[8] Evidence for a threshold enhancement in the $p\overline{p}$ mass spectrum was also reported by ABE 02K, AUBERT,B 05L, and WANG 05A in $B^+ \to p\overline{p}K^+$, WANG 05A in $B^0 \to p\overline{p}K^0_S$, ABE 02W in $\overline{B}^0 \to p\overline{p}D^0$, DEL-AMO-SANCHEZ 12 in $B \to D(D^*)p\overline{p}(\pi)$, and WEI 08 in $B^+ \to p\overline{p}\pi^+$ decays. Not seen by ATHAR 06 in $\Upsilon(1S) \to p\overline{p}\gamma$.

[9] From the fit including final state interaction effects in isospin 0 $S$-wave according to SIBIRTSEV 05A. Systematic errors not estimated.

### $X(1835)$ DECAY MODES

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **seen** | [1] ABLIKIM | 16J | BES3 | $J/\psi \to \gamma\pi^+\pi^-\eta'$ |

[1] ABLIKIM 16J quotes B( $J/\psi \to \gamma X(1835)$) × B( $X(1835) \to \pi^+\pi^-\eta'$) = $(3.93 \pm 0.38 \,^{+0.31}_{-0.84}) \times 10^{-4}$ from a fit of the measured $\pi^+\pi^-\eta'$ lineshape that accounts for the abrupt distortion observed at the $p\overline{p}$ threshold with a Flatte formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ($M \approx$ 1919 MeV; $\Gamma \approx$ 51 MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16J is that a second resonance near 1870 MeV interferes with the $X(1835)$; fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.

## $f_2(1910)$

$I^G(J^{PC}) = 0^+(2^{++})$

OMITTED FROM SUMMARY TABLE

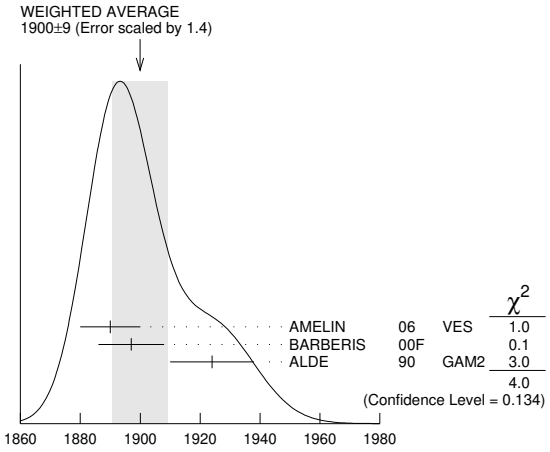
We list here three different peaks with close masses and widths seen in the mass distributions of $\omega\omega$, $\eta\eta'$, and $K^+K^-$ final states. ALDE 91B argues that they are of different nature.

### $f_2(1910)$ MASS

#### $f_2(1910)$ $\omega\omega$ MODE

| VALUE (MeV) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **1900± 9 OUR AVERAGE** Error includes scale factor of 1.4. See the ideogram below. | | | | |
| 1890±10 | [1] AMELIN | 06 | VES | 36 $\pi^- p \to \omega\omega n$ |
| 1897±11 | BARBERIS | 00F | | 450 $pp \to p_f\omega\omega p_s$ |
| 1924±14 | ALDE | 90 | GAM2 | 38 $\pi^- p \to \omega\omega n$ |

[1] Supersedes BELADIDZE 92B.



$f_2(1910)$ $\omega\omega$ MODE MASS (MeV)

#### $f_2(1910)$ $\eta\eta'$ MODE

| VALUE (MeV) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **1934±16** | [1] BARBERIS | 00A | | 450 $pp \to p_f\eta\eta' p_s$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| 1934±20 | [2] ANISOVICH | 00J | SPEC | |
| 1911±10 | ALDE | 91B | GAM2 | 38 $\pi^- p \to \eta\eta' n$ |

[1] Also compatible with $J^{PC}=1^{-+}$.
[2] Combined fit with $\eta\eta$, $\pi\pi$, and $\eta\pi\pi$.

#### $f_2(1910)$ $K^+K^-$ MODE

| VALUE (MeV) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|

[4] ANISOVICH 00E recommends to withdraw ADOMEIT 96 that assumed a single $J^P = 2^+$ resonance.

#### $\overline{p}p \to \pi\pi$

| VALUE (MeV) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| ~ 2090 | [5] OAKDEN | 94 | RVUE | 0.36–1.55 $\overline{p}p \to \pi\pi$ |
| ~ 2120 | [6] OAKDEN | 94 | RVUE | 0.36–1.55 $\overline{p}p \to \pi\pi$ |
| ~ 2170 | [7] MARTIN | 80B | RVUE | |
| ~ 2150 | [7] MARTIN | 80C | RVUE | |
| ~ 2150 | [8] DULUDE | 78B | OSPK | 1–2 $\overline{p}p \to \pi^0\pi^0$ |

[5] OAKDEN 94 makes an amplitude analysis of LEAR data on $\overline{p}p \to \pi\pi$ using a method based on Barrelet zeros. This is solution A. The amplitude analysis of HASAN 94 includes earlier data as well, and assume that the data can be parametrized in terms of towers of nearly degenerate resonances on the leading Regge trajectory. See also KLOET 96 and MARTIN 97 who make related analyses.
[6] From solution B of amplitude analysis of data on $\overline{p}p \to \pi\pi$.
[7] $I(J^P) = 0(2^+)$ from simultaneous analysis of $p\overline{p} \to \pi^-\pi^+$ and $\pi^0\pi^0$.
[8] $I^G(J^P) = 0^+(2^+)$ from partial-wave amplitude analysis.

[1] From the fit to the BABAR data of LEES 13Q assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution. The resonance significance is 3.5 $\sigma$.
[2] From the fit to the BABAR data of LEES 13Q and BESIII data of ABLIKIM 19L assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution.
[3] Could also be another state. Seen in $J/\psi$ decay with branching ratio $J/\psi \to X\pi^0 \to K^+K^-\pi^0 = (6.7 \pm 1.1^{+2.2}_{-1.8}) \times 10^{-6}$.
[4] The observed structure can be due to both the $\phi(2170)$ and $\rho(2150)$.
[5] Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the $\rho(1450)$, $\rho(1700)$, and $\rho(2150)$ resonances as free parameters of the fit.
[6] Includes ATKINSON 85.

[1] From the fit to the BABAR data of LEES 13Q assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution. The resonance significance is 3.5 $\sigma$.
[2] From the fit to the BABAR data of LEES 13Q and BESIII data of ABLIKIM 19L assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution.
[3] Could also be another state. Seen in $J/\psi$ decay with branching ratio $J/\psi \to X\pi^0 \to K^+K^-\pi^0 = (6.7 \pm 1.1^{+2.2}_{-1.8}) \times 10^{-6}$.
[4] The observed structure can be due to both the $\phi(2170)$ and $\rho(2150)$.
[5] Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the $\rho(1450)$, $\rho(1700)$, and $\rho(2150)$ resonances as free parameters of the fit.
[6] Includes ATKINSON 85.

### $\overline{p}p \to \pi\pi$

# STRANGE MESONS
## ($S = \pm 1$, $C = B = 0$)

$K^+ = u\overline{s}$, $K^0 = d\overline{s}$, $\overline{K}^0 = \overline{d}s$, $K^- = \overline{u}s$, similarly for $K^*$'s

## $K^{\pm}$ $I(J^P) = \frac{1}{2}(0^-)$

### CHARGED KAON MASS

Revised 1994 by T.G. Trippe (LBNL).

The average of the six charged kaon mass measurements which we use in the Particle Listings is

$$m_{K^\pm} = 493.677 \pm 0.013 \text{ MeV (S = 2.4)}, \quad (1)$$

where the error has been increased by the scale factor S. The large scale factor indicates a serious disagreement between different input data. The average before scaling the error is

$$m_{K^\pm} = 493.677 \pm 0.005 \text{ MeV},$$
$$\chi^2 = 22.9 \text{ for 5 D.F., Prob. } = 0.04\%, \quad (2)$$

where the high $\chi^2$ and correspondingly low $\chi^2$ probability further quantify the disagreement.

The main disagreement is between the two most recent and precise results,

$$m_{K^\pm} = 493.696 \pm 0.007 \text{ MeV} \quad \text{DENISOV 91}$$
$$m_{K^\pm} = 493.636 \pm 0.011 \text{ MeV (S = 1.5)} \quad \text{GALL 88}$$
$$\text{Average} = 493.679 \pm 0.006 \text{ MeV}$$
$$\chi^2 = 21.2 \text{ for 1 D.F., Prob. } = 0.0004\%, \quad (3)$$

both of which are measurements of x-ray energies from kaonic atoms. Comparing the average in Eq. (3) with the overall average in Eq. (2), it is clear that DENISOV 91 and GALL 88 dominate the overall average, and that their disagreement is responsible for most of the high $\chi^2$.

