#### July 2020 LIMOS seminar

updated for the MascotNum ETICS2020 school in Oct.

and the Webinar Data analytics & AI IMT in Nov. 2020 cite as HAL document no. hal-02913882, https://hal.archives-ouvertes.fr/hal-02913882

#### Foreword

This talk was first given at the LIMOS on July the 9th 2020 and was mainly intended for an audience of non specialists of Gaussian processes (GPs). It was then updated for the GDR MascotNum ETICS2020 school in October and the Webinar Data analytics & AI at Mines Telecom in November.

The first slides (up to slide 12) about GPs and Bayesian Optimization should probably be skipped by readers already aware about these topics.

The review of dimension reduction techniques is an attempt at providing a unified point of view on this ubiquitous topic. The two research contributions on variable selection for optimization 1) by kernel methods and, 2) by penalized likelihood in a mapped space, may be of interest to many experts.

< 由 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Context: optimization of costly functions

 $\min_{x\in\mathcal{S}}f(x)$ 

S: search space, continuous, discrete, mixed, others (graphs?). Default  $S \in \mathbb{R}^d$  (hyper-rectangle). d is the dimension.

*Costly*: one call to f takes more CPU than the rest of the optimization algorithm. Examples: nonlinear partial differential equations (finite elements), training of a neural network, real experiment ...

An exciting part of machine learning: algorithm design critical to performance, use expert knowledge.

R. Le Riche et al. (CNRS EMSE)

Reducing dimension in BO

3/45

July 2020 3 / 45

#### Context: optimization of costly functions

To save calls to f, build a model of it based on previous evaluations and rely on it whenever possible  $\longrightarrow$  metamodel / surrogate based optimization.

## Gaussian Process Regression (kriging)

 $Y(x)|Y(\mathbb{X})=\mathbb{F}$  is  $\mathcal{N}(m(.), c(.,.))$  with

$$m(x) = \mathbb{E}[Y(x)|Y(\mathbb{X})=\mathbb{F}] = k(x,\mathbb{X})k(\mathbb{X},\mathbb{X})^{-1}\mathbb{F}$$
  
$$c(x,x') = \operatorname{Cov}[Y(x),Y(x')|Y(\mathbb{X})=\mathbb{F}] = k(x,x') - k(x,\mathbb{X})k(\mathbb{X},\mathbb{X})^{-1}k(\mathbb{X},x')$$

$$\begin{split} Y(x) \text{ is parameterized through } k(x, x'; \theta). \\ \text{Ex: } k(x, x') &= \sigma^2 \exp(-\sum_{i=1}^d \frac{(x_i - x'_i)^2}{2\theta_i^2}). \\ \text{Learn the GP typically by max. likelihood, } \theta^\star &= \arg \max_{\theta} L(\theta; \mathbb{F}). \end{split}$$

### Bayesian Optimization

Global optimization methods are a trade-off between

- Intensification in known good regions
- Exploration of new regions

In our example, the best observed value is 1.79

We need a criterion that uses the GP and seeks a compromise between exploration and intensification: the expected improvement (among other acquisition criteria).

Measure of progress: the improvement,  $I(x) = \max (0, (\min(F) - Y(x) | Y(X) = F)).$ Acquisition criterion:  $EI(x) = \int_{-\infty}^{+\infty} I(x) dy(x) = \cdots =$  $\sqrt{c(x,x)} \left[ w(x) \operatorname{cdf}_{\mathcal{N}}(w(x)) + \operatorname{pdf}_{\mathcal{N}}(w(x)) \right]$ with  $w(x) = \frac{\min(F) - m(x)}{\sqrt{(c(x,x))}}$ 3 0.8 04 10 Image: A matrix R. ▶ < 重 > < 重 > July 2020

This algorithm is called **Efficient Global Optimization** (EGO, [Jones et al., 1998]), an instance of Bayesian Optimization (BO):

- make an initial design of experiments X and calculate the associated F, t = length(F)
- **2** build a GP from (X, F) (max. likelihood  $\rightarrow \theta$ )
- x<sup>t+1</sup> = arg max<sub>x</sub> El(x) (with another optimizer, e.g. CMA-ES [Hansen and Ostermeier, 2001])
- calculate  $F_{t+1} = f(X_{t+1})$ , increment t

```
• stop (t > t^{\max}) or go to 2.
```

State-of-the-art for costly functions.

