## Outline

I. Recall of Some Classical Theorems
II. First Equivalence Theorem: De Rham, Lions, Necas
III. The Divergence Operator
IV. Second Equivalence Theorem: Lions, Poincaré
V. The Curl Operator

## I. Recall of Some Classical Theorems

In this work, we assume that $\Omega$ is a bounded open connected of $\mathbb{R}^{N}, N \geq 2$, with Lipschitz-continuous boundary.

The notation $X^{\prime}<,>_{X}$ denotes a duality pairing between a topological space $X$ and its dual $X^{\prime}$.

We shall use bold characters for the vector fields or the vector spaces and the non-bold characters for the scalars.
The letter $C$ denotes a constant that not necessarily the same at its various occurrences.
We set

$$
\boldsymbol{V}(\Omega)=\left\{\boldsymbol{\varphi} \in \boldsymbol{H}_{0}^{1}(\Omega) ; \operatorname{div} \varphi=0 \quad \text { in } \Omega\right\}
$$

## I. 1 The Classical J.L. Lions Lemma

We know that

$$
f \in L^{2}(\Omega) \Longrightarrow f \in H^{-1}(\Omega) \quad \text { and } \quad \nabla f \in \boldsymbol{H}^{-1}(\Omega)
$$

The classical Lions Lemma asserts that the reciprocal holds:

## Theorem 1 (Classical Lions Lemma)

We have the following property

$$
f \in H^{-1}(\Omega) \quad \text { and } \quad \nabla f \in \boldsymbol{H}^{-1}(\Omega) \Longrightarrow f \in L^{2}(\Omega)
$$

- G. Duvaut - J.L. Lions (1972) where $\Omega$ is $\mathcal{C}^{\infty}$ (see also L. Tartar (1978))

## I. 2 Necas Inequalities

## Theorem 2 (Necas Inequality)

i) For any $f \in L^{2}(\Omega)$, we have

$$
\begin{equation*}
\|f\|_{L^{2}(\Omega)} \leq C\left(\|f\|_{H^{-1}(\Omega)}+\|\nabla f\|_{H^{-1}(\Omega)}\right) \tag{1}
\end{equation*}
$$

ii) More generally, for any integer $m$ and any $1<p<\infty$, we have for all $f \in W^{m, p}(\Omega)$,

$$
\begin{equation*}
\|f\|_{W^{m, p}(\Omega)} \leq C\left(\|f\|_{W^{m-1, p}(\Omega)}+\|\nabla f\|_{W^{m-1, p}(\Omega)}\right) \tag{2}
\end{equation*}
$$

- J. Necas (1965)

## I. 3 Korn's Inequality, Duvaut-Lions (1972)

Setting

$$
e_{i j}(\boldsymbol{v})=\frac{\partial v_{i}}{\partial x_{j}}+\frac{\partial v_{j}}{\partial x_{i}}
$$

## Theorem 3 (Korn's Inequality)

$$
\begin{equation*}
\forall \boldsymbol{v} \in \boldsymbol{H}^{1}(\Omega), \quad\|\boldsymbol{v}\|_{\boldsymbol{H}^{1}(\Omega)} \leq C\left(\|\boldsymbol{v}\|_{L^{2}(\Omega)}+\|e(\boldsymbol{v})\|_{L^{2}(\Omega)}\right) \tag{3}
\end{equation*}
$$

Proof. To prove this inequality, it suffices to prove that

$$
\left(\boldsymbol{v} \in \boldsymbol{L}^{2}(\Omega) \quad \text { and } \quad e(\boldsymbol{v}) \in \boldsymbol{L}^{2}(\Omega)\right) \Longrightarrow \nabla \boldsymbol{v} \in \boldsymbol{L}^{2}(\Omega)
$$

and then to use the Banach Theorem. Let us consider $\boldsymbol{v} \in \boldsymbol{L}^{2}(\Omega)$ and $e(\boldsymbol{v}) \in \boldsymbol{L}^{2}(\Omega)$. Thanks to the following relation

$$
\frac{\partial}{\partial x_{j}}\left(\frac{\partial v_{k}}{\partial x_{i}}\right)=\frac{\partial e_{i k}}{\partial x_{j}}+\frac{\partial e_{i j}}{\partial x_{k}}-\frac{\partial e_{j k}}{\partial x_{i}} .
$$

we deduce that

$$
\nabla \frac{\partial v_{k}}{\partial x_{i}} \in \boldsymbol{H}^{-1}(\Omega) .
$$

Because $\frac{\partial v_{k}}{\partial x_{i}} \in H^{-1}(\Omega)$, the classical Lions Lemma implies that $\frac{\partial v_{k}}{\partial x_{i}} \in L^{2}(\Omega)$.

Remark. There exist different proofs, that do not use Lions Lemma, of the Korn inequality:

- J. Gobert (1962): Proof uses Calderon-Zygmund singular integrals
- V.A Kondrat'ev - O.A. Oleinik (1988): Proof uses integral inequalities with $(\operatorname{dist}(\cdot, \Gamma))^{2}$ as a weight and hypoellipticity of $\Delta$.

## I. 4 De Rham's Theorem

It is clear that if $q \in L^{2}(\Omega)$, then $\nabla q \in \boldsymbol{H}^{-1}(\Omega)$ and

$$
\forall \boldsymbol{v} \in V(\Omega), \quad<\nabla q, \boldsymbol{v}>=0
$$

We will prove later that the divergence operator

$$
\operatorname{div}: \boldsymbol{H}_{0}^{1}(\Omega) / \boldsymbol{V}(\Omega) \mapsto L_{0}^{2}(\Omega)
$$

is an isomorphism. So, by duality, we deduce that

## Theorem 4 (De Rham in $\boldsymbol{H}^{-1}(\Omega)$, First Version)

The operator

$$
\begin{equation*}
\operatorname{grad}: L^{2}(\Omega) / \mathbb{R} \mapsto \boldsymbol{V}(\Omega)^{\circ} \tag{4}
\end{equation*}
$$

where

$$
\boldsymbol{V}(\Omega)^{\circ}=\left\{\boldsymbol{f} \in \boldsymbol{H}^{-1}(\Omega) ; \forall \boldsymbol{v} \in \boldsymbol{V}(\Omega),<\boldsymbol{f}, \boldsymbol{v}>=0\right\} .
$$

