#### Abstract

Garay-Avendaño & Zamboni-Rached (2014) proposed a method to obtain time-harmonic axisymmetric free Maxwell fields in explicit form, by starting from a solution of the scalar wave equation. The method has two variants, depending on whether or not the EM field, thus derived from a scalar wave, is transformed by EM duality. We show that this method (with its two variants) allows one to obtain all time-harmonic axisymmetric free Maxwell fields, and hence, by summation on frequencies, all axisymmetric free Maxwell fields.

**Keywords:** Maxwell equations; axial symmetry; exact solutions; electromagnetic duality.

#### 1 Introduction

Axially symmetric solutions of the Maxwell equations occur frequently, at least as a relevant approximation. For instance, they are used to model EM beams and their propagation (e.g. [1, 2]). In particular, non-diffracting beams are usually endowed with this symmetry, see e.g. Refs. [3, 4, 5]. Moreover, one often considers time-harmonic solutions, since a general time dependence is got by summing such solutions. Two classes of time-harmonic axisymmetric solutions of the free Maxwell equations, mutually associated by EM duality, have been introduced recently [6]. The main aim was to

"describe in exact and analytic form the propagation of nonparaxial scalar and electromagnetic beams." However, as noted by the authors of Ref. [6], the analytical expression for a time-harmonic axisymmetric solution  $\Psi$  of the scalar wave equation, from which they start [Eq. (1) below], covers all such solutions [5] — thus not merely ones corresponding to nonparaxial scalar beams. The first class of EM fields created by the method of Ref. [6] is obtained by associating with any such scalar solution  $\Psi$  a vector potential  $\mathbf{A}$  by Eq. (9) below, and the second class is deduced from the first one by EM duality [6].

The aim of the present work is to show that, perhaps surprisingly, this method turns out to be general enough so as to describe all time-harmonic axisymmetric EM fields. More precisely, we shall prove that any time-harmonic axisymmetric EM field is the sum of two EM fields, say  $(\mathbf{E}_1, \mathbf{B}_1)$  and  $(\mathbf{E}_2', \mathbf{B}_2')$ , deduced from two time-harmonic axisymmetric solutions of the scalar wave equation, say  $\Psi_1$  and  $\Psi_2$ : the first EM field derives from the vector potential  $\mathbf{A}_1 = \Psi_1 \mathbf{e}_z$ , the second one is deduced by EM duality from the EM field that derives from the vector potential  $\mathbf{A}_2 = \Psi_2 \mathbf{e}_z$ . Because this method is based on determining two vector potentials from merely two scalar fields, this result was not necessarily expected. Section 2 presents and comments the method proposed in Ref. [6] (although Eqs. (14)–(16) are new). Section 3 presents the proof of the announced result.

#### 2 From scalar waves to Maxwell fields

#### 2.1 Axially symmetric scalar waves

We adopt cylindrical coordinates  $\rho$ ,  $\phi$ , z about the symmetry axis, that is the z axis. Any time-harmonic axisymmetric solution of the scalar wave equation (of d'Alembert) can be written in the form [6, 5]:

$$\Psi_{\omega S}(t, \rho, z) = e^{-i\omega t} \int_{-K}^{+K} J_0\left(\rho\sqrt{K^2 - k^2}\right) e^{ikz} S(k) dk,$$
 (1)

with  $\omega$  the angular frequency,  $K := \omega/c$ , <sup>1</sup> and  $J_0$  the first-kind Bessel function of order 0. (c is the velocity of light.) Thus the (axial) "wave

<sup>&</sup>lt;sup>1</sup> Beware that instead  $K := 2\omega/c$  in Ref. [6]. Our notation seems as natural and gives more condensed formulas.

vector spectrum" S is a (generally complex) function of the real variable  $k=k_z$  ( $-K \leq k \leq K$ ), that is the projection of the wave vector on the z axis. This function S determines the spatial dependency of the time-harmonic solution (1) in the two-dimensional space left by the axial symmetry, i.e. the half-plane ( $\rho \geq 0, z \in ]-\infty, +\infty[$ ).

Thus, any time-harmonic axisymmetric scalar wave  $\Psi$  can be put in the explicit form (1), in which no restriction has to be put on the "wave vector spectrum" S (except for a minimal regularity ensuring that the function  $\Psi$  is at least twice continuously differentiable: the integrability of S,  $S \in L^1([-K, +K])$ , would be enough for this). Note that, of course, the general axisymmetric solution of the scalar wave equation can be got from (1) by an appropriate summation over a frequency spectrum: an integral (inverse Fourier transform) in the general case, or a discrete sum if a discrete frequency spectrum is considered for simplicity.

