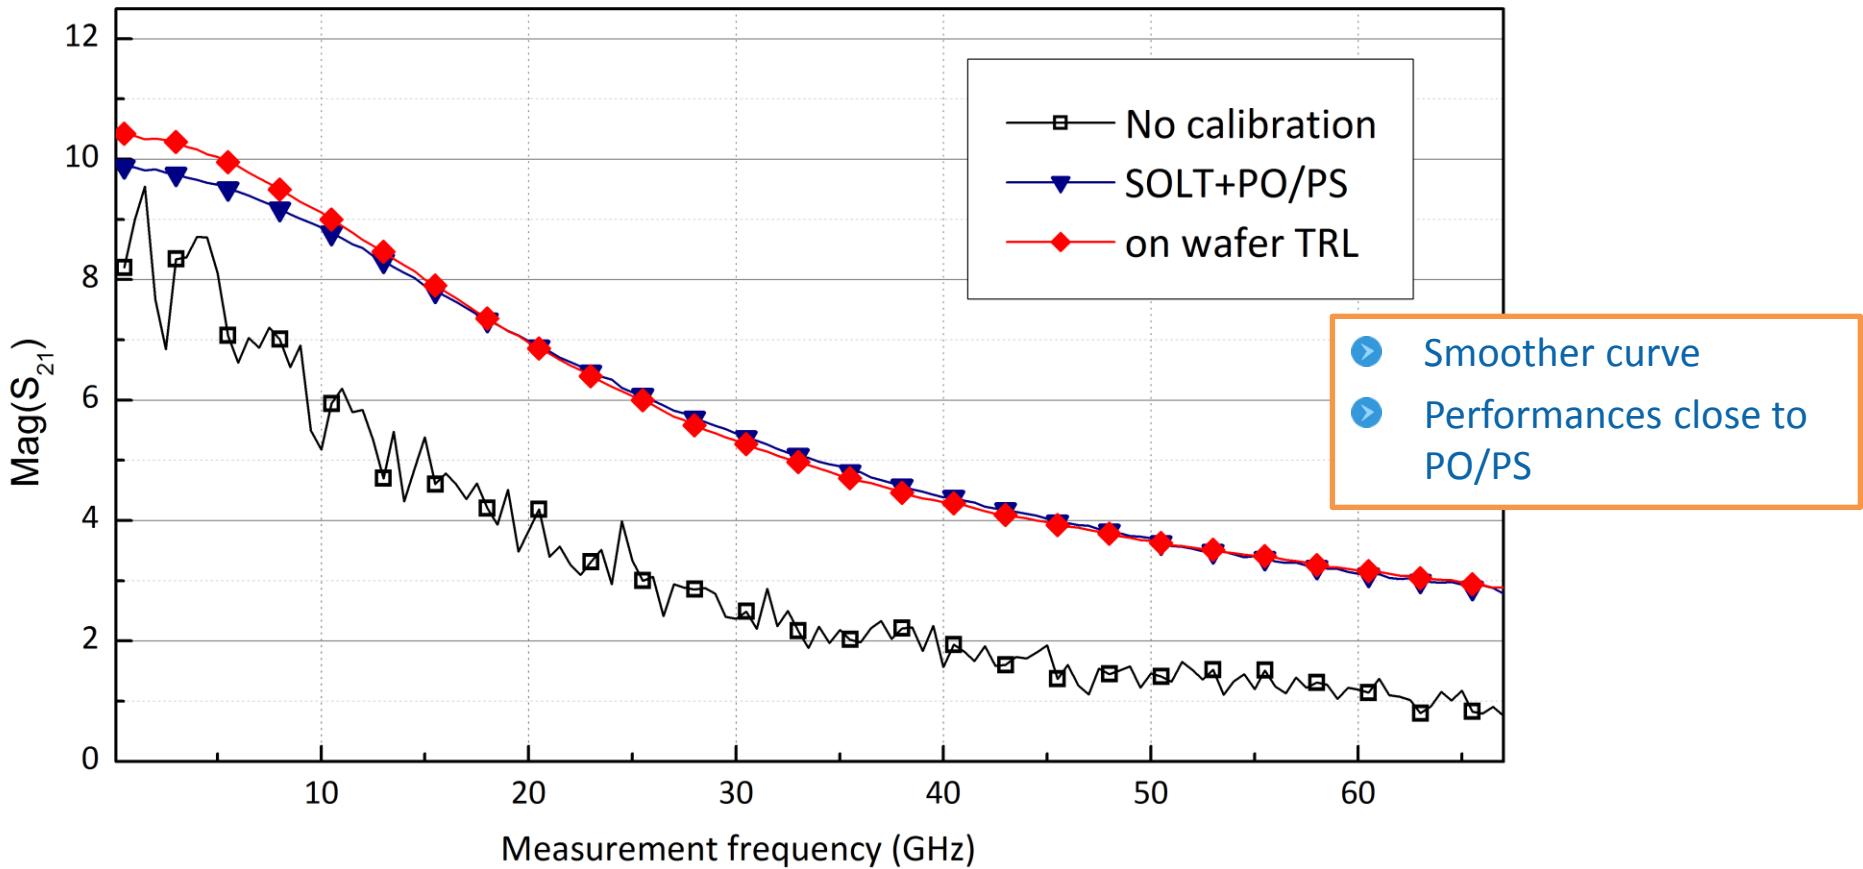

### TRL On wafer calibration (Thru, Reflect, Line)

- Remove contribution of cable, millimeter head, RF probes, RF pads and access lines
- Define the reference plane at the access line ends

# On-wafer TRL calibration and deembedding

on-wafer TRL calibration : results

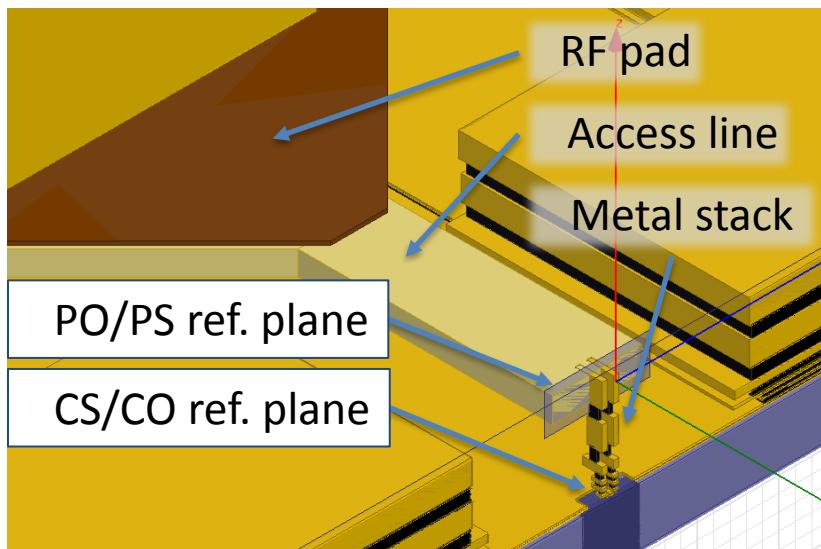

On-wafer calibration 2/4

# On-wafer TRL calibration and deembedding

## CS/CO deembedding

On-wafer calibration 3/4

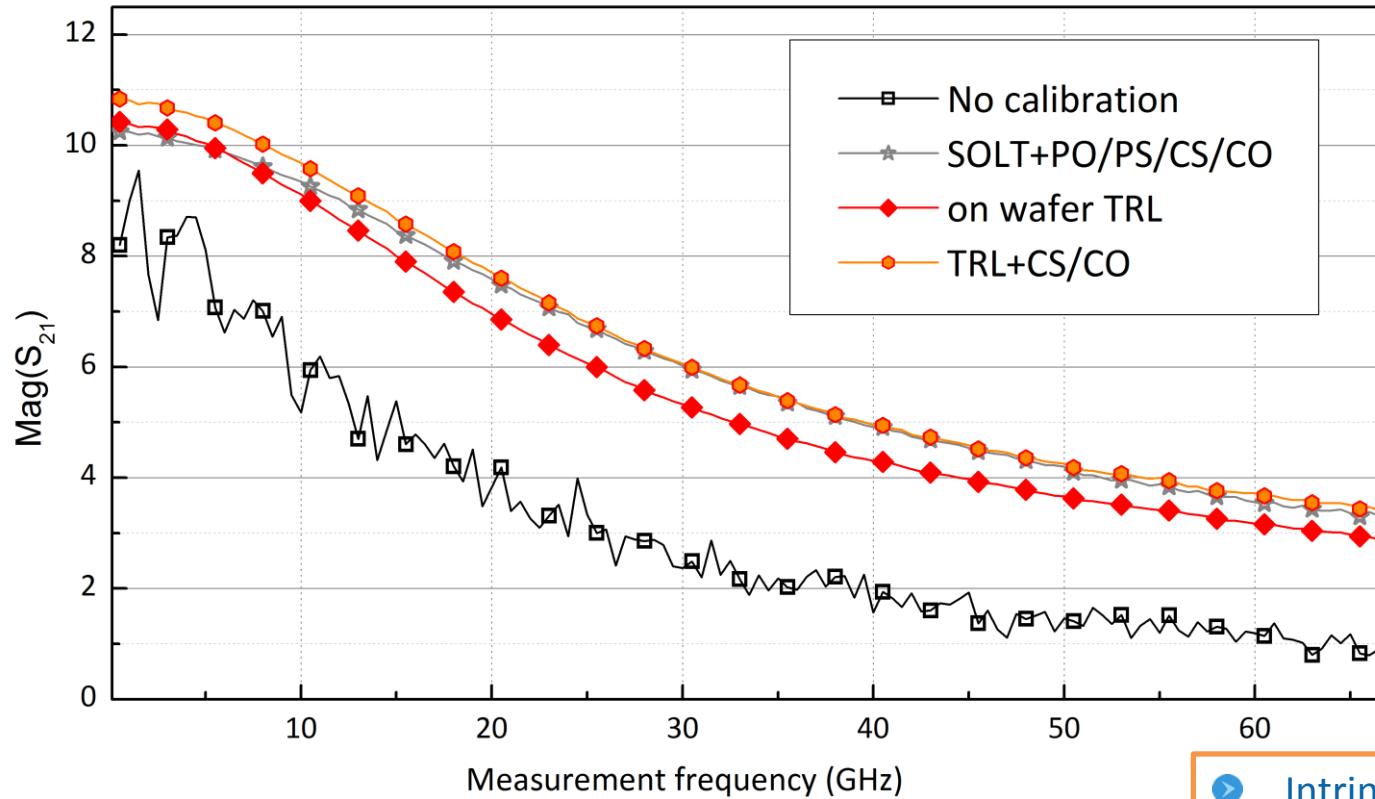

- Deembedding Complete-open and Complete-short correction (CS/CO)
  - Remove parasitic of metal stack
  - Reference plane → DUT contact

# On-wafer TRL calibration and deembedding

## CS/CO deembedding : results

On-wafer calibration 4/4

➤ Intrinsic component

➤ Less steps, less standards

# State Of the Art methods

To sum up

## ➤ Off wafer SOLT calibration and 4 steps deembedding

Pro	Cons
Wide Band	Many standards → Complex procedure
Same width standards → No probes manipulation required	Off wafer → Deembedding necessary

## ➤ On wafer TRL calibration and 2 steps standards

Pro	Cons
Less standards → less contact error	Use more silicon area
On wafer → Same environment as measurement	Line length is longer → Environment alteration