is an isomorphism.
That means that for any $\boldsymbol{f} \in \boldsymbol{H}^{-1}(\Omega)$ satisfying

$$
\forall \boldsymbol{v} \in V(\Omega), \quad<\boldsymbol{f}, \boldsymbol{v}>=0
$$

there exists $\pi \in L^{2}(\Omega)$, unique up to an additive constant, such that

$$
f=\nabla \pi .
$$

## Theorem 5 (Stokes Equations)

For any $\boldsymbol{f} \in \boldsymbol{H}^{-1}(\Omega)$, there exists a unique solution

$$
(\boldsymbol{u}, \pi) \in \boldsymbol{H}_{0}^{1}(\Omega) \times L_{0}^{2}(\Omega)
$$

to the Stokes equations

$$
\begin{equation*}
-\Delta \boldsymbol{u}+\nabla \pi=\boldsymbol{f} \quad \text { and } \quad \operatorname{div} \boldsymbol{u}=0 \quad \text { in } \Omega \tag{5}
\end{equation*}
$$

Proof. Using Lax-Milgram Lemma, there exists a unique $\boldsymbol{u} \in \boldsymbol{V}(\Omega)$ satisfying the following variational formulation:

Find $\boldsymbol{u} \in \boldsymbol{V}(\Omega)$ such that

$$
\begin{equation*}
\forall \boldsymbol{v} \in \boldsymbol{V}(\Omega), \quad \int_{\Omega} \nabla \boldsymbol{u}: \nabla \boldsymbol{v}=<\boldsymbol{f}, \boldsymbol{v}> \tag{6}
\end{equation*}
$$

Consequently we have

$$
\forall v \in V(\Omega), \quad<-\Delta u-f, v>=0
$$

Finally, by De Rham's Theorem, there exists $\pi \in L^{2}(\Omega)$, unique up an additive constant, such that

$$
-\Delta u+\nabla \pi=f \quad \text { in } \Omega
$$

We can improve the previous De Rham Theorem (see Amrouche-Girault, Czech. Math. Journ., 1994).
Setting

$$
\mathcal{V}(\Omega)=\{\boldsymbol{v} \in \mathcal{D}(\Omega) ; \operatorname{div} \boldsymbol{v}=0 \quad \text { in } \Omega\},
$$

we have

## Theorem 6. (De Rham in $\boldsymbol{H}^{-1}(\Omega)$ Second Version)

Let $\boldsymbol{f} \in \boldsymbol{H}^{-1}(\Omega)$ satisfying

$$
\forall \boldsymbol{v} \in \mathcal{V}(\Omega), \quad<\boldsymbol{f}, \boldsymbol{v}>=0
$$

Then there exists $\pi \in L^{2}(\Omega)$, unique up to an additive constant, such that

$$
f=\nabla \pi
$$

Proof. i) Firstly, we prove the algebraical and topological following indentity:

$$
\left\{u \in L_{\mathrm{loc}}^{2}(\Omega) ; \nabla u \in \boldsymbol{H}^{-1}(\Omega)\right\}=L^{2}(\Omega) .
$$

ii) Therefore, it suffices to proof the existence of $\pi$ in $L_{\text {loc }}^{2}(\Omega)$. To this end, consider an increasing sequence $\left(\Omega_{k}\right)_{k}$ of Lipschitz-continuous, connected open sets such that

$$
\overline{\Omega_{k}} \subset \Omega, \quad \cup_{k} \Omega_{k}=\Omega
$$

Take any function $\boldsymbol{v} \in V\left(\Omega_{k}\right)$ and let us extend it by zero outside $\Omega_{k}$. Then the extended function, still denoted by $v$ belongs to $V(\Omega)$. Then, for all sufficiently small $\varepsilon>0$, we have:

$$
\rho_{\varepsilon} \star \boldsymbol{v} \in \mathcal{D}(\Omega), \quad \operatorname{div}\left(\rho_{\varepsilon} \star \boldsymbol{v}\right)=0
$$

As $\rho_{\varepsilon} \star \boldsymbol{v} \in \mathcal{V}(\Omega)$, the assumption on $\boldsymbol{f}$ yields:

$$
<\boldsymbol{f}, \boldsymbol{v}>=\lim _{\varepsilon \rightarrow 0}<\boldsymbol{f}, \rho_{\varepsilon} \star \boldsymbol{v}>=0
$$

De Rham's Theorem first version applied in $\Omega_{k}$ to $f_{\mid \Omega_{k}}$ implies that there exists $\pi_{k} \in L^{2}\left(\Omega_{k}\right)$ such that $f_{\mid \Omega_{k}}=\nabla \pi_{k}$. And since $\pi_{k+1}-\pi_{k}$ is constant in $\Omega_{k}$, this constant can be choose so that $\pi_{k+1}=\pi_{k}$ in $\Omega_{k}$, and hence $f=\nabla \pi$ with $\pi \in L^{2}(\omega)$ for any proper subset $\omega$ of $\Omega$, i.e $\pi \in L_{\text {loc }}^{2}(\Omega)$.

Remark We have proved that the following properties are equivalent:
(i) The operator div is onto: div : $\boldsymbol{H}_{0}^{1}(\Omega) / \boldsymbol{V}(\Omega) \mapsto L_{0}^{2}(\Omega)$ is an isomorphism.
(ii) First Version of De Rham's Theorem
(iii) Second Version of De Rham's Theorem

