[^0]

Figure S4: Comparison between experimental (red circle) and theoretical (blue diamond) CCS for CYS PAMAM G0 to G3. Error bars represent the standard deviation on 5 (G0) or 3 (G1 to G3) experimental measurements, and on 200 theoretical structures, respectively.

Figure S5: Number of oxygen atoms and amine nitrogen atoms found in concentric shells $0.1 \AA$ thick, as a function of the distance from terminal amine nitrogens in EDA G2 neutral and +1 . For the neutral, the curve is the average over all the terminal amines (blue). For the +1 , the averages over all the neutral amines (red) and the protonated amine (black) are separated. A zoom between 2.2 and $3.4 \AA$ is in insert.

Figure S6: Evolution of the ${ }^{\mathrm{TM}} \mathrm{CCS}_{\mathrm{He}}$ for EDA PAMAM G0 from 0 to 2 charges. For each charge state, the structure is represented with the vdW surface in red.

Figure S7: Evolution of the ${ }^{\mathrm{TM}} \mathrm{CCS}_{\mathrm{He}}$ for EDA PAMAM G1 from 0 to 4 charges. For each charge state, the structure is represented with the vdW surface in red.

Figure S8: Evolution of the ${ }^{\mathrm{TM}} \mathrm{CCS}_{\text {нe }}$ for EDA PAMAM G3 from 0 to 7 charges. For each charge state, the structure is represented with the vdW surface in red.

Figure S9: Evolution of the ${ }^{\mathrm{TM}} \mathrm{CCS}_{\mathrm{He}}$ for CYS PAMAM G0 from 0 to 2 charges. For each charge state, the structure is represented with the vdW surface in red.

Figure S10: Evolution of the ${ }^{\mathrm{TM}} \mathrm{CCS}_{\mathrm{He}}$ for CYS PAMAM G1 from 0 to 4 charges. For each charge state, the structure is represented with the vdW surface in red.

Figure S11: Evolution of the ${ }^{\mathrm{TM}} \mathrm{CCS}_{\mathrm{He}}$ for CYS PAMAM G2 from 0 to 6 charges. For each charge state, the structure is represented with the vdW surface in red.

Figure S12: Evolution of the ${ }^{\mathrm{TM}} \mathrm{CCS}_{\mathrm{He}}$ for CYS PAMAM G3 from 0 to 7 charges. For each charge state, the structure is represented with the vdW surface in red.

Table S3: Molecular dynamics simulation of the globular PAMAM ions and neutrals: theoretical CCS, SASA, $\mathbf{V}_{\text {SASA }}$ and corresponding densities.

$$

Figure S14: Representation of the extra volume due to the probe decreasing with the radius of the molecule. For a probe radius of 1 in arbitrary units, the shell represents $42 \%$ of the total volume for an internal radius of 5 while it represents only $14 \%$ for an internal radius of 20 . For the development of the equation for the $\mathrm{V}_{\text {shell }}$ calculation, see the end of the SI.

Figure S15: Number of atoms found in concentric shells 0.1 A thick, as a function of the distance from the geometrical center. Results of EDA G0, for charge states 0 to +2 . The average parabolic fit corresponding to a dense core model is displayed in dashed lines. The fit for all the generations differs from the curves for G0.

Figure S16: Number of atoms found in concentric shells 0.1 Å thick, as a function of the distance from the geometrical center. Results of EDA G1, for charge states 0 to +4 . A parabolic fit corresponding to a dense core model is displayed in dashed lines.

Figure S17: Number of atoms found in concentric shells 0.1 A thick, as a function of the distance from the geometrical center. Results of EDA G3, for charge states 0 to +7 . A parabolic fit corresponding to a dense core model is displayed in dashed lines.

Figure S18: Number of atoms found in concentric shells 0.1 Å thick, as a function of the distance from the geometrical center. Results of CYS G0, for charge states 0 to +2 . The average parabolic fit corresponding to a dense core model is displayed in dashed lines. The fit for all the generations differs from the curves for G0.