# Outline

I. Context

II. State of the Art of calibration and deembedding

III. On-wafer calibration improvements

Meander Line

3D-TRL

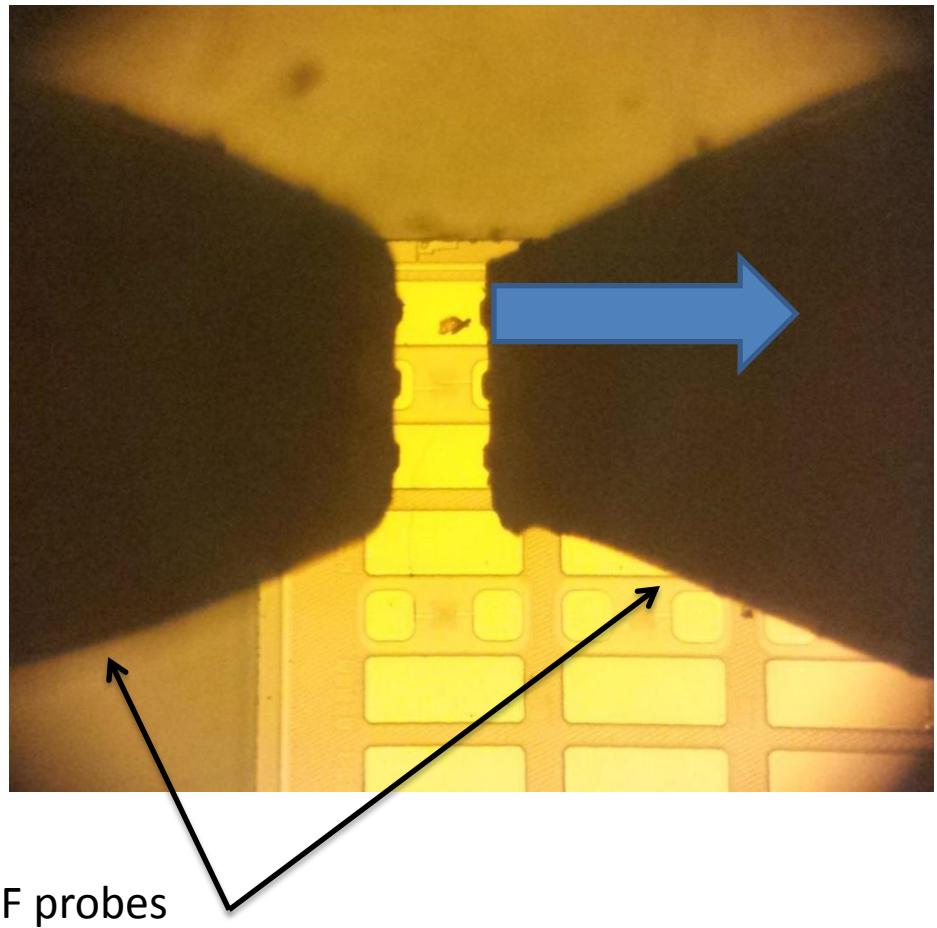

IV. Beyond 100GHz

V. Conclusion

# Probe movement during calibration

Probe movement 1/3

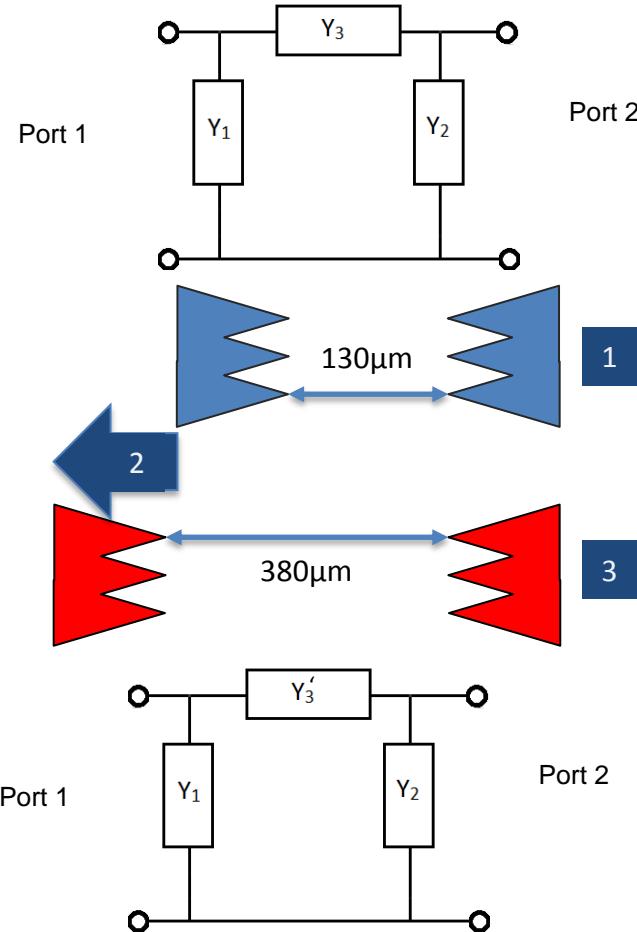

- The Line is longer than the other standard
  - At least one probe needs to be moved
  - The RF signal path may be altered

# Probe movement during calibration

## Error quantification methodology

## Probe movement 2/3

1 Measurement of the “probe in air”  
(distance between probes :  $130\mu\text{m}$ )

2 Movement of the left probes

3 Measurement of the “probe in air”  
(distance between probes :  $380\mu\text{m}$ )

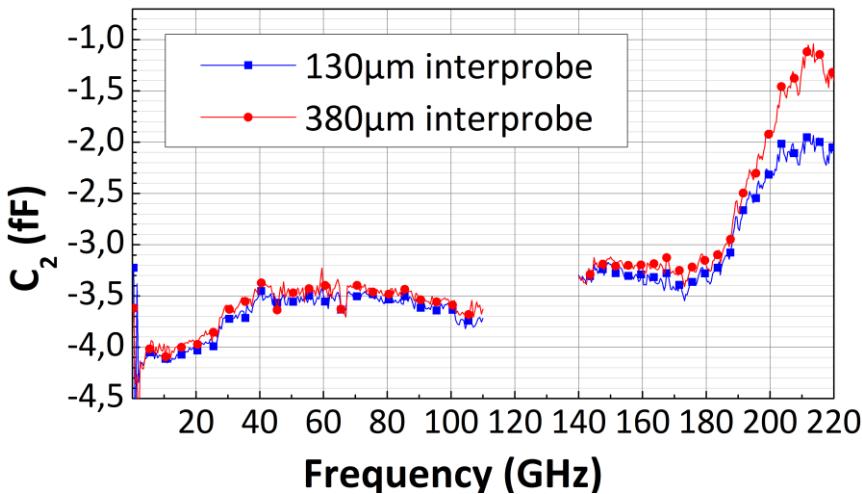

4 Comparison of the probe impedance  
before and after the probe movement

M Potéreau, C Raya, “Limitations of on-wafer calibration and deembedding methods in the sub-THz range”, JCC, vol1, n°6, p25-29, nov13

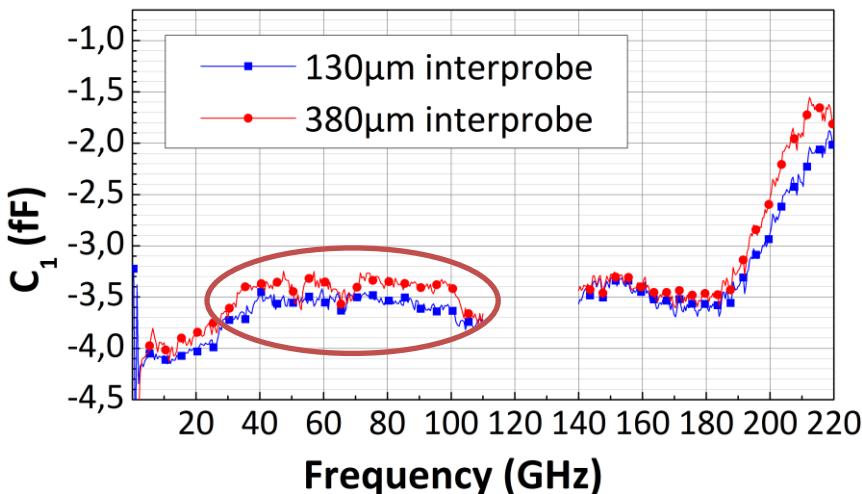

# Probe movement during calibration

Experimentation results : Probes capacitance

Probe movement 3/3

Probe not moved between the two measurements.  
**No significant modification under 110GHz**  
Above 190GHz, not clear so far

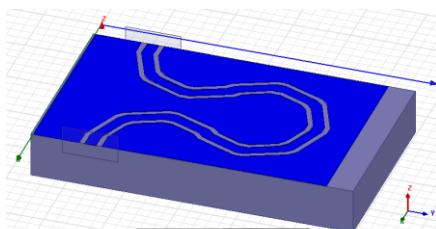

Probe moved between the two measurements.  
**Higher modification under 110GHz (10%)**  
Above 190GHz, not clear so far

# Description of the new standards

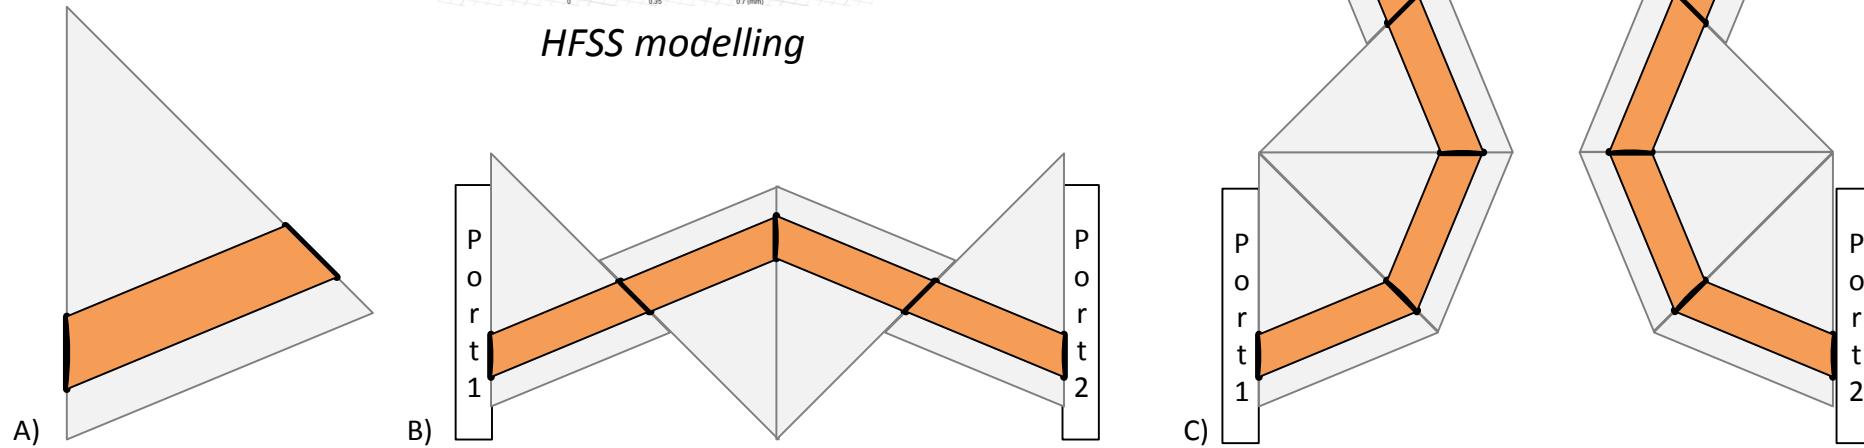

## TRL with meander lines method

- Based on “on-wafer” TRL calibration.

- LINE and THRU standards are made from patterns lined-up.
- REFLECT standard is remained unchanged.