## II. First Equivalence Theorem: De Rham, Lions, Necas

## Theorem 7 (Lions-Necas-De Rham and Divergence operator)

The followings are equivalent:
(i) The operator div is onto: div : $\boldsymbol{H}_{0}^{1}(\Omega) / \boldsymbol{V}(\Omega) \mapsto L_{0}^{2}(\Omega)$ is an isomorphism.
(ii) First Version of De Rham's Theorem: For any $f \in \boldsymbol{H}^{-1}(\Omega)$ satisfying

$$
\forall \boldsymbol{v} \in \boldsymbol{V}(\Omega), \quad<\boldsymbol{f}, \boldsymbol{v}>=0
$$

there exists $\pi \in L^{2}(\Omega)$, unique up to an additive constant, such that $f=\nabla \pi$. (iii) Second Version of De Rham's Theorem: Let $\boldsymbol{f} \in \boldsymbol{H}^{-1}(\Omega)$ satisfying

$$
\forall v \in \mathcal{V}(\Omega), \quad<\boldsymbol{f}, \boldsymbol{v}>=0
$$

Then there exists $\pi \in L^{2}(\Omega)$, unique up to an additive constant, such that $f=\nabla \pi$. (iv) Classical Lions Lemma: $L^{2}(\Omega)=\left\{q \in H^{-1}(\Omega) ; \nabla q \in \boldsymbol{H}^{-1}(\Omega)\right\}$.
(v) Necas Inequality:

$$
\begin{equation*}
\forall q \in L^{2}(\Omega), \quad\|q\|_{L^{2}(\Omega)} \leq C\left(\|q\|_{H^{-1}(\Omega)}+\|\nabla q\|_{H^{-1}(\Omega)}\right) \tag{7}
\end{equation*}
$$

(vi) General Lions Lemma: $L^{2}(\Omega)=\left\{q \in \mathcal{D}^{\prime}(\Omega) ; \nabla q \in \boldsymbol{H}^{-1}(\Omega)\right\}$.

Sketch of Proof of Theorem 1.According to the previous remark, we know that the the properties (i), (ii) and (iii) are equivalent.

1. Implication (i) $\Longrightarrow$ (iv). We deduce from point (i) that the operator

$$
\begin{equation*}
\operatorname{div}: \boldsymbol{V}(\Omega)^{\perp} \mapsto L_{0}^{2}(\Omega) \tag{8}
\end{equation*}
$$

is an isomorphism and by duality that

$$
\begin{equation*}
\operatorname{grad}: L^{2}(\Omega) / \mathbb{R} \mapsto \boldsymbol{V}(\Omega)^{\circ} \tag{9}
\end{equation*}
$$

is also an isomorphism, where the polar set $\boldsymbol{V}(\Omega)^{\circ}$ is defined by

$$
\boldsymbol{V}(\Omega)^{\circ}=\left\{\boldsymbol{f} \in \boldsymbol{H}^{-1}(\Omega) ; \forall \boldsymbol{v} \in \boldsymbol{V}(\Omega),<\boldsymbol{f}, \boldsymbol{v}>=0\right\}
$$

Let now

$$
q \in H^{-1}(\Omega) \quad \text { such that } \quad \nabla q \in \boldsymbol{H}^{-1}(\Omega)
$$

Using the density of $\mathcal{D}(\Omega)$ in

$$
\boldsymbol{H}_{0}^{1}(\operatorname{div} ; \Omega)=\left\{\boldsymbol{v} \in \boldsymbol{H}_{0}^{1}(\Omega) ; \operatorname{div} \boldsymbol{v} \in H_{0}^{1}(\Omega)\right\}
$$

we deduce that for all $\boldsymbol{v} \in \boldsymbol{V}(\Omega)$ :

$$
\boldsymbol{H}^{-1}(\Omega)<\nabla q, \boldsymbol{v}>_{\boldsymbol{H}_{0}^{1}(\Omega)}=-{ }_{H^{-1}(\Omega)}<q, \operatorname{div} \boldsymbol{v}>_{H_{0}^{1}(\Omega)}=0
$$

So $\nabla q \in \boldsymbol{V}(\Omega)^{\circ}$ and then

$$
\nabla q=\nabla p \quad \text { with some } p \text { in } L^{2}(\Omega)
$$

which proves the point ii), since

$$
q=p+C \in L^{2}(\Omega), \quad \text { for some constant } C .
$$

2. Implication (iv) $\Longrightarrow$ (v). The space

$$
E(\Omega)=\left\{f \in H^{-1}(\Omega) ; \nabla f \in \boldsymbol{H}^{-1}(\Omega)\right\}
$$

endowed with the graph norm is complete. The canonical injection

$$
\operatorname{Id}: L^{2}(\Omega) \mapsto E(\Omega)
$$

is one-to-one, (clearly) continuous and onto by the classical Lions Lemma. Therefore, by Banach open mapping Theorem, the inverse $\mathrm{Id}^{-1}$ is also continuous and then we deduce the Necas inequality

$$
\begin{equation*}
\forall f \in L^{2}(\Omega), \quad\|f\|_{L^{2}(\Omega)} \leq C\left(\|f\|_{H^{-1}(\Omega)}+\|\nabla f\|_{\boldsymbol{H}^{-1}(\Omega)}\right) \tag{10}
\end{equation*}
$$

3. Implication (v) $\Longrightarrow$ (i). Recall firstly the Peetre-Tartar Theorem. Let $E_{1}, E_{2}, E_{3}$ be three Banach spaces, $A \in \mathcal{L}\left(E_{1} ; E_{2}\right)$ and $B \in \mathcal{L}\left(E_{1} ; E_{3}\right)$ a compact operator such that

$$
\forall u \in E_{1}, \quad\|u\|_{E_{1}} \simeq\|A u\|_{E_{2}}+\|B u\|_{E_{3}}
$$

Then the mapping

$$
A: E_{1 / \operatorname{Ker} A} \mapsto \mathcal{R}(A)
$$

is an isomorphism and $\mathcal{R}(A)$ is a closed subspace of $E_{2}$. Observe that the Necas inequality implies that

$$
\begin{equation*}
\forall f \in L^{2}(\Omega), \quad\|f\|_{L^{2}(\Omega)} \simeq\|f\|_{H^{-1}(\Omega)}+\|\nabla f\|_{H^{-1}(\Omega)} \tag{11}
\end{equation*}
$$

Because the injection of $L^{2}(\Omega)$ in $H^{-1}(\Omega)$ is compact, we can apply the Peetre-Tartar Theorem, with

$$
A=\nabla, B=I d, E_{1}=L^{2}(\Omega), E_{2}=\boldsymbol{H}^{-1}(\Omega), E_{3}=H^{-1}(\Omega)
$$

to deduce that the operator

$$
\begin{equation*}
\operatorname{grad}: L^{2}(\Omega) / \mathbb{R} \mapsto \boldsymbol{V}(\Omega)^{\circ} \tag{12}
\end{equation*}
$$

is an isomorphism and by duality

$$
\begin{equation*}
\operatorname{div}: V(\Omega)^{\perp} \mapsto L_{0}^{2}(\Omega) \tag{13}
\end{equation*}
$$

is also an isomorphism, which proves the point i).
4. Implication (iv) $\Longleftrightarrow$ ( $\mathbf{v i}$ ). It is clear that the general Lions Lemma implies the classical Lions Lemma. Conversely, suppose that the classical Lions Lemma holds. Let $q \in \mathcal{D}^{\prime}(\Omega)$ such that $\nabla q \in \boldsymbol{H}^{-1}(\Omega)$. Then

$$
\forall \boldsymbol{v} \in \mathcal{V}(\Omega), \quad<\nabla q, \boldsymbol{v}>=0
$$

Because the classical Lions Lemma is equivalent to the second version of De Rham's Theorem, there exists $\pi \in L^{2}(\Omega)$ such that $\nabla q=\nabla \pi$. Since $q=\pi+C$, we deduce that $q \in L^{2}(\Omega)$.