The GALL 88 measurement was made using four different kaonic atom transitions, $K^-$ Pb ($9 \to 8$), $K^-$ Pb ($11 \to 10$), $K^-$ W ($9 \to 8$), and $K^-$ W ($11 \to 10$). The $m_{K^\pm}$ values they obtain from each of these transitions is shown in the Particle Listings and in Fig. 1. Their $K^-$ Pb ($9 \to 8$) $m_{K^\pm}$is below and somewhat inconsistent with their other three transitions. The average of their four measurements is

$$m_{K^\pm} = 493.636 \pm 0.007,$$
$$\chi^2 = 7.0 \text{ for 3 D.F., Prob. } = 7.2\%. \quad (4)$$

This is a low but acceptable $\chi^2$ probability so, to be conservative, GALL 88 scaled up the error on their average by S=1.5 to obtain their published error ±0.011 shown in Eq. (3) above and used in the Particle Listings average.

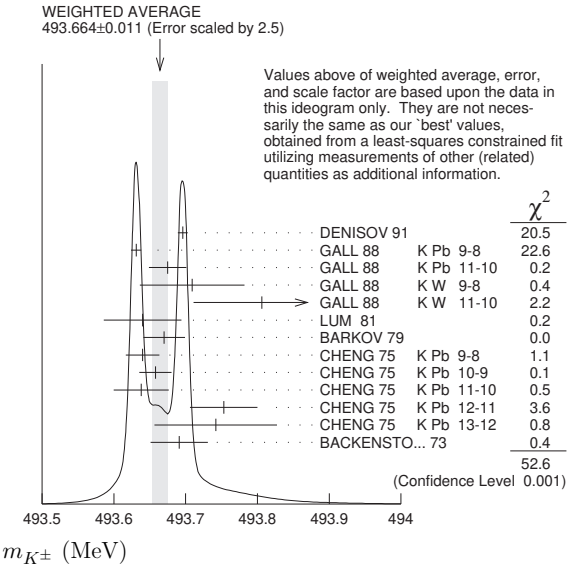

**Figure 1:** Ideogram of $m_{K^\pm}$ mass measurements. GALL 88 and CHENG 75 measurements are shown separately for each transition they measured.

The ideogram in Fig. 1 shows that the DENISOV 91 measurement and the GALL 88 $K^-$ Pb ($9 \to 8$) measurement yield two well-separated peaks. One might suspect the GALL 88 $K^-$ Pb ($9 \to 8$) measurement since it is responsible both for the internal inconsistency in the GALL 88 measurements and the disagreement with DENISOV 91.

To see if the disagreement could result from a systematic problem with the $K^-$ Pb ($9 \to 8$) transition, we have separated the CHENG 75 data, which also used $K^-$ Pb, into its separate transitions. Figure 1 shows that the CHENG 75 and GALL 88 $K^-$ Pb ($9 \to 8$) values are consistent, suggesting the possibility of a common effect such as contaminant nuclear $\gamma$ rays near the $K^-$ Pb ($9 \to 8$) transition energy, although the CHENG 75 errors are too large to make a strong conclusion. The average of all 13 measurements has a $\chi^2$ of 52.6 as shown in Fig. 1 and the first line of Table 1, yielding an unacceptable $\chi^2$ probability of 0.00005%. The second line of Table 1 excludes both the GALL 88 and CHENG 75 measurements of the $K^-$ Pb ($9 \to 8$) transition and yields a $\chi^2$ probability of 43%. The third [fourth] line of Table 1 excludes only the GALL 88 $K^-$ Pb ($9 \to 8$) [DENISOV 91] measurement and yields a $\chi^2$ probability of 20% [8.6%]. Table 1 shows that removing both measurements of the $K^-$ Pb ($9 \to 8$) transition produces the most consistent set of data, but that excluding only the GALL 88 $K^-$ Pb ($9 \to 8$) transition or DENISOV 91 also produces acceptable probabilities.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

**Table 1:** $m_{K^{\pm}}$ averages for some combinations of Fig. 1 data.

| $m_{K^{\pm}}$ (MeV) | $\chi^2$ | D.F. | Prob. (%) | Measurements used |
|---|---|---|---|---|
| $493.664 \pm 0.004$ | 52.6 | 12 | 0.00005 | all 13 measurements |
| $493.690 \pm 0.006$ | 10.1 | 10 | 43 | no $K^-$ Pb(9→8) |
| $493.687 \pm 0.006$ | 14.6 | 11 | 20 | no GALL 88 $K^-$ Pb(9→8) |
| $493.642 \pm 0.006$ | 17.8 | 11 | 8.6 | no DENISOV 91 |

Yu.M. Ivanov, representing DENISOV 91, has estimated corrections needed for the older experiments because of improved $^{192}$Ir and $^{198}$Au calibration $\gamma$-ray energies. He estimates that CHENG 75 and BACKENSTOSS 73 $m_{K^{\pm}}$ values could be raised by about 15 keV and 22 keV, respectively. With these estimated corrections, Table 1 becomes Table 2. The last line of Table 2 shows that if such corrections are assumed, then GALL 88 $K^-$ Pb (9 → 8) is inconsistent with the rest of the data even when DENISOV 91 is excluded. Yu.M. Ivanov warns that these are rough estimates. Accordingly, we do not use Table 2 to reject the GALL 88 $K^-$ Pb (9 → 8) transition, but we note that a future reanalysis of the CHENG 75 data could be useful because it might provide supporting evidence for such a rejection.

**Table 2:** $m_{K^{\pm}}$ averages for some combinations of Fig. 1 data after raising CHENG 75 and BACKENSTOSS 73 values by 0.015 and 0.022 MeV respectively.

| $m_{K^{\pm}}$ (MeV) | $\chi^2$ | D.F. | Prob. (%) | Measurements used |
|---|---|---|---|---|
| $493.666 \pm 0.004$ | 53.9 | 12 | 0.00003 | all 13 measurements |
| $493.693 \pm 0.006$ | 9.0 | 10 | 53 | no $K^-$ Pb(9→8) |
| $493.690 \pm 0.006$ | 11.5 | 11 | 40 | no GALL 88 $K^-$ Pb(9→8) |
| $493.645 \pm 0.006$ | 23.0 | 11 | 1.8 | no DENISOV 91 |

The GALL 88 measurement uses a Ge semiconductor spectrometer which has a resolution of about 1 keV, so they run the risk of some contaminant nuclear $\gamma$ rays. Studies of $\gamma$ rays following stopped $\pi^-$ and $\Sigma^-$ absorption in nuclei (unpublished) do not show any evidence for contaminants according to GALL 88 spokesperson, B.L. Roberts. The DENISOV 91 measurement uses a crystal diffraction spectrometer with a resolution of 6.3 eV for radiation at 22.1 keV to measure the 4f-3d transition in $K^-$ $^{12}$C. The high resolution and the light nucleus reduce the probability for overlap by contaminant $\gamma$ rays, compared with the measurement of GALL 88. The DENISOV 91 measurement is supported by their high-precision measurement of the 4d-2p transition energy in $\pi^-$ $^{12}$C, which is good agreement with the calculated energy.

While we suspect that the GALL 88 $K^-$ Pb (9 → 8) measurements could be the problem, we are unable to find clear grounds for rejecting it. Therefore, we retain their measurement in the average and accept the large scale factor until further information can be obtained from new measurements and/or from reanalysis of GALL 88 and CHENG 75 data.

We thank B.L. Roberts (Boston Univ.) and Yu.M. Ivanov (Petersburg Nuclear Physics Inst.) for their extensive help in understanding this problem.

[1] Error increased from 0.0059 based on the error analysis in IVANOV 92.
[2] This value is the authors' combination of all of the separate transitions listed for this paper.
[3] The CHENG 75 values for separate transitions were calculated from their Table 7 transition energies. The first error includes a 20% systematic error in the noncircular contaminant shift. The second error is due to a ±5 eV uncertainty in the theoretical transition energies.

[a] See the Particle Listings below for the energy limits used in this measurement.

[b] Most of this radiative mode, the low-momentum $\gamma$ part, is also included in the parent mode listed without $\gamma$'s.

[c] Structure-dependent part.

[d] See the review on "Form Factors for Radiative Pion and Kaon Decays" for definitions and details.

[e] Direct-emission branching fraction.

[f] Derived from an analysis of neutrino-oscillation experiments.

[g] Violates angular-momentum conservation.