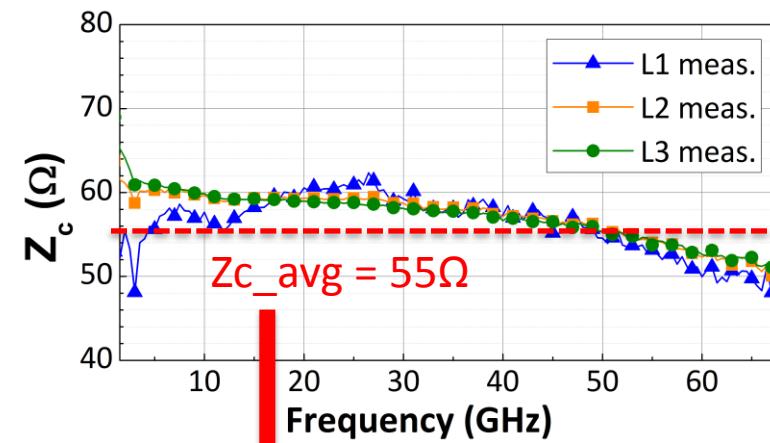

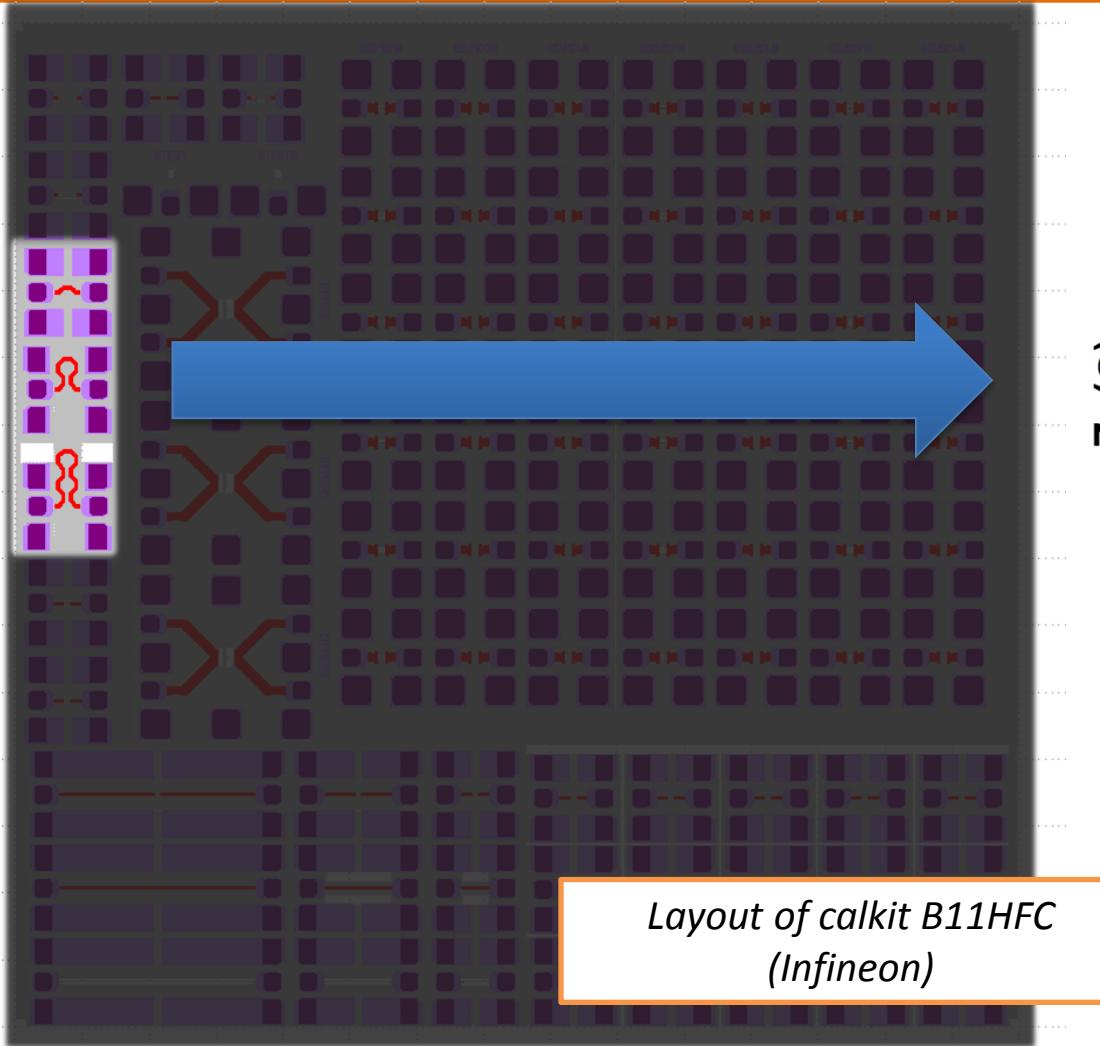

*HFSS modelling*

**Patented method**

# Implementation

## Layout for B11HFC (Infineon)

Correction with  $50\Omega$  match

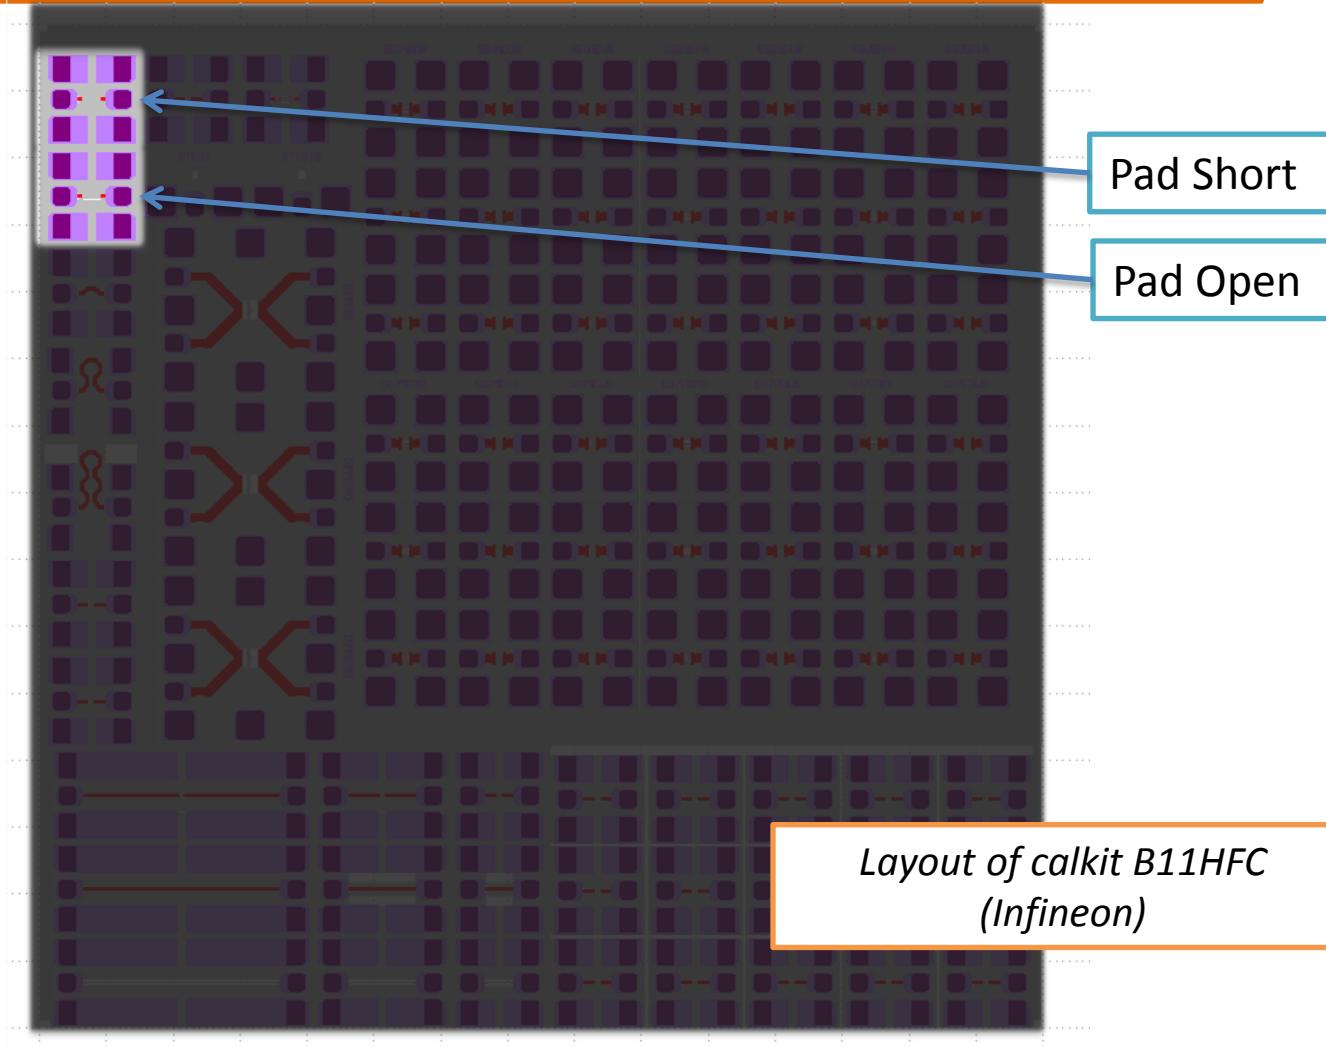

# Experimentation : setup and results

- Comparison between three methods :
  - SOLT+PO/PS
  - TRL with straight lines
  - TRL with meander lines
- The reference plane is defined at top metal for all methods
- Measurement of a HBT from Infineon B11HFC (emitter window :  $5 \times 0.16 \mu\text{m}^2$ )
  - Transit frequency  $f_T$
  - Base emitter capacitance  $C_{BE}$
  - Base Collector capacitance  $C_{BC}$

