HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Fiber frequency-shifting loop for RF up-conversion and waveform generation

H. Zhang,¹ H. Yang,¹ M. Brunel,² M. Vallet,² C. Zhao,¹ and S. Yang¹

Introduction

- ring interferometer + frequency-shifter + amplifier [1-4]
=> self-heterodyning, Frequency-Shifted Feedback laser, real-time Fourier Transform, wavelength scan, etc.
- microwave photonics context (lidar-radar for example) [5-8]
=> RF up-conversion, waveform generation
- Here high-harmonic RF beats, sub-threshold operation (\neq FSF laser)
+ all-fibered experiment @ 1064 nm vs simulation

Model: time delayed interferences

$$\begin{bmatrix} E_{\text{out}1} \\ E_{\text{out}2} \end{bmatrix} = \begin{bmatrix} t_{11} & t_{12} \\ t_{21} & t_{22} \end{bmatrix} \begin{bmatrix} E_{\text{in}1} \\ E_{\text{in}2} \end{bmatrix}$$

- $\lambda = 1064$ nm (YDFA with gain G)
- Acousto-Optic Frequency Shifter
 $f_{\text{AO}} = 200$ MHz ± 5 MHz, $\eta = 0.4$
- ~ 20 m loop ($\tau = 5$ ns)

Inside the loop:

$$E_{\text{out}2}(t) = t_{21} \sum_{p=0}^{\infty} (t_{22}\gamma)^p E_{\text{in}1}(t-p\tau) e^{i2\pi f_{\text{AO}} p(t-\tau)} e^{-i\pi f_{\text{AO}} p^2 \tau} \quad \text{with } \gamma = \sqrt{\eta G} e^{i\varphi}$$

Output field:

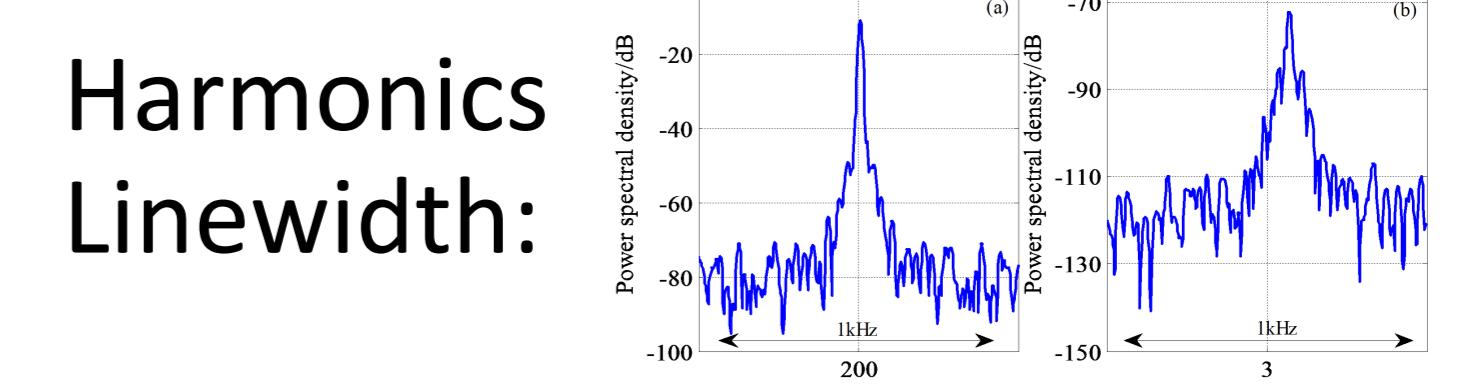

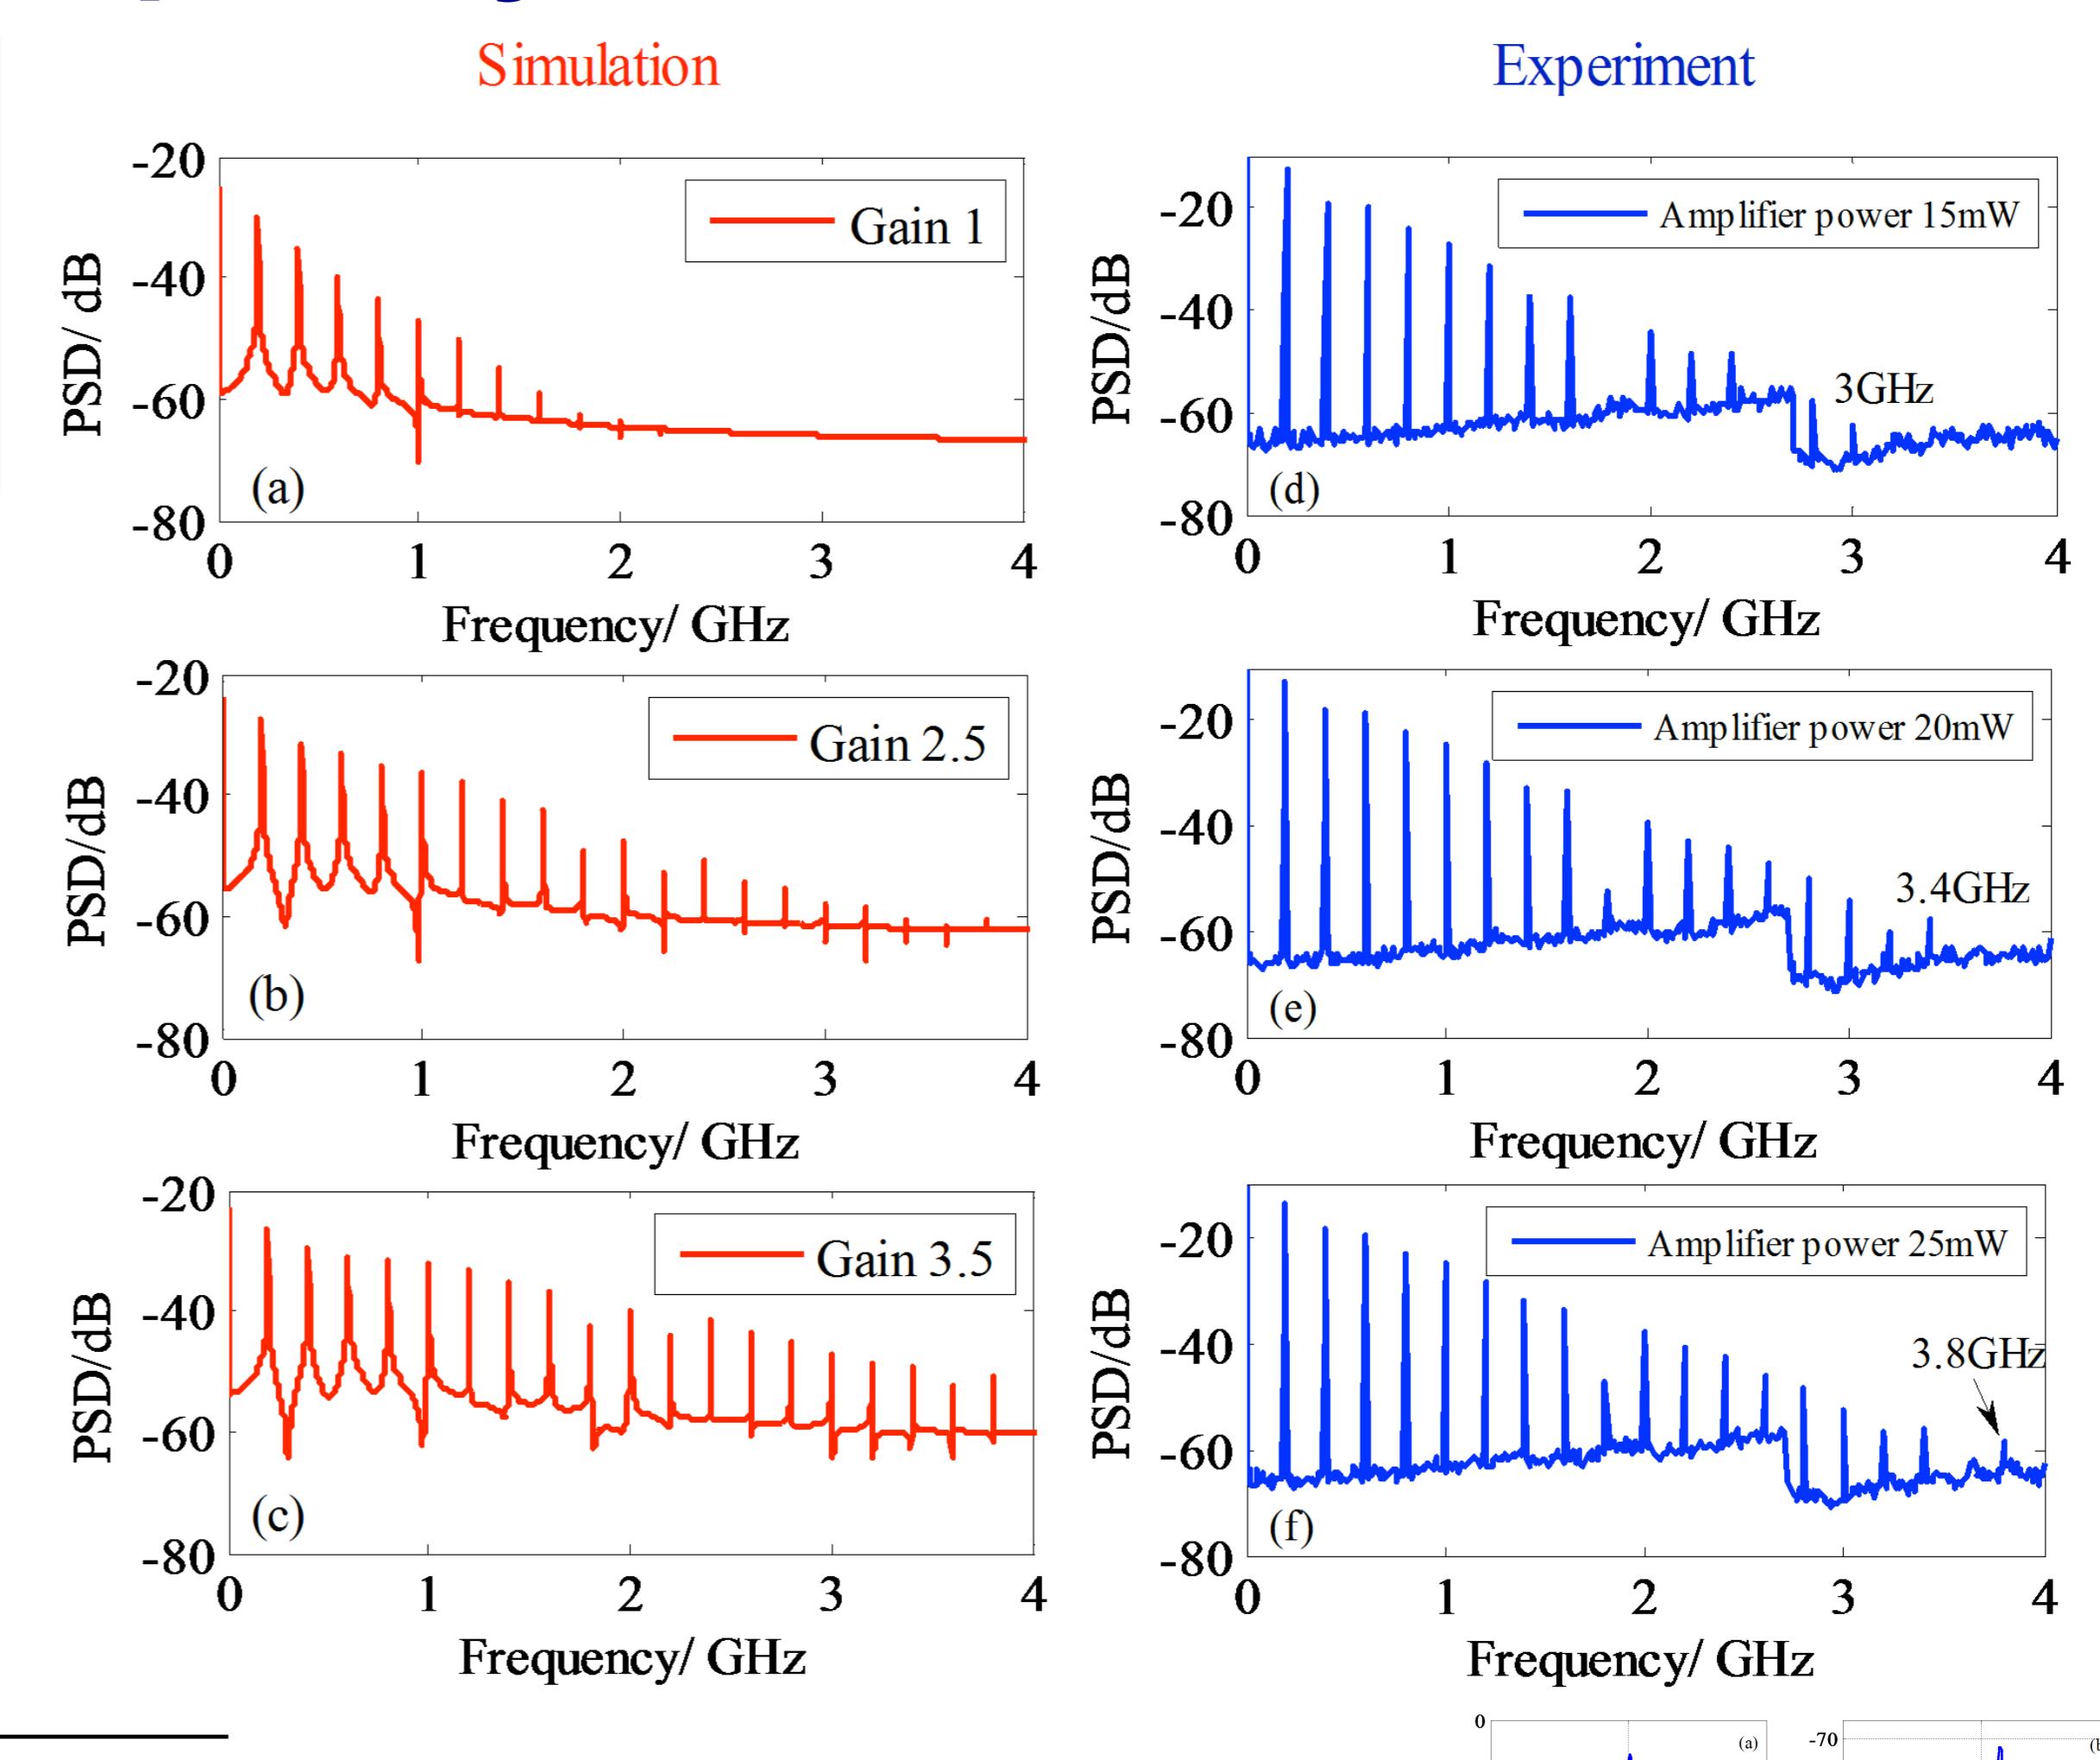

$$\begin{aligned} E_{\text{out}1}(t) &= t_{11} E_{\text{in}1}(t) + t_{12} E_{\text{in}2}(t) \\ &= t_{11} E_{\text{in}1}(t) + t_{12} \gamma E_{\text{out}2}(t-\tau) e^{i2\pi f_{\text{AO}}(t-\tau)} \\ &= t_{11} E_{\text{in}1}(t) + t_{12} \gamma t_{21} \sum_{p=1}^{\infty} (t_{22}\gamma)^{(p-1)} E_{\text{in}1}(t-p\tau) e^{-i\pi f_{\text{AO}} p\tau} e^{i2\pi f_{\text{AO}} p t} e^{-i\pi f_{\text{AO}} p^2 \tau} \end{aligned}$$

