Background

Today's estimates indicate that 30-60% of Neurofibromatosis type 1 (NF1) children suffer from learning disorder, including reading disabilities, secondary to language and/or visuospatial deficits (Chaix et al., 2017) with a profound impact on their academic achievement (Krab et al., 2008). Some studies suggest a delay in the maturation of low-level vision processes in children with NF1 (e.g. saccadic system, Lasker et al., 2003; magnocellular processing, Ribeiro et al., 2012). The findings from typically developing readers suggest a strong relationship between reading ability and visual processing (Leibnitz, et al., 2017). The main goal of this study was to investigate the occurrence of perceptual, visuo-attentional and oculomotor deficits in NF1 children and their potential to explain reading behavior and reading problems in this population.

Method

Forty-two children with NF1 (9,8 ± 1,5 years, 26 girls) and forty-two control children (TD, 10 ± 1,1 years, 20 girls) participated in the study. Parents and children gave their informed consent prior to the experiment, approved by the local ethics committee. Reading and visual processing skills were respectively evaluated with the Alouette test (Lefavrais, 2005) and the DEM test (Garzia et al., 1990). We also recorded eye movements while a subgroup of 17 NF1 children (9;8 ± 1;4 years, 10 girls) and 21 control children (9;4 ± 0;9 years, 10 girls) performed an oculomotor lateralized bisection task on words, strings of hash marks and solid lines.

BEHAVIOUR TYPE	VERTICAL TIME	HORIZONTAL TIME	RATIO				
Type 1	Normal	Normal	Normal				
Type 2	Normal	High	High				
Туре 3	High	High	Normal				
Type 4	High	High	High				
BEHAVIOUR TYPE CHARACTERISTICS							
Type 1	Normal au	utomaticity and oculomotor skills					
Type 2	Oculomot	Oculomotor dysfunction					
Type 3	Deficienci	Deficiencies in automaticity/number calling skills					

DEM test : digit reading tasks

DEM test : type of oculomotor behavior

and to validate this position by pressing a button

Results

Children with NF1 presented lower reading skills than TD children (**p<.001). -> 18 NF1 presented a Reading Delay (NF1-RD) and 24 didn't (NF1-nonRD)

- NF1-RD children presented more atypical oculomotor behavior than NF1-nonRD (p<.001). - groups also differed

according to the DEM zscores for HT, VT/Ht proportion (rapport) and error (**=p<.001)

- More flattened curve for NF1-nonRD -> TD children locate their 1st fixation mostly around P2 whereas the landing positions cover a more expanded zone, P2-P3 with NF1-nonRD

tracker (EYELINK II, SR Research Ltd).

NF1-RD displayed poor results in visual attention and generation of saccadic processing (e.g., less accurate, more variability, no sensibility to the discreteness of the stimuli).

A link between reading age and performance in both tasks : DEM test (r=.55, p<.05) and ocular bisection task (r=.59, p<.05) was evidenced in NF1 children.

No significant correlations were found between DEM parameters and the density of landing positions (r=-0.368 and r=-0.011, for VT/density in P2-P3 and HT/density in P2-P3)

Conclusions

DEM test (especially the HT) can be used clinically to distinguish NF1 with RD from NF1 without RD. Analysis of eye movement patterns represents a potential way to identify differences in the cognitive processing and visuo-attentional mechanisms underlying reading in NF1 children before the occurrence of school failure. Both language and visual aspects of reading should be targeted in intervention programs.