Note the 2 internal optimization problems, one in S (*d* dimensions), one in the number of parameters of the GP (typically O(d)).

イロト 不得 トイヨト イヨト 二日

#### Bayesian optimization and COCO

COCO : COmparing Continuous Optimizers [Hansen et al., 2016] with 24 functions of the BBOB noiseless suite [Hansen et al., 2010]. 15 repetitions of runs of length  $30 \times d$  (=2,3,5,10)  $\rightarrow$  360 optimizations per dimension, 432000 maximizations solved, millions of covariance matrices inversions.

QuadMean : Bayesian Optimizer with quadratic trend optimized every 5 iterations.

best09 : utopic algorithm made of the best (for each cost and dimension) of the 32 algorithms competing at BBOB 2009.

#### Bayesian optimization and COCO

#### Outline

#### Bayesian Optimization in a nutshell.

- BO & dimension reduction: review of principles.
- 8 Reduce dimension by selecting variables.
- Gaussian process and optimization in reduced dimension for shapes.

A (10) × (10) × (10)

#### Bayesian optimization and dimension

Bayesian optimizers are very competitive at low number of function evaluations but they loose this advantage with dimension.

Intuitively logical since they attempt to build a model of the function throughout the search space S.

Recent efforts for improving BO performance in more than 5 dimensions:

- search locally around good points (trust regions).
- search in low dimensional linear subspaces.
- search in low dimensional nonlinear subspaces.

"search" = build a metamodel + perform internal optimizations. 2 ingredients to dimension issue in BO.

イロト 不得下 イヨト イヨト

### BO and trust regions

Principle: counteract the effect of increasing dimension (volume) by restricting the search to a smaller (controlled) trust region. Research questions: how to control the trust region? Global (outside TR) vs. local (inside) steps?

- TRIKE, Trust-Region Implementation in Kriging-based optimization with Expected Improvement, [Regis, 2016].
- TURBO, a TrUst-Region BO solver, [Eriksson et al., 2019].
- TREGO, a Trust-Region framework for EGO, [Diouane et al., 2020]

45

July 2020 1

A B F A B F

## BO in a linear subspace

Principle: build the statistical model and optimize  $f_R(\alpha) = f(A\alpha)$ where A is  $d \times \delta$ ,  $\delta \ll d$ . Linear embedding  $x = A\alpha$ . Research questions: choice of A, link between bounds on x and  $\alpha$ .

- (R)REMBO & improvements, Random EMbedding Bayesian Optimization, [Wang et al., 2016, Binois et al., 2020].
- Choice of A by Partial Least Squares, SEGOKPLS [Amine Bouhlel et al., 2018] (internal optim in high dimensions), EGORSE (EGO coupled with Random and Supervised Embeddings [Priem, 2020]).
- Choice of A by the active subspace method [Li et al., 2019].

### BO with variable selection

Principle: a special case of embedding, only keep some of the variables  $x_i$ 's ( $\equiv A$  as a selection of basis vectors).

Research questions: what to do with non selected  $x_i$ 's? How to adapt selection as progress is made?

- Select variables from GP length scales: Split-and-Doubt [Ben Salem et al., 2019], L1-regularized likelihood [Gaudrie et al., 2020].
- Sensitivity analysis for optimization (using sublevel sets and mean embeddings in RKHS) [Spagnol et al., 2019]: in Appendix

### BO within a manifold

Principle: find a low dimensional manifold. Compose a nonlinear map,  $\phi(x)$ , with linear analysis (cf. before). Research questions: how to find the nonlinear map? Pre-image problem: find an inverse map  $x(\alpha)$ .