# Experimentation : setup and results

Structures used in the deembedding PO/PS

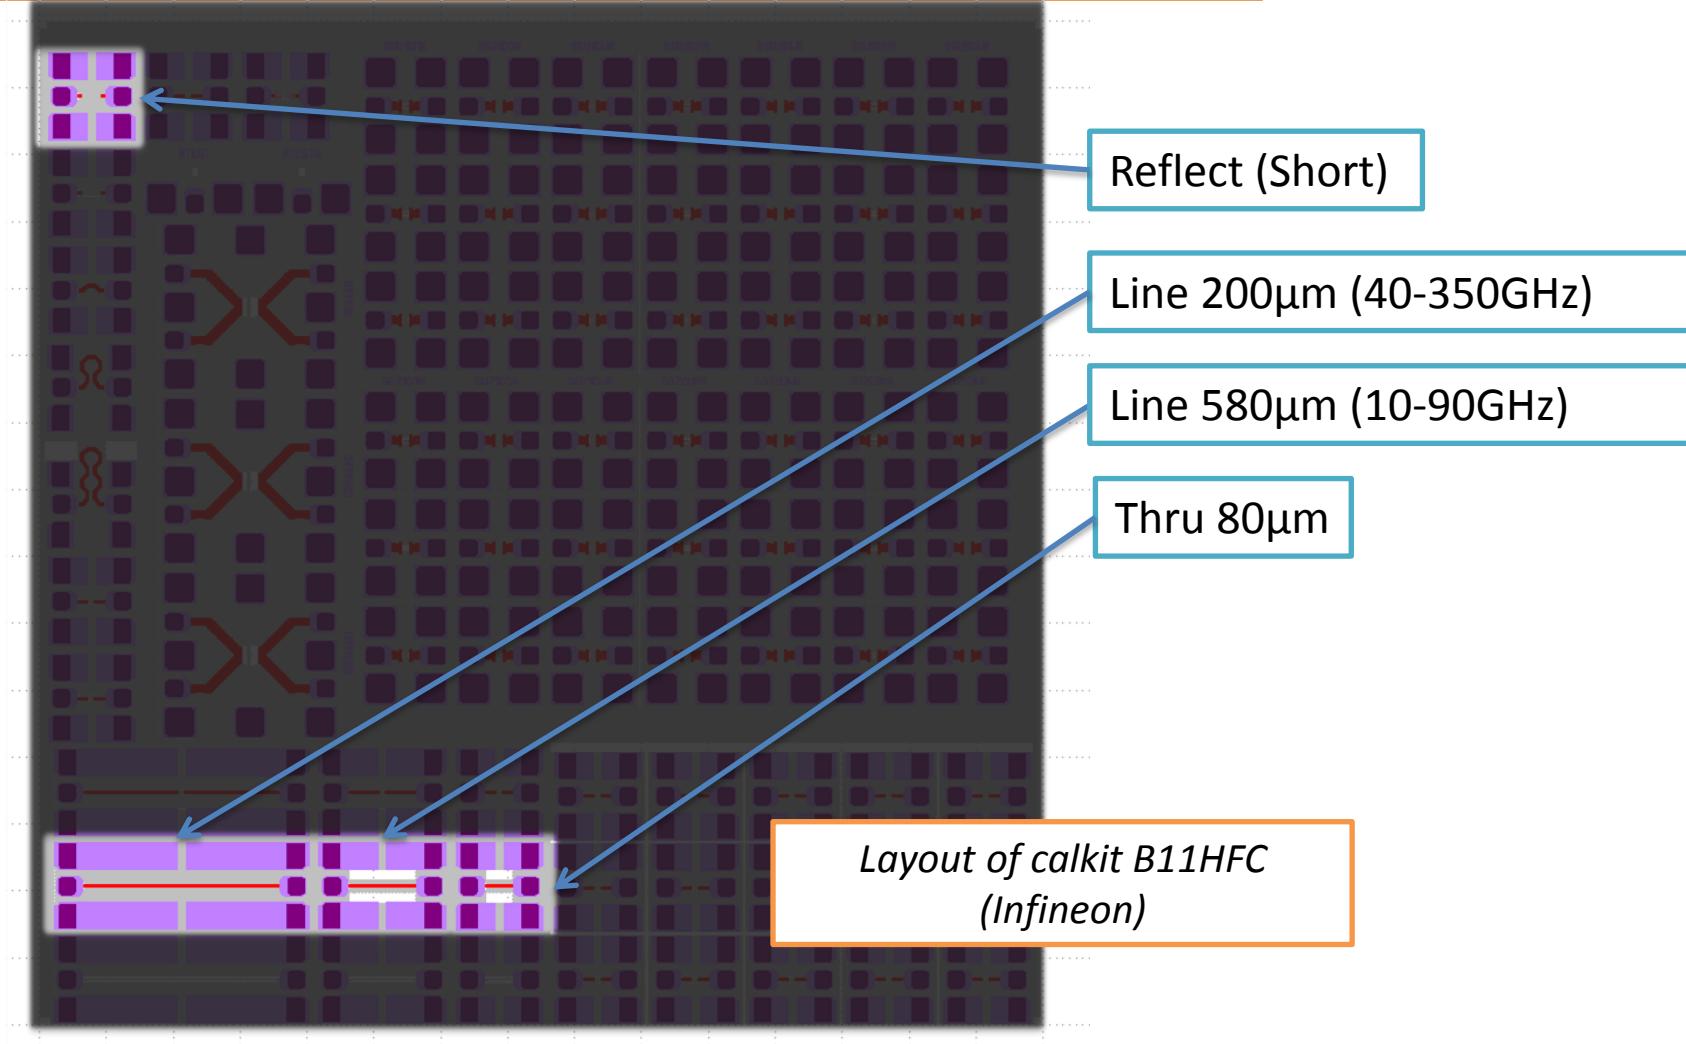

Experimentation 2/3

# Experimentation : setup and results

Structures used in the TRL using straight lines

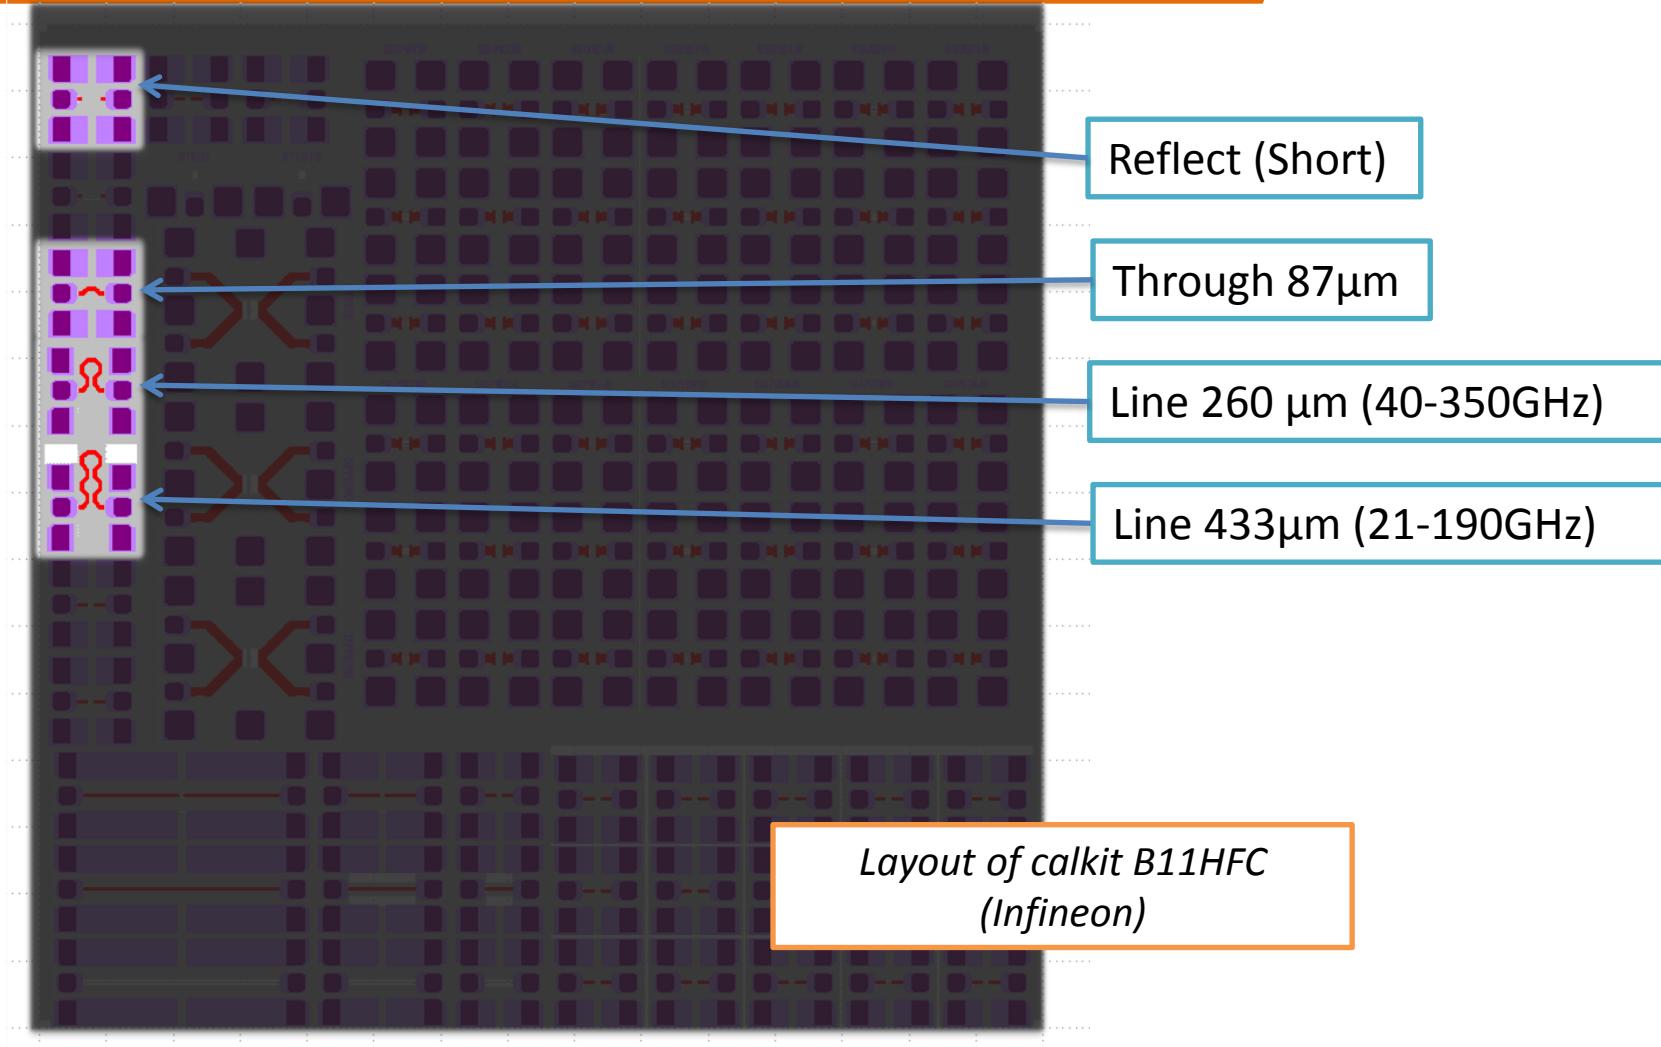

Experimentation 2/3

# Experimentation : setup and results

Structures used in the TRL using meander lines

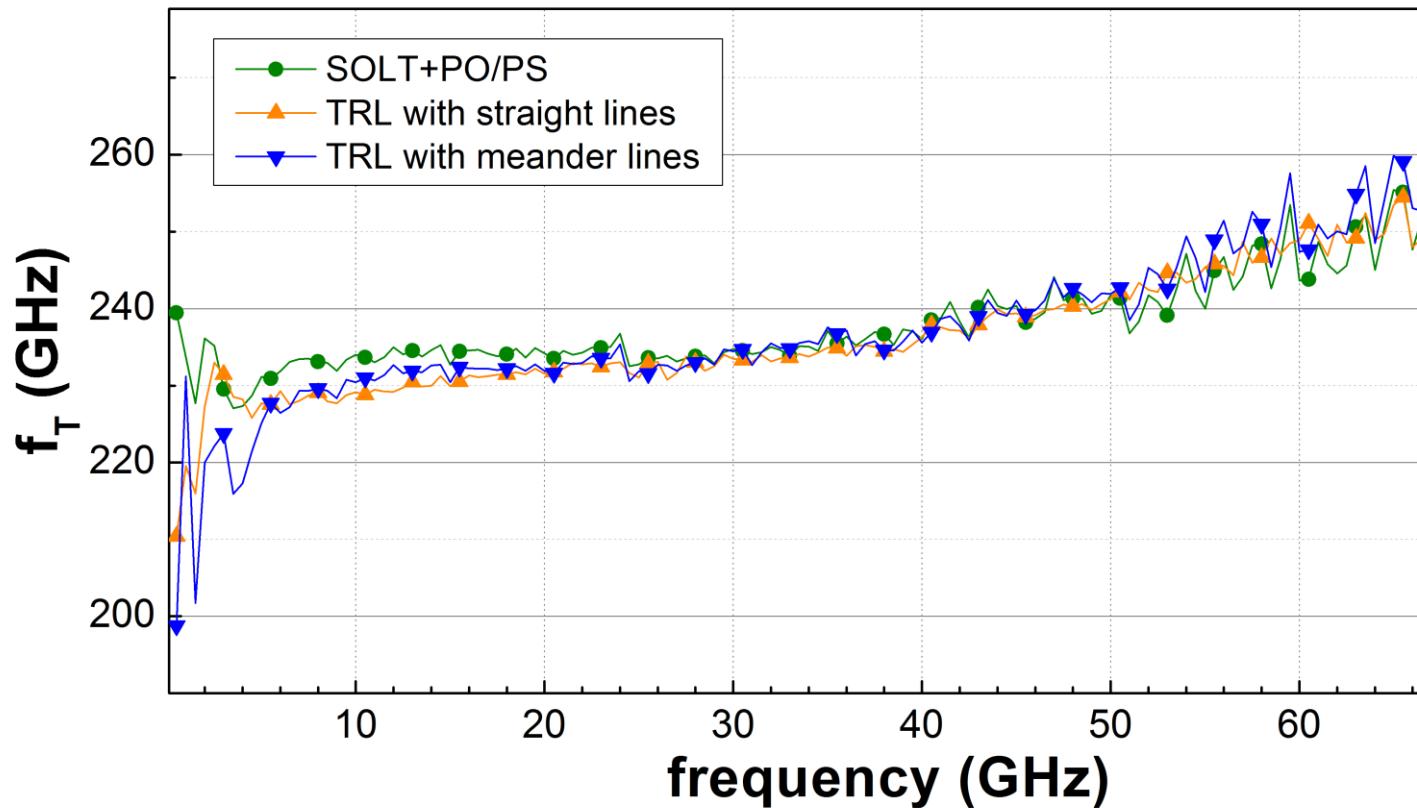

Experimentation 2/3

# Experimentation : setup and results

Results :  $f_T$

Experimentation 3/3

- ▶ The three methods give very close results.