#### 2.2 Reminder on time-harmonic free Maxwell fields

In this subsection, we recall equations more briefly recalled in Ref. [6], some of which are not easy to see in that form in the literature. The electric and magnetic fields in SI units are given in terms of the scalar and (3-)vector potentials V and  $\mathbf{A}$  by

$$\mathbf{E} = -\nabla V - \frac{\partial \mathbf{A}}{\partial t},\tag{2}$$

$$\mathbf{B} = \text{rot}\mathbf{A}.\tag{3}$$

These equations imply that  $\mathbf{E}$  and  $\mathbf{B}$  obey the first group of Maxwell equations. If one imposes the Lorenz gauge condition

$$\frac{1}{c^2} \frac{\partial V}{\partial t} + \operatorname{div} \mathbf{A} = 0, \tag{4}$$

then the validity of the second group of the Maxwell equations in free space for  $\mathbf{E}$  and  $\mathbf{B}$  is equivalent to ask that V and  $\mathbf{A}$  verify d'Alembert's wave equation (this is easier to see in the 4-D writing [7], §46). Moreover, if one assumes a harmonic time-dependence for V and  $\mathbf{A}$ :

$$V(t, \mathbf{x}) = e^{-i\omega t} \hat{V}(\mathbf{x}), \qquad \mathbf{A}(t, \mathbf{x}) = e^{-i\omega t} \hat{\mathbf{A}}(\mathbf{x}),$$
 (5)

then the wave equation for A becomes the Helmholtz equation:  $^2$ 

$$\Delta \mathbf{A} + \frac{\omega^2}{c^2} \mathbf{A} = \mathbf{0},\tag{6}$$

and the Lorenz gauge condition (4) rewrites as

$$V = -i\frac{c^2}{\omega} \text{div} \mathbf{A}. \tag{7}$$

If **A** is time-harmonic [Eq.  $(5)_2$ ] and obeys (6), then V given by (7) is time-harmonic and automatically satisfies the wave equation. The electric field (2) is then easily rewritten as

$$\mathbf{E} = i \,\omega \mathbf{A} + i \,\frac{c^2}{\omega} \nabla \left( \text{div} \mathbf{A} \right). \tag{8}$$

Thus, the data of a time-harmonic vector potential  $\mathbf{A}$  obeying the wave equation, or equivalently obeying Eq. (6), determines a unique solution of the free Maxwell equations, by Eqs. (3) and (8), and that solution is time-harmonic with the same frequency  $\omega$  as for  $\mathbf{A}$ .

### 2.3 Time-harmonic axisymmetric fields: from a scalar wave to a Maxwell field

To any axisymmetric time-harmonic solution  $\Psi(t,\rho,z)=e^{-\mathrm{i}\omega t}\hat{\Psi}(\rho,z)$  of the scalar wave equation, the authors of Ref. [6] associate a vector potential  $\mathbf{A}$  by

$$\mathbf{A} := \Psi \mathbf{e}_z, \quad \text{or} \quad A_z := \Psi, \ A_\rho = A_\phi = 0. \tag{9}$$

(We shall denote by  $(\mathbf{e}_{\rho}, \mathbf{e}_{\phi}, \mathbf{e}_z)$  the standard point-dependent orthonormal basis associated with the cylindrical coordinates.) Thus, in the way recalled in the foregoing subsection, they define a unique solution of the free Maxwell equations, which is time-harmonic. Their equations for the different compo-

<sup>&</sup>lt;sup>2</sup> Of course, just the same equation (6) applies to the "amplitude field"  $\hat{\mathbf{A}}$ .

nents of this solution  $(\mathbf{E}, \mathbf{B})$  are as follows:

$$B_{\phi} = -\frac{\partial A_z}{\partial \rho}, \qquad E_{\phi} = 0, \tag{10}$$

$$E_{\rho} = i \frac{c^2}{\omega} \frac{\partial^2 A_z}{\partial \rho \partial z}, \qquad B_{\rho} = 0,$$
 (11)

$$E_z = i\frac{c^2}{\omega}\frac{\partial^2 A_z}{\partial z^2} + i\omega A_z, \qquad B_z = 0.$$
 (12)

These equations follow easily from Eqs. (3), (8) and (9), and from the axisymmetry of  $A_z = \Psi(t, \rho, z)$ , by using the standard formulas for the curl and divergence in cylindrical coordinates. Equations (10)–(12) provide an axisymmetric EM field whose electric field is radially polarized ( $\mathbf{E} = E_{\rho}\mathbf{e}_{\rho} + E_{z}\mathbf{e}_{z}$ ), in short a "radially polarized" EM field.

An "azimuthally polarized" solution  $(\mathbf{E}', \mathbf{B}')$  (in the sense that  $\mathbf{E}' = E'_{\phi} \mathbf{e}_{\phi}$ ) of the free Maxwell equations can alternatively be deduced from the data  $\Psi$ , by transforming the solution (10)–(12) through the EM duality, that is:

$$\mathbf{E}' = c\mathbf{B}, \quad \mathbf{B}' = -\mathbf{E}/c. \tag{13}$$

The two axisymmetric time-harmonic solutions of the free Maxwell equations, thus associated with an axisymmetric time-harmonic solution  $\Psi$  of the scalar wave equation, will be called here the "GAZR1 solution" and the "GAZR2 solution", respectively, because both were derived in Ref. [6].