## II. The divergence operator

## Theorem 8

Let $\Omega$ be a bounded, connected open subset of $\mathbb{R}^{n}$, with $n \geq 2$ and with a Lipschitz-continuous boundary.
i) The following operator

$$
\begin{equation*}
\operatorname{div}: \boldsymbol{H}_{0}^{1}(\Omega) / \boldsymbol{V}(\Omega) \mapsto L_{0}^{2}(\Omega) \tag{14}
\end{equation*}
$$

is an isomorphism.
ii) Moreover the operator

$$
\begin{equation*}
\operatorname{div}: \mathcal{D}(\Omega) \mapsto \mathcal{D}(\Omega) \cap L_{0}^{2}(\Omega) \tag{15}
\end{equation*}
$$

is onto
Proof. This result is due to Bogovskii (1979) with a very short proof. The following more complete proof is inspired by the proof given in the book of P. Galdi (1994).
To get (14), we will prove that for any $f \in L_{0}^{2}(\Omega)$, there exists a vector field $\boldsymbol{u} \in \boldsymbol{H}_{0}^{1}(\Omega)$ such that div $\boldsymbol{u}=f$ and satisfying the inequality

$$
\begin{equation*}
\|\boldsymbol{u}\|_{H^{1}(\Omega)} \leq C\|f\|_{L^{2}(\Omega)} \tag{16}
\end{equation*}
$$

First step. We suppose that $\Omega$ is starlike with respect to some open ball $B$ contained it in. In this case, the vector $\boldsymbol{u}:=\boldsymbol{R} f$ is constructed explicitly.
i) Construction of $\boldsymbol{R}$. Suppose $f \in \mathcal{D}(\Omega)$ and let $\tilde{f} \in \mathcal{D}\left(\mathbb{R}^{n}\right)$ its extension by 0 outside of $\Omega$, with $n \geq 2$. Let $\theta$ a fixed function satisfying

$$
\theta \in \mathcal{D}\left(\mathbb{R}^{n}\right), \quad 0 \leq \theta \leq 1, \quad \text { with } \operatorname{supp} \theta \subset B \quad \text { and } \quad \int_{\mathbb{R}^{n}} \theta=1
$$

Consider the function $t \mapsto t^{n} \tilde{f}(y+t(x-y))$, with $t \in \mathbb{R}$ and $(x, y) \in \mathbb{R}^{n} \times \mathbb{R}^{n}$. Then

$$
\frac{d}{d t}\left(t^{n} \tilde{f}\right)(y+t(x-y))=t^{n-1} \nabla_{x} \cdot((x-y) \tilde{f}(y+t(x-y))
$$

Multiplying this relation by $\theta(y)$ and integrating with respect $y$ in $\Omega$ and with respect $t$ on $] 1, \infty[$. Then,

$$
f(x)=-\int_{\Omega} \int_{1}^{\infty} \theta(y) t^{n-1} \nabla_{x} \cdot((x-y) \tilde{f}(y+t(x-y)) d t d y
$$

The following vector field
$x \in \Omega, \quad \boldsymbol{u}(x)=-\int_{\mathbb{R}^{n}}(x-y) \theta(y) \int_{1}^{\infty} t^{n-1} \tilde{f}(y+t(x-y)) d t d y$.
satisfies, as we will prove later,

$$
\operatorname{div} \boldsymbol{u}=f \quad \text { in } \Omega
$$

Setting successively $z=y+t(x-y), t=(r-1) / r, s=1-r$ and after changing $z$ into $y$ and $s$ into $t$, we obtain

$$
\begin{equation*}
x \in \Omega, \quad \boldsymbol{u}(x)=\int_{\mathbb{R}^{n}}(x-y) f(y) \int_{1}^{\infty} t^{n-1} \theta(y+t(x-y)) d t d y \tag{18}
\end{equation*}
$$

Setting finally $r=t|x-y|$, we have also
$\boldsymbol{u}(x):=\boldsymbol{R} f(x)=\int_{\Omega} \frac{x-y}{|x-y|^{n}} f(y) \int_{|x-y|}^{\infty} \theta\left(y+r \frac{x-y}{|x-y|}\right) r^{n-1} d r d y$.
We verify then that $\operatorname{supp} \boldsymbol{R} f$ is compact and $\boldsymbol{R} f$ is $\mathcal{C}^{\infty}(\Omega)$.
ii) Proof of $\operatorname{div} R f=f$. We observe first that

$$
\boldsymbol{u}(x)=\lim _{\varepsilon \rightarrow 0} \int_{|x-y| \geq \varepsilon} \tilde{f}(y) \boldsymbol{K}(x, y) d y
$$

where
$\boldsymbol{K}(x, y)=(x-y) \int_{1}^{\infty} t^{n-1} \theta(y+t(x-y)) d t=\frac{x-y}{|x-y|^{n}} \int_{|x-y|}^{\infty} \theta\left(y+r \frac{x-y}{|x-y|}\right) r^{n-1} d r$
Then

$$
\begin{equation*}
\frac{\partial u_{i}}{\partial x_{j}}(x)=\lim _{\varepsilon \rightarrow 0}\left[\int_{|x-y| \geq \varepsilon} \tilde{f}(y) \frac{\partial K_{i}}{\partial x_{j}}(x, y) d y+\int_{|x-y|=\varepsilon} \tilde{f}(y) \frac{x_{j}-y_{j}}{|x-y|} K_{i}(x, y) d \sigma_{y}\right] \tag{20}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{\varepsilon \rightarrow 0} \int_{|x-y|=\varepsilon} \tilde{f}(y) \frac{x_{j}-y_{j}}{|x-y|} K_{i}(x, y) d \sigma_{y}=\tilde{f}(x) \int_{\Omega} \frac{\left(x_{j}-y_{j}\right)\left(x_{i}-y_{i}\right)}{|x-y|^{2}} \theta(y) d \sigma_{y} \tag{21}
\end{equation*}
$$