# Contribution à la caractérisation de composants sub-terahertz

## Outline

I. Context

II. State of the Art of calibration and deembedding

III. Issues and proposed improvements

Meander Lines

3D-TRL

IV. Beyond 100GHz

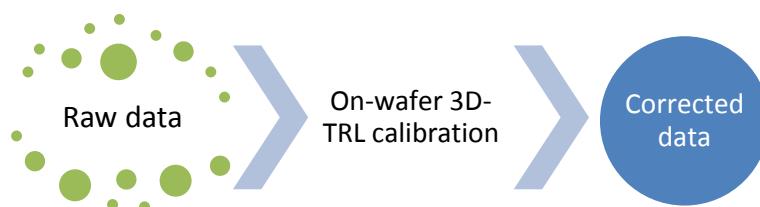

V. Conclusion

# Description of the new standards

## 3D-TRL method

## 3D-TRL method 1/3

- Based on “on-wafer” TRL calibration
- LINE and THRU standards are altered to take into account the metal stack

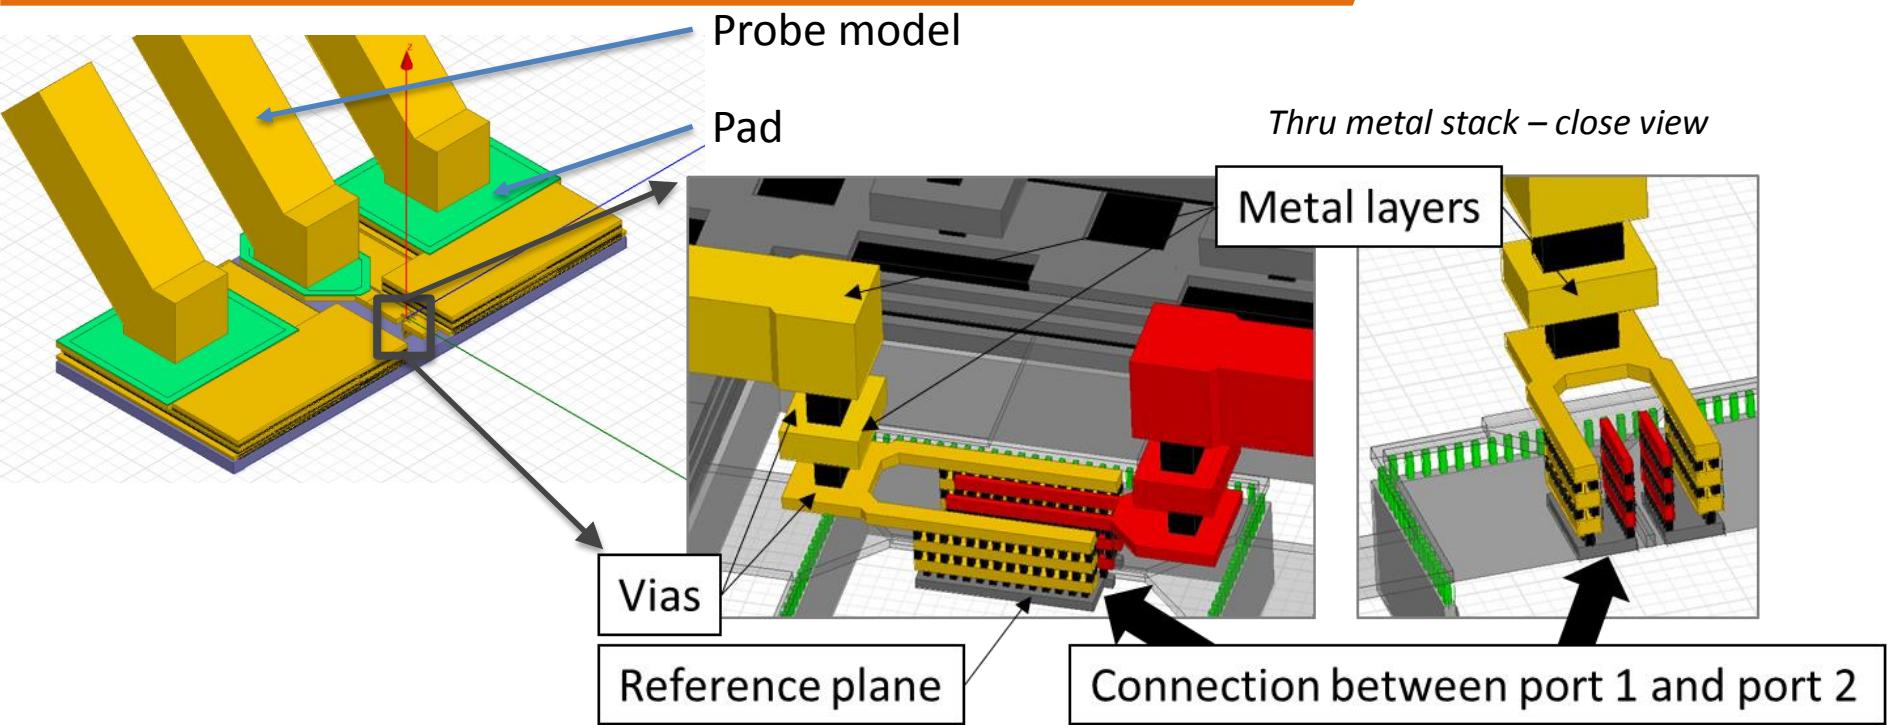

Reference plane defined at DUT  
access in **1 step**

# Description of the new standards

## THRU modification

## 3D-TRL method 2/3

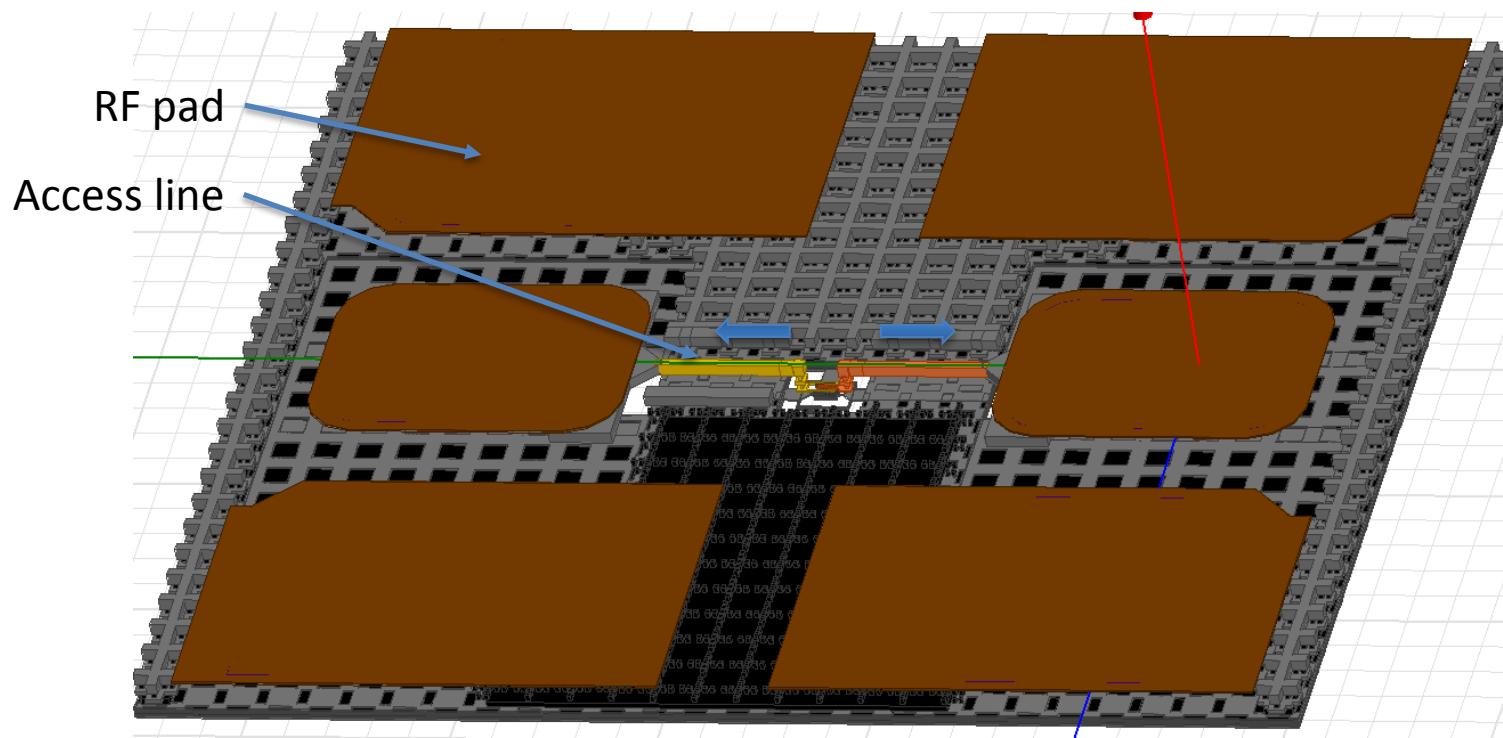

- Based on the component structure
  - Component is removed
  - Port 1 and port 2 are connected on bottom metal layer

# Description of the new standards

## LINE modification

3D-TRL method 3/3

- ▶ LINE standard is based on THRU standard
  - ▶ Access lines (red and yellow) are stretched along blue arrows

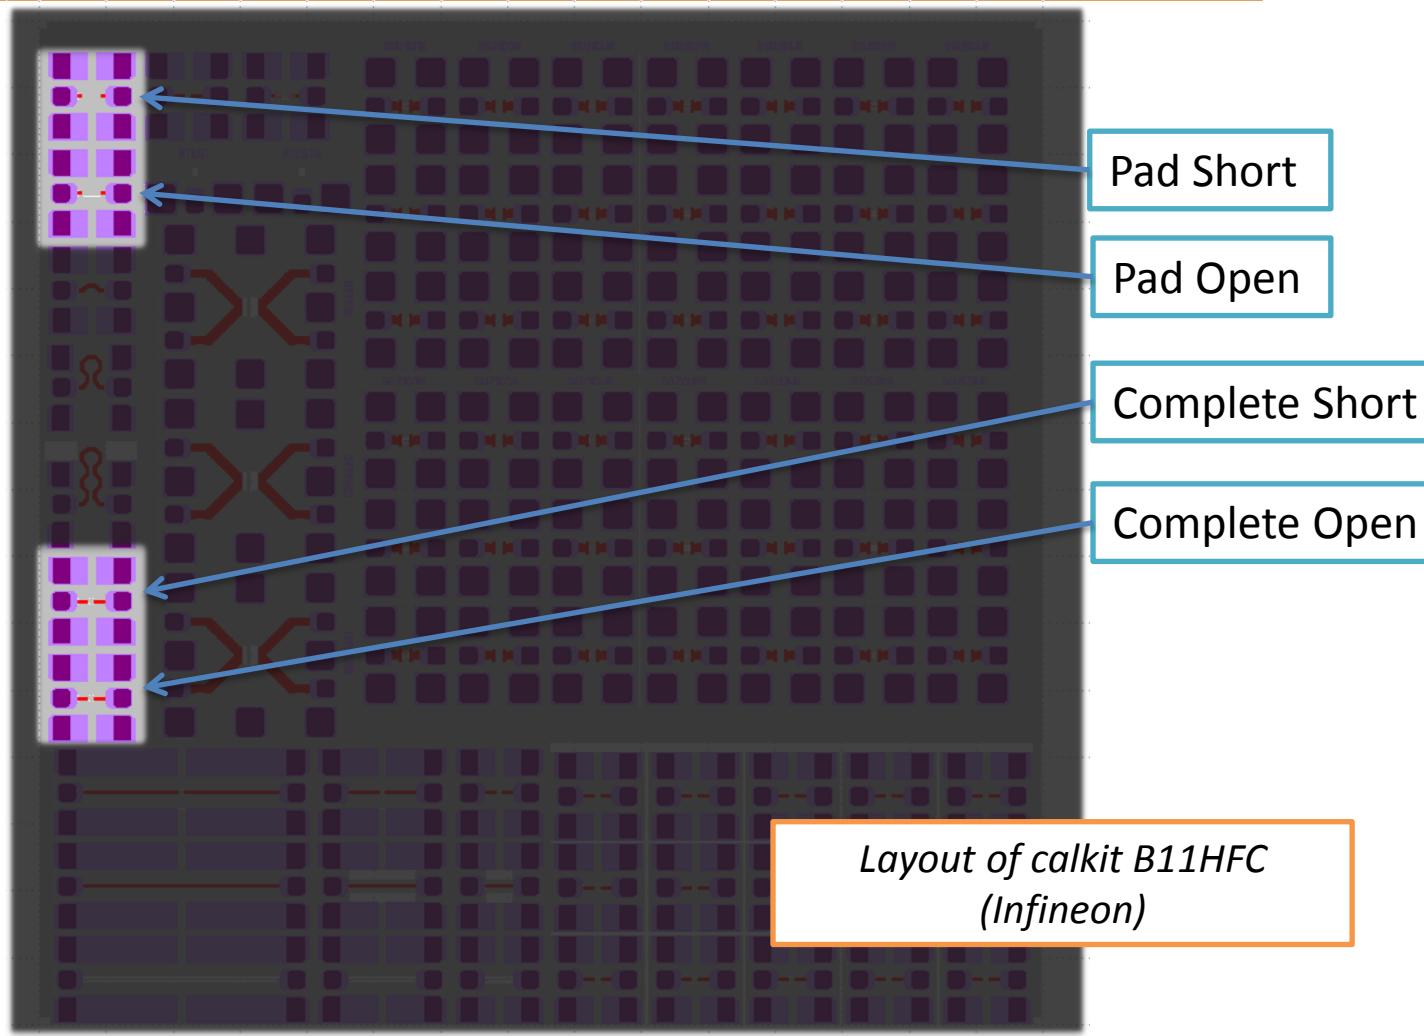

# Experimentation : setup and results

- Comparison between the three methods exposed
  - SOLT+PO/PS/CS/CO
  - TRL+CS/CO
  - 3D-TRL
  
- Measurement of a HBT from Infineon B11HFC (emitter window : 5x0.16μm)
  - Transit frequency  $f_T$