### CONSTRAINED FIT INFORMATION

An overall fit to the mean life, a decay rate, and 15 branching ratios uses 35 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 53.4$ for 28 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

| | $x_2$ | $x_3$ | $x_4$ | $x_5$ | $x_9$ | $x_{10}$ | $x_{11}$ |

[1] First FORD 70 value is second FORD 70 combined with FORD 67.

### $K^+$ BRANCHING RATIOS

#### Leptonic and semileptonic modes

#### $\Gamma(e^+\nu_e)/\Gamma(\mu^+\nu_\mu)$ $\Gamma_1/\Gamma_2$

See the note on "Decay Constants of Charged Pseudoscalar Mesons" in the $D_s^+$ Listings.

| VALUE (units $10^{-5}$) | EVTS | DOCUMENT ID | | TECN | CHG |
|---|---|---|---|---|---|
| **2.488±0.009 OUR AVERAGE** | | | | | |
| 2.488±0.007±0.007 | 150k | [1] LAZZERONI | 13 | NA62 | ± |
| 2.493±0.025±0.019 | 13.8K | [2] AMBROSINO | 09E | KLOE | ± |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 2.487±0.011±0.007 | 60k | [3] LAZZERONI | 11 | NA62 | + |
| 2.51 ±0.15 | 404 | HEINTZE | 76 | SPEC | + |
| 2.37 ±0.17 | 534 | HEARD | 75B | SPEC | + |
| 2.42 ±0.42 | 112 | CLARK | 72 | OSPK | + |

[1] LAZZERONI 13 uses full data sample collected from 2007 to 2008. This ratio is defined to be fully inclusive, including internal-bremsstrahlung.

[2] The ratio is defined to include internal-bremsstrahlung, ignoring direct-emission contributions. AMBROSINO 09E determined the ratio from the measurement of $\Gamma(K \to e\nu(\gamma)$, $E_\gamma < 10$ MeV) / $\Gamma(K \to \mu\nu(\gamma))$. 89.8% of $K \to e\nu(\gamma)$ events had $E_\gamma < 10$ MeV.

[3] This ratio is defined to be fully inclusive, including internal-bremsstrahlung.

#### $\Gamma(\mu^+\nu_\mu)/\Gamma_{\text{total}}$ $\Gamma_2/\Gamma$

See the note on "Decay Constants of Charged Pseudoscalar Mesons" in the $D_s^+$ Listings.

| VALUE (units $10^{-2}$) | EVTS | DOCUMENT ID | | TECN | CHG | COMMENT |
|---|---|---|---|---|---|---|
| **63.56±0.11 OUR FIT** Error includes scale factor of 1.2. | | | | | | |
| **63.60±0.16 OUR AVERAGE** | | | | | | |
| 63.66±0.09±0.15 | 865k | [1] AMBROSINO | 06A | KLOE | + | |
| 63.24±0.44 | 62k | CHIANG | 72 | OSPK | + | 1.84 GeV/$c$ $K^+$ |

[1] Fully inclusive. Used tagged kaons from $\phi$ decays.

#### $\Gamma(\pi^0 e^+\nu_e)/\Gamma_{\text{total}}$ $\Gamma_3/\Gamma$

| VALUE (units $10^{-2}$) | EVTS | DOCUMENT ID | | TECN | CHG | COMMENT |

[1] BATLEY 12 uses data collected in 2003–2004. The result is inclusive of $K^{\pm} \to \pi^+\pi^- e^{\pm}\nu\gamma$ decays. Using PDG 12 value for $\Gamma(\pi^+\pi^-\pi^+)/\Gamma = (5.59\pm0.04)\times10^{-2}$. BATLEY 12 obtains $B(\pi^+\pi^- e\nu) = (4.257 \pm 0.004 \pm 0.035)\times10^{-5}$ where the syst. error is dominated by the error on the normalization mode.
[2] PISLAK 01 reports $\Gamma(\pi^+\pi^- e^+\nu_e)/\Gamma_{total} = (4.109 \pm 0.008 \pm 0.110)\times10^{-5}$ using the PDG 00 value $\Gamma(\pi^+\pi^+\pi^-)/\Gamma_{total} = (5.59 \pm 0.05)\times10^{-2}$. We divide by the PDG value and unfold its error from the systematic error. PISLAK 03 and PISLAK 10A give additional details on the branching ratio measurement and give improved errors on the $S$-wave $\pi$-$\pi$ scattering length: $a_0^0 = 0.235 \pm 0.013$ and $a_0^2 = -0.0410 \pm 0.0027$.

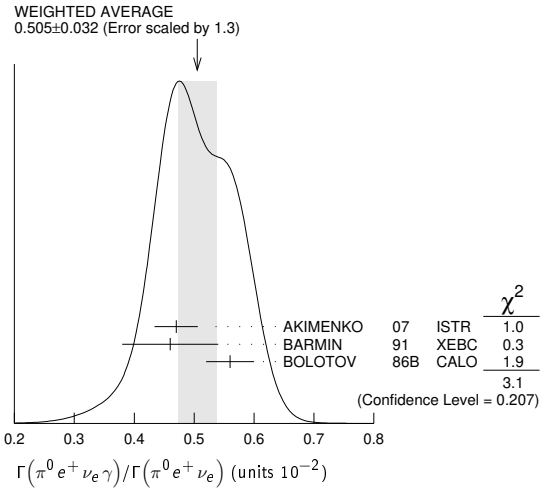
| 1.2 ±0.8 | | BELLOTTI | 67 | HLBC | | $E_\gamma > 30$ MeV |

[1] AKIMENKO 07 provides values for three kinematic regions. For averaging, we use value with $E_\gamma > 10$ MeV and $0.6 < \cos(\theta_{e\gamma}) < 0.9$.
[2] BARMIN 91 quotes branching ratio $\Gamma(K \to e\pi^0\nu\gamma)/\Gamma_{\text{all}}$. The measured normalization is $[\Gamma(K \to e\pi^0\nu) + \Gamma(K \to \pi^+\pi^+\pi^-)]$. For comparison with other experiments we used $\Gamma(K \to e\pi^0\nu)/\Gamma_{\text{all}} = 0.0482$ to calculate the values quoted here.
[3] $\cos(\theta_{e\gamma})$ between 0.6 and 0.9.
[4] First LJUNG 73 value is for $\cos(\theta_{e\gamma})$ <0.9, second value is for $\cos(\theta_{e\gamma})$ between 0.6 and 0.9 for comparison with ROMANO 71.
[5] Both ROMANO 71 values are for $\cos(\theta_{e\gamma})$ between 0.6 and 0.9. Second value is for comparison with second LJUNG 73 value. We use lowest $E_\gamma$ cut for Summary Table value. See ROMANO 71 for $E_\gamma$ dependence.



#### $\Gamma(\pi^0 e^+\nu_e\gamma(\text{SD}))/\Gamma_{\text{total}}$ $\Gamma_{18}/\Gamma$

### Hadronic modes with photons

#### $\Gamma(\pi^+\pi^0\gamma(\text{INT}))/\Gamma_{\text{total}}$ $\Gamma_{21}/\Gamma$

The $K^+ \to \pi^+\pi^0\gamma$ differential decay rate can be described in terms of $T_{\pi^+}$, the charged pion kinetic energy, and $W^2 = (P_K \cdot P_\gamma)(P_{\pi^+} \cdot P_\gamma) / (m_K\, m_{\pi^+})^2$; then we can write $d^2\Gamma(K^+ \to \pi^+\pi^0\gamma) / (dT_{\pi^+}\, dW^2) = d^2\Gamma(K^+ \to \pi^+\pi^0\gamma)_{IB}$ / $(dT_{\pi^+}\, dW^2)$ $[1 + 2\cos(\pm\phi + \delta_1^1 - \delta_0^2)\, m_\pi^2\, m_K^2\, W^2\, X_E + m_\pi^4\, m_K^4\, (X_E^2 + X_M^2)\, W^4]$. The IB differential and total branching ratios are expressed in terms of the non-radiative experimental width $\Gamma(K^+ \to \pi^+\pi^0)$ by Low's theorem. Using PDG 10 $B(K^+ \to \pi^+\pi^0) = 0.2066 \pm 0.0008$, one obtains respectively $B(K^+ \to \pi^+\pi^0\gamma)_{IB}$ ($55 < T_{\pi^+} < 90$ MeV)= $2.55 \times 10^{-4}$ and $B(K^+ \to \pi^+\pi^0\gamma)_{IB}$ ($0 < T_{\pi^+} < 80$ MeV)= $1.80 \times 10^{-4}$. Fitting respectively the piece proportional to $W^2$ and the piece proportional to $W^4$, the interference contribution (INT), proportional to $X_E$, and the direct contribution (DE) proportional to $X_E^2 + X_M^2$ are extracted.

| VALUE (units $10^{-6}$) | EVTS | DOCUMENT ID | | TECN | CHG | COMMENT |
|---|---|---|---|---|---|---|
| **−4.24±0.63±0.70** | 600k | [1] BATLEY | 10A | NA48 | ± | $T_{\pi^+}$ 0–80 MeV |

[1] The cut on the photon energy implies $W^2 > 0.2$. BATLEY 10A obtains the INT and DE fractional branchings with respect to IB from a simultaneous kinematical fit of INT and DE and then we use the PDG 10 value for $B(K^+ \to \pi^+\pi^0) = 20.66 \pm 0.08$ to determine the IB. The INT and DE correlation coefficients −0.83. Assuming a constant electric amplitude, $X_E$, this INT value implies $X_E = -24 \pm 6$ GeV$^{-4}$.