As usual, it is implicit that, in Eqs. (10)–(12),  $B_{\phi}$ ,  $E_{\rho}$  and  $E_z$  are actually the real parts of the respective r.h.s. [as are also **E** and **B** in Eqs. (2), (3), and (8)]. Thus, with  $A_z$  given by (1) (as can always be the case in view of the general representativity of that equation), and using the fact that  $dJ_0/dx = -J_1(x)$ , we obtain:

$$B_{\phi\omega S} = \mathcal{R}e \left[ e^{-i\omega t} \int_{-K}^{+K} \sqrt{K^2 - k^2} J_1 \left( \rho \sqrt{K^2 - k^2} \right) S(k) e^{ikz} dk \right], \quad (14)$$

$$E_{\rho\omega S} = \mathcal{R}e \left[ -i\frac{c^2}{\omega} e^{-i\omega t} \int_{-K}^{+K} \sqrt{K^2 - k^2} J_1 \left( \rho \sqrt{K^2 - k^2} \right) ik S(k) e^{ikz} dk \right], \tag{15}$$

$$E_{z\omega S} = \mathcal{R}e \left[ ie^{-i\omega t} \int_{-K}^{+K} J_0 \left( \rho \sqrt{K^2 - k^2} \right) \left( \omega - \frac{c^2}{\omega} k^2 \right) S(k) e^{ikz} dk \right], \quad (16)$$
where  $K := \omega/c$ .

#### 3 From Maxwell fields to scalar waves

Now an important question arises: Do the GAZR solutions generate all axisymmetric time-harmonic solutions of the Maxwell equations (in which case, by summation on frequencies, they would generate all axisymmetric solutions of the Maxwell equations)? That is:  $let(\mathbf{A}, \mathbf{E}, \mathbf{B})$  be any time-harmonic axisymmetric solution of the free Maxwell equations. Can one find a GAZR1 solution and a GAZR2 solution, whose sum give just that starting solution?

Note from Eqs. (10)–(12) and (13) that the GAZR1 solution and the GAZR2 solution are complementary: in cylindrical coordinates, the GAZR1 solution provides non-zero components  $B_{\phi}$ ,  $E_{\rho}$ ,  $E_{z}$ , the other components  $E_{\phi}$ ,  $B_{\rho}$ ,  $B_{z}$  being zero — and the exact opposite is true for the GAZR2 solution. In view of this complementarity, we can consider separately the two sets of components:  $B_{\phi}$ ,  $E_{\rho}$ ,  $E_{z}$  on one side, and  $E_{\phi}$ ,  $B_{\rho}$ ,  $B_{z}$  on the other side.

## 3.1 Sufficient conditions for the existence of the decomposition

For the "GAZR1" solution, which gives non-zero values to the first among the two sets of components just mentioned, we have the following result:

**Proposition 1.** Let  $(\mathbf{A}, \mathbf{E}, \mathbf{B})$  be any time-harmonic axisymmetric solution of the free Maxwell equations. In order that a time-harmonic axisymmetric solution  $(A_{1z}, B_{1\phi}, E_{1\rho}, E_{1z}; E_{1\phi} = B_{1\rho} = B_{1z} = 0)$ , of the form (10)–(12), and having the same frequency  $\omega$  as the starting solution  $(\mathbf{A}, \mathbf{E}, \mathbf{B})$ , be such that  $B_{1\phi} = B_{\phi}$ ,  $E_{1\rho} = E_{\rho}$ ,  $E_{1z} = E_{z}$ , it is sufficient that we have just

$$B_{1\phi} = B_{\phi}. \tag{17}$$

*Proof.* Let  $A_{1z}(t, \rho, z)$  be a time-harmonic axisymmetric solution of the wave equation, with frequency  $\omega$ , and assume that  $B_{1\phi}$  as defined by Eq. (10)

[with  $A_{1z}$  in the place of  $A_z$ ] is equal to  $B_{\phi}$ , where **B** is defined by Eq. (3). I.e., assume that

$$-\frac{\partial A_{1z}}{\partial \rho} = \frac{\partial A_{\rho}}{\partial z} - \frac{\partial A_{z}}{\partial \rho}.$$
 (18)

Denoting by  $\mathbf{A}_1 := A_{1z}\mathbf{e}_z$  the vector potential that provides the GAZR1 solution  $(B_{1\phi}, E_{1\rho}, E_{1z}; E_{1\phi} = B_{1\rho} = B_{1z} = 0)$ , let us compute  $E_{\rho} - E_{1\rho}$  and  $E_z - E_{1z}$ . We have by Eq. (8):

$$\frac{\omega}{\mathrm{i}c^2} \left( \mathbf{E} - \mathbf{E}_1 \right) = \nabla \left( \mathrm{div} \mathbf{A}' \right) + \frac{\omega^2}{c^2} \mathbf{A}', \tag{19}$$

where

$$\mathbf{A}' := \mathbf{A} - \mathbf{A}_1 := \mathbf{A} - A_{1z} \mathbf{e}_z. \tag{20}$$