Figure S19: Number of atoms found in concentric shells 0.1 Å thick, as a function of the distance from the geometrical center. Results of CYS G1, for charge states 0 to +4 . A parabolic fit corresponding to a dense core model is displayed in dashed lines.

Figure S20: Number of atoms found in concentric shells $0.1 \AA$ thick, as a function of the distance from the geometrical center. Results of CYS G2, for charge states 0 to +6 . A parabolic fit corresponding to a dense core model is displayed in dashed lines.

Figure S21: Number of atoms found in concentric shells $0.1 \AA$ thick, as a function of the distance from the geometrical center. Results of CYS G3, for charge states 0 to +7 . A parabolic fit corresponding to a dense core model is displayed in dashed lines.

Figure S23: Comparison between experimental (red circle) and theoretical (blue diamond) CCS for PPI G1. Error bars represent the standard deviation on 5 experimental measurements, and on 200 theoretical structures, respectively.

Figure S24: Comparison between experimental (red circle) and theoretical (blue diamond) CCS for PPI G2. Error bars represent the standard deviation on 3 experimental measurements, and on 200 theoretical structures, respectively.

Figure S25: Comparison between experimental (red circle) and theoretical (blue diamond) CCS for PPI G3. Error bars represent the standard deviation on 3 experimental measurements, and on 200 theoretical structures, respectively.

Figure S26: Evolution of the theoretical ${ }^{\mathrm{TM}} \mathrm{CCS}_{\mathrm{He}}$ for PPI G1 from 0 to 2 charges. For each charge state, the structure is represented with the Connolly surface in red.

Figure S27: Evolution of the theoretical ${ }^{\mathrm{TM}} \mathrm{CCS}_{\mathrm{He}}$ for PPI G2 from 0 to 3 charges. For each charge state, the structure is represented with the Connolly surface in red.

Figure S28: Evolution of the theoretical ${ }^{\mathrm{TM}} \mathrm{CCS}_{\mathrm{He}}$ for PPI G3 from 0 to 5 charges. For each charge state, the structure is represented with the Connolly surface in red.

Figure S29: Number of atoms found in concentric shells $0.1 \AA$ thick, as a function of the distance from the geometrical center. Results of PPI G1, for charge states 0 to +2 . The average parabolic fit corresponding to a dense core model is displayed in dashed lines. The fit for all the generations differs from the curves for G1.

Figure S30: Number of atoms found in concentric shells $0.1 \AA$ thick, as a function of the distance from the geometrical center. Results of PPI G2, for charge states 0 to +3 . A parabolic fit corresponding to a dense core model is displayed in dashed lines.

Figure S31: Number of atoms found in concentric shells 0.1 A thick, as a function of the distance from the geometrical center. Results of PPI G3, for charge states 0 to +5 . A parabolic fit corresponding to a dense core model is displayed in dashed lines.

Figure S32: Number density of the dense core for PPI G1 to G3 with different charge states. The average density is represented in dash lines.

Table S6: Comparison between SASA density and apparent density for lowest charge state PPI ions

| PPI |  |  |  |
| :--- | :--- | :--- | :--- |
| $\mathrm{G}_{\mathrm{x}}$ | Charge | $\rho \mathrm{CCs}\left(\mathrm{D} / / \AA^{3}\right)$ | $\rho \mathrm{SASA}\left(\mathrm{Da} / \AA^{3}\right)$ |
| G1 | +1 | 0.33 | 0.32 |
| G2 | +1 | 0.30 | 0.36 |
| G3 | +2 | 0.30 | 0.40 |