#### $\Gamma(\pi^+\pi^0\gamma(\text{DE}))/\Gamma_{\text{total}}$ $\Gamma_{22}/\Gamma$

Direct emission (DE) part of $\Gamma(\pi^+\pi^0\gamma)/\Gamma_{\text{total}}$, assuming that interference (INT) component is zero.

| −100 ± 600 | | | CHEN | 68 | OSPK | + | $T\pi$ 60–90 MeV |

[1] LAZZERONI 14 combines NA62 and NA48/2 results. The result for the full kinematic range is extrapolated from the model-independent branching fraction $(9.65 \pm 0.61 \pm 0.14) \times 10^{-7}$ for $(m_{\gamma\gamma}/m_K)^2 > 0.2$. The measured ChPT parameter $\hat{c} = 1.86 \pm 0.25$.

[2] KITCHING 97 is extrapolated from their model-independent branching fraction $(6.0 \pm 1.5 \pm 0.7) \times 10^{-7}$ for 100 MeV/$c$<$P_{\pi^+}$ < 180 MeV/$c$ using Chiral Perturbation Theory.

[3] BATLEY 14 uses data collected in 2003 and 2004. Branching ratio is obtained by determining the parameter $\hat{c} = 1.41 \pm 0.38 \pm 0.11$ and integrating the $\mathcal{O}(p^6)$ chiral spectrum. A model independent value for the branching ratio is also obtained $(8.77 \pm 0.87 \pm 0.17) \times 10^{-7}$ for kinematic range $(m_{\gamma\gamma}/m_K)^2 > 0.2$.

[4] ARTAMONOV 05 limit assumes ChPT with $\hat{c}$= 1.8 with unitarity corrections. With $\hat{c}$= 1.6 and no unitarity corrections they obtain < $2.3 \times 10^{-8}$ at 90% CL. This partial branching ratio is predicted to be $6.10 \times 10^{-9}$ and $0.49 \times 10^{-9}$ for the cases with and without unitarity correction.

## $\Gamma(\pi^+ 3\gamma)/\Gamma_{total}$ $\Gamma_{27}/\Gamma$

[1] BATLEY 08 also reports the Chiral Perturbation Theory parameter $\hat{c} = 0.9 \pm 0.45$ obtained using the shape of the $e^+e^-\gamma$ invariant mass spectrum. By extrapolating the theoretical amplitude to $m_{ee\gamma} < 260$ MeV, it obtains the inclusive $B(K^+ \to \pi^+e^+e^-\gamma) = (1.29 \pm 0.13 \pm 0.03) \times 10^{-8}$, where the first error is the combined statistical and systematic errors and the second error is from the uncertainty in $\hat{c}$.

[1] Value extrapolated from a measurement in the region $z = (m_{ee}/m_K)^2 > 0.08$. BATLEY 09 also evaluated the shape of the form factor using four different theoretical models.

[2] APPEL 99 establishes vector nature of this decay and determines form factor $f(Z) = f_0(1+\delta Z)$, $Z = M^2_{ee}/m^2_K$, $\delta = 2.14 \pm 0.13 \pm 0.15$.

[3] ALLIEGRO 92 assumes a vector interaction with a form factor given by $\lambda = 0.105 \pm 0.035 \pm 0.015$ and a correlation coefficient of −0.82.

[4] BLOCH 75 assumes a vector interaction.

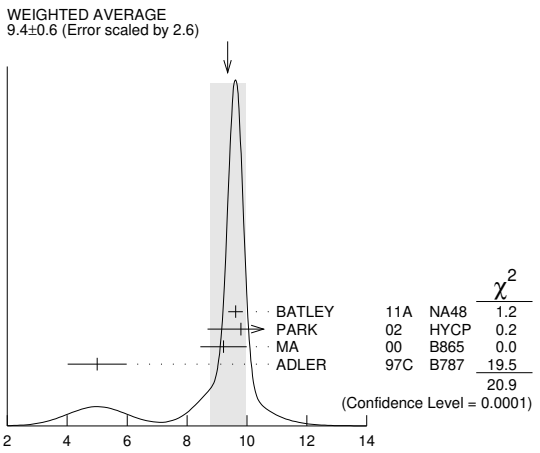
[1] BATLEY 11A also studies the form factor $f(z)$ dependence of the decay, described via single photon exchange: i) assuming a linear form factor, $f(z) = f_0\,(1+\delta\, z)$, $z = (M_{\mu\mu}/m_K)^2$, finding $f_0 = 0.470 \pm 0.040$ and $\delta = 3.11 \pm 0.57$ and ii) assuming a linear form factor including $\pi$-$\pi$ rescattering , $W_{\pi\pi}$, as in DAMBROSIO 98A, finding $f(z) = G_F\, m_K^2\, (a_+ + b_+\, z) + W_{\pi\pi}(z)$, $a_+ = -0.575 \pm 0.039$, $b_+ = -0.813 \pm 0.145$.

[2] PARK 02 "±" result comes from combining $K^+ \to \pi^+\mu^+\mu^-$ and $K^- \to \pi^-\mu^+\mu^-$, assuming $CP$ is conserved.

[3] MA 00 establishes vector nature of this decay and determines form factor $f(z) = f_0\,(1 + \delta\, z)$, $z = (M_{\mu\mu}/m_K)^2$, $\delta = 2.45^{+1.30}_{-0.95}$.

[4] ADLER 97C gives systematic error $0.7 \times 10^{-8}$ and theoretical uncertainty $0.6 \times 10^{-8}$, which we combine in quadrature to obtain our second error.



$\Gamma(\pi^+\mu^+\mu^-)/\Gamma_{total}$ $\Gamma_{38}/\Gamma$

### $\Gamma(\pi^+\nu\overline{\nu})/\Gamma_{total}$ $\Gamma_{39}/\Gamma$

Test for $\Delta S = 1$ weak neutral current. Allowed by higher-order electroweak interactions. Branching ratio values are extrapolated from the momentum or energy regions shown in the comments assuming Standard Model phase space except for those labeled "Scalar" or "Tensor" to indicate the assumed non-Standard-Model interaction.

[1] Value obtained combining ANISIMOVSKY 04, ADLER 04, and the present ARTAMONOV 08 results.

[2] Based on a sample of $1.21 \times 10^{11}$ $K^+$ decays collected in 2016. One signal candidate is observed while the expected background is 0.152 events. The single-event-sensitivity is estimated to be $3.15 \times 10^{-10}$.

[3] Observed 3 events with an estimated background of $0.93 \pm 0.17^{+0.32}_{-0.24}$. Signal-to-background ratio for each of these 3 events is 0.20, 0.42, and 0.47.

[4] Value obtained combining the previous result ADLER 02C with 1 event and the present result with 0 events to obtain an expected background $1.22 \pm 0.24$ events and 1 event observed.

[5] Value obtained combining the previous E787 result ADLER 02 with 2 events and the present E949 with 1 event. The additional event has a signal-to-background ratio 0.9. Superseded by ARTAMONOV 08.

[6] Superseded by ADLER 04.

[7] Combining ATIYA 93 and ATIYA 93B results. Superseded by ADLER 96.

### $\Gamma(\pi^+\gamma)/\Gamma_{total}$ $\Gamma_{50}/\Gamma$

Violates angular momentum conservation and gauge invariance. Current interest in this decay is as a search for non-commutative space-time effects as discussed in ARTAMONOV 05 and for exotic physics such as a vacuum expectation value of a new vector field, non-local Superstring effects, or departures from Lorentz invariance, as discussed in ADLER 02B.

## DALITZ PLOT PARAMETERS FOR $K \to 3\pi$ DECAYS

Revised 1999 by T.G. Trippe (LBNL).