Kernel PCA [Schölkopf et al., 1997]:  $\phi(x)$  implicit. In the field of shape optimization,  $\phi(x)$  is natural: x are CAD parameters,  $\phi(x)$  is the shape. Use  $\phi(x)$  to infer manifolds and optimize in

[Raghavan et al., 2013, Li et al., 2018, Cinquegrana and Iuliano, 2018]. BO and manifold search in [Gaudrie et al., 2020]. Sum it up later.

### Kernel based sensitivity indices for optimization

Global sensitivity analysis: quantify the importance of a given set of variables for the function f.

Classically, the part of the function variance attributed to the set of variables

But optimization is focused on low regions of f (as opposed to all the fluctuations). R. Le Riche et al. (CNRS EMSE) Reducing dimension in BO 21/45 July 2020 21/45

#### A goal-oriented index for optimization

Natural to use sublevel sets in optimization:

 $\mathcal{D}_q = \{x \in \mathcal{S} \mid f(x) \leq q\}$ 

Dixon-Price function,  $f(X) = (X_1 - 1)^2 + 2(X_2^2 - X_1)^2$ X<sub>1</sub> unimportant to reach q = 10000, both X<sub>1</sub> and X<sub>2</sub> important and coupled for q = 50

R. Le Riche et al. (CNRS EMSE)

July 2020 22 / 45

An optimization oriented sensitivity for  $X_i$ : distance between the non-informative  $p(X_i)$  and the marginal distribution of the good points  $p(X_i | X \in D_q)$ .

July 2020 23 / 45

#### A robust statistics: the MMD

How to measure the distance between  $\mathbf{P} \equiv p(X_i)$  and  $\mathbf{Q} \equiv p(X_i) \mid X \in \mathcal{D}_q$ ? Use the *Maximum Mean Discrepancy* (MMD), a kernel-based measure that is less sensitive to the number of points and dimension (adaptation to the data):

$$\mathsf{MMD}^{2}(\mathbf{P}, \mathbf{Q}) = \left(\sup_{f \in \mathcal{H}, \|f\| \leq 1} [\mathbb{E}_{\mathbf{P}}(f(X)) - \mathbb{E}_{\mathbf{Q}}(f(X))]\right)^{2}$$

 $\mathcal{H}$  RKHS induced by kernel k(.,.). See Gretton et al., [Smola et al., 2007, Fukumizu et al., 2009]

R. Le Riche et al. (CNRS EMSE)

Reducing dimension in BO

O 24/45

July 2020 24 / 45

#### MMD estimation

$$\begin{aligned} \text{Mean embedding} : \ \mu_{\mathbf{P}}(.) &= \int k(x,.)p(x)dx \\ \text{MMD}^{2}(\mathbf{P},\mathbf{Q}) &= \left(\sup_{f \in \mathcal{H}, \|f\| \leq 1} [\mathbb{E}_{\mathbf{P}}(f(X)) - \mathbb{E}_{\mathbf{Q}}(f(X))]\right)^{2} \\ \mathbb{E}_{\mathbf{P}}(f(X)) &= \int f(x)p(x)dx = \int \langle k(x,.), f \rangle_{\mathcal{H}} p(x)dx = \langle \mu_{\mathbf{P}}(.), f \rangle_{\mathcal{H}} \\ \sup_{f \in \mathcal{H}, \|f\| \leq 1} [\mathbb{E}_{\mathbf{P}}(f(X)) - \mathbb{E}_{\mathbf{Q}}(f(X))] &= \sup_{f \in \mathcal{H}, \|f\| \leq 1} \langle \mu_{\mathbf{P}}(.) - \mu_{\mathbf{Q}}(.), f \rangle_{\mathcal{H}} = \|\mu_{\mathbf{P}}(.) - \mu_{\mathbf{Q}}(.)\|_{\mathcal{H}} \\ \\ \text{MMD}^{2}(\mathbf{P},\mathbf{Q}) &= \langle \mu_{\mathbf{P}}(.) - \mu_{\mathbf{Q}}(.), \mu_{\mathbf{P}}(.) - \mu_{\mathbf{Q}}(.)\rangle_{\mathcal{H}} \end{aligned}$$

