Cost function to minimize :

$$\mathcal{J}(\mathbf{m}) = \frac{1}{2} \|\mathbf{d}_{obs} - \mathcal{F}(\mathbf{m})\|^2$$

- ▶ $\mathcal{F}(m)$ is the restriction on the receivers of the simulated waves in the medium m . (With $m = c, \rho, \kappa \dots$)
- ▶ FWI iterates until $\mathcal{J}(m) \rightarrow 0$

Continuous Forward Model

First order acoustic wave equation

$$\begin{cases} \frac{1}{\rho c^2} \frac{\partial p}{\partial t} + \nabla \cdot v = f_p & \text{on } \Omega \\ \rho \frac{\partial v}{\partial t} + \nabla p = 0 & \text{on } \Omega \\ p = 0 & \text{on } \Gamma_1 \\ \frac{\partial p}{\partial t} + c \nabla p \cdot n = 0 & \text{on } \Gamma_2 \\ p(0) = 0, \quad v(0) = 0 \end{cases}$$

Domain with Absorbing Boundary Conditions

Discrete Forward Model

Space Discretization : Discontinuous Galerkin Elements

- ▶ Nodal (Lagrangian / Jacobian)
- ▶ Modal (Bernstein-Bézier)

Discrete Forward Model

Space Discretization :
Discontinuous Galerkin Elements

- ▶ Nodal (Lagrangian / Jacobian)
- ▶ Modal (Bernstein-Bézier)

Semi-discretized model :

$$\frac{\partial}{\partial t} \bar{\mathbf{U}}(t) = A \bar{\mathbf{U}}(t) + \bar{\mathbf{F}}(t)$$

with :

$$\bar{\mathbf{U}}(t) = \begin{pmatrix} \bar{\mathbf{P}}(t) \\ \bar{\mathbf{V}}(t) \end{pmatrix}$$

Discrete Forward Model

Space Discretization :
Discontinuous Galerkin Elements

- ▶ Nodal (Lagrangian / Jacobian)
- ▶ Modal (Bernstein-Bézier)

Time schemes :

- ▶ Runge Kutta 2/4
- ▶ Adams Bashforth 3

Semi-discretized model :

$$\frac{\partial}{\partial t} \bar{\mathbf{U}}(t) = A \bar{\mathbf{U}}(t) + \bar{\mathbf{F}}(t)$$

with :

$$\bar{\mathbf{U}}(t) = \begin{pmatrix} \bar{\mathbf{P}}(t) \\ \bar{\mathbf{V}}(t) \end{pmatrix}$$

Discrete Forward Model

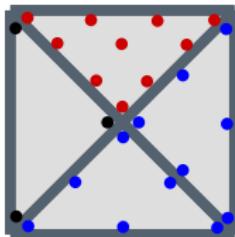

Discontinuous Galerkin Method

Assets of Discontinuous Galerkin Methods :

- ▶ Unstructured grid (enable to match the topography and medium irregularities)
- ▶ Robust to physical discontinuities
- ▶ hp-adaptivity
- ▶ Massively parallel performance properties

h-adaptivity

p-adaptivity with P1,
P2, P3 elements

Adjoint State Method

Lagrangian fonctional [1] :

$$\mathcal{L}(\hat{\mathbf{u}}, \hat{\boldsymbol{\lambda}}, \mathbf{m}) = \frac{1}{2} \|\mathbf{d}_{obs} - \mathcal{R}(\hat{\mathbf{u}})\|^2 + \langle Forward_{\mathbf{m}}(\hat{\mathbf{u}}) - f_p, \hat{\boldsymbol{\lambda}} \rangle$$

If $\hat{\mathbf{u}} = \mathbf{u}$ Solution of the Direct Problem $\iff (Forward_{\mathbf{m}}(\mathbf{u}) - f_p = 0)$:

$$\mathcal{J}(\mathbf{m}) = \mathcal{L}(\mathbf{u}, \hat{\boldsymbol{\lambda}}, \mathbf{m})$$

[1] Plessix R-E

A review of the adjoint-state method for computing the gradient of a functional with geophysical applications
Geophysical Journal International, Volume 167, Issue 2, 2006

Adjoint State Method

Lagrangian fonctional [1] :

$$\mathcal{L}(\hat{\mathbf{u}}, \hat{\boldsymbol{\lambda}}, \mathbf{m}) = \frac{1}{2} \|\mathbf{d}_{obs} - \mathcal{R}(\hat{\mathbf{u}})\|^2 + \langle Forward_{\mathbf{m}}(\hat{\mathbf{u}}) - f_p, \hat{\boldsymbol{\lambda}} \rangle$$

If $\hat{\mathbf{u}} = \mathbf{u}$ Solution of the Direct Problem $\iff (Forward_{\mathbf{m}}(\mathbf{u}) - f_p = 0)$:

$$\mathcal{J}(\mathbf{m}) = \mathcal{L}(\mathbf{u}, \hat{\boldsymbol{\lambda}}, \mathbf{m})$$