## Equations development

For a sphere with a radius R , a mass M and a density $\rho$ :

$$
\begin{gathered}
\operatorname{CCS}=\pi \mathrm{R}^{2} \text { and } V=\frac{4 \pi \mathrm{R}^{3}}{3}=\frac{\mathrm{M}}{\rho} \\
\mathrm{R}=\sqrt[3]{\frac{3 \mathrm{M}}{4 \pi \rho}} \\
\mathrm{CCS}=\pi\left(\frac{3 \mathrm{M}}{4 \pi \rho}\right)^{2 / 3} \\
\text { CCS }=\left(\frac{3 \sqrt{\pi}}{4 \rho}\right)^{2 / 3} \mathrm{M}^{2 / 3}=\mathrm{A} \mathrm{M}^{2 / 3} \text { (Equation 2) } \\
\mathrm{A}=\left(\frac{3 \sqrt{\pi}}{4 \rho}\right)^{2 / 3} \\
\mathrm{~A}^{3 / 2}=\frac{3 \sqrt{\pi}}{4 \rho} \\
\rho=\frac{3}{4} \sqrt{\frac{\pi}{\mathrm{~A}^{3}} \quad \text { (Equation 3) }}
\end{gathered}
$$

Parabolic fitting of RDF:

$$
N(R \rightarrow R+\Delta R)=n V(R \rightarrow R+\Delta R)(\text { Equation 4) }
$$

The volume $(V)$ of a spherical shell between $R$ and $R+\Delta R$ is the difference between the volume of the sphere of radius $R+\Delta R$ and the inner sphere of radius $R$ as given by:

$$
\begin{gathered}
V(R \rightarrow R+\Delta R)=\frac{4 \pi}{3}(R+\Delta R)^{3}-\frac{4 \pi}{3} R^{3} \\
V(R \rightarrow R+\Delta R)=\frac{4 \pi}{3}\left(3 R^{2} \Delta R+3 R(\Delta R)^{2}+(\Delta R)^{3}\right)
\end{gathered}
$$

In our calculations, the shell thickness is set at $0.1 \AA$, so $\Delta R$ can be replaced by 0.1 to give:

$$
\mathrm{V}(\mathrm{R} \rightarrow \mathrm{R}+\Delta \mathrm{R})=4 \pi\left(0.1 \mathrm{R}^{2}+0.01 \mathrm{R}+\frac{0.001}{3}\right)
$$

This equation together with equation 4 give the evolution of the number of atoms as a function of the distance for a homogeneous sphere.

$$
N(R \rightarrow R+\Delta R)=n 4 \pi\left(0.1 R^{2}+0.01 R+\frac{0.001}{3}\right)(\text { Equation } 5)
$$

## Ion mobility parameters

Table S7: TWIMS parameters for PAMAM G0 and PPI G1

| Set | Mass range | IMS Gas Flow (mL.min ${ }^{-1}$ ) | IMS Wave Velocity (m.s $\mathbf{s}^{-1}$ ) | IMS Wave Height (V) |
| :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1}$ | $100-4000$ | 95 | 950 | 40 |
| $\mathbf{2}$ | $100-4000$ | 75 | 800 | 40 |
| $\mathbf{3}$ | $100-4000$ | 70 | 850 | 40 |
| $\mathbf{4}$ | $100-2000$ | 85 | 900 | 40 |
| $\mathbf{5}$ | $100-2000$ | 80 | 800 | 40 |

Table S8: TWIMS parameters for other ions

| Set | Mass range | IMS Gas Flow (mL.min$\left.{ }^{-1}\right)$ | IMS Wave Velocity (m.s $\left.\mathbf{s}^{-1}\right)$ | IMS Wave Height (V) |
| :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1}$ | $100-4000$ | 75 | 800 | 40 |
| $\mathbf{2}$ | $100-4000$ | 70 | 850 | 40 |
| $\mathbf{3}$ | $100-2000$ | 60 | 650 | 40 |

## DRIFT TUBE EXPERIMENTS

${ }^{\text {DT }} \mathrm{CCS}_{\text {He }}$ are measured using a custom DTIMS instrument described elsewhere ${ }^{2,3}$. The drift tube measures 79 cm and is filled with a constant helium pressure of 5.1 Torr at 295 K. Spectra are recorded with voltage between 200 and 600 V.