develop, get terms like  $\langle \mu_{\mathbf{P}}(.), \mu_{\mathbf{Q}}(.) \rangle_{\mathcal{H}} = \int \int k(x, x') p(x) q(x') dx dx'$  and take the empirical means from input sample  $\mathbb{X}_i = \{x_i^1, \ldots, x_i^n\}$  and subsample  $\widetilde{\mathbb{X}}_i = \{x_i^1, \ldots, x_i^m \mid x \in \mathcal{D}_q\}$ 

$$\mathsf{MMD}^{2}(\mathbf{P},\mathbf{Q}) \approx \frac{1}{n(n-1)} \sum_{p=1}^{n} \sum_{q \neq p}^{n} k(x_{i}^{p}, x_{i}^{q}) + \frac{1}{m(m-1)} \sum_{p=1}^{m} \sum_{q \neq p}^{m} k(\tilde{x}_{i}^{p}, \tilde{x}_{i}^{q}) - \frac{2}{nm} \sum_{p=1}^{n} \sum_{q=1}^{m} k(x_{i}^{p}, \tilde{x}_{i}^{q})$$

Easy to calculate. Equivalent to an independence measure between  $X_i$  and  $\mathbb{1}(f(X) \le q)$ [Spagnol et al., 2019].

R. Le Riche et al. (CNRS EMSE)

Reducing dimension in BO

#### Kernel-based sensitivity index

Sensitivity of variable *i* to reach the sublevel set  $D_q$ :

$$S_i = \frac{\mathsf{MMD}^2(p(X_i), p(X_i \mid X \in \mathcal{D}_q))}{\sum_{j=1}^d \mathsf{MMD}^2(p(X_j), p(X_j \mid X \in \mathcal{D}_q))}$$

For costly functions, estimate  $S_i$ with the Gaussian process trajecto- (In ries (account for model error)  $\Rightarrow$  one  $S_i^{(I)}$  per trajectory I.

#### KSA-BO

Kernel-based Sensitivity Analysis Bayesian Optimization

- make an initial design of experiments X and calculate the associated F, t = length(F)
- **2** build a GP from (X, F) (max. likelihood)
- Select active variables  $a \in \{1, ..., d\}$ : variable *i* selected if p-value:  $\mathbb{P}\left[\bar{S}_i = 1/N_{\text{traj}} \sum_I S_i^{(I)} < S \text{ random sample}\right] \leq 0.01 \text{ or } 0.05 \text{ determ.:}$  or  $\bar{S}_i > 1/d$ 
  - $x_a^{t+1} = \arg \max_{x_a} EI(x_a)$ ,  $x_{\overline{a}}^{t+1} = best$  so far or random with proba 0.5, component-wise
  - So calculate  $F_{t+1} = f(X_{t+1})$ , increment t
  - stop  $(t > t^{\max})$  or go to 2.

Robustified version of the KSA-BO from [Spagnol et al., 2019]. Some tuning omitted here :

how to choose  $x_{\bar{a}}$ , initial  $p(X_i)$  and q? Details in [Spagnol, 2020],  $(a_{\bar{a}})$ ,  $(a_{\bar{a})})$ ,  $(a_{\bar{a}})$ ,  $(a_$ 

R. Le Riche et al. (CNRS EMSE)

July 2020 27 / 45

#### Preliminary results

Welded beam problem, a priori selection of the active variables (no GP), d = 4 but  $a = \{1, 4\}$  (deterministic strategy), 10000 repetitions of optimization.

Note the compromise accuracy of the optimum vs. cost.