Output power:

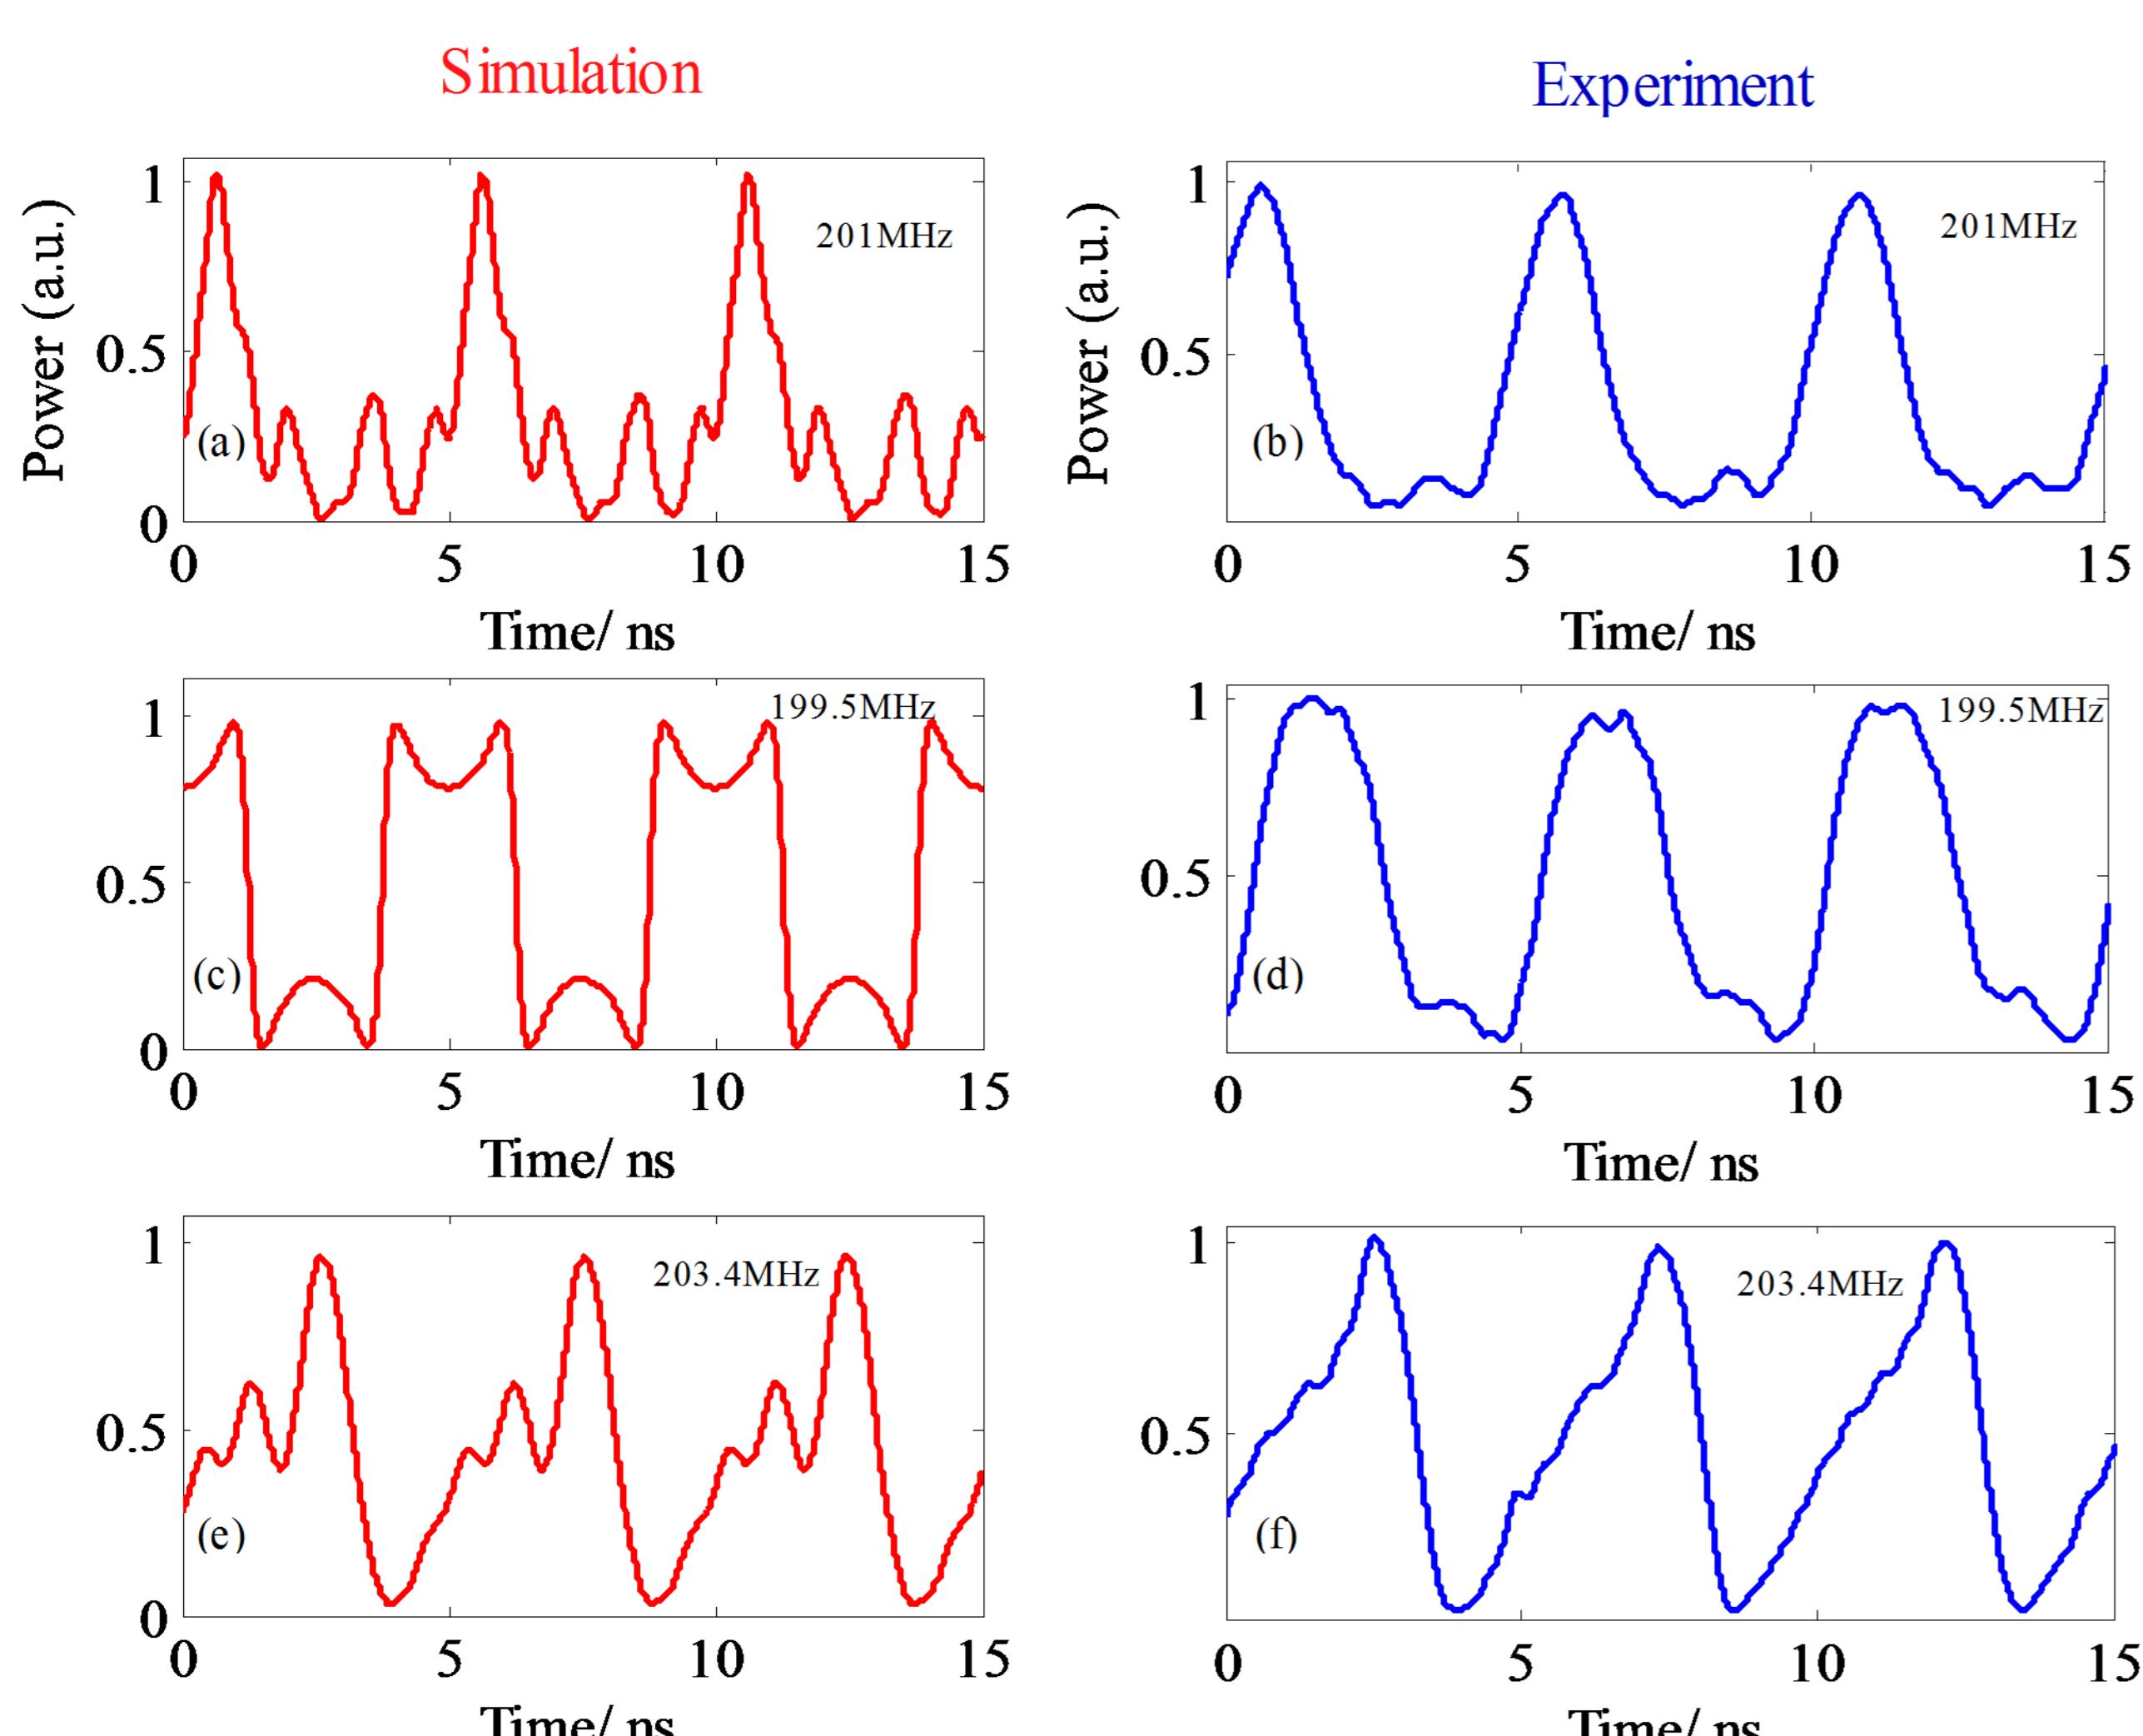

$$P_{\text{out}}(t) = \left| t_{11} + t_{12} \gamma t_{21} \sum_{p=0}^{\infty} (t_{22}\gamma)^p e^{i2\pi f_{\text{AO}}(p+1)t} e^{-i\pi f_{\text{AO}}(p+2)(p+1)\tau} \right|^2 P_{\text{in}}$$

$$P_{\text{out}}(t) = P_0 + \sum_{n=1}^{\infty} \left[P_n e^{i2\pi n f_{\text{AO}} t} + \text{cc} \right] \quad \text{with } |P_n| = (\Gamma T_{11})^{n/2} T_{12} \sqrt{\frac{(1-\Gamma)^2 + 4\Gamma \sin^2(n\pi f_{\text{AO}} \tau)}{(1-\Gamma T_{11})^2 + 4\Gamma T_{11} \sin^2(n\pi f_{\text{AO}} \tau)}} \quad \Gamma = |\gamma^2|$$

