8 Figures

Figure SI-1 . Irradiance of the fluorescent tubes Sylvania F15W/BL 368S used in devices 1 and 2.

**Figure SI-2**. Background level of NOx formation and NOx formation upon irradiation of IMD  $(10^{-4} \text{ M})$  for 1 h in device 1.

Figure SI-3 . Calibration curve for nitroso-phenol and nitro-phenol.

**Figure SI-4**. Consumption profile of aqueous IMD  $(10^{-4} \text{ M})$  irradiated in device 1, formation of NO<sub>3</sub><sup>-</sup> and NO<sub>2</sub><sup>-</sup> and area UPLC-HRMS of desnitro-IMD.

**Figure SI-5.** Structures (a)-(k) of the minimum energy structures and TSs at the MN12SX/6-31++G(d,p),PCM//MN12SX/6-31+G(d,p),PCM level. Energies are given relatively to the global minimum (see Figure 4). Specific bond distances (Å) are also indicated.

**Figure SI-7**. Consumption profile of IMD  $(10^{-4} \text{ M})$  upon irradiation in device 2.

**Figure SI-8 :** Formation of nitroso-resorcinol and nitro-resorcinol upon irradiation in device 2 of IMD ( $10^{-4}$  M) and resorcinol ( $10^{-4}$  M).

Table SI-1. HPLC conditions used for separation and analysis of the different compounds.

Table SI-2 : UPLC-HMRS of IMD and photoproducts

Table SI-3: Cartesian coordinates of the minimum energy structures and TSs at the MN12SX/6-

311++G(d,p),PCM//MN12SX/6-31+G(d,p),PCM level.

**Table SI-4 :** Photonitration and photonitrosation of the probes after 16 h of irradiation in device 2 in presence of IMD ( $10^{-5}$  or  $10^{-4}$  M) or a mixture of NO<sub>3</sub><sup>-</sup> ( $2 \times 10^{-5}$  M) and NO<sub>2</sub><sup>-</sup> ( $5 \times 10^{-6}$  M).

Figure SI-1 . Irradiance of the fluorescent tubes Sylvania F15W/BL 368S used in devices 1 and 2.

**Figure SI-2**. Background level of NOx formation (A) and NOx formation upon irradiation of IMD ( $10^{-4}$  M) for 1 h in device 1 (B). After selected irradiation times, the light was turned off and the outlet of the reactor connected to the NOx analyzer. NOx were measured every 10 seconds for a period of 1-2 min at a flow rate of 0.7 L min<sup>-1</sup>. The time profile of NOx concentrations corresponds to the decay of NOx level in the reactor due to the dilution with clean air.

 Table SI-2. HPLC conditions used for separation and analysis of the different compounds.

**Figure SI-3**. Calibration curve for nitroso-phenol (open circles) and for nitro-phenol (black circles). Area were obtained by UPLC-HR-MS analyses in electrospray negative mode. For nitrosophenol m/z = 122.0237 (5 ppm) and for nitrophenol m/z = 138.0186 (5 ppm).

**Figure SI-4**. Consumption profile of aqueous IMD ( $10^{-4}$  M) irradiated in device 1, formation of NO<sub>3</sub><sup>-</sup> and NO<sub>2</sub><sup>-</sup> (A) and area UPLC-HRMS of desnitro-IMD (B). IMD was analyzed by HPLC-UV, NO<sub>3</sub><sup>-</sup> by ionic chromatography, NO<sub>2</sub><sup>-</sup> by HPLC-UV after derivatization by DNPH. Desnitro-IMD was identified by UPLC-HRMS (m/z = 22.0740/213.0709,  $\Delta$  = 2.2 ppm)

**Figure SI-6.** Structures of  $\mathbf{RN}^+$  (a),  $\mathbf{RN}^+$ , $\mathbf{H}_2\mathbf{O}$  (b) and  $\mathbf{RN}$ , $\mathbf{H}_2\mathbf{O}$  (c) obtained at the MN12SX/6-31+G(d,p),PCM level and calculation of  $\mathbf{RN}^+$  energy:

## Calculation of RN<sup>+</sup> energy:

Optimization of  $RN^+$  at the MN12SX/6-31+G(d,p),PCM level gave rise to the high energy cyclized species in Fig SI-6a. This structure is similar to that found in the gas phase (MN12SX/6-31+G(d,p)) and it became clear that the PCM model was not sufficient to account for solvent effects here. It was thus decided to optimize  $RN^+$  at the MN12SX/6-31+G(d,p),PCM level in the presence of one water molecule (implicit + explicit solvation model). The obtained geometry is shown below in Figure SI-6b (no spurious cyclization). Thus, the more accurate energy of  $RN^+$  ( $RN^+/NO_2^-$  at 69.0 kcal/mol in Figure 4) was that of  $RN^+$  obtained at the MN12SX/6-31+G(d,p),PCM level and corrected with the energy difference below, i.e:

**Figure SI-7**. Consumption profile of IMD  $(10^{-4} \text{ M})$  upon irradiation in device 2. The concentrations of IMD were determined by HPLC-UV.

**Figure SI-8 :** Formation of nitroso-resorcinol (open circles) and nitro-resorcinol (full circles) upon irradiation in device 2 of IMD ( $10^{-4}$  M) and resorcinol ( $10^{-4}$  M). The concentrations of nitroso and nitro-resorcinols were estimated using calibration curves of Figure SI-3.

**Table SI-4 :** Photonitration and photonitrosation of the probes after 16 h of irradiation in device 2 in presence of IMD ( $10^{-5}$  or  $10^{-4}$  M) or a mixture of NO<sub>3</sub><sup>-</sup> ( $2 \times 10^{-5}$  M) and NO<sub>2</sub><sup>-</sup> ( $5 \times 10^{-6}$  M). The concentrations of IMD and of the probes were obtained by HPLC-UV while the amunts of nitro and nitro-derivatives by UPLC-HRMS.

Conditions	% of converted IMD	% of converted probe	Nitroso derivative formed (µg.L <sup>-1</sup> )	Nitro derivative formed (µg.L <sup>-1</sup> )	Sum (µg.L <sup>-1</sup> )
