HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Feasibility toward a compact high performance coherent population trapping clock

Abstract—Atomic clock based on the constructive polarization modulation coherent population trapping, demonstrated a promising performance with frequency stability at the level of $3.2 \times 10^{-13} \tau^{-1/2}$ up to the averaging time of 100 seconds. The feasibility to implement a compact and high performance CPT clock is discussed.

Keywords—CPT; atomic clock; miniaturization;

Here we demonstrated a high performance coherent population trapping atomic clock based on the constructive polarization modulation configuration [1,2]. In this method, a phase modulation is applied to the two optical components of a bichromatic laser field, synchronously with the polarization modulation, we then defined it as double-modulation (DM) CPT. With careful work parameters investigation and noise suppression, a promising frequency stability at the level of $3.2 \times 10^{-13} \tau^{-1/2}$ up to the averaging time of 100 seconds is observed [3]. Currently, the short-term stability is mainly limited by the microwave power fluctuation which coupled to the fiber electro-optic phase modulator.

Thanks to DM CPT, in which the polarization modulation frequency for the maximum CPT signal contrast is in the range of several kHz [4], allowing employing a liquid crystal device as the polarization switch. This low voltage driving and negligible size liquid crystal device is an ideal choice to build a very compact and robust setup while maintaining its high performance. The possibility to directly modulate a DFB laser diode with half of Cs ground states hyperfine splitting (~ 4.6 GHz) and miniaturization by micro-optical integration technology are discussed, with the aim to implement an even more compact and high performance CPT clock.
