## Bounding Basis-Risk Using s-convex Orders on Beta-unimodal Distributions

Claude Lefèvre, Stéphane Loisel, Pierre Montesinos

April 2020

#### Cat model = 4 components

OICA - Pierre Montesinos - April 2020

2 / 21

#### Cat model = 4 components

**Hazard:** consists of a large number of catastrophe event scenarios that together provide a representation of possible loss-causing events, and an associated modeled rate of occurence for each.

Let *n* be the number of stochastic events, and  $p_i$  be the occurrence rate of the event *i*, i = 1, ..., n.

< ロ > < 同 > < 三 > < 三 > <

### Cat model = 4 components

Hazard: catastrophe event scenarios + occurence rate

**Inventory:** represents the exposure. In practice, the exposure is not perfectly known (uncertain even trajectory + uncertain exposure when the event occurs).

Let  $Y_i$  be a positive random variable representing the exposure of scenario i, i = 1, ..., n. Assume  $Y_i \leq m$  a.s., where for instance m stands for the total size of the portfolio. Sometimes,  $a_i \leq Y_i \leq b_i$  a.s.

< ロ > < 同 > < 三 > < 三 > <

### Cat model = 4 components

Hazard: catastrophe event scenarios + occurence rate Inventory: uncertain exposure

**Vulnerability:** provides the intensity of the catastrophe event on the exposed portfolio. We use the damage ratio (aka destruction rate or loss proportion) represented by

 $S_i \sim \mathcal{B}eta(\alpha_i, \beta_i), \quad S_i \perp Y_i.$ 

The loss in scenario *i* is then  $X_i = S_i Y_i$ .

OICA - Pierre Montesinos - April 2020

< ロ > < 同 > < 三 > < 三 > <

### Cat model = 4 components

Hazard: catastrophe event scenarios + occurence rate Inventory: uncertain exposure Vulnerability: intensity = destruction rate

S<sub>i</sub> ~  $\mathcal{B}eta(\alpha_i, \beta_i), \quad S_i \perp Y_i.$ 

**Loss:** translates the expected physical damage into monetary loss taking into account any insurance structures.

### Cat model = 4 components

Hazard: catastrophe event scenarios + occurence rate Inventory: uncertain exposure

**Loss:** translates the expected physical damage into monetary loss taking into account any insurance structures. Index-based transaction: the index in scenario i takes the value  $c_i$ .

### Cat model = 4 components

Hazard: catastrophe event scenarios + occurence rate Inventory: uncertain exposure

**Vulnerability:** intensity = destruction rate  $S_i \sim Beta(\alpha_i, \beta_i), \quad S_i \perp Y_i.$ 

**Loss:** translates the expected physical damage into monetary loss taking into account any insurance structures. Index-based transaction: the index in scenario i takes the value  $c_i$ .

The final flow in scenario *i* is given by  $S_i Y_i - c_i$ .

OICA - Pierre Montesinos - April 2020

In a nutshell:

OICA - Pierre Montesinos - April 2020

$$BR^{(s)} = \sum_{i=1}^{n} p_i \mathbb{E} \left[ \phi \left( X_{i, \max}^{(s)} - c_i \right) \right], \quad s = 2, \dots$$

# Beta-unimodal Distributions

**Definition** An  $\mathbb{R}_+$ -valued rv X has a continuous Beta-unimodal distribution if it has the product representation

$$X =_d SY, \tag{1}$$

where Y is a positive continuous rv, and  $S \sim Beta(\alpha, \beta)$  is a random contracting factor independent of Y.

# Beta-unimodal Distributions

**Definition** An  $\mathbb{R}_+$ -valued rv X has a continuous Beta-unimodal distribution if it has the product representation

$$X =_d SY, \tag{1}$$

where Y is a positive continuous rv, and  $S \sim Beta(\alpha, \beta)$  is a random contracting factor independent of Y.

**From** *Y* **to** *X*: if  $Y \sim F_Y$  and if *X* is Beta-unimodal

$$\bar{F}_X(x) = \frac{\Gamma(\alpha + \beta)}{\Gamma(\alpha)} x^{\alpha} (I_{\beta} \phi)(x), \qquad (2)$$

where:

-  $(I_{\beta}\phi)(x) = \int_{x}^{\infty} \frac{1}{\Gamma(\beta)} (t-x)^{\beta-1} \phi(t) dt$  is called the Weyl fractional-order integral operator, -  $\phi(t) = \bar{F}_{Y}(t)t^{-\alpha-\beta}$ .

