Submitted on 19 Dec 2019

HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

¹ Den-Service de la Corrosion et du Comportement des Matériaux dans leur Environnement (SCCME) – CEA, Université Paris-Saclay, F-91191, Gif-sur-Yvette, France

² Hall de Recherche de Pierrelatte (HRP) – Division Chimie et Enrichissement, F-26701, Pierrelatte, France

Context and goals

Iron corrosion in fluorinated atmosphere

- FeF₂ and FeF₃ as corrosion products
- improve the Fe-F thermodynamic description
- Fe-F database built using CALPHAD method

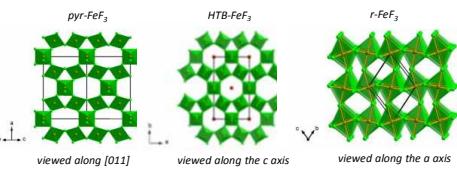

Lithium ion batteries

- FeF₃ as electrode, especially cathode material
- synthesis of nanostructured material => effect on ΔG_f° => nano-CALPHAD

Literature review

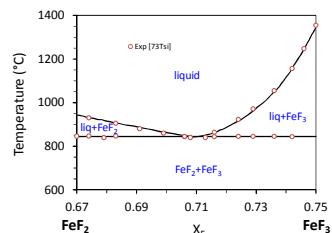

Crystal structure

Compound	Symmetry	Space group	Cell parameters
FeF ₂	tetragonal	P42/mnm	a=4.9696±0.002 Å [58Bau] c=3.1796 ± 0.003 Å
FeF ₃	cubic (pyrochlore)	Fd3m	a=10.325±0.002 Å [86Pap]
	hexagonal (HTB)	Cmcm	a=7.423±0.003 Å [83Leb] b=12.730±0.004 Å
	rhomboedric (ReO ₃)	R-3C	c=7.526±0.003 Å a=5.362±0.001 Å [92Leb] α=57.99±0.01 °

Phase diagram

- Only one experimental phase diagram determined by Differential Thermal Analysis between FeF₂ and FeF₃ [73Tsi]

- Discrepancies on the FeF₂ melting temperature (950 °C [73Tsi], 975 °C [89Joh] or 1100 °C [98Cha])
- No FeF₃ fusion: sublimation without melting

Thermodynamic properties

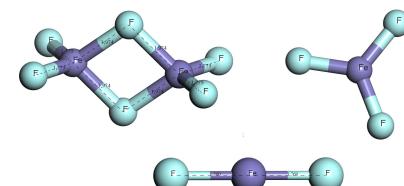

Solid Compounds	$\Delta H_{f,298\text{ K}}^\circ$ (kJ/mol)	Experimental method	Reference
FeF ₂	-710.12	Mass spectrometry (2 nd law)	[81Sch]
	-715.5±0.5	Mass spectrometry	[81Sch]
	-705.8±41.8	Mass spectrometry (3 rd law)	[28Jel]
FeF ₃	-989.6±2.2	Calorimetric bomb	[81Joh]
	-1037.6±4.5	F.e.m (3 rd law)	[81Sch]
	-1056	Mass spectrometry (3 rd law)	[28Jel]
Fe ₂ F ₆	-1043	Mass spectrometry (2 nd law)	[28Jel]
	-993	Mass spectrometry (2 nd law)	[37Dom]
	-990.8±2.1	Calorimetric bomb	[79Fer]

- Good agreement for $\Delta H_{f,298\text{ K}}^\circ$ (FeF₂, cr) and $\Delta G_{f,T}^\circ$ (FeF₂, cr)
- $\Delta H_{f,298\text{ K}}^\circ$ (FeF₃, cr) data scattered
- No thermodynamic properties for gaseous molecule Fe₂F₆ and only estimations for FeF₃

First principle calculations

- Calculations on gaseous molecules performed using Density Functional Theory implemented in DMol3 software
- Generalized gradient approximation for exchange and correlation energy (GGA)
- Spin of iron atoms taken into account

Molecules	$\Delta H_{f,298\text{ K}}^\circ$ (kJ/mol)	Reference
FeF ₂	-387.9 -389.5	This work [98Cha]
FeF ₃	-660.8 -820.9	This work [98Cha]
Fe ₂ F ₆	-1472.5	This work

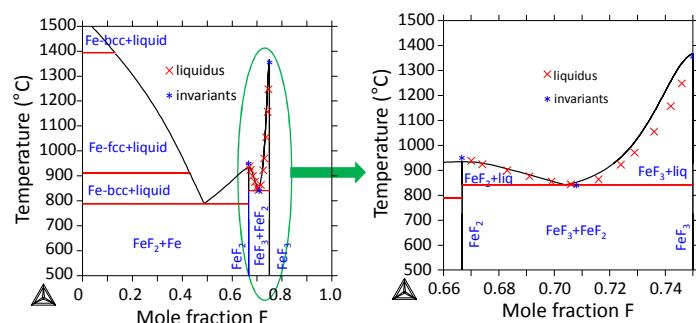

Optimisation (in progress)

Modeling

- At first, selected literature data from [73Tsi] for optimisation
- Liquid associated model : (Fe, FeF₂, FeF₃)
- Hypothetic pure liquid FeF₃ at high pressure
- Interaction parameters : $^0L(FeF_2, FeF_3)=514668-501xT$
 $^1L(FeF_2, FeF_3)=29253$

Results

- $\Delta H_{f,298\text{ K}}^\circ$ (FeF₂,cr)=-713 kJ/mol
- $\Delta H_{f,298\text{ K}}^\circ$ (FeF₃,cr)=-990 kJ/mol

Further work

- DTA experiments to check the phase diagram between FeF₂ and FeF₃ and between Fe and FeF₂
- FeF₂ fusion temperature measurement
- Optimisation of the Fe-F system taken into account the new experimental data
- Effect of the nanostructure of FeF₂ and FeF₃ on the phase diagram and thermodynamic properties
- Enlarge the study to Fe-O-F ternary system