Besides, we have

$$
\begin{align*}
\frac{\partial K_{i}}{\partial x_{j}}(x, y) & =\delta_{i j} \int_{1}^{\infty} t^{n-1} \theta(y+t(x-y)) d t+\left(x_{i}-y_{i}\right) \int_{1}^{\infty} t^{n} \frac{\partial \theta}{\partial x_{j}}(y+t(x-y)) d t \\
& =\frac{\delta_{i j}}{|x-y|^{n}} \int_{0}^{\infty} \theta\left(x+r \frac{x-y}{|x-y|}\right)(|x-y|+r)^{n-1} d r \\
& +\frac{x_{i}-y_{i}}{|x-y|^{n}} \int_{0}^{\infty} \frac{\partial \theta}{\partial x_{j}}\left(x+r \frac{x-y}{|x-y|}\right)(|x-y|+r)^{n} d r \tag{22}
\end{align*}
$$

From this relations, we deduce that

$$
\begin{aligned}
\nabla_{x} \cdot \boldsymbol{K}(x, y) & =n \int_{1}^{\infty} t^{n-1} \theta(y+t(x-y))+\int_{1}^{\infty} t^{n} \frac{\partial \theta}{\partial t}(y+t(x-y)) \\
& =-\theta(x)
\end{aligned}
$$

and

$$
\operatorname{div} \boldsymbol{u}(x)=-\theta(x) \int_{\Omega} f(y) d y+f(x)=f(x)
$$

because by assumption the integral of $f$ is equal to 0 .
iii) We will prove now that

$$
\boldsymbol{R}: L_{0}^{2}(\Omega) \mapsto \boldsymbol{H}_{0}^{1}(\Omega)
$$

is continuous, that means that

$$
\begin{equation*}
\|\nabla \boldsymbol{R} f\|_{\boldsymbol{L}^{2}(\Omega)} \leq C\|f\|_{L^{2}(\Omega)} \tag{23}
\end{equation*}
$$

Thanks to the Newton's binôme formula, we have the following decomposition:

$$
\frac{\partial K_{i}}{\partial x_{j}}(x, y)=K_{i j}(x, x-y)+G_{i j}(x, y)
$$

where

$$
\begin{aligned}
K_{i j}(x, x-y) & =\frac{\delta_{i j}}{|x-y|^{n}} \int_{0}^{\infty} \theta\left(x+r \frac{x-y}{|x-y|}\right) r^{n-1} d r+ \\
& +\frac{x_{i}-y_{i}}{|x-y|^{n+1}} \int_{0}^{\infty} \frac{\partial \theta}{\partial x_{j}}\left(x+r \frac{x-y}{|x-y|}\right) r^{n} d r \\
: & =\frac{k_{i j}(x, x-y)}{|x-y|^{n}}
\end{aligned}
$$

and $G_{i j}$ satisfies the following estimate:

$$
\left|G_{i j}(x, y)\right| \leq C \delta(\Omega)^{n-1} /|x-y|^{n-1}
$$

with $C=C(\theta, n)$.
We deduce from (20)-(22) that

$$
\begin{aligned}
\frac{\partial(R f)_{i}}{\partial x_{j}}(x) & =\int_{\Omega} K_{i j}(x, x-y) f(y) d y+\int_{\Omega} G_{i j}(x, y) f(y) d y+ \\
& +f(x) \int_{\Omega} \frac{\left(x_{j}-y_{j}\right)\left(x_{i}-y_{i}\right)}{|x-y|^{2}} \theta(y) d y \\
: & =J_{1} f(x)+J_{2} f(x)+J_{3} f(x) .
\end{aligned}
$$

It is clear that $\left|J_{3} f(x)\right| \leq|f(x)|$ and then

$$
\left\|J_{3} f\right\|_{L^{2}(\Omega)} \leq\|f\|_{L^{2}(\Omega)}
$$

We have also

$$
\left|J_{2} f(x)\right| \leq C \delta(\Omega)^{n-1}\left|\int_{\mathbb{R}^{n}} \frac{\tilde{f}(y)}{|x-y|^{n-1}} d y\right|
$$

That means that

$$
\left|J_{2} f(x)\right| \leq C \delta(\Omega)^{n-1}\left|I_{1} \tilde{f}(x)\right|
$$

where $I_{1} \tilde{f}$ is the Riesz potential of order 1 . Hence

$$
\left\|J_{2} f\right\|_{L^{2}(\Omega)} \leq C \delta(\Omega)^{n-1}\left\|I_{1} \tilde{f}\right\|_{L^{2}\left(\mathbb{R}^{n}\right)}
$$

Recall now that for any $\varphi \in \mathcal{D}\left(\mathbb{R}^{n}\right)$,

$$
\left\|\nabla I_{1} \varphi\right\|_{L^{2}\left(\mathbb{R}^{n}\right)} \leq C\|\varphi\|_{L^{2}\left(\mathbb{R}^{n}\right)}
$$

and by duality, for any $\varphi \in \mathcal{D}\left(\mathbb{R}^{n}\right)$ such that $\int_{\mathbb{R}^{n}} \varphi=0$,

$$
\left\|I_{1} \varphi\right\|_{L^{2}\left(\mathbb{R}^{n}\right)} \leq C\|\varphi\|_{W_{0}^{-1,2}\left(\mathbb{R}^{n}\right)}
$$

where $W_{0}^{-1,2}\left(\mathbb{R}^{n}\right)$ is the dual space of

$$
W_{0}^{1,2}\left(\mathbb{R}^{n}\right)=\left\{v \in \mathcal{D}^{\prime}\left(\mathbb{R}^{n}\right) ; \frac{v}{\omega} \in L^{2}\left(\mathbb{R}^{n}\right) \nabla v \in \boldsymbol{L}^{2}\left(\mathbb{R}^{n}\right)\right\}
$$

with
$\omega=1+|x| \quad$ if $\quad n \geq 3 \quad$ and $\quad \omega=(1+|x|) \ln (2+|x|) \quad$ if $\quad n=2$.
Applying the previous inequality to $\tilde{f}$, because $\Omega$ is bounded, we get

$$
\left\|I_{1} \tilde{f}\right\|_{L^{2}\left(\mathbb{R}^{n}\right)} \leq C\|\tilde{f}\|_{W_{0}^{-1,2}\left(\mathbb{R}^{n}\right)} \leq C\|f\|_{L^{2}(\Omega)}
$$

Finally, concerning the estimate of $J_{1} f$, we need the following lemma due to Calderon-Zygmund.