Let us choose $\hat{\boldsymbol{\lambda}} = \boldsymbol{\lambda}$ such as $\frac{\partial \mathcal{L}}{\partial \mathbf{u}} = 0$

$$(\mathcal{R}^* \mathbf{d}_{obs} - \mathbf{u}) + Forward_{\mathbf{m}}^*(\boldsymbol{\lambda}) = 0$$

[1] Plessix R-E

A review of the adjoint-state method for computing the gradient of a functional with geophysical applications
Geophysical Journal International, Volume 167, Issue 2, 2006

Adjoint State Method

Lagrangian functional [1] :

$$\mathcal{L}(\hat{\mathbf{u}}, \hat{\boldsymbol{\lambda}}, \mathbf{m}) = \frac{1}{2} \|\mathbf{d}_{obs} - \mathcal{R}(\hat{\mathbf{u}})\|^2 + \langle Forward_{\mathbf{m}}(\hat{\mathbf{u}}) - f_p, \hat{\boldsymbol{\lambda}} \rangle$$

If $\hat{\mathbf{u}} = \mathbf{u}$ Solution of the Direct Problem $\iff (Forward_{\mathbf{m}}(\mathbf{u}) - f_p = 0)$:

$$\mathcal{J}(\mathbf{m}) = \mathcal{L}(\mathbf{u}, \hat{\boldsymbol{\lambda}}, \mathbf{m})$$

Let us choose $\hat{\boldsymbol{\lambda}} = \boldsymbol{\lambda}$ such as $\frac{\partial \mathcal{L}}{\partial \mathbf{u}} = 0$

$$(\mathcal{R}^* \mathbf{d}_{obs} - \mathbf{u}) + Forward_{\mathbf{m}}^*(\boldsymbol{\lambda}) = 0$$

For $Forward_{\mathbf{m}}(\mathbf{u}) - f_p = 0$:

$$\partial_{\mathbf{m}_i} \mathcal{J}(\mathbf{m}) = \partial_{\mathbf{m}_i} \mathcal{L}(\mathbf{u}, \boldsymbol{\lambda}, \mathbf{m}) = \partial_{\mathbf{m}_i} \langle Forward_{\mathbf{m}}(\mathbf{u}), \boldsymbol{\lambda} \rangle$$

AtD : Adjoint then Discretized Strategy

$$\mathcal{J}(\boldsymbol{p}) = \frac{1}{2} \|\boldsymbol{d}_{obs} - R\boldsymbol{p}\|^2$$

$$\begin{cases} \frac{1}{\rho \mathbf{c}^2} \frac{\partial \boldsymbol{p}}{\partial t} + \nabla \cdot \boldsymbol{v} = f_p & \text{on } \Omega \\ \rho \frac{\partial \boldsymbol{v}}{\partial t} + \nabla \cdot \boldsymbol{p} = 0 & \text{on } \Omega \\ \boldsymbol{p} = 0 & \text{on } \Gamma_1 \\ \frac{\partial \boldsymbol{p}}{\partial t} + \mathbf{c} \nabla \boldsymbol{p} \cdot \mathbf{n} = 0 & \text{on } \Gamma_2 \\ \boldsymbol{p}(0) = 0, \quad \boldsymbol{v}(0) = 0 \end{cases}$$

$$t \in [0, T]$$

$$\begin{cases} \frac{1}{\rho \mathbf{c}^2} \frac{\partial \boldsymbol{\lambda}_1}{\partial t} + \nabla \cdot \boldsymbol{\lambda}_2 = \frac{\partial \mathcal{J}}{\partial \boldsymbol{p}} & \text{on } \Omega \\ \rho \frac{\partial \boldsymbol{\lambda}_2}{\partial t} + \nabla \cdot \boldsymbol{\lambda}_1 = 0 & \text{on } \Omega \\ \boldsymbol{\lambda}_1 = 0 & \text{on } \Gamma_1 \\ \frac{\partial \boldsymbol{\lambda}_1}{\partial t} - \mathbf{c} \nabla \boldsymbol{\lambda}_1 \cdot \mathbf{n} = 0 & \text{on } \Gamma_2 \\ \boldsymbol{\lambda}_1(T) = 0, \quad \boldsymbol{\lambda}_2(T) = 0 \end{cases}$$

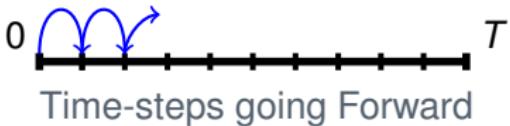

$$t \in [T, 0]$$

AtD : Adjoint then Discretized Strategy

$$\mathcal{J}(\boldsymbol{p}) = \frac{1}{2} \|\boldsymbol{d}_{obs} - R\boldsymbol{p}\|^2$$

$$\left\{ \begin{array}{l} \frac{\partial \bar{\boldsymbol{U}}^n}{\partial t} = A\bar{\boldsymbol{U}}^n + \bar{\boldsymbol{F}}^n \\ \text{With : } \bar{\boldsymbol{U}}^n = \begin{pmatrix} \bar{\boldsymbol{P}}^n \\ \bar{\boldsymbol{V}}^n \end{pmatrix} \end{array} \right.$$

$$\left\{ \begin{array}{l} \frac{\partial \bar{\boldsymbol{\Lambda}}^n}{\partial t} = A\bar{\boldsymbol{\Lambda}}^n + R^*(R\bar{\boldsymbol{U}}^n - \boldsymbol{d}_{obs}) \\ \text{With : } \bar{\boldsymbol{\Lambda}}^n = \begin{pmatrix} \bar{\boldsymbol{\Lambda}}_1^n \\ \bar{\boldsymbol{\Lambda}}_2^n \end{pmatrix} \end{array} \right.$$