# Experimentation : setup and results

Structures used in the deembedding PO/PS/CS/CO

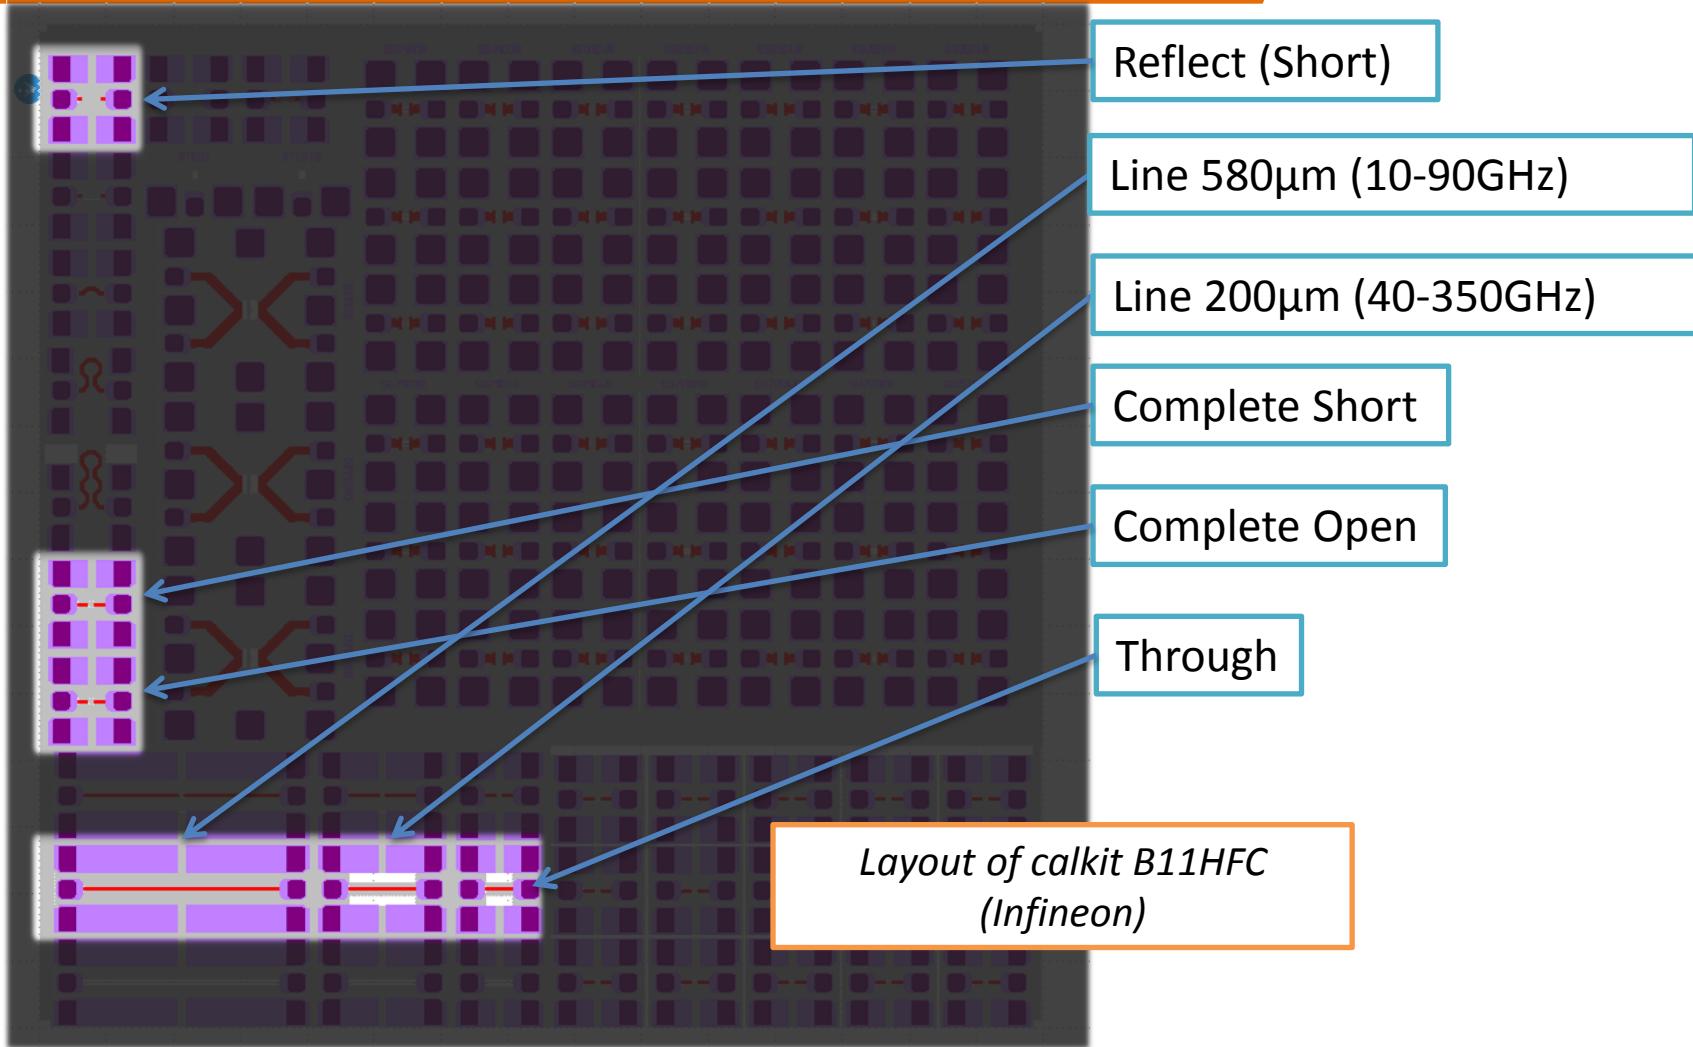

Experimentation 2/3

# Experimentation : setup and results

Structures used in on-wafer TRL and 2 steps deembedding

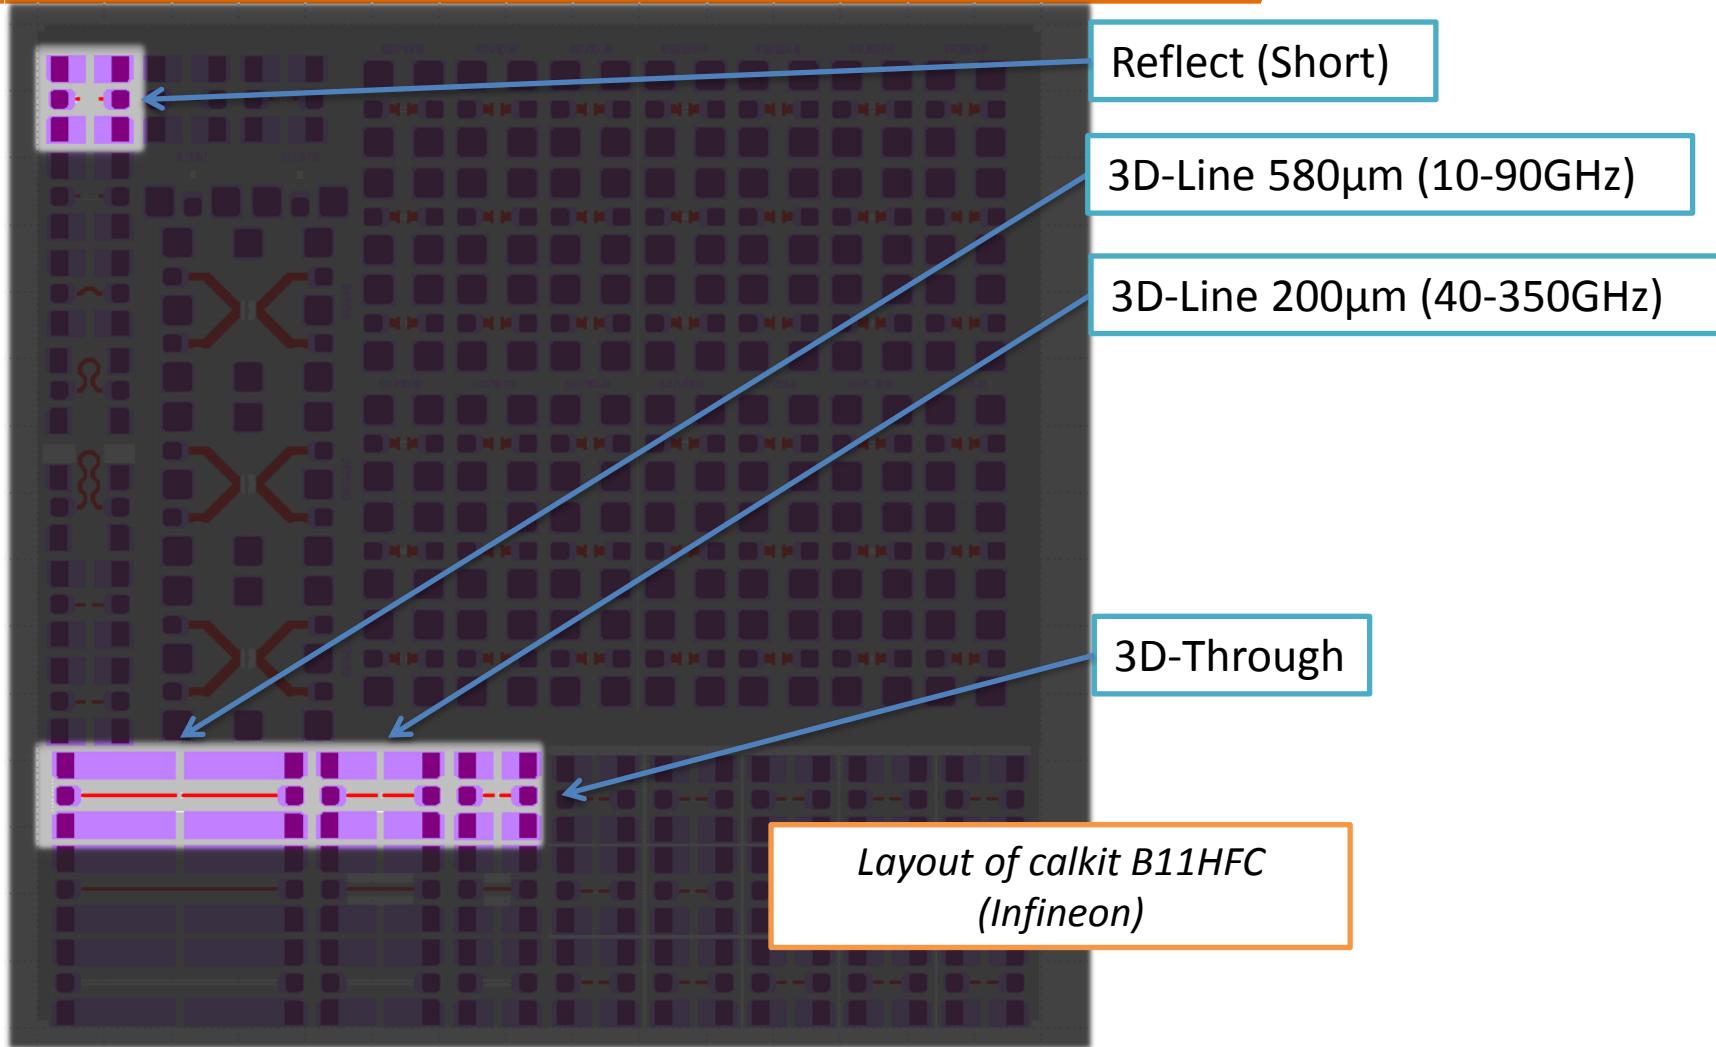

Experimentation 2/3

# Experimentation : setup and results

## Structures used in on-wafer 3D-TRL

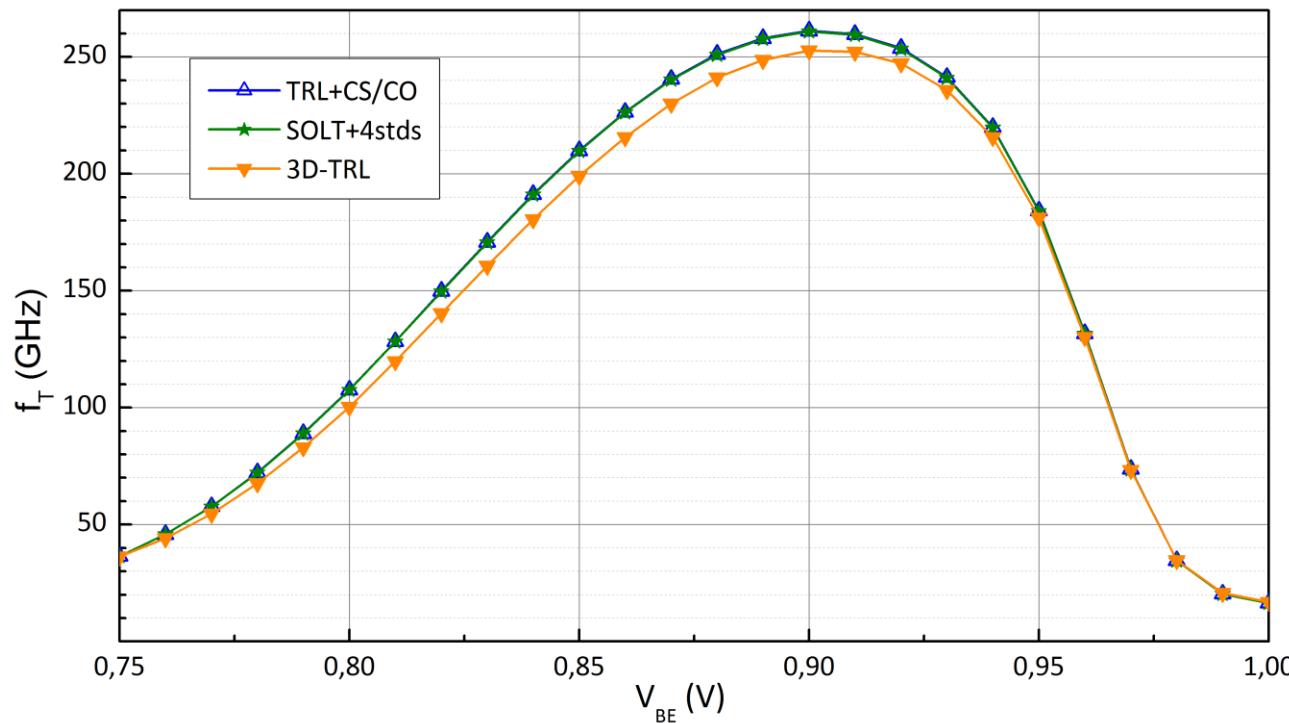

Experimentation 2/3

# Experimentation : setup and results

Results :  $f_T$

Experimentation 3/3

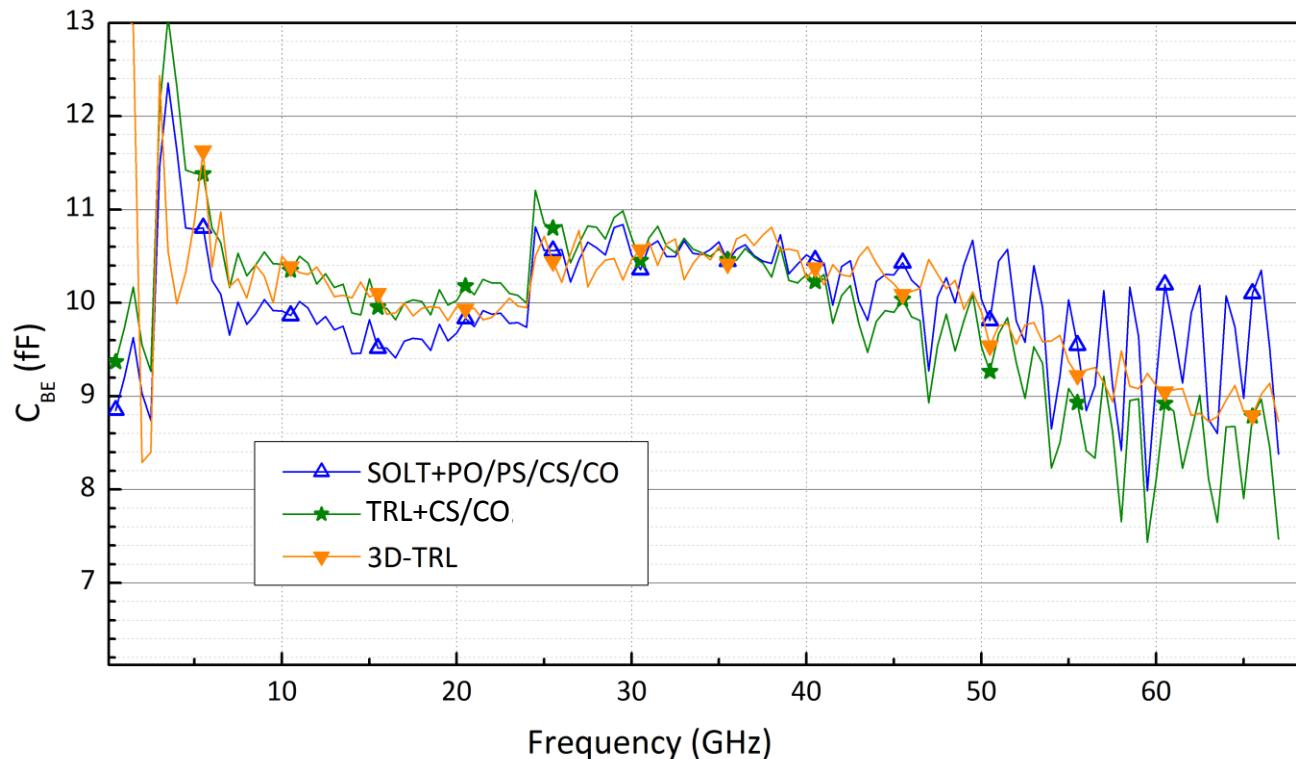

$f_T$  versus  $V_{BE}$   
( $f = 30\text{GHz}$ ;  $V_{BC} = 0\text{V}$ )

- ➊ PO/PS/CS/CO and TRL+CS/CO give same results