## Lemma (Calderon-Zygmund)

Let be $K(x, y)=N(x, x-y)$, where $N$ is homogeneous of degre $-n$ in $y$ and
i) for any $x$,

$$
\int_{|y|=1} N(x, y) d y=0
$$

ii) there exist $q>0$ and $C>0$ such that

$$
\forall x, \quad \int_{|y|=1}|N(x, y)|^{q} d y \leq C
$$

then the operator defined by

$$
K f(x)=\int_{\mathbb{R}^{n}} K(x, y) f(y) d y
$$

is continuous from $L^{p}\left(\mathbb{R}^{n}\right)$ into $L^{p}\left(\mathbb{R}^{n}\right)$, for any $p$ such that $q /(q-1) \leq p<\infty$.

Applying this lemma with $N(x, y)=K_{i j}(x, y)$. It is clear that $K_{i j}(x, y)$ is homogeneous of degre $-n$ in $y$ and

$$
\begin{aligned}
\int_{|z|=1} K_{i j}(x, z) d z & =\int_{|z|=1} \int_{0}^{\infty}\left(\delta_{i j} \theta(x+r z) r^{n-1} d r d \sigma_{z}+\right. \\
& \left.+z_{i} \frac{\partial \theta}{\partial x_{j}}(x+r z) r^{n}\right) d r d \sigma_{z} \\
& =\int_{\mathbb{R}^{n}}\left(\delta_{i j} \theta(x+y)+y_{i} \frac{\partial \theta}{\partial x_{j}}(x+y)\right) d y=0
\end{aligned}
$$

Finally, the property ii) is satisfied by using the fact that supp $\theta \subset B$ and $\Omega$ is bounded, that finishes the proof of the continuity property (23) and the first step of the proof of Theorem 1.

Second step. We know that every bounded Lipschitz domain $\Omega$ is the union of a finite number of bounded domains, each of which is starlike with respect to an open ball. Thanks to a partition of unity subordinated to this covering, we extend the result of the step 1 to the case where $\Omega$ is a bounded Lipschitz domain.

Third step. We have prove that

$$
\forall f \in \mathcal{D}(\Omega) \cap L_{0}^{2}(\Omega), \quad \exists \boldsymbol{u} \in \mathcal{D}(\Omega) \quad \text { such that } \quad \operatorname{div} \boldsymbol{u}=f
$$

with the inequality

$$
\|\boldsymbol{u}\|_{\boldsymbol{H}^{1}(\Omega)} \leq C\|f\|_{L^{2}(\Omega)}
$$

Let us consider now $f \in L_{0}^{2}(\Omega)$ only. And let $\psi \in \mathcal{D}(\Omega)$ fixed with $\int_{\Omega} \psi=1$ and

$$
f_{k} \in \mathcal{D}(\Omega) \quad \text { such that } \quad f_{k} \rightarrow f \quad \text { in } L^{2}(\Omega)
$$

Setting

$$
F_{k}=f_{k}-\psi \int_{\Omega} f_{k}
$$

then

$$
F_{k} \in \mathcal{D}(\Omega) \cap L_{0}^{2}(\Omega), \quad F_{k} \rightarrow f \quad \text { in } L^{2}(\Omega)
$$

and there exists $\boldsymbol{u}_{k} \in \mathcal{D}(\Omega)^{n}$ satisfying

$$
\operatorname{div} \boldsymbol{u}_{k}=F_{k},
$$

with

$$
\boldsymbol{u}_{k} \rightarrow \boldsymbol{u} \in \boldsymbol{H}_{0}^{1}(\Omega) \quad \text { and } \quad \operatorname{div} \boldsymbol{u}=f
$$

Moreover

$$
\|\boldsymbol{u}\|_{\boldsymbol{H}^{1}(\Omega)} \leq C\|f\|_{L^{2}(\Omega)} .
$$

We are now in position to give some extensions.

## Theorem 9.

For any integer $m \geq 1$, the following operator

$$
\begin{equation*}
\operatorname{div}: H_{0}^{m+1}(\Omega) / V_{m+1} \mapsto H_{0}^{m}(\Omega) \cap L_{0}^{2}(\Omega) \tag{24}
\end{equation*}
$$

is an isomorphism, where

$$
V_{m+1}=\left\{\boldsymbol{v} \in \boldsymbol{H}_{0}^{m+1}(\Omega) ; \operatorname{div} \boldsymbol{v}=0\right\} .
$$

Proof. We give here a sketch of the proof and we consider only the case $m=1$, the same raisoning being avalaible for $m \geq 2$.
We will use here the same arguments as in the point iii) of the first theorem concerning the divergence operator defined on $\boldsymbol{H}_{0}^{1}(\Omega)$ and we would like to prove the following estimate:

$$
\forall f \in H_{0}^{1}(\Omega) \cap L_{0}^{2}(\Omega), \quad\left\|\frac{\partial^{2} \boldsymbol{R} f}{\partial x_{k} \partial x_{j}}\right\|_{\boldsymbol{L}^{2}(\Omega)} \leq C\|f\|_{H^{1}(\Omega)}
$$

for any $1 \leq j, k \leq n$.
Rewriting the relation (19) under the form

$$
\boldsymbol{R} f(x)=\int_{\mathbb{R}^{n}} \frac{z}{|z|^{n}} \tilde{f}(x-z) \int_{0}^{\infty} \theta\left(x+s \frac{z}{|z|}\right)(|z|+s)^{n-1} d s d y
$$

we obtain

$$
\begin{aligned}
\frac{\partial \boldsymbol{R} f}{\partial x_{j}}(x) & =\int_{\mathbb{R}^{n}} \frac{z}{|z|^{n}} \frac{\partial \tilde{f}}{\partial x_{j}}(x-z) \int_{0}^{\infty} \theta\left(x+s \frac{z}{|z|}\right)(|z|+s)^{n-1} d s d y \\
& +\int_{\mathbb{R}^{n}} \frac{z}{|z|^{n}} \tilde{f}(x-z) \int_{0}^{\infty} \frac{\partial \theta}{\partial x_{j}}\left(x+s \frac{z}{|z|}\right)(|z|+s)^{n-1} d s d y \\
& =\boldsymbol{g}_{1}(x)+\boldsymbol{g}_{2}(x)
\end{aligned}
$$