In order that the vector potential **A** of the *a priori* given solution (**A**, **E**, **B**) be axisymmetric, its components  $A_{\rho}$ ,  $A_{\phi}$ ,  $A_{z}$  must depend only on t,  $\rho$ , z, i.e., be independent of  $\phi$ . Therefore:

$$\operatorname{div} \mathbf{A} = \frac{1}{\rho} \frac{\partial (\rho A_{\rho})}{\partial \rho} + \frac{\partial A_{z}}{\partial z}, \tag{21}$$

and, using this and (20):

$$\operatorname{div} \mathbf{A}' = \frac{1}{\rho} \frac{\partial (\rho A_{\rho})}{\partial \rho} + \frac{\partial A'_{z}}{\partial z}.$$
 (22)

Hence, in (19), we have

$$\nabla (\operatorname{div} \mathbf{A}') = \nabla \left( \frac{\partial A_{\rho}}{\partial \rho} + \frac{A_{\rho}}{\rho} + \frac{\partial A'_{z}}{\partial z} \right)$$

$$= \left( \frac{\partial^{2} A_{\rho}}{\partial \rho^{2}} + \frac{1}{\rho} \frac{\partial A_{\rho}}{\partial \rho} - \frac{1}{\rho^{2}} A_{\rho} + \frac{\partial^{2} A'_{z}}{\partial \rho \partial z} \right) \mathbf{e}_{\rho} + \left( \frac{\partial^{2} A_{\rho}}{\partial z \partial \rho} + \frac{1}{\rho} \frac{\partial A_{\rho}}{\partial z} + \frac{\partial^{2} A'_{z}}{\partial z^{2}} \right) \mathbf{e}_{z}.$$

$$(23)$$

The radial component of the vector (19) is thus:

$$\frac{\omega}{\mathrm{i}c^2} \left( \mathbf{E} - \mathbf{E}_1 \right)_{\rho} = \frac{\partial^2 A_{\rho}}{\partial \rho^2} + \frac{1}{\rho} \frac{\partial A_{\rho}}{\partial \rho} - \frac{A_{\rho}}{\rho^2} + \frac{\partial^2 A_z}{\partial \rho \partial z} - \frac{\partial^2 A_{1z}}{\partial \rho \partial z} + \frac{\omega^2}{c^2} A_{\rho}. \tag{24}$$

However, the vector potential **A** obeys the Helmholtz equation (6), that is for the radial component (using the fact that  $\frac{\partial A_{\rho}}{\partial \phi} = \frac{\partial A_{\phi}}{\partial \phi} \equiv 0$ ):

$$(\Delta \mathbf{A})_{\rho} + \frac{\omega^{2}}{c^{2}} A_{\rho} \equiv \Delta A_{\rho} - \frac{A_{\rho}}{\rho^{2}} - \frac{2}{\rho^{2}} \frac{\partial A_{\phi}}{\partial \phi} + \frac{\omega^{2}}{c^{2}} A_{\rho}$$

$$\equiv \frac{\partial^{2} A_{\rho}}{\partial \rho^{2}} + \frac{1}{\rho} \frac{\partial A_{\rho}}{\partial \rho} + \frac{\partial^{2} A_{\rho}}{\partial z^{2}} - \frac{A_{\rho}}{\rho^{2}} + \frac{\omega^{2}}{c^{2}} A_{\rho} = 0. \quad (25)$$

Inserting (25) into (24) gives us:

$$\frac{\omega}{\mathrm{i}c^2} \left( \mathbf{E} - \mathbf{E}_1 \right)_{\rho} = -\frac{\partial^2 A_{\rho}}{\partial z^2} + \frac{\partial^2 A_z}{\partial \rho \partial z} - \frac{\partial^2 A_{1z}}{\partial \rho \partial z} = -\frac{\partial}{\partial z} \left( \frac{\partial A_{\rho}}{\partial z} - \frac{\partial A_z}{\partial \rho} + \frac{\partial A_{1z}}{\partial \rho} \right). \tag{26}$$

Therefore, if Eq. (18) is satisfied, then we have  $E_{1\rho} = E_{\rho}$ .

Similarly, from (23), the axial component of the vector (19) is

$$\frac{\omega}{\mathrm{i}c^2} \left( \mathbf{E} - \mathbf{E}_1 \right)_z = \frac{\partial^2 A_\rho}{\partial z \partial \rho} + \frac{1}{\rho} \frac{\partial A_\rho}{\partial z} + \frac{\partial^2 A_z}{\partial z^2} - \frac{\partial^2 A_{1z}}{\partial z^2} + \frac{\omega^2}{c^2} \left( A_z - A_{1z} \right). \tag{27}$$

On the other hand, the axial component of the Helmholtz equation (6) is

$$(\Delta \mathbf{A})_z + \frac{\omega^2}{c^2} A_z \equiv \Delta A_z + \frac{\omega^2}{c^2} A_z$$
$$\equiv \frac{\partial^2 A_z}{\partial \rho^2} + \frac{1}{\rho} \frac{\partial A_z}{\partial \rho} + \frac{\partial^2 A_z}{\partial z^2} + \frac{\omega^2}{c^2} A_z = 0. \tag{28}$$