- ➋ 3D-TRL slightly lower
  - ➌ Remaining parasitic ?

# Experimentation : setup and results

Results :  $C_{BE}$

Experimentation 3/3

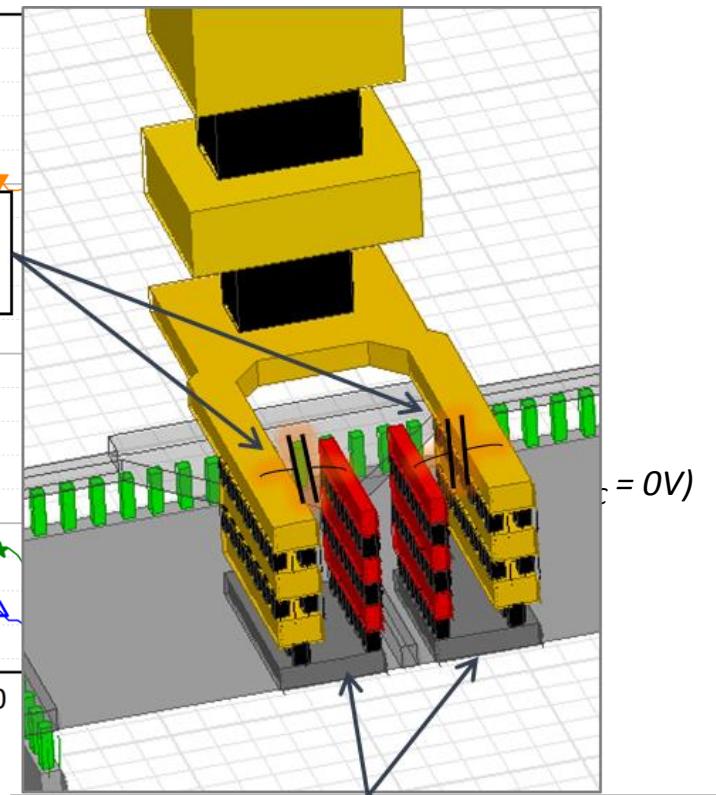

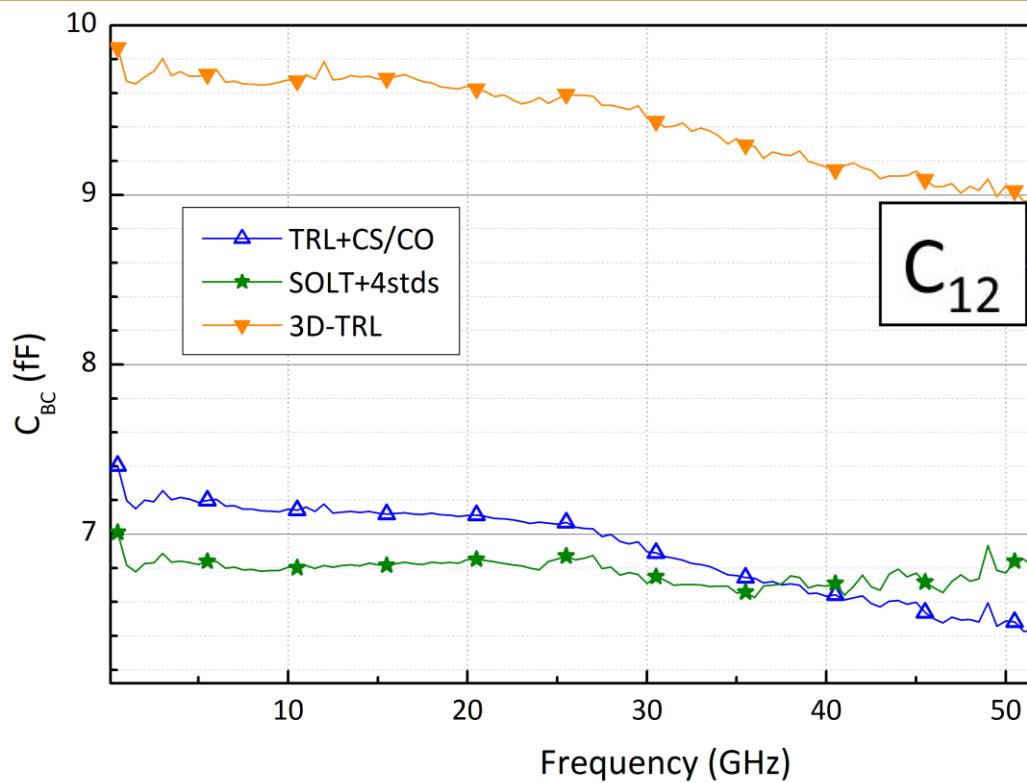

$C_{BE}$  versus  $F$   
( $V_{BE} = 0.5V$ ;  $V_{BC} = 0V$ )

- 3 methods gives same results
- 3D-TRL less noisy above 40GHz
  - less standards → less contact errors
- $C_{BE}$  value close to 10fF → above the 1fF limit

# Experimentation : setup and results

Results :  $C_{BC}$

Experimentation 3/3

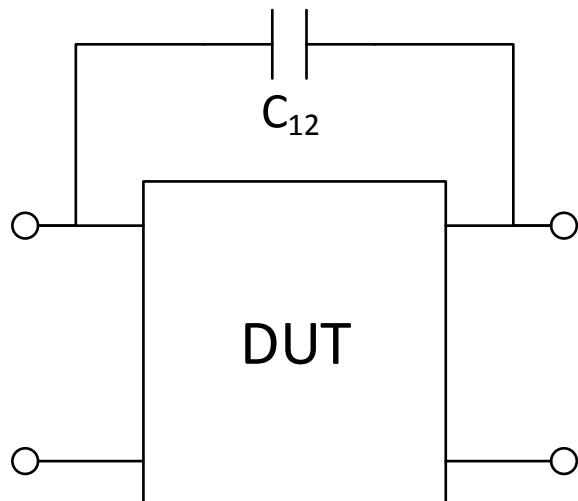

- PO/PS/CS/CO and TRL+CS/CO give similar results
- 3D-TRL higher by 2.6fF
  - Remaining error ( $C_{12}$ ) → deembedding needed