DtA : Discretize then Adjoint Strategy

Example With RK4

All time scheme can be summed-up such as :

$$L\bar{U} = E\bar{F}$$

RK4 time-scheme leads to :

$$\bar{U}^{n+1} = B\bar{U}^n + C_0\bar{F}^n + C_{\frac{1}{2}}\bar{F}^{n+\frac{1}{2}} + C_1\bar{F}^{n+1}$$

$$L\bar{U} = E\bar{F} = \bar{G}$$

$$\begin{pmatrix} I & & & \\ -B & I & & \\ & -B & I & \\ & & \ddots & \ddots & \\ & & & -B & I \end{pmatrix} \begin{pmatrix} \bar{U}^0 \\ \bar{U}^1 \\ \bar{U}^2 \\ \vdots \\ \bar{U}^n \end{pmatrix} = \begin{pmatrix} \bar{G}^0 \\ \bar{G}^1 \\ \bar{G}^2 \\ \vdots \\ \bar{G}^n \end{pmatrix}$$

DtA : Discretize then Adjoint Strategy

13

All time scheme can be summed-up such as :

$$\mathcal{L}\bar{\mathbf{U}} = \mathcal{E}\bar{\mathbf{F}}$$

We are looking for a Discrete Adjoint state satisfying :

$$\mathcal{L}^*\bar{\Lambda} = -R^*(\mathcal{d}_{obs} - R\bar{\mathbf{U}})$$

With the adjoint operator \mathcal{L}^* satisfying :

$$<\mathcal{L}\bar{\mathbf{U}}, \bar{\Lambda}> = <\bar{\mathbf{U}}, \mathcal{L}^*\bar{\Lambda}>$$

DtA : Discretize then Adjoint Strategy

13

All time scheme can be summed-up such as :

$$\mathcal{L}\bar{\mathbf{U}} = \mathcal{E}\bar{\mathbf{F}} = \bar{\mathbf{G}}$$

We are looking for a Discrete Adjoint state satisfying :

$$\mathcal{L}^*\bar{\Lambda} = -R^*(\mathcal{d}_{obs} - R\bar{\mathbf{U}}) = \bar{\mathbf{D}}$$

With the adjoint operator \mathcal{L}^* satisfying :

$$<\mathcal{L}\bar{\mathbf{U}}, \bar{\Lambda}> = <\bar{\mathbf{U}}, \mathcal{L}^*\bar{\Lambda}>$$

$$<\bar{\mathbf{G}}, \bar{\Lambda}> = <\bar{\mathbf{U}}, \bar{\mathbf{D}}> \quad (\text{Adjoint Test})$$

Adjoint test succeeds \iff operator \mathcal{L}^* well established

DtA : Discretize then Adjoint Strategy

Example with RK4

RK4 time-scheme leads to :

$$\bar{\mathbf{U}}^{n+1} = B\bar{\mathbf{U}}^n + \mathbf{C}_0\bar{\mathbf{F}}^n + \mathbf{C}_{\frac{1}{2}}\bar{\mathbf{F}}^{n+\frac{1}{2}} + \mathbf{C}_1\bar{\mathbf{F}}^{n+1}$$

$$L\bar{\mathbf{U}} = E\bar{\mathbf{F}} = \bar{\mathbf{G}}$$

$$\begin{pmatrix} I & & & \\ -B & I & & \\ & -B & I & \\ & & \ddots & \ddots & \\ & & & -B & I \end{pmatrix} \begin{pmatrix} \bar{\mathbf{U}}^0 \\ \bar{\mathbf{U}}^1 \\ \bar{\mathbf{U}}^2 \\ \vdots \\ \bar{\mathbf{U}}^n \end{pmatrix} = \begin{pmatrix} \bar{\mathbf{G}}^0 \\ \bar{\mathbf{G}}^1 \\ \bar{\mathbf{G}}^2 \\ \vdots \\ \bar{\mathbf{G}}^n \end{pmatrix}$$

So :

$$\mathbf{L}^* = \begin{pmatrix} I & -B^* & & & \\ & I & -B^* & & \\ & & \ddots & \ddots & \\ & & & I & -B^* \\ & & & & I \end{pmatrix}$$

Adjoint Strategies Comparison

Adjoint Then Discretize

- + Physical approach
- + Same discrete operators for Forward and Backward
- Approximate gradient [1]
 - Consistent with the discretization

Discretize then Adjoint

- + Numerical approach
- + Has an Adjoint Test
- Tremendous work to develop the adjoint operators
- Non-consistency of the adjoint state [2]