If Eq. (18) is satisfied, we have

$$\frac{\partial^2 A_z}{\partial \rho^2} = \frac{\partial^2 A_\rho}{\partial \rho \partial z} + \frac{\partial^2 A_{1z}}{\partial \rho^2}.$$
 (29)

In Eq. (28), we replace  $\frac{\partial^2 A_z}{\partial \rho^2}$  by its value given on the r.h.s. above, and we replace  $\frac{\partial A_z}{\partial \rho}$  by its value given by Eq. (18). This gives:

$$\frac{\partial^2 A_{\rho}}{\partial \rho \partial z} + \frac{\partial^2 A_{1z}}{\partial \rho^2} + \frac{1}{\rho} \frac{\partial A_{\rho}}{\partial z} + \frac{1}{\rho} \frac{\partial A_{1z}}{\partial \rho} + \frac{\partial^2 A_{z}}{\partial z^2} + \frac{\omega^2}{c^2} A_z = 0. \tag{30}$$

Using this equation in Eq. (27), we rewrite the latter as

$$\frac{\omega}{\mathrm{i}c^2} \left( \mathbf{E} - \mathbf{E}_1 \right)_z = -\frac{\partial^2 A_{1z}}{\partial \rho^2} - \frac{1}{\rho} \frac{\partial A_{1z}}{\partial \rho} - \frac{\partial^2 A_{1z}}{\partial z^2} - \frac{\omega^2}{c^2} A_{1z}. \tag{31}$$

We recognize the r.h.s as that of Eq. (28), though with the minus sign, and with  $A_{1z}$  in the place of  $A_z$ . I.e., Eq. (31) is just

$$\frac{\omega}{\mathrm{i}c^2} \left( \mathbf{E} - \mathbf{E}_1 \right)_z = -\Delta A_{1z} - \frac{\omega^2}{c^2} A_{1z}. \tag{32}$$

But this is zero, since  $A_{1z}$  is by assumption a time-harmonic solution of the wave equation, with frequency  $\omega$ . Therefore, if Eq. (18) is satisfied, then we have  $E_{1z} = E_z$ , too. This completes the proof of Proposition 1.

It follows for the dual ("GAZR2") solution:

Corollary 1. Let  $(\mathbf{A}, \mathbf{E}, \mathbf{B})$  be any time-harmonic axisymmetric solution of the free Maxwell equations. In order that a time-harmonic solution  $(A_{2z}, E'_{2\phi}, B'_{2\rho}, B'_{2z}; B'_{2\phi} = E'_{2\rho} = E'_{2z} = 0)$  with the same frequency, deduced from Eqs. (10)–(12) by the duality (13), be such that  $E'_{2\phi} = E_{\phi}$ ,  $B'_{2\rho} = B_{\rho}$ ,  $B'_{2z} = B_z$ , it is sufficient that we have just

$$E'_{2\phi} = E_{\phi}. \tag{33}$$

*Proof.* The GAZR2 solution  $(A_{2z}, E'_{2\phi}, B'_{2\rho}, B'_{2z}; B'_{2\phi} = E'_{2\rho} = E'_{2z} = 0)$  is deduced from the GAZR1 solution  $(A_{2z}, B_{2\phi}, E_{2\rho}, E_{2z}; E_{2\phi} = B_{2\rho} = B_{2z} = 0)$ , associated with the same potential  $A_{2z}$ , by the duality relation (13). Suppose that Eq. (33) is satisfied. With the starting solution  $(\mathbf{A}, \mathbf{E}, \mathbf{B})$  of the free Maxwell equations, we may associate another solution, by the inverse duality:

$$\widetilde{\mathbf{B}} = \frac{1}{c}\mathbf{E}, \quad \widetilde{\mathbf{E}} = -c\mathbf{B}.$$
 (34)

The assumed relation (33) means that

$$B_{2\phi} = \widetilde{B}_{\phi}. \tag{35}$$

Indeed, by applying successively  $(13)_1$ , (33), and  $(34)_1$ , we obtain:

$$B_{2\phi} = \frac{1}{c}E'_{2\phi} = \frac{1}{c}E_{\phi} = \widetilde{B}_{\phi}.$$
 (36)

In turn, the relation (35) means that we may apply Proposition 1 to the GAZR1 solution  $(A_{2z}, B_{2\phi}, ...)$  and the solution  $(\widetilde{\mathbf{A}}, \widetilde{\mathbf{E}}, \widetilde{\mathbf{B}})$ . Thus, Proposition 1 tells us here that, since  $B_{2\phi} = \widetilde{B}_{\phi}$ , we have also

$$E_{2\rho} = \widetilde{E}_{\rho} \quad \text{and} \quad E_{2z} = \widetilde{E}_{z},$$
 (37)