The Dalitz plot distribution for $K^{\pm} \to \pi^{\pm}\pi^{\pm}\pi^{\mp}$, $K^{\pm} \to \pi^0\pi^0\pi^{\pm}$, and $K_L^0 \to \pi^+\pi^-\pi^0$ can be parameterized by a series expansion such as that introduced by Weinberg [1]. We use the form

$$\left|M\right|^2 \propto 1 + g\frac{(s_3 - s_0)}{m_{\pi^+}^2} + h\left[\frac{s_3 - s_0}{m_{\pi^+}^2}\right]^2 + j\,\frac{(s_2 - s_1)}{m_{\pi^+}^2} + k\left[\frac{s_2 - s_1}{m_{\pi^+}^2}\right]^2 + f\,\frac{(s_2 - s_1)}{m_{\pi^+}^2}\frac{(s_3 - s_0)}{m_{\pi^+}^2} + \cdots , \quad (1)$$

where $m_{\pi^+}^2$ has been introduced to make the coefficients $g$, $h$, $j$, and $k$ dimensionless, and

$$s_i = (P_K - P_i)^2 = (m_K - m_i)^2 - 2m_K T_i \ , \ i = 1, 2, 3,$$
$$s_0 = \frac{1}{3}\sum_i s_i = \frac{1}{3}(m_K^2 + m_1^2 + m_2^2 + m_3^2) \quad .$$

Here the $P_i$ are four-vectors, $m_i$ and $T_i$ are the mass and kinetic energy of the $i^{th}$ pion, and the index 3 is used for the odd pion.

The coefficient $g$ is a measure of the slope in the variable $s_3$ (or $T_3$) of the Dalitz plot, while $h$ and $k$ measure the quadratic dependence on $s_3$ and $(s_2 - s_1)$, respectively. The coefficient $j$ is related to the asymmetry of the plot and must be zero if $CP$ invariance holds. Note also that if $CP$ is good, $g$, $h$, and $k$ must be the same for $K^+ \to \pi^+\pi^+\pi^-$ as for $K^- \to \pi^-\pi^-\pi^+$.

Since different experiments use different forms for $\left|M\right|^2$, in order to compare the experiments we have converted to $g$, $h$, $j$, and $k$ whatever coefficients have been measured. Where such conversions have been done, the measured coefficient $a_y$, $a_t$, $a_u$, or $a_v$ is given in the comment at the right. For definitions of

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

these coefficients, details of this conversion, and discussion of the data, see the April 1982 version of this note [2].

## ENERGY DEPENDENCE OF $K^{\pm}$ DALITZ PLOT

$|\text{matrix element}|^2 = 1 + gu + hu^2 + kv^2$
where $u = (s_3 - s_0) / m_{\pi}^2$ and $v = (s_2 - s_1) / m_{\pi}^2$

### LINEAR COEFFICIENT $g$ FOR $K^{\pm} \to \pi^{\pm}\pi^{+}\pi^{-}$

Some experiments use Dalitz variables $x$ and $y$. In the comments we give $a_y$ = coefficient of $y$ term. See note above on "Dalitz Plot Parameters for $K \to 3\pi$ Decays." For discussion of the conversion of $a_y$ to $g$, see the earlier version of the same note in the *Review* published in Physics Letters **111B** 70 (1982).

[1] BATLEY 07E includes data from BATLEY 06. Uses quadratic parametrization and value $g_+ + g_- = 2g$ from BATLEY 07B. This measurement neglects any possible charge asymmetries in higher order slope parameters $h$ or $k$.
[2] This measurement neglects any possible charge asymmetries in higher order slope parameters $h$ or $k$.

### LINEAR COEFFICIENT $g$ FOR $K^{\pm} \to \pi^{\pm}\pi^{0}\pi^{0}$

Unless otherwise stated, all experiments include terms quadratic in $(s_3 - s_0) / m_{\pi^+}^2$. See note above on "Dalitz Plot Parameters for $K \to 3\pi$ Decays."

See BATUSOV 98 for a discussion of the discrepancy between their result and others, especially BOLOTOV 86. At this time we have no way to resolve the discrepancy so we depend on the large scale factor as a warning.

[1] BATLEY 07E includes data from BATLEY 06A. Uses quadratic parametrization and PDG 06 value $g = 0.626 \pm 0.007$ to obtain $g_+ - g_- = (2.2 \pm 2.1 \pm 0.7) \times 10^{-4}$. Neglects any possible charge asymmetries in higher order slope parameters $h$ or $k$.
[2] Asymmetry obtained assuming that $g_+ + g_- = 2\times 0.652$ (PDG 02) and that asymmetries in $h$ and $k$ are zero.
[3] Linear and quadratic slopes from PDG 04 are used. Any possible charge asymmetries in higher order slope parameters $h$ or $k$ are neglected.

## ALTERNATIVE PARAMETRIZATIONS OF $K^{\pm} \to \pi^{\pm}\pi^{0}\pi^{0}$ DALITZ PLOT

The following functional form for the matrix element suggested by $\pi\pi$ rescattering in $K^+ \to \pi^+$"$\pi^+\pi^-$"$\to \pi^+\pi^0\pi^0$ is used for this fit (CABIBBO 04A, CABIBBO 05): Matrix element $= M_0 + M_1$ where $M_0 = 1 + (1/2)g_0\, u + (1/2)\, h'\, u^2 + (1/2)k_0\, v^2$ with $u = (s_3 - s_0)/(m_{\pi^+})^2$, $v = (s_2 - s_1)/(m_{\pi^+})^2$ and where $M_1$ takes into account the non-analytic piece due to pi pi rescattering amplitudes $a_0$ and $a_2$; The parameters $g_0$ and $h'$ are related to the parameters $g$ and $h$ of the matrix element squared given in the previous section by the approximations $g_0 \sim g^{PDG}$ and $h' \sim h^{PDG} - (g/2)^2$ and $k_0 \sim k^{PDG}$.

In addition, we also consider the effective field theory framework of COLANGELO 06A and BISSEGGER 09 to extract $g_{BB}$ and $h'_{BB}$.

### LINEAR COEFFICIENT $g_0$ FOR $K^{\pm} \to \pi^{\pm}\pi^{0}\pi^{0}$

## $K^\pm_{\ell 3}$ AND $K^0_{\ell 3}$ FORM FACTORS

Updated September 2013 by T.G. Trippe (LBNL) and C.-J. Lin (LBNL).

Assuming that only the vector current contributes to $K \to \pi\ell\nu$ decays, we write the matrix element as

$$M \propto f_+(t)\left[(P_K + P_\pi)_\mu \overline{\ell}\gamma_\mu(1+\gamma_5)\nu\right] + f_-(t)\left[m_\ell \overline{\ell}(1+\gamma_5)\nu\right] \ , \quad (1)$$

where $P_K$ and $P_\pi$ are the four-momenta of the $K$ and $\pi$ mesons, $m_\ell$ is the lepton mass, and $f_+$ and $f_-$ are dimensionless form factors which can depend only on $t = (P_K - P_\pi)^2$, the square of the four-momentum transfer to the leptons. If time-reversal invariance holds, $f_+$ and $f_-$ are relatively real. $K_{\mu 3}$ experiments, discussed immediately below, measure $f_+$ and $f_-$, while $K_{e3}$ experiments, discussed further below, are sensitive only to $f_+$ because the small electron mass makes the $f_-$ term negligible.

***$K_{\mu 3}$ Experiments***. Analyses of $K_{\mu 3}$ data frequently assume a linear dependence of $f_+$ and $f_-$ on $t$, *i.e.*,

$$f_\pm(t) = f_\pm(0)\left[1 + \lambda_\pm(t/m^2_{\pi^+})\right] \ . \quad (2)$$

Most $K_{\mu 3}$ data are adequately described by Eq. (2) for $f_+$ and a constant $f_-$ (*i.e.*, $\lambda_- = 0$).

***Two commonly used equivalent parametrizations***:

***(1) $\lambda_+, \xi(0)$ parametrization***. Older analyses of $K_{\mu 3}$ data often introduce the ratio of the two form factors

$$\xi(t) = f_-(t)/f_+(t) \ . \quad (3)$$

The $K_{\mu 3}$ decay distribution is then described by the two parameters $\lambda_+$ and $\xi(0)$ (assuming time reversal invariance and $\lambda_- = 0$).

***(2) $\lambda_+, \lambda_0$ parametrization***. More recent $K_{\mu 3}$ analyses have parametrized in terms of the form factors $f_+$ and $f_0$, which are associated with vector and scalar exchange, respectively, to the lepton pair. $f_0$ is related to $f_+$ and $f_-$ by

$$f_0(t) = f_+(t) + \left[t/(m_K^2 - m_\pi^2)\right] f_-(t) \ . \quad (4)$$

Here $f_0(0)$ must equal $f_+(0)$ unless $f_-(t)$ diverges at $t = 0$. The earlier assumption that $f_+$ is linear in $t$ and $f_-$ is constant leads to $f_0$ linear in $t$:

$$f_0(t) = f_0(0)\left[1 + \lambda_0(t/m^2_{\pi^+})\right] \ . \quad (5)$$

With the assumption that $f_0(0) = f_+(0)$, the two parametrizations, $(\lambda_+, \xi(0))$ and $(\lambda_+, \lambda_0)$ are equivalent as long as correlation information is retained. $(\lambda_+, \lambda_0)$ correlations tend to be less strong than $(\lambda_+, \xi(0))$ correlations.