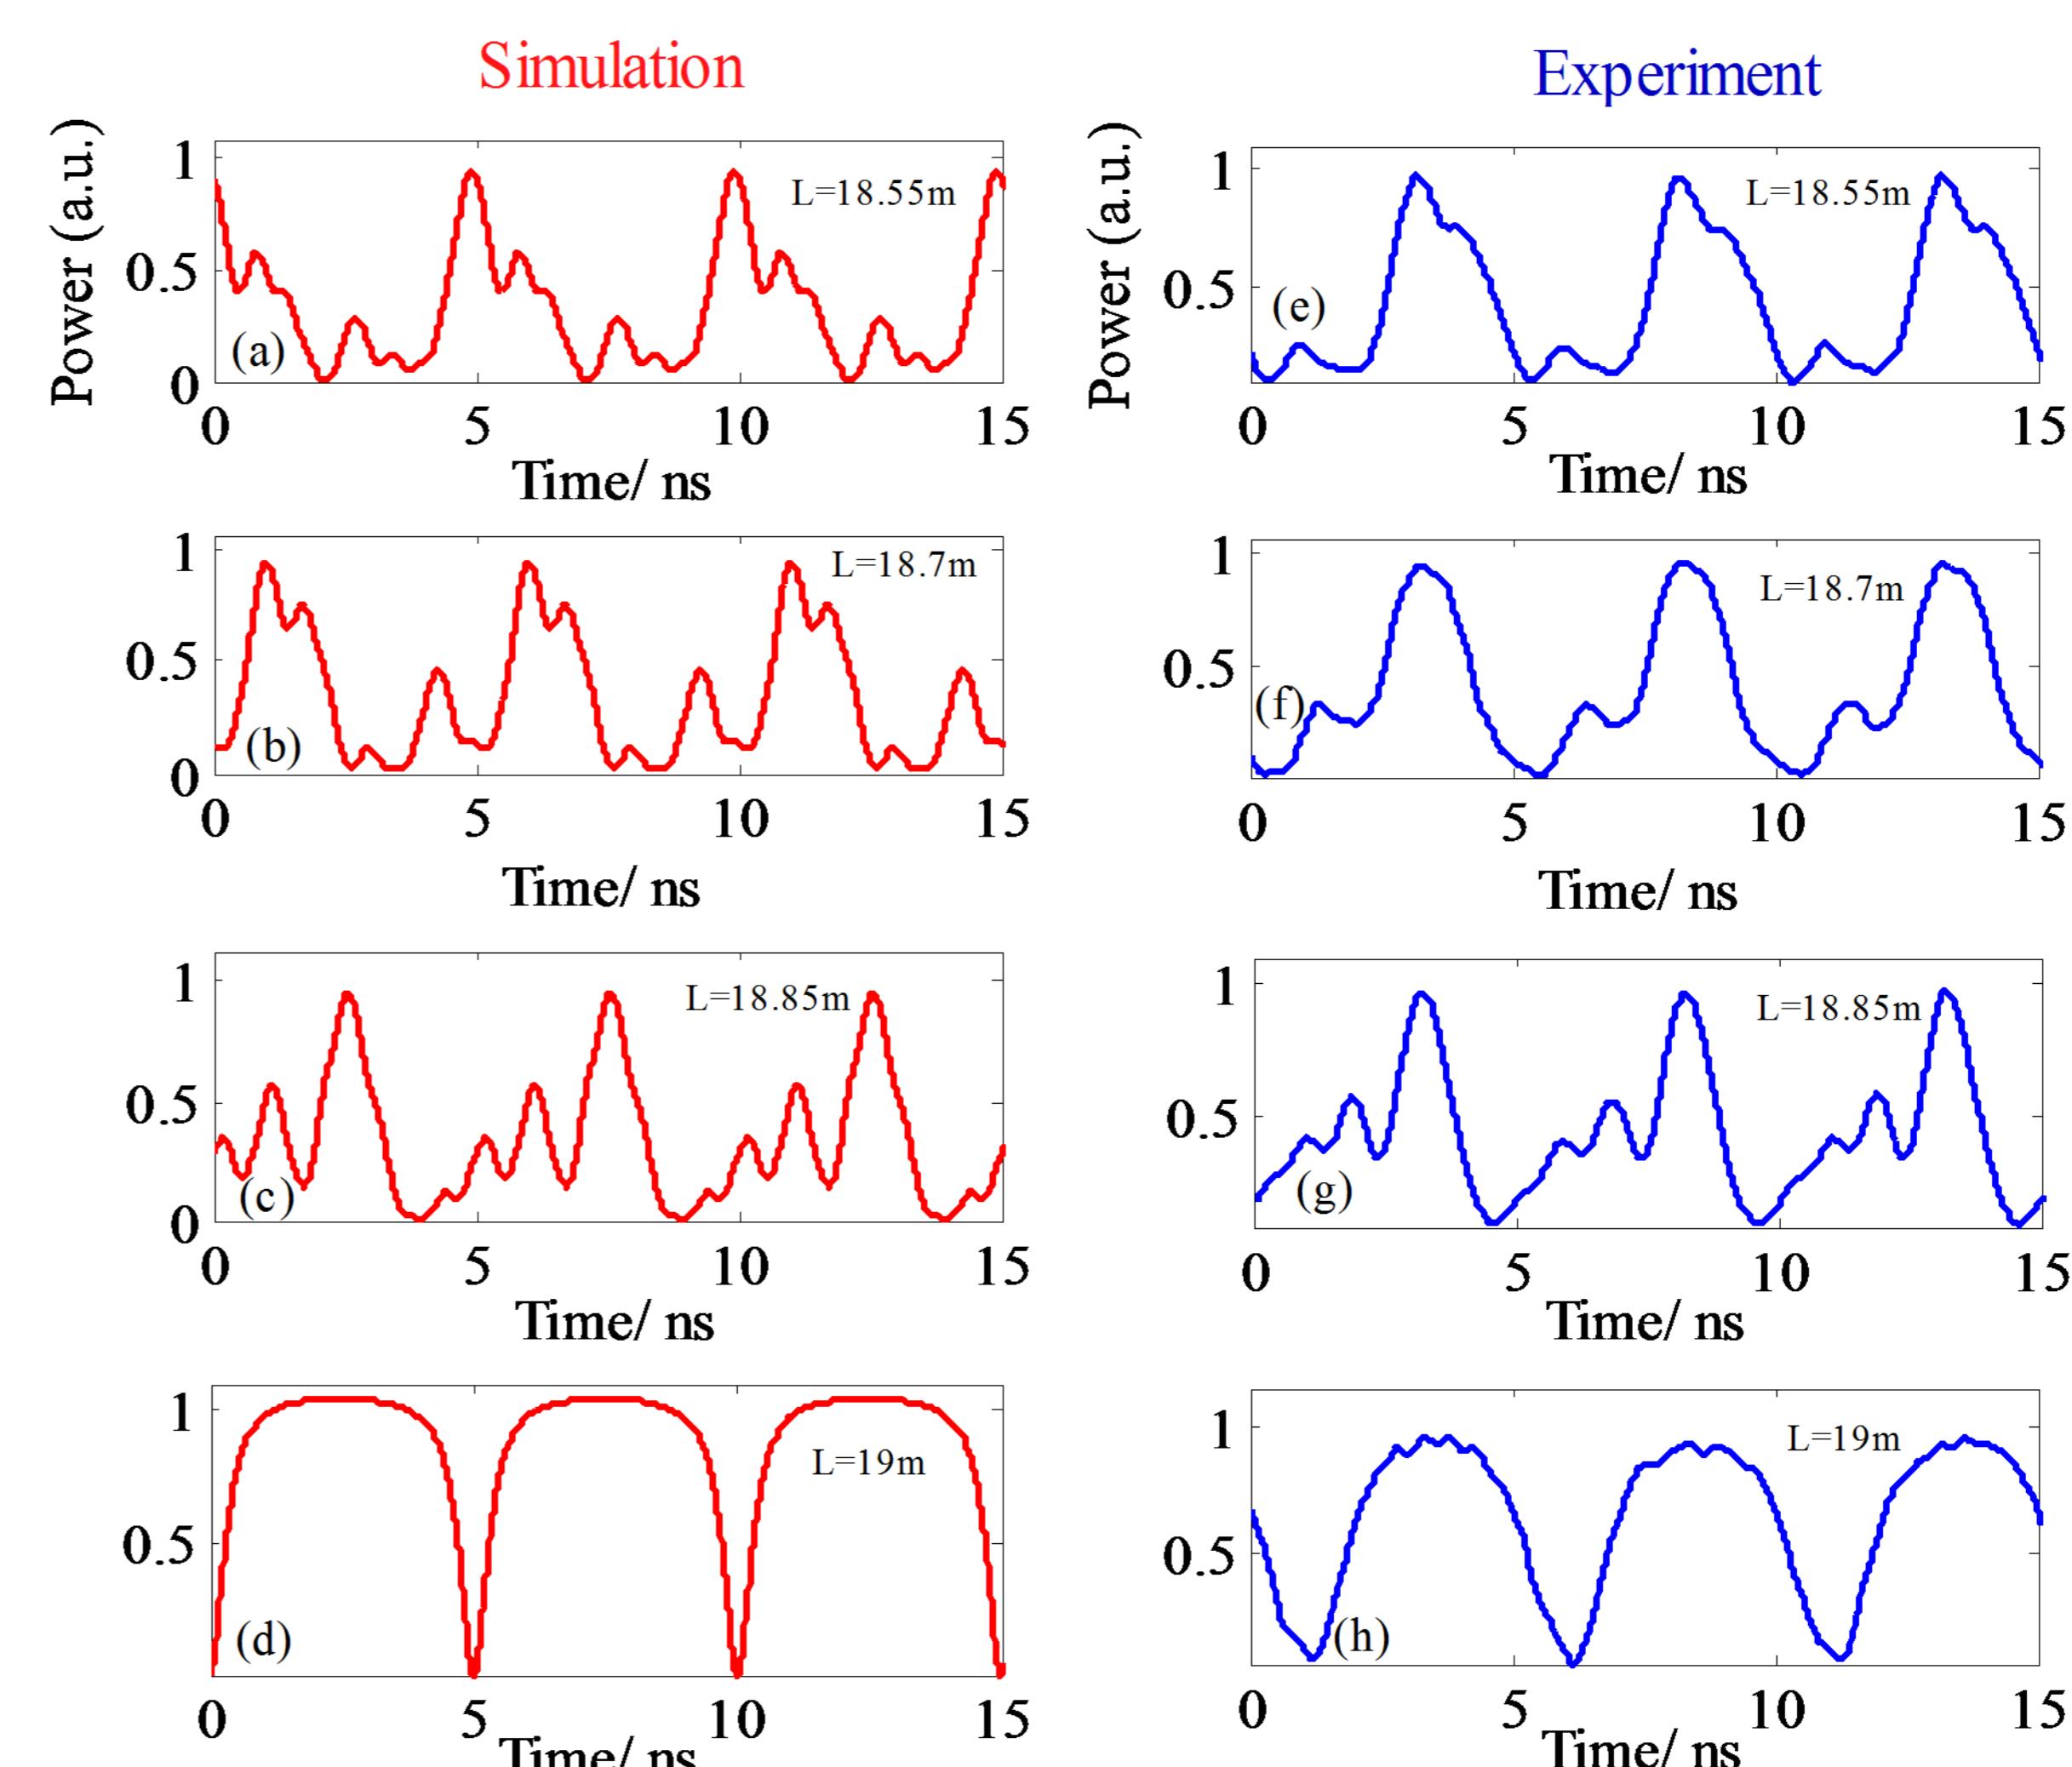

Frequency domain: harmonics vs gain

Time domain: waveform depends on the RF harmonics phases ($n\pi f_{\text{AO}} \tau$)

Influence of frequency shift on the waveform

Influence of the loop length on the waveform (steps of 15 cm)

Conclusion

– RF enhancement x15 (here up to ~ 4 GHz)

– programmable and integrable scheme

Perspectives

– + SHG => green source for underwater [5-6]

– Ultra-low Doppler frequency shifts

– All-fibered experiment @ 1550 nm

– Above threshold (solitons, mode-locking, etc)