<sup>&</sup>lt;sup>3</sup> The explicit expression of the corresponding vector potential  $\widetilde{\mathbf{A}}$  as function of  $(\mathbf{A}, \mathbf{E}, \mathbf{B})$  is not needed: only the existence of an axisymmetric  $\widetilde{\mathbf{A}}$ , such that  $\widetilde{\mathbf{B}} = \operatorname{rot} \widetilde{\mathbf{A}}$ , is needed. Precisely,  $\widetilde{\mathbf{A}}$  is got as a solution of the PDE  $\operatorname{rot} \widetilde{\mathbf{A}} = \widetilde{\mathbf{B}}$ . (Such a solution always exists in a topologically trivial domain, thus in particular if the domain is the whole space.) Hence  $\widetilde{\mathbf{A}}$  can indeed be chosen axisymmetric, i.e. with its components in cylindrical coordinates being independent of  $\phi$ , because with this choice the independent variables of the PDE  $\operatorname{rot} \widetilde{\mathbf{A}} = \widetilde{\mathbf{B}}$  simply do not include  $\phi$  — since  $\widetilde{\mathbf{B}} = \frac{1}{c}\mathbf{E}$  is axisymmetric, as is  $\mathbf{E}$  by assumption.

i.e., in view of  $(13)_2$  and  $(34)_2$ :

$$-cB'_{2\rho} = -cB_{\rho}$$
 and  $-cB'_{2z} = -cB_z$ . (38)

This proves Corollary 1.

#### 3.2 Generality of the decomposition

**Proposition 2.** Let  $(\mathbf{A}, \mathbf{E}, \mathbf{B})$  be any time-harmonic axisymmetric solution of the free Maxwell equations. There exists a time-harmonic axisymmetric solution  $A_{2z}$  of the wave equation, with the same frequency, such that the associated GAZR2 solution  $(\mathbf{E}'_2, \mathbf{B}'_2)$ , deduced from  $A_{2z}$  by Eqs. (10)–(12) followed by the duality transformation (13), satisfy

$$E'_{2\phi} = E_{\phi}, \quad B'_{2\rho} = B_{\rho}, \quad B'_{2z} = B_z.$$
 (39)

*Proof.* In view of Corollary 1, we merely have to prove that there exists a time-harmonic axisymmetric solution  $A_{2z}$  of the wave equation, such that Eq. (33) is satisfied. From Eqs. (8) and (21), we have

$$E_{\phi} = i\omega A_{\phi}. \tag{40}$$

Using this with Eqs. (10) and (13)<sub>1</sub>, we may rewrite the sought-for relation (33) as:

$$-\frac{\partial A_{2z}}{\partial \rho} = \frac{\mathrm{i}\omega}{c} A_{\phi}.\tag{41}$$

This equation can be solved by a quadrature:

$$A_{2z}(t,\rho,z) = h(t,z) + \int_{\rho_0}^{\rho} -\frac{i\omega}{c} A_{\phi}(t,\rho',z) d\rho'.$$
 (42)

We thus have to find out if it is possible to determine the function h so that  $A_{2z}$  given by (42) obey the wave equation. Moreover, the unknown function  $A_{2z}$  must have a harmonic time dependence with frequency  $\omega$  as has  $A_{\phi}$ , i.e.,

$$A_{2z}(t,\rho,z) = \psi(\rho,z) e^{-i\omega t}, \quad A_{\phi}(t,\rho,z) = \hat{A}_{\phi}(\rho,z) e^{-i\omega t},$$
 (43)

so we must have  $h(t,z)=e^{-\mathrm{i}\omega t}g(z)$ , too. Hence we may rewrite (42) as

$$\psi(\rho, z) = g(z) + \int_{\rho_0}^{\rho} -\frac{\mathrm{i}\omega}{c} \hat{A}_{\phi}(\rho', z) \,\mathrm{d}\rho', \tag{44}$$

and now the question is to know if g can be determined so that  $\psi$  obey the scalar Helmholtz equation, i.e. [cf. Eq. (28)]:

$$\mathcal{H}\psi := \Delta\psi + \frac{\omega^2}{c^2}\psi \equiv \frac{\partial^2\psi}{\partial\rho^2} + \frac{1}{\rho}\frac{\partial\psi}{\partial\rho} + \frac{\partial^2\psi}{\partial z^2} + \frac{\omega^2}{c^2}\psi = 0 \tag{45}$$

— knowing that  $A_{\phi}$  or  $\hat{A}_{\phi}$  does obey the  $\phi$  component of the vector Helmholtz equation (6), i.e.:

$$\left(\Delta \hat{\mathbf{A}}\right)_{\phi} + \frac{\omega^{2}}{c^{2}} \hat{A}_{\phi} \equiv \Delta \hat{A}_{\phi} - \frac{\hat{A}_{\phi}}{\rho^{2}} + \frac{2}{\rho^{2}} \frac{\partial \hat{A}_{\rho}}{\partial \phi} + \frac{\omega^{2}}{c^{2}} \hat{A}_{\phi}$$

$$\equiv \frac{\partial^{2} \hat{A}_{\phi}}{\partial \rho^{2}} + \frac{1}{\rho} \frac{\partial \hat{A}_{\phi}}{\partial \rho} + \frac{\partial^{2} \hat{A}_{\phi}}{\partial z^{2}} - \frac{\hat{A}_{\phi}}{\rho^{2}} + \frac{\omega^{2}}{c^{2}} \hat{A}_{\phi} = 0. \quad (46)$$