Since the 2006 edition of the *Review* [4], we no longer quote results in the $(\lambda_+, \xi(0))$ parametrization. We have removed many older low statistics results from the Listings. See the 2004 version of this note [5] for these older results, and the 1982 version [6] for additional discussion of the $K^0_{\mu 3}$ parameters, correlations, and conversion between parametrizations.

***Quadratic Parametrization***. More recent high-statistics experiments have included a quadratic term in the expansion of $f_+(t)$,

$$f_+(t) = f_+(0)\left[1 + \lambda'_+(t/m^2_{\pi^+}) + \frac{\lambda''_+}{2}(t/m^2_{\pi^+})^2\right] \ . \quad (6)$$

If there is a non-vanishing quadratic term, then $\lambda_+$ of Eq. (2) represents the average slope, which is then different from $\lambda'_+$. Our convention is to include the factor $\frac{1}{2}$ in the quadratic term, and to use $m_{\pi^+}$ even for $K^+_{e3}$ and $K^+_{\mu 3}$ decays. We have converted other's parametrizations to match our conventions, as noted in the beginning of the "$K^\pm_{\ell 3}$ and $K^0_{\ell 3}$ Form Factors" sections of the Listings.

***Pole Parametrization***. The pole model describes the $t$-dependence of $f_+(t)$ and $f_0(t)$ in terms of the exchange of the lightest vector and scalar $K^*$ mesons with masses $M_v$ and $M_s$, respectively:

$$f_+(t) = f_+(0)\left[\frac{M_v^2}{M_v^2 - t}\right] \ , \quad f_0(t) = f_0(0)\left[\frac{M_s^2}{M_s^2 - t}\right] \ . \quad (7)$$

***Dispersive Parametrization***. This approach [7,8] uses dispersive techniques and the known low-energy K-$\pi$ phases to parametrize the vector and scalar form factors:

$$f_+(t) = f_+(0)\exp\left[\frac{\mathrm{t}}{\mathrm{m}_\pi^2}(\Lambda_+ + \mathrm{H(t)})\right]; \quad (8)$$

$$f_0(t) = f_+(0)\exp\left[\frac{\mathrm{t}}{(\mathrm{m}_\mathrm{K}^2 - \mathrm{m}_\pi^2)}\,(\ln[\mathrm{C}] - \mathrm{G(t)})\right], \quad (9)$$

where $\Lambda_+$ is the slope of the vector form factor, and $\ln[\mathrm{C}] = \ln[\mathrm{f}_0(\mathrm{m}_\mathrm{K}^2 - \mathrm{m}_\pi^2)]$ is the logarithm of the scalar form factor at

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

the Callan-Treiman point. The functions H(t) and G(t) are dispersive integrals.

***$K_{e3}$ Experiments***. Analysis of $K_{e3}$ data is simpler than that of $K_{\mu 3}$ because the second term of the matrix element assuming a pure vector current [Eq. (1) above] can be neglected. Here $f_+$ can be assumed to be linear in $t$, in which case the linear coefficient $\lambda_+$ of Eq. (2) is determined, or quadratic, in which case the linear coefficient $\lambda_+^{'}$ and quadratic coefficient $\lambda_+^{''}$ of Eq. (6) are determined.

If we remove the assumption of a pure vector current, then the matrix element for the decay, in addition to the terms in Eq. (1), would contain

$$+2m_K\, f_S\, \overline{\ell}(1+\gamma_5)\nu$$
$$+(2f_T/m_K)(P_K)_\lambda(P_\pi)_\mu\, \overline{\ell}\,\sigma_{\lambda\mu}(1+\gamma_5)\nu\ , \qquad (10)$$

where $f_S$ is the scalar form factor, and $f_T$ is the tensor form factor. In the case of the $K_{e3}$ decays where the $f_-$ term can be neglected, experiments have yielded limits on $|f_S/f_+|$ and $|f_T/f_+|$.

***Fits for $K_{\ell 3}$ Form Factors***. For $K_{e3}$ data, we determine best values for the three parametrizations: linear ($\lambda_+$), quadratic ($\lambda_+^{'}$, $\lambda_+^{''}$) and pole ($M_v$). For $K_{\mu 3}$ data, we determine best values for the three parametrizations: linear ($\lambda_+$, $\lambda_0$), quadratic ($\lambda_+^{'}, \lambda_+^{''}$, $\lambda_0$) and pole ($M_v$, $M_s$). We then assume $\mu - e$ universality so that we can combine $K_{e3}$ and $K_{\mu 3}$ data, and again determine best values for the three parametrizations: linear ($\lambda_+$, $\lambda_0$), quadratic ($\lambda_+^{'}, \lambda_+^{''}$, $\lambda_0$), and pole ($M_v$, $M_s$). When there is more than one parameter, fits are done including input correlations. Simple averages suffice in the two $K_{e3}$ cases where there is only one parameter: linear ($\lambda_+$) and pole ($M_v$).

Both KTeV and KLOE see an improvement in the quality of their fits relative to linear fits when a quadratic term is introduced, as well as when the pole parametrization is used. The quadratic parametrization has the disadvantage that the quadratic parameter $\lambda_+^{''}$ is highly correlated with the linear parameter $\lambda_+^{'}$, in the neighborhood of 95%, and that neither parameter is very well determined. The pole fit has the same number of parameters as the linear fit, but yields slightly better fit probabilities, so that it would be advisable for all experiments to include the pole parametrization as one of their choices [9].

The "Kaon Particle Listings" show the results with and without assuming $\mu$-$e$ universality. The "Meson Summary Tables" show all of the results assuming $\mu$-$e$ universality, but most results not assuming $\mu$-$e$ universality are given only in the Listings.

## $K_{\ell 3}^{\pm}$ FORM FACTORS

In the form factor comments, the following symbols are used.

$f_+$ and $f_-$ are form factors for the vector matrix element.
$f_S$ and $f_T$ refer to the scalar and tensor term.
$f_0 = f_+ + f_-\ t/(m^2_{K^+} - m^2_{\pi^0})$.
$t$ = momentum transfer to the $\pi$.
$\lambda_+$ and $\lambda_0$ are the linear expansion coefficients of $f_+$ and $f_0$:
$f_+(t) = f_+(0)\ (1 + \lambda_+\, t\, /m^2_{\pi^+})$
For quadratic expansion
$f_+(t) = f_+(0)\ (1 + \lambda'_+\, t\, /m^2_{\pi^+} + \frac{\lambda''_+}{2}\ t^2/m^4_{\pi^+}\ )$
as used by KTeV. If there is a non-vanishing quadratic term, then $\lambda_+$ represents an average slope, which is then different from $\lambda'_+$.
NA48/2 and OKA quadratic expansion coefficients are converted with
$\lambda'_+{}^{PDG} = \lambda'_+{}^{NA48/2}$ and $\lambda''_+{}^{PDG} = 2\,\lambda''_+{}^{NA48/2}$
$\lambda'_+{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2\ \lambda'_+{}^{OKA}$ and
$\lambda''_+{}^{PDG} = 2\,(\frac{m_{\pi^+}}{m_{\pi^0}})^4\ \lambda''_+{}^{OKA}$
OKA linear expansion coefficients are converted with
$\lambda_+{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2\ \lambda_+{}^{OKA}$ and $\lambda_0{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2\ \lambda_0{}^{OKA}$
The pole parametrization is
$f_+(t) = f_+(0)\ (\frac{M_V^2}{M_V^2 - t}\ )$
$f_0(t) = f_0(0)\ (\frac{M_S^2}{M_S^2 - t}\ )$
where $M_V$ and $M_S$ are the vector and scalar pole masses.
The following abbreviations are used:
DP = Dalitz plot analysis.
PI = $\pi$ spectrum analysis.
MU = $\mu$ spectrum analysis.
POL= $\mu$ polarization analysis.
BR = $K^{\pm}_{\mu 3}/K^{\pm}_{e3}$ branching ratio analysis.
E = positron or electron spectrum analysis.
RC = radiative corrections.

For previous $\lambda'_+$ and $\lambda''_+$ parametrizations used by NA48 (e.g. LAI 07A) and ISTRA (e.g. YUSHCHENKO 04B) see PDG 18.