Short-circuit in M1

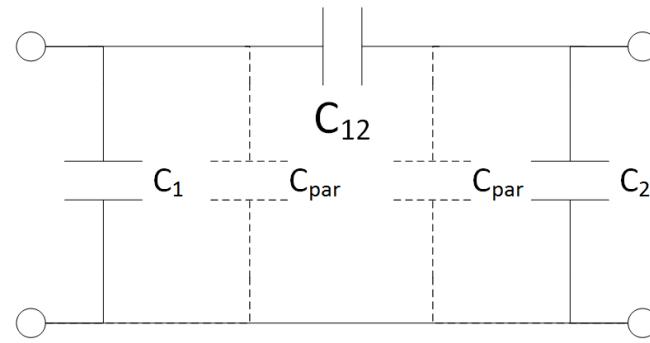

# Experimentation : setup and results

## Deembedding procedure : CO\*

CO\* deembedding 1/3

*Residual parasitic of the  
3D-TRL method*

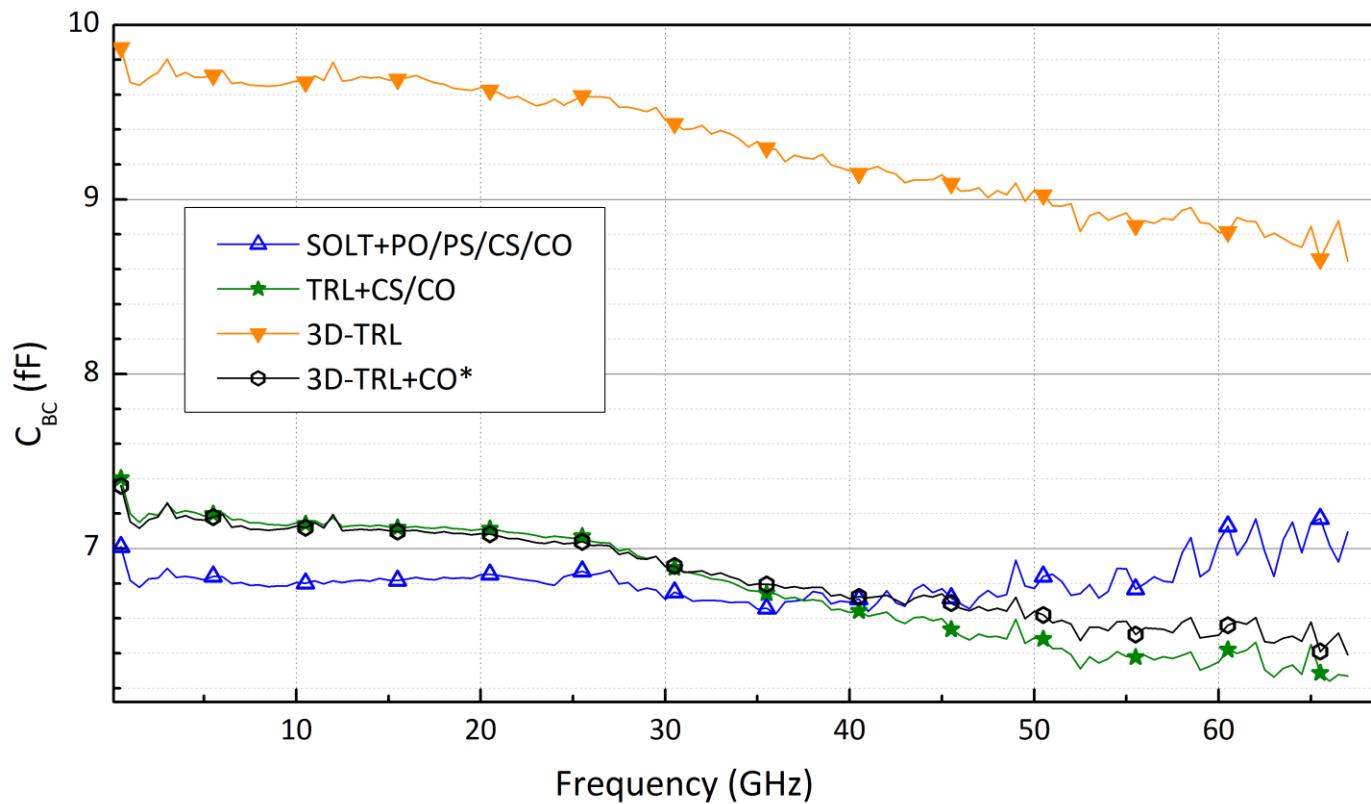

*Parasitic of the complete open*

- Emitter capacitance is correctly evaluated
  - The port admittance parasitics are removed
- Collector Capacitance is not correctly evaluated
  - Residual capacitance between the port
- Using CO,  $C_{12}$  is removed from the DUT

# Experimentation : setup and results

Results :  $C_{BC}$

CO\* deembedding 2/3

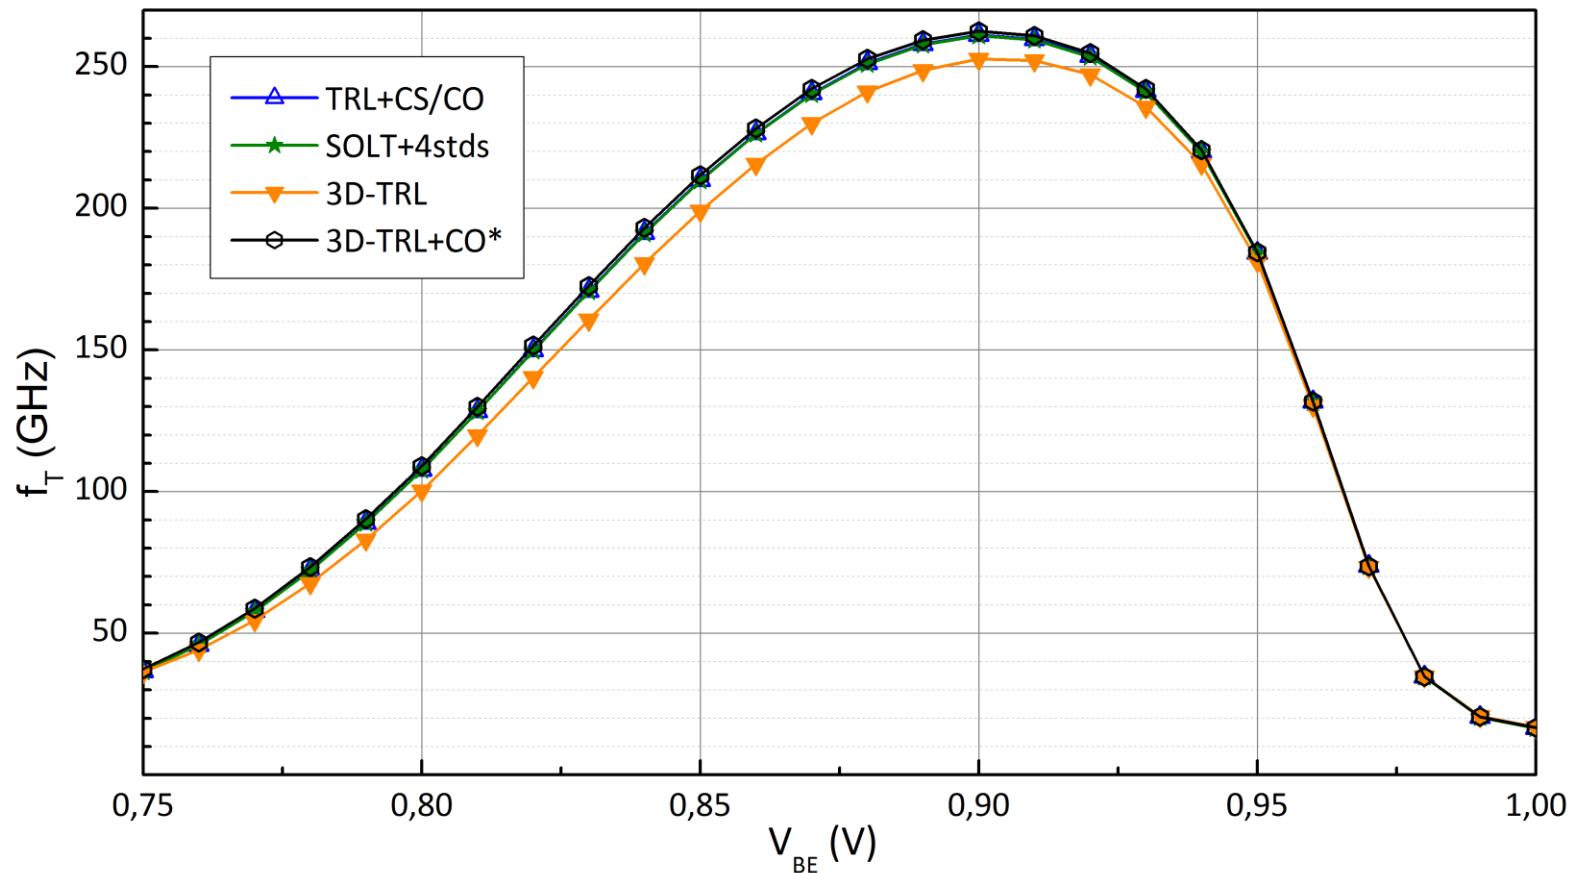

- With  $C_{12}$  removed, the three methods give similar results

# Experimentation : setup and results

Results :  $f_T$

CO\* deembedding 3/3

- Same results for the  $f_T$

# Contribution à la caractérisation de composants sub-terahertz

## Outline

I. Context

II. State of the Art of calibration and deembedding

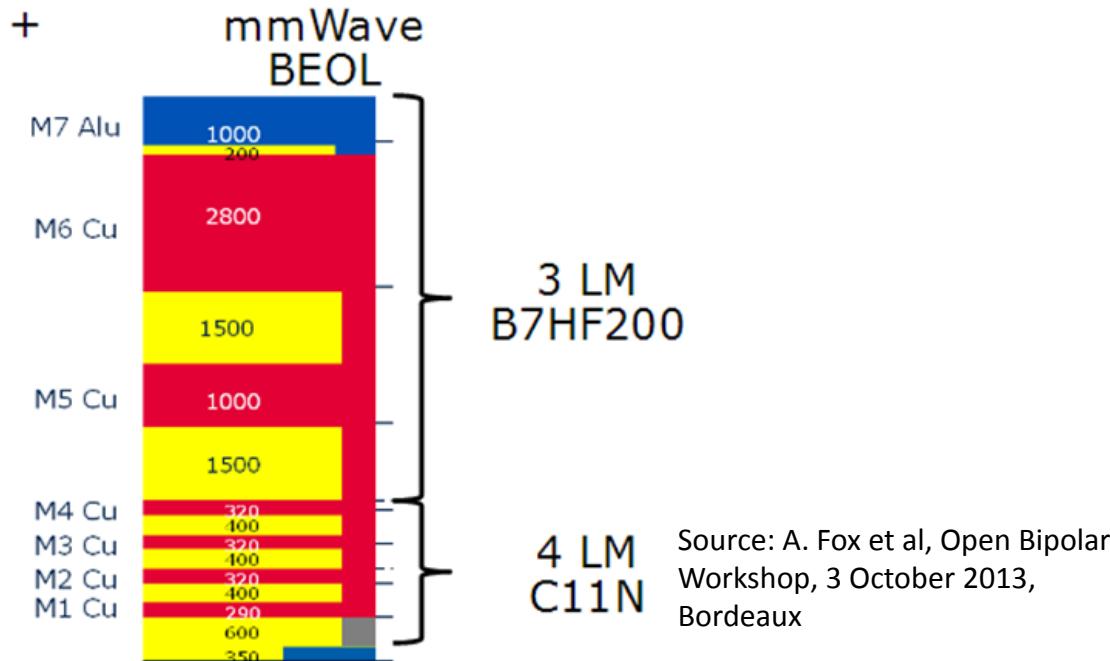

III. On-wafer calibration improvements

IV. Beyond 100GHz

V. Conclusion

# And what about beyond 100GHz ?

## Test-structures Back-End-Of-Line

Schematic view of the BEOL of INFINEON's B7HF200 process

What about Probe tip positioning?

# Beyond 100GHz: Measurements uncertainties

What about Probe coupling with underlying surface ?

# Beyond 100GHz: Measurements uncertainties

What about SOLT Calibration on ISS compared to on wafer TRL calibration?

# Contribution à la caractérisation de composants sub-terahertz

## Outline

I. Context

II. State of the Art of calibration and deembedding

III. On-wafer calibration improvements

IV. Beyond 100GHz

V. Conclusion

# Conclusion

- State of the Art of calibration and deembedding techniques
  - Presentation of both off-wafer and on-wafer techniques
  - Highlights of advantages and drawbacks of both of them
- Presentation of new meander lines structures
  - New structures give results close to the SoA
  - No manipulation required during calibration → easier calibration, automotive probe station
- Presentation of new 3D-TRL structures
  - New structures → less noisy results, less test structures are needed
  - More straightforward
- Measurement beyond 100GHz
  - Reliable measurements: to be benchmarked through EM-simulation
  - On-wafer TRL calibration: method of choice beyond 100GHz
  - Investigation of probe positioning and probe coupling

# Contribution à la caractérisation de composants sub-terahertz