We have from Eqs. (41) and (43):

$$\frac{\partial \psi}{\partial \rho} = -\frac{\mathrm{i}\omega}{c} \hat{A}_{\phi},\tag{47}$$

hence

$$\frac{\partial^2 \psi}{\partial \rho^2} = -\frac{\mathrm{i}\omega}{c} \frac{\partial \hat{A}_\phi}{\partial \rho}.\tag{48}$$

And we get from (44):

$$\frac{\partial \psi}{\partial z} = \frac{\mathrm{d}g}{\mathrm{d}z} - \int_{\rho_0}^{\rho} \frac{\mathrm{i}\omega}{c} \frac{\partial \hat{A}_{\phi}}{\partial z} (\rho', z) \,\mathrm{d}\rho', \tag{49}$$

whence

$$\frac{\partial^2 \psi}{\partial z^2} = \frac{\mathrm{d}^2 g}{\mathrm{d}z^2} - \int_{\rho_0}^{\rho} \frac{\mathrm{i}\omega}{c} \frac{\partial^2 \hat{A}_{\phi}}{\partial z^2} (\rho', z) \,\mathrm{d}\rho'. \tag{50}$$

Entering Eqs. (47), (48) and (50) into  $(45)_1$ , we obtain:

$$\mathcal{H}\psi = -\frac{\mathrm{i}\omega}{c} \frac{\partial \hat{A}_{\phi}}{\partial \rho} - \frac{\mathrm{i}\omega}{c} \frac{\hat{A}_{\phi}}{\rho} + \frac{\mathrm{d}^{2}g}{\mathrm{d}z^{2}} - \int_{\rho_{0}}^{\rho} \frac{\mathrm{i}\omega}{c} \frac{\partial^{2} \hat{A}_{\phi}}{\partial z^{2}} (\rho', z) \, \mathrm{d}\rho'$$

$$+ \frac{\omega^{2}}{c^{2}} \left( g - \frac{\mathrm{i}\omega}{c} \int_{\rho_{0}}^{\rho} \hat{A}_{\phi}(\rho', z) \, \mathrm{d}\rho' \right).$$
(51)

Therefore, the scalar Helmholtz equation  $(45)_2$  rewrites as

$$\frac{\mathrm{d}^2 g}{\mathrm{d}z^2} + \frac{\omega^2}{c^2} g = \frac{\mathrm{i}\omega}{c} \left[ \frac{\partial \hat{A}_\phi}{\partial \rho} + \frac{\hat{A}_\phi}{\rho} + \int_{\rho_0}^{\rho} \left( \frac{\partial^2 \hat{A}_\phi}{\partial z^2} + \frac{\omega^2}{c^2} \hat{A}_\phi \right) \mathrm{d}\rho' \right], \tag{52}$$

or, using (46):

$$\frac{\mathrm{d}^2 g}{\mathrm{d}z^2} + \frac{\omega^2}{c^2} g = \frac{\mathrm{i}\omega}{c} \left[ \frac{\partial \hat{A}_{\phi}}{\partial \rho} + \frac{\hat{A}_{\phi}}{\rho} + \int_{\rho_0}^{\rho} \left( -\frac{\partial^2 \hat{A}_{\phi}}{\partial \rho'^2} - \frac{1}{\rho'} \frac{\partial \hat{A}_{\phi}}{\partial \rho'} + \frac{\hat{A}_{\phi}}{\rho'^2} \right) \mathrm{d}\rho' \right]. \tag{53}$$

An integration by part gives us:

$$\int_{\rho_0}^{\rho} \left( -\frac{\partial^2 \hat{A}_{\phi}}{\partial \rho'^2} + \frac{\hat{A}_{\phi}}{\rho'^2} \right) d\rho' = -\left[ \frac{\partial \hat{A}_{\phi}}{\partial \rho'} + \frac{\hat{A}_{\phi}}{\rho'} \right]_{\rho_0}^{\rho} + \int_{\rho_0}^{\rho} \frac{1}{\rho'} \frac{\partial \hat{A}_{\phi}}{\partial \rho'} d\rho', \tag{54}$$

so Eq. (53) rewrites as

$$\frac{\mathrm{d}^2 g}{\mathrm{d}z^2} + \frac{\omega^2}{c^2} g = \frac{\mathrm{i}\omega}{c} \left[ \frac{\partial \hat{A}_{\phi}}{\partial \rho} (\rho_0, z) + \frac{\hat{A}_{\phi}(\rho_0, z)}{\rho_0} \right]. \tag{55}$$

As is well known and easy to check, this very ordinary differential equation can be solved explicitly by the method of variation of constants. (The general solution g of (55) depends linearly on two arbitrary constants.) And by construction, any among the solutions g of (55) is such that, with that g, the function  $\psi$  in Eq. (44) obeys the scalar Helmholtz equation (45). This proves Proposition 2.