OICA - Pierre Montesinos - April 2020

7 / 21

# Beta-unimodal Distributions

**Definition** An  $\mathbb{R}_+$ -valued rv X has a continuous Beta-unimodal distribution if it has the product representation

$$X =_d SY, \tag{3}$$

where Y is a positive continuous rv, and  $S \sim \mathcal{B}(\alpha, \beta)$  is a random contracting factor independent of Y.

**From** X to Y: if  $X \sim F_X$  and if X is Beta-unimodal

$$\bar{F}_{Y}(x) = (-1)^{n} x^{\alpha+\beta} \frac{\Gamma(\alpha)}{\Gamma(\alpha+\beta)} (I_{\delta} D^{n} \psi)(x), \qquad (4)$$

where:

- $\delta \in [0,1]$  such as  $\beta + \delta = n \in \mathbb{N}$ ,
- $-\psi(t)=\bar{F}_X(t)t^{-\alpha},$
- $D^n$  denotes the *n*-fold derivative operator.

8 / 21

**Definition:** s-convexity A function  $\phi$  defined on S is said to be s-convex if the inequality  $[x_0, ..., x_s; \phi] \ge 0$ , holds for any choice of distinct points  $x_0, ..., x_s$  in S.  $[x_0, ..., x_s; \phi]$  denotes a divided difference of the function  $\phi$  at the different points  $x_0, ..., x_s$ .

**Definition:** s-convexity A function  $\phi$  defined on S is said to be *s*-convex if the inequality  $[x_0, ..., x_s; \phi] \ge 0$ , holds for any choice of distinct points  $x_0, ..., x_s$  in S.  $[x_0, ..., x_s; \phi]$  denotes a divided difference of the function  $\phi$  at the different points  $x_0, ..., x_s$ .

s differentiability condition: if  $\phi^{(s)}$  exists in S, then  $\phi$  is *s*-convex if and only if  $\phi^{(s)} \ge 0$ .

### Definition: s-convexity

### Definition: s-increasing convexity

A function  $\phi$  is said to be *s*-increasing convex on its domain S if and only if for all choices of k + 1 distincts points  $x_0 < x_1 < x_k$  in S, we have

$$[x_0, x_1, ..., x_k; \phi] \ge 0, \ k = 2, ..., s.$$

We denote by  $\mathcal{U}_{s-icx}^{\mathcal{S}}$  the class of the s-increasing convex functions on  $\mathcal{S}.$ 

Definition: s-convexity

Definition: s-increasing convexity

#### Definition: s-convex order

Let  $X_1$  and  $X_2$  be two random variables that take on values in S. Then  $X_1$  is said to be smaller than  $X_2$  in the *s*-convex order, denoted by  $X_1 \leq_{s-cx}^{S} X_2$  if

$$\mathbb{E}[\phi(X_1)] \le \mathbb{E}[\phi(X_2)] \text{ for all } \phi \in \mathcal{U}_{s-cx}^{\mathcal{S}},$$
(5)

where  $\mathcal{U}_{s-cx}^{\mathcal{S}}$  is the class of all the *s*-convex functions  $\phi : \mathcal{S} \to \mathbb{R}$ .

#### Definition: moment space

We denote by  $\mathcal{B}_s([a, b], \mu_1, \mu_2, ..., \mu_{s-1})$  the moment space of all the random variables valued in [a, b] and with known s - 1 moments  $\mu_1, ..., \mu_{s-1}$ .

#### Definition: moment space

We denote by  $\mathcal{B}_s([a, b], \mu_1, \mu_2, ..., \mu_{s-1})$  the moment space of all the random variables valued in [a, b] and with known s - 1 moments  $\mu_1, ..., \mu_{s-1}$ .

**Theorem:** s-convex extrema Let  $Y \in \mathcal{B}_{s}([a, b], \mu_{1}, \mu_{2}, ..., \mu_{s-1})$ . Within  $\mathcal{B}_{s}([a, b], \mu_{1}, \mu_{2}, ..., \mu_{s-1})$ , there exist two unique random variables  $Y_{min}^{(s)}$  and  $Y_{max}^{(s)}$  such that  $Y_{min}^{(s)} \leq_{s-cx} Y \leq_{s-cx} Y_{max}^{(s)}$ .

Proof. See Denuit et al. (1999).

s-convex extrema are actually extremal distributions built from the s-1 first moments of Y.

