Bibliography
The name Sudetes has been derived from Sudeti montes. Sudetes consist of 3 parts:

1. Western Sudetes,
2. Central Sudetes,
3. Eastern Sudetes

Study area is Western Sudetes: Karkonosze Mountains and Izera Mountains. Karkonosze National Park (Karkonoski Park Narodowy, KPN), created in 1959. Area: 55.8 km².
Characteristics of the Study Area

The city of Karpacz - one of the most notable towns located long the border of the Czech Republic and Poland, extending ca. 300 km between the Elbe and Oder rivers, Erzgebirge and Carpathians. KNP encompasses sensitive higher parts of the mountain range (altitude > 900-1000m) and special nature reserves below this zone.

- **Geology**: Granite, schist, shale and calcite
- **Tectonics**: Caledonian, Varescan
- **Period**: Neoproterozoic, Palaeozoic
- **Vegetation**:
  - Alpine vegetation zone - 1,400 m: large rocky deserts
  - Subalpine zone above the timber line - 1,250 to 1,350 m: knee timber, mountain mat-grass meadows and subarctic highmoor, alpine grasslands
  - Spruce, mixed forest

GEM MSc Course, University of Warsaw
Environmental Problems

- Acid Rain: Between 1981-1987
- Sources: NOx, SO2 and dust from 3 Lignite mines (Turoszow field, Lusatian field and North-Czech field) and 7 power plants
- Impacts: 11,000 ha of spruce forest was destroyed in Sudety mountains and 15,000 hectares in North West Czech Republic and Saxony

Unsupervised Classification by CLUSTER

Methods of this research are based on using IDRISI GIS. Unsupervised image classification was done using CLUSTER function.

GEM MSc Course, University of Warsaw
1984

Map of Land Cover Classes. Results of the Unsupervised Classification: July 1984.

Reclassification

Land Cover classes in Sudetes, 2003. Re-classed raster of Unsupervised Classification. After reclassification we can distinguish more clearly main land cover classes: Light blue - coniferous; dark blue - deciduous, red - fresh vegetation; orange - fields, light yellow - urban areas.

GEM MSc Course, University of Warsaw
Supervised Classification of IDRISI GIS has 2 approaches.

**Minimal Distance (MINDIST) Method**

This is the simplest and fastest method of all classifiers. However, prone to incorrect classifications.

**Maximal Likelihood (MAXLIKE) Method**

Evaluates the standard deviation of the reflectance values above the mean. The slowest technique but more accurate classification (provided the training sites are good).
Supervised Classification: MINDIST Algorithm

Training sites for supervised classification