Estimate of $\left\|\frac{\partial g_{1}}{\partial x_{k}}\right\|_{L^{2}(\Omega)^{n}}$
As below, we prove that

$$
\left\|\frac{\partial \boldsymbol{g}_{1}}{\partial x_{k}}\right\|_{L^{2}(\Omega)} \leq C\left\|\frac{\partial f}{\partial x_{j}}\right\|_{L^{2}(\Omega)}
$$

Estimate of $\left\|\frac{\partial \boldsymbol{g}_{2}}{\partial x_{k}}\right\|_{L^{2}(\Omega)^{n}}$
We remark that $\boldsymbol{g}_{2}$ is the same form as $\boldsymbol{R} f$, with the difference that $\theta$ is replaced by $\frac{\partial \theta}{\partial x_{j}}$. Note that we does'nt use the property $\int_{B} \theta=1$ to find the estimate of the point iv). That means that with the same raisonning, we obtain

$$
\left\|\frac{\partial \boldsymbol{g}_{2}}{\partial x_{k}}\right\|_{L^{2}(\Omega)} \leq C\|f\|_{L^{2}(\Omega)}
$$

Hence we have established the result for $f \in \mathcal{D}(\Omega) \cap L_{0}^{2}(\Omega)$ and proceeding as in the step 3 of the proof of the first theorem concerning the divergence operator defined on $\boldsymbol{H}_{0}^{1}(\Omega)$, we extend this one to the case where $f \in H_{0}^{1}(\Omega) \cap L_{0}^{2}(\Omega)$.

## Corollary 10. (De Rham in $\boldsymbol{H}^{-m-1}(\Omega)$ First Version)

Let $m$ a positve integer and $\boldsymbol{f} \in \boldsymbol{H}^{-m-1}(\Omega)$ satisfying

$$
\forall \boldsymbol{v} \in V_{m+1}, \quad<\boldsymbol{f}, \boldsymbol{v}>=0
$$

Then there exists $\pi \in H^{-m}(\Omega)$, unique up to an additive constant, such that $f=\nabla \pi$.

Using then the densité of $\mathcal{V}(\Omega)$ in $V_{m+1}$, we can prove the following theorem:

## Theorem 11. (De Rham in $\boldsymbol{H}^{-m-1}(\Omega)$, Second Version)

Let $m$ a positve integer and $\boldsymbol{f} \in \boldsymbol{H}^{-m-1}(\Omega)$ satisfying the following property:

$$
\forall \boldsymbol{v} \in \mathcal{V}(\Omega), \quad<\boldsymbol{f}, \boldsymbol{v}>=0
$$

Then there exists $\pi \in H^{-m}(\Omega)$, unique up an additive constant, such that

$$
f=\nabla \pi
$$

As application, we can give a new proof of De Rham's theorem.

## Theorem 12 (Original De Rham).

Let $\boldsymbol{f} \in \mathcal{D}^{\prime}(\Omega)$ satisfying the following property:

$$
\forall \boldsymbol{v} \in \mathcal{V}(\Omega), \quad<\boldsymbol{f}, \boldsymbol{v}>=0
$$

Then there exists $\pi \in \mathcal{D}^{\prime}(\Omega)$, unique up an additive constant, such that

$$
f=\nabla \pi
$$

Proof. It is an immediate consequence of the fact that we have prove that the divergence operator

$$
\operatorname{div}: \mathcal{D}(\Omega) / \mathcal{V}(\Omega) \mapsto \mathcal{D}(\Omega) \cap L_{0}^{2}(\Omega)
$$

is bijective.

## Theorem 13 (General Lions Lemma)

For any integer $m$ and any $1<p<\infty$,

$$
f \in \mathcal{D}^{\prime}(\Omega) \quad \text { and } \quad \nabla f \in \boldsymbol{W}^{-m-1, p}(\Omega) \Longrightarrow f \in W^{-m-1, p}(\Omega) .
$$

- G. Geymonat - P. Suquet (1986): $m=0$
- W. Borchers - H. Sohr (1990): $m \geq 0$
- C. Amrouche - V. Girault (1994): for any integer $m$

## IV. Second Equivalence Theorem: Korn, Lions, Poincaré

Recall first the original Poincaré Lemma:
Let $\Omega$ a bounded open simply connected of $\mathbb{R}^{3}$ and let

$$
\boldsymbol{f} \in \mathcal{C}^{1}(\Omega) \quad \text { such that } \quad \operatorname{curl} \boldsymbol{f}=\mathbf{0}
$$

Then

$$
f=\operatorname{grad} \chi \quad \text { with } \quad \chi \in \mathcal{C}^{2}(\Omega)
$$

## Theorem 14 (Equivalence Lions-Poincaré).

i) Suppose that $\Omega$ is simply-connected. Then the general J.L. Lions lemma implies that the following Weak version of Poincaré's lemma holds: Assume that

$$
\begin{equation*}
\boldsymbol{f} \in \boldsymbol{H}^{-1}(\Omega) \quad \text { with } \quad \operatorname{curl} \boldsymbol{f}=\mathbf{0} \text { in } \boldsymbol{H}^{-2}(\Omega) . \tag{25}
\end{equation*}
$$

Then there exists a scalar potential $\chi$ in $L^{2}(\Omega)$, uniquely determined up to the addition of a constant, such that

$$
\begin{equation*}
\boldsymbol{f}=\boldsymbol{\operatorname { g r a d }} \chi \quad \text { in } \Omega \quad \text { and } \quad\|\chi\|_{L^{2}(\Omega)} \leq C\|\boldsymbol{f}\|_{\boldsymbol{H}^{-1}(\Omega)} . \tag{26}
\end{equation*}
$$

ii) Conversely, the weak Poincaré Lemma on any simply-connected domain in $\mathbb{R}^{N}$ implies that J.L. Lions Lemma holds on any domain in $\mathbb{R}^{N}$.