コト (四) (ヨト (ヨト

## Identification: s-convex extrema

### **3-convex extremal distributions** Let $Y \in \mathcal{B}_3([a, b], \mu_1, \mu_2)$ .

$$\mathbf{Y}_{min}^{(3)} = \begin{cases} a \text{ with proba} & \frac{\mu_2 - \mu_1^2}{(a - \mu_1)^2 + \mu_2 - \mu_1^2}, \\ b \text{ with proba} & \frac{(a - \mu_1)^2}{(a - \mu_1)^2 + \mu_2 - \mu_1^2}, \end{cases}$$

and

$$Y_{max}^{(3)} = \begin{cases} \mu_1 - \frac{\mu_2 - \mu_1^2}{b - \mu_1} & \text{with proba } \frac{(b - \mu_1)^2}{(b - \mu_1)^2 + \mu_2 - \mu_1^2}, \\ b & \text{with proba } \frac{\mu_2 - \mu_1^2}{(b - \mu_1)^2 + \mu_2 - \mu_1^2}. \end{cases}$$

OICA - Pierre Montesinos - April 2020

< ロ > < 同 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Proposition (Beta-unimodal s-convex extrema) Let  $Y \in \mathcal{B}_{s}(\mathcal{S}, \mu_{1}, \mu_{2}, ..., \mu_{s-1})$ , and let  $\phi \in \mathcal{U}_{s-cx}^{\mathcal{S}}$ . If X is Beta-unimodal, then  $X \in \mathcal{B}_{s}(\mathcal{S}, v_{1}, v_{2}, ..., v_{s-1})$  and the s-convex extrema in this set are  $X_{min}^{(s)} = SY_{min}^{(s)}$ , and  $X_{max}^{(s)} = SY_{max}^{(s)}$ . Besides, if  $\phi \in \mathcal{U}_{s-icx}^{\mathcal{S}}$ , then  $\mathbb{E}[\phi(X)] < \mathbb{E}[\phi(SY_{max}^{(s)})] \le \mathbb{E}[\phi(SY_{max}^{(s-1)})] \le \dots \le \mathbb{E}[\phi(SY_{max}^{(2)})],$ which can be written as,  $\forall k \in [\![2,s]\!], X \leq_{k-cx} X_{max}^{(s)} \leq_{k-cx} X_{max}^{(s-1)} \leq_{k-cx} \dots \leq_{k-cx} X_{max}^{(2)}.$ When  $\phi \in \mathcal{U}_{s-icx}^{\mathcal{S}}$ , the more moments, the sharper the bounds !

14 / 21

## Measure

### Penalty functions

A penalty function g allows us to represent the consequences of a positive or negative difference between the Loss and the Index.

## Measure

### Example

$$g(x-c) = f_1(x) + f_2(x) + \phi_n(x), \quad x \in \mathbb{R}$$

where

$$f_1(x) = \eta(c-x)_+, \quad f_2(x) = \gamma(x-c)_+, \quad \phi_n(x) = \gamma(x-(c+d))_+^n.$$

OICA - Pierre Montesinos - April 2020

◆□ > ◆□ > ◆臣 > ◆臣 > ○臣 ○ のへで

## Measure

### Example

$$g(x-c) = f_1(x) + f_2(x) + \phi_n(x), \quad x \in \mathbb{R}$$

where

$$f_1(x) = \eta(c-x)_+, \quad f_2(x) = \gamma(x-c)_+, \quad \phi_n(x) = \gamma(x-(c+d))_+^n.$$

 $f_1$  and  $f_2$  are only 2-cx whereas  $\phi_n$  is *n*-icx. Consequently,

$$\begin{split} \mathbb{E}[f_{1}(X_{min}^{(2)}) + f_{2}(X_{min}^{(2)})] + \mathbb{E}[\phi_{n}(X_{min}^{(n-1)})] \\ &\leq \mathbb{E}[f_{1}(X_{min}^{(2)}) + f_{2}(X_{min}^{(2)})] + \mathbb{E}[\phi_{n}(X_{min}^{(n)})] \\ &\leq \mathbb{E}[g(X)] \\ &\leq \mathbb{E}[f_{1}(X_{max}^{(2)}) + f_{2}(X_{max}^{(2)})] + \mathbb{E}[\phi_{n}(X_{max}^{(n)})] \\ &\leq \mathbb{E}[f_{1}(X_{max}^{(2)}) + f_{2}(X_{max}^{(2)})] + \mathbb{E}[\phi_{n}(X_{max}^{(n-1)})] \end{split}$$