Reducing dimension in BO

28/45

July 2020 28 / 45

#### Results : test set

#### 20 repetitions on

Name	$d_{\rm eff}$	d	Expression

#### Dimension reduction for shapes : summary

Shapes are described by CAD parameters  $x \in \mathbb{R}^d$ 

Nonlinear map to a high dimensional space  $\phi(x) \in \mathbb{R}^D$ ,  $D \gg d$  (free from biases created by CAD choices): here by contour discretization [Stegmann and Gomez, 2002]

< ∃ > < ∃

From a database of possible shapes  $[\phi(x^{(1)}), \ldots, \phi(x^{(n)})]$ ,

extract a basis of most important shapes by principal component analysis,  $\{V^1, \ldots, V^\delta\}$ .

Then work (build a GP, optimize) in this basis,

i.e. in the  $(\alpha_1, \ldots, \alpha_{\delta})$  manifold.

The choice of  $\phi(x)$  is important. Other choices: characteristic function [Raghavan et al., 2013], signed distance to contour [Raghavan et al., 2014]

35/45

1...

July 2020 35 / 45

Further reduce dimension of the GP within the  $\alpha\mbox{-space}$  of eigencomponents:

- Likelihood that favors sparsity [Yi et al., 2011]: max<sub>θ</sub> Likelihood(θ; f(X)) − λ||θ<sup>-1</sup>||<sub>1</sub>
- GP with zonal anisotropy [Allard et al., 2016]:  $Y(\alpha) = Y^{a}(\alpha_{a}) + Y^{\bar{a}}(\alpha_{\bar{a}}), Y^{a}(\alpha_{a})$  detailed (anisotropic),  $Y^{\bar{a}}(\alpha_{\bar{a}})$  isotropic

Expl NACA22 : Card(a) = 3 , 
$$\delta = 10$$
 ,  $d = 22$  ,  $D = 600$ 

R. Le Riche et al. (CNRS EMSE)

and optimize in the reduced dimensional space:

۲  $\alpha^{(t+1)*}$  comes from  $\max([\alpha_{\textit{a}},\overline{\alpha}])$  ,  $\in \mathbb{R}^{\delta+1}$ o<sup>a</sup> spac  $\alpha^{\alpha}$  space  $\overline{\alpha}$  coordinate along a random line in non-active space Solve pre-image problem:  $x^{(t+1)} = \arg \min \|\mathbf{V}^{\top}(\phi(x) - \overline{\phi}) - \alpha^{(t+1)*}\|^2$  $x \in S$ and evaluate  $f(x^{(t+1)})$ . Eigencomp.  $\alpha^{(t+1)} = \mathbf{V}^{\top}(\phi(x^{(t+1)}) - \overline{\phi})$  $\alpha^{(t+1)^*}$  $\alpha_3$ Replication: update GP with both  $\alpha^{(t+1)*}$  and  $\alpha^{(t+1)}$  $\alpha_2$  $\alpha_1$ R. Le Riche et al. (CNRS EMSE) Reducing dimension in BO 37/45 July 2020 37 / 45

#### Example: NACA 22 airfoil drag minimization

- Faster decrease of the objective function in the reduced eigenshape basis (left) compared with the standard approach (right, CAD parameter space).
- Smoother airfoils are obtained because a shape basis is considered instead of a combination of local parameters.

#### Conclusions

BO's performance degrades with dimensionality. 2 techniques for reducing dimensions in BO:

- variable selection specific to optimization because based on sublevel sets; select variables from a robust statistics, the maximum mean discrepancy in the RKHS;  $x = (x_a, x_{\bar{a}})$ , optimize on the active  $x_a$ .
- build an embedding, φ(x), and identify its most active directions (eigenshapes), V<sup>a</sup>, from the regularized likelihood; build a GP and optimize with more details in V<sup>a</sup> while not completely overlooking V<sup>ā</sup>.
- Perpectives: generalize and cumulate: create embeddings for general optimization problem and select variables from sublevel sets in this better parameterized space.