Corollary 2. Let  $(\mathbf{A}, \mathbf{E}, \mathbf{B})$  be any time-harmonic axisymmetric solution of the free Maxwell equations. There exists a time-harmonic axisymmetric solution  $A_{1z}$  of the wave equation, with the same frequency, such that the associated GAZR1 solution  $(\mathbf{E}_1, \mathbf{B}_1)$ , deduced from  $A_{1z}$  by Eqs. (10)–(12), satisfy

$$B_{1\phi} = B_{\phi}, \quad E_{1\rho} = E_{\rho}, \quad E_{1z} = E_{z}.$$
 (56)

*Proof.* Let  $A_{1z}$  be a time-harmonic axisymmetric solution of the wave equation, and consider:

- (i) the GAZR1 solution defined from  $A_{1z}$  by Eqs. (10)–(12) (thus with  $A_{1z}$ ,  $B_{1\phi}$ ,  $E_{1\rho}$ ,  $E_{1z}$ , ... instead of  $A_z$ ,  $B_{\phi}$ ,  $E_{\rho}$ ,  $E_z$ , ... respectively).
- (ii) the GAZR2 solution defined from the same  $A_{1z}$  by applying the duality (13) to the said GAZR1 solution:

$$E'_{1\phi} := cB_{1\phi}, \quad B'_{1\rho} := -\frac{1}{c}E_{1\rho}, \quad B'_{1z} := -\frac{1}{c}E_{1z},$$
 (57)

$$E'_{1\rho} := cB_{1\rho} = 0, \quad E'_{1z} := cB_{1z} = 0, \quad B'_{1\phi} := -\frac{1}{c}E_{1\phi} = 0.$$
 (58)

On the other hand, consider the free Maxwell field  $(\mathbf{E}', \mathbf{B}')$  deduced from the given time-harmonic axisymmetric solution  $(\mathbf{E}, \mathbf{B})$  of the free Maxwell equations by the same duality relation:

$$\mathbf{E}' := c\mathbf{B}, \quad \mathbf{B}' := -\mathbf{E}/c. \tag{59}$$

Just in the same way as it was shown in Note 3, we know that a vector potential  $\mathbf{A}'$  such that  $\mathbf{B}' = \operatorname{rot} \mathbf{A}'$  does exist and can be chosen to be axisymmetric (and is indeed chosen so) — as are  $\mathbf{E}$  and  $\mathbf{B}$ , and hence  $\mathbf{E}'$  and  $\mathbf{B}'$ . Clearly, the sought-for relation (56) is equivalent to

$$E'_{1\phi} = E'_{\phi}, \quad B'_{1\rho} = B'_{\rho}, \quad B'_{1z} = B'_{z}.$$
 (60)

Therefore, the existence of  $A_{1z}$  as in the statement of Corollary 2 is ensured by Proposition 2.

Accounting for Proposition 2 and for Corollary 2, and remembering the "complementarity" of the GAZR1 and GAZR2 solutions, we thus can answer positively to the question asked at the beginning of this section:

**Theorem.** Let  $(\mathbf{A}, \mathbf{E}, \mathbf{B})$  be any time-harmonic axisymmetric solution of the free Maxwell equations. There exist a unique GAZR1 solution  $(\mathbf{E}_1, \mathbf{B}_1)$  and a unique GAZR2 solution  $(\mathbf{E}_2, \mathbf{B}_2)$ , both with the same frequency as has  $(\mathbf{A}, \mathbf{E}, \mathbf{B})$ , and whose sum gives just that solution:

$$\mathbf{E} = \mathbf{E}_1 + \mathbf{E}_2', \qquad \mathbf{B} = \mathbf{B}_1 + \mathbf{B}_2'. \tag{61}$$

Remark. Thus, the uniqueness of the representation concerns the electric and magnetic fields. It of course does not concern the potentials  $\mathbf{A}_1 = A_{1z}\mathbf{e}_z$  and  $\mathbf{A}_2 = A_{2z}\mathbf{e}_z$  that generate respectively  $(\mathbf{E}_1, \mathbf{B}_1)$  and  $(\mathbf{E}_2', \mathbf{B}_2')$ .

#### 4 Conclusion

In Ref. [6], a method has been introduced to obtain in explicit form timeharmonic axisymmetric solutions of the free Maxwell equations: given any "wave vector spectrum", i.e., a function  $k \mapsto S(k)$ , defined for  $-\frac{\omega}{c} \leq k \leq \frac{\omega}{c}$ , one first defines a time-harmonic axisymmetric solution  $\Psi$  of the wave equation by Eq. (1). Then, in the first variant of the method, one deduces a time-harmonic axisymmetric solution  $(\mathbf{E}, \mathbf{B})$  of the free Maxwell equations from the vector potential  $\mathbf{A} := \Psi \mathbf{e}_z$ . The second variant associates with  $\Psi$  (or with S) the different EM field  $(\mathbf{E}', \mathbf{B}')$ , deduced from  $(\mathbf{E}, \mathbf{B})$  by the EM duality, Eq. (13). It has been shown here that this method allows one to get all time-harmonic axisymmetric free Maxwell fields (and thus, by the appropriate summation on frequencies, all axisymmetric free Maxwell fields). This is not an obviously expected result and its proof is not immediate. It provides a constructive method to obtain axisymmetric free Maxwell fields.