Proof. i) To prove that the general J.L. Lions lemma implies the weak version of Poincaré's lemma, let

$$
\boldsymbol{f} \in \boldsymbol{H}^{-1}(\Omega) \quad \text { be such that } \quad \operatorname{curl} \boldsymbol{f}=\mathbf{0} \text { in } \Omega .
$$

We know that there exists a unique

$$
(\boldsymbol{u}, \pi) \in \boldsymbol{H}_{0}^{1}(\Omega) \times L_{0}^{2}(\Omega)
$$

such that

$$
\begin{equation*}
-\Delta \boldsymbol{u}+\nabla p=\boldsymbol{f} \quad \text { and } \quad \operatorname{div} \boldsymbol{u}=0 \quad \text { in } \Omega \tag{27}
\end{equation*}
$$

Hence

$$
\Delta(\operatorname{curl} \boldsymbol{u})=\mathbf{0} \quad \text { in } \Omega
$$

so that the hypoellipticity of the polyharmonic operator $\Delta$ implies that

$$
\operatorname{curl} \boldsymbol{u} \in \mathcal{C}^{\infty}(\Omega)
$$

Since $\operatorname{div} \boldsymbol{u}=0$, we deduce that

$$
\Delta u=-\operatorname{curl} \operatorname{curl} \boldsymbol{u} \in \mathcal{C}^{\infty}(\Omega)
$$

Now $\Delta \boldsymbol{u}$ is a smooth irrotational vector field and by the classical Poincaré theorem, there exists $q \in \mathcal{C}^{\infty}(\Omega)$ such that

$$
\nabla q=\Delta \boldsymbol{u}=\nabla p-\boldsymbol{f} \quad \text { in } \boldsymbol{H}^{-1}(\Omega) .
$$

The distribution $\tilde{p}$ defied by $\tilde{p}=p-q$ satisfies

$$
\nabla \tilde{p}=\boldsymbol{f} \in \boldsymbol{H}^{-1}(\Omega) .
$$

Consequently, $\tilde{p} \in L^{2}(\Omega)$ by the general J.L. Lions Lemma.
ii) The converse is immediate. Indeed, suppose that the weak version of Poincaré's Lemma holds and let

$$
f \in(\mathcal{D}(\Omega))^{\prime} \quad \text { such that } \nabla f \in \boldsymbol{H}^{-1}(\Omega)
$$

Because curl $(\nabla \boldsymbol{f})=\mathbf{0}$ in $\Omega$, there exists $\chi \in L^{2}(\Omega)$ satisfying

$$
\nabla \boldsymbol{f}=\nabla \chi
$$

Then $f=\chi+C$ and $f \in L^{2}(\Omega)$.

## V. The curl operator

Let us introduce the following space:

$$
\mathcal{G}=\{\boldsymbol{v} \in \mathcal{D}(\Omega) ; \boldsymbol{c u r l} \boldsymbol{v}=\mathbf{0}\},
$$

where we suppose here that $\Omega$ is a Lipschitzian bounded domain of $\mathbb{R}^{3}$.

## Theorem 11.

Let $\boldsymbol{f} \in \mathcal{D}^{\prime}(\Omega)$ satisfying the following property:

$$
\begin{equation*}
\forall \boldsymbol{v} \in \mathcal{G}, \quad<\boldsymbol{f}, \boldsymbol{v}>=0 \tag{28}
\end{equation*}
$$

Then there exists $\boldsymbol{\psi} \in \boldsymbol{D}^{\prime}(\Omega)$ with div $\boldsymbol{\psi}=0$ and such that

$$
f=\operatorname{curl} \psi
$$

Proof. Note that the condition (28) implies that

$$
\operatorname{div} \boldsymbol{f}=0
$$

which is a necessary condition for that

$$
f=\operatorname{curl} \psi
$$

To prove the result is equivalent to prove that the following operator

$$
\text { curl : } \mathcal{D}(\Omega) / \mathcal{G} \mapsto \mathcal{V}(\Omega) \perp \boldsymbol{K}_{\tau}(\Omega)
$$

is bijective, where

$$
\boldsymbol{K}_{\tau}(\Omega)=\left\{\boldsymbol{v} \in \boldsymbol{L}^{2}(\Omega) ; \operatorname{div} \boldsymbol{v}=0, \operatorname{curl} \boldsymbol{v}=\mathbf{0} \text { in } \Omega \quad \text { and } \quad \boldsymbol{v} \cdot \boldsymbol{n}=0 \text { on } \Gamma\right\} .
$$

Recall that

$$
\boldsymbol{K}_{\tau}(\Omega)=\{\mathbf{0}\} \quad \text { when } \Omega \text { is simply connected. }
$$

We will use here the same ideas as in the proof of Theorem 2.
Construction of the operator $T$.
Let $f \in \mathcal{V}(\Omega)$ satisfying the following property:

$$
\forall \boldsymbol{v} \in \boldsymbol{K}_{\tau}(\Omega), \quad \int_{\Omega} \boldsymbol{f} \cdot \boldsymbol{v}=0
$$

Instead of the operator $\boldsymbol{R}$, we set

$$
\begin{equation*}
\boldsymbol{T} \boldsymbol{f}(x):=\int_{\Omega} \boldsymbol{f}(y) \times \frac{x-y}{|x-y|^{3}} \int_{|x-y|}^{\infty} \theta\left(y+r \frac{x-y}{|x-y|}\right) r^{n-1} d r d y \tag{29}
\end{equation*}
$$

where $\Omega$ is starlike with respect to some open ball $B$ contained it in and $\operatorname{supp} \theta \subset B$. Then, we verify that

$$
f=\operatorname{curl} \boldsymbol{T} \boldsymbol{f} \quad \text { and } \quad \boldsymbol{f}=\mathbf{\operatorname { c u r l }} \boldsymbol{T} \boldsymbol{f} \in \mathcal{D}(\Omega)
$$

And we finish the proof for general Lipschitzian bounded domain as in Theorem 2.