### $\lambda_+$ (LINEAR ENERGY DEPENDENCE OF $f_+$ IN $K_{e3}^{\pm}$ DECAY)

These results are for a linear expansion only. See the next section for fits including a quadratic term. For radiative correction of the $K^{\pm}_{e3}$ Dalitz plot, see GINSBERG 67, BECHERRAWY 70, CIRIGLIANO 02, CIRIGLIANO 04, and ANDRE 07. Results labeled OUR FIT are discussed in the review "$K^{\pm}_{\ell 3}$ and $K^0_{\ell 3}$ Form Factors" above. For earlier, lower statistics results, see the 2004 edition of this review, Physics Letters **B592** 1 (2004).

## $K^{\pm}_{\ell4}$ FORM FACTORS

Based on the parametrizations of AMOROS 99, the $K^{\pm}_{\ell4}$ form factors can be expressed as

$$F_s = f_s + f'_s\, q^2 + f''_s\, q^4 + f'_e\, S_e / 4m_\pi^2$$
$$F_p = f_p$$
$$G_p = g_p + g'_p\, q^2$$
$$H_p = h_p$$

where $q^2 = (S_\pi / 4m_\pi^2) - 1$, $S_\pi$ is the invariant mass squared of the dipion, and $S_e$ is the invariant mass squared of the dilepton.

### $f_s$ FOR $K^{\pm} \to \pi^+\pi^- e^{\pm}\nu$ DECAY

## DECAY FORM FACTOR FOR $K^{\pm} \to \pi^0\pi^0 e^{\pm}\nu$

Given in BOLOTOV 86B, BARMIN 88B, and SHIMIZU 04.

## $K^{\pm} \to \ell^{\pm}\nu\gamma$ FORM FACTORS

For definitions of the axial-vector $F_A$ and vector $F_V$ form factor, see the "Note on $\pi^{\pm} \to \ell^{\pm}\nu\gamma$ and $K^{\pm} \to \ell^{\pm}\nu\gamma$ Form Factors" in the $\pi^{\pm}$ section. In the kaon literature, often different definitions $a_K = F_A/m_K$ and $v_K = F_V/m_K$ are used.

### $F_A + F_V$, SUM OF AXIAL-VECTOR AND VECTOR FORM FACTOR FOR $K \to e\nu_e\gamma$

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.133 ± 0.008 OUR AVERAGE** | | Error includes scale factor of 1.3. | | | See the ideogram below. |
| 0.125 ± 0.007 ± 0.001 | 1.4K | [1] AMBROSINO | 09E | KLOE | $E_\gamma$ in 10–250 MeV, $p_e > 200$ MeV/c |

| $0.150^{+0.018}_{-0.023}$ | 56 | [3] HEARD | 75 | SPEC | |

[1] AMBROSINO 09E measures the absolute value $|F_A + F_V|$ which is parametrized as $|F_A + F_V| = F_V\,(1 + \lambda(1-x)) + F_A$, $x = 2E_\gamma/m_K$. $(F_A + F_V)$ and $\lambda$ are fit parameters. The fitted value of $\lambda = 0.38 \pm 0.20 \pm 0.02$ with a correlation of −0.93 between $(F_A + F_V)$ and $\lambda$.

[2] HEINTZE 79 quotes absolute value of $|F_A + F_V| \sin\theta_C$. We use $\sin\theta_C = V_{us} = 0.2205$.

[3] HEARD 75 quotes absolute value of $|F_A + F_V| \sin\theta_C$. We use $\sin\theta_C = V_{us} = 0.2205$.

## $K^{\pm}$ CHARGE RADIUS

| VALUE (fm) | DOCUMENT ID | | COMMENT |
|---|---|---|---|
| **0.560 ± 0.031 OUR AVERAGE** | | | |
| 0.580 ± 0.040 | AMENDOLIA | 86B | $Ke \to Ke$ |
| 0.530 ± 0.050 | DALLY | 80 | $Ke \to Ke$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | |
| 0.620 ± 0.037 | BLATNIK | 79 | VMD + dispersion relations |

## $K^+$ LONGITUDINAL POLARIZATION OF EMITTED $\mu^+$

| VALUE | CL% | DOCUMENT ID | | TECN | CHG | COMMENT |
|---|---|---|---|---|---|---|
| **< −0.990** | 90 | [1] AOKI | 94 | SPEC | + | |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | | |
| < −0.990 | 90 | IMAZATO | 92 | SPEC | + | Repl. by AOKI 94 |
| −0.970 ± 0.047 | | [2] YAMANAKA | 86 | SPEC | + | |
| −1.0 ± 0.1 | | [2] CUTTS | 69 | SPRK | + | |
| −0.96 ± 0.12 | | [2] COOMBES | 57 | CNTR | + | |

[1] AOKI 94 measures $\xi P_\mu = -0.9996 \pm 0.0030 \pm 0.0048$. The above limit is obtained by summing the statistical and systematic errors in quadrature, normalizing to the physically significant region ($|\xi P_\mu| < 1$) and assuming that $\xi$=1, its maximum value.

[2] Assumes $\xi$=1.

## FORWARD-BACKWARD ASYMMETRY IN $K^{\pm}$ DECAYS

$$A_{FB}(K^{\pm}_{\pi\mu\mu}) = \frac{\Gamma(\cos(\theta_{K\mu})>0) - \Gamma(\cos(\theta_{K\mu})<0)}{\Gamma(\cos(\theta_{K\mu})>0) + \Gamma(\cos(\theta_{K\mu})<0)}$$

| VALUE | CL% | DOCUMENT ID | | TECN |
|---|---|---|---|---|
| **< 2.3 × 10⁻²** | 90 | [1] BATLEY | 11A | NA48 |

[1] BATLEY 11A gives a corresponding value of the asymmetry $A_{FB} = (-2.4 \pm 1.8) \times 10^{-2}$.

## $T$-VIOLATION PARAMETER IN $K^0$-$\overline{K}^0$ MIXING

The asymmetry $A_T = \frac{\Gamma(\overline{K}^0 \to K^0) - \Gamma(K^0 \to \overline{K}^0)}{\Gamma(\overline{K}^0 \to K^0) + \Gamma(K^0 \to \overline{K}^0)}$ must vanish if $T$ invariance holds.

## ASYMMETRY $A_T$ IN $K^0$-$\overline{K}^0$ MIXING

| VALUE (units $10^{-3}$) | EVTS | DOCUMENT ID | | TECN |
|---|---|---|---|---|
| **6.6±1.3±1.0** | 640k | [1] ANGELOPO... | 98E | CPLR |

[1] ANGELOPOULOS 98E measures the asymmetry $A_T = [\Gamma(\overline{K}^0_{t=0} \to e^+\pi^-\nu_{t=\tau}) - \Gamma(K^0_{t=0} \to e^-\pi^+\overline{\nu}_{t=\tau})]/[\Gamma(\overline{K}^0_{t=0} \to e^+\pi^-\nu_{t=\tau}) + \Gamma(K^0_{t=0} \to e^-\pi^+\overline{\nu}_{t=\tau})]$ as a function of the neutral-kaon eigentime $\tau$. The initial strangeness of the neutral kaon is tagged by the charge of the accompanying charged kaon in the reactions $p\overline{p} \to K^-\pi^+K^0$ and $p\overline{p} \to K^+\pi^-\overline{K}^0$. The strangeness at the time of the decay is tagged by the lepton charge. The reported result is the average value of $A_T$ over the interval $1\tau_S < \tau < 20\tau_S$. From this value of $A_T$ ANGELOPOULOS 01B, assuming $CPT$ invariance in the $e\pi\nu$ decay amplitude, determine the $T$-violating as $\Delta S = \Delta S$ conserving parameter (for its definition, see Review below) $4\mathrm{Re}(\epsilon) = (6.2 \pm 1.4 \pm 1.0) \times 10^{-3}$.

**See the related review(s):**
*CPT* Invariance Tests in Neutral Kaon Decay

## $CP$-VIOLATION PARAMETERS

### Re($\epsilon$)

| VALUE (units $10^{-3}$) | DOCUMENT ID | | TECN |
|---|---|---|---|
| **1.596±0.013** | [1] AMBROSINO | 06H | KLOE |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | |
| 1.664±0.010 | [2] LAI | 05A | NA48 |

[1] AMBROSINO 06H uses Bell-Steinberger relations with the following measurements: B($K^0_L \to \pi^+\pi^-$) in AMBROSINO 06F, B($K^0_S \to \pi^0\pi^0\pi^0$) in AMBROSINO 05B, the $K^0_S$-semileptonic charge asymmetry in AMBROSINO 06E, and $K^0$-semileptonic results in ANGELOPOULOS 98F.

[2] LAI 05A values are obtained through unitarity (Bell-Steinberger relations), improving determination of $\eta_{000}$ and combining other data from PDG 04 and APOSTOLAKIS 99B.

## $CPT$-VIOLATION PARAMETERS

In $K^0$-$\overline{K}^0$ mixing, if $CP$-violating interactions include a $T$ conserving part then

$$|K_S\rangle = [|K_1\rangle + (\epsilon+\delta)|K_2\rangle]/\sqrt{1+|\epsilon+\delta|^2}$$
$$|K_L\rangle = [|K_2\rangle + (\epsilon-\delta)|K_1\rangle]/\sqrt{1+|\epsilon-\delta|^2}$$

where

$$|K_1\rangle = [|K^0\rangle + |\overline{K}^0\rangle]/\sqrt{2}$$
$$|K_2\rangle = [|K^0\rangle - |\overline{K}^0\rangle]/\sqrt{2}$$

and

$$|\overline{K}^0\rangle = CP|K^0\rangle.$$

The parameter $\delta$ specifies the $CPT$-violating part.

Estimates of $\delta$ are given below assuming the validity of the $\Delta S = \Delta Q$ rule. See also THOMSON 95 for a test of $CPT$-symmetry conservation in $K^0$ decays using the Bell-Steinberger relation.

### REAL PART OF $\delta$

A nonzero value violates $CPT$ invariance.

| VALUE (units $10^{-4}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **2.51± 2.25** | | [1] ABOUZAID | 11 | KTEV | |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |

| 2100 ±3700 | 6481 | [6] DEMIDOV | 95 | | $K_{\ell 3}$ reanalysis |

[1] ABOUZAID 11 uses Bell-Steinberger relations.

[2] AMBROSINO 06H uses Bell-Steinberger relations with the following measurements: B($K^0_L \to \pi^+\pi^-$) in AMBROSINO 06F, B($K^0_S \to \pi^0\pi^0\pi^0$) in AMBROSINO 05B, the $K^0_S$-semileptonic charge asymmetry in AMBROSINO 06E, and $K^0$-semileptonic results in ANGELOPOULOS 98F.

[3] LAI 05A values are obtained through unitarity (Bell-Steinberger relations), improving determination of $\eta_{000}$ and combining other data from PDG 04 and APOSTOLAKIS 99B.

[4] APOSTOLAKIS 99B assumes only unitarity and combines CPLEAR and other results.

[5] If $\Delta S = \Delta Q$ is not assumed, ANGELOPOULOS 98F finds $\mathrm{Im}\delta = (-15 \pm 23 \pm 3) \times 10^{-3}$.

[6] DEMIDOV 95 reanalyzes data from HART 73 and NIEBERGALL 74.

### Re(y)

A non-zero value would violate $CPT$ invariance in $\Delta S = \Delta Q$ amplitude. Re(y) is the following combination of $K_{\ell 3}$ decay amplitudes:

$$\mathrm{Re(y)} = \mathrm{Re}\left( \frac{A(\overline{K}^0 \to e^-\pi^+\overline{\nu}_e)^* - A(K^0 \to e^+\pi^-\nu_e)}{A(\overline{K}^0 \to e^-\pi^+\overline{\nu}_e)^* + A(K^0 \to e^+\pi^-\nu_e)} \right)$$

| VALUE (units $10^{-3}$) | EVTS | DOCUMENT ID | | TECN |

[1] AMBROSINO 06H uses Bell-Steinberger relations with the following measurements: $B(K^0_L \to \pi^+\pi^-)$ in AMBROSINO 06F, $B(K^0_S \to \pi^0\pi^0\pi^0)$ in AMBROSINO 05B, the $K^0_S$-semileptonic charge asymmetry in AMBROSINO 06E, and $K^0$-semileptonic results in ANGELOPOULOS 98F.
[2] Uses PDG 04 for the $K^0_L$ semileptonic charge asymmetry and Re($\delta$) from CPLEAR, ANGELOPOULOS 98F.
[3] Constrained by Bell-Steinberger (or unitarity) relation.

### $|m_{K^0} - m_{\overline{K}^0}| / m_{\text{average}}$

A test of $CPT$ invariance. "Our Evaluation" is described in the "Tests of Conservation Laws" section. It assumes $CPT$ invariance in the decay and neglects some contributions from decay channels other than $\pi\pi$.

| VALUE | CL% | DOCUMENT ID | | TECN |
|---|---|---|---|---|
| **$< 6 \times 10^{-19}$** | 90 | PDG | 12 | |

• • • We do not use the following data for averages, fits, limits, etc. • • •

| | | | | |
|---|---|---|---|---|
| $(-3 \pm 4) \times 10^{-18}$ | [1] ANGELOPO... | 99B | RVUE | |

[1] ANGELOPOULOS 99B assumes only unitarity and combines CPLEAR and other results.

### $(\Gamma_{K^0} - \Gamma_{\overline{K}^0})/m_{\text{average}}$

A test of $CPT$ invariance.

| VALUE | DOCUMENT ID | | TECN |
|---|---|---|---|
| **$(7.8 \pm 8.4) \times 10^{-18}$** | [1] ANGELOPO... | 99B | RVUE |

[1] ANGELOPOULOS 99B assumes only unitarity and combines CPLEAR with other results. Correlated with $(m_{K^0} - m_{\overline{K}^0}) / m_{\text{average}}$ with a correlation coefficient of $-0.95$.

## TESTS OF $\Delta S = \Delta Q$ RULE

### Re($x_+$)

A non-zero value would violate the $\Delta S = \Delta Q$ rule in $CPT$ conserving transitions. $x_+$ is defined above in the Re($x_-$) section.

| VALUE (units $10^{-3}$) | EVTS | DOCUMENT ID | | TECN |
|---|---|---|---|---|
| **$-0.9 \pm 3.0$ OUR AVERAGE** | | | | |
| $-2 \pm 10$ | | [1] BATLEY | 07D | NA48 |
| $-0.5 \pm 3.6$ | 13k | [2] AMBROSINO | 06E | KLOE |
| $-1.8 \pm 6.1$ | | [3] ANGELOPO... | 98D | CPLR |

[1] Result obtained from the measurement $\Gamma(K^0_S \to \pi e \nu) / \Gamma(K^0_L \to \pi e \nu) = 0.993 \pm 0.34$, neglecting possible $CPT$ non-invariance and using PDG 06 values of $B(K^0_L \to \pi e \nu) = 0.4053 \pm 0.0015$, $\tau_L = (5.114 \pm 0.021) \times 10^{-8}$ s and $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$ s.
[2] Re($x_+$) can be shown to be equal to the following combination of rates:

$$\text{Re}(x_+) = \frac{1}{2} \frac{\Gamma(K^0_S \to \pi e \nu) - \Gamma(K^0_L \to \pi e \nu)}{\Gamma(K^0_S \to \pi e \nu) + \Gamma(K^0_L \to \pi e \nu)}$$

which is valid up to first order in terms violating $CPT$ and/or the $\Delta S = \Delta Q$ rule.
[3] Obtained neglecting $CPT$ violating amplitudes.

## $K^0_S$

$I(J^P) = \frac{1}{2}(0^-)$

### $K^0_S$ MEAN LIFE

For earlier measurements, beginning with BOLDT 58B, see our 1986 edition, Physics Letters **170B** 130 (1986).

OUR FIT is described in the note on "$CP$ violation in $K_L$ decays" in the $K^0_L$ Particle Listings. The result labeled "OUR FIT Assuming $CPT$" ["OUR FIT Not assuming $CPT$"] includes all measurements except those with the comment "Not assuming $CPT$" ["Assuming $CPT$"]. Measurements with neither comment do not assume $CPT$ and enter both fits.

| VALUE ($10^{-10}$ s) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.8954 $\pm$0.0004 OUR FIT** | | Error includes scale factor of 1.1. Assuming $CPT$ | | | |

[1] The two ABOUZAID 11 values use the same full KTeV dataset from 1996, 1997, and 1999. The first enters the "assuming $CPT$" fit and the second enters the "not assuming $CPT$" fit.
[2] ABOUZAID 11 fit has $\Delta m$, $\tau_S$, $\phi_\epsilon$, Re($\epsilon'/\epsilon$), and Im($\epsilon'/\epsilon$) as free parameters. See Im($\epsilon'/\epsilon$) in the "$K^0_L$ $CP$ violation" section for correlation information.
[3] ABOUZAID 11 fit has $\Delta m$ and $\tau_S$ free but constrains $\phi_\epsilon$ to the Superweak value, i.e. assumes $CPT$. This $\tau_S$ value is correlated with their $\Delta m = m_{K^0_L} - m_{K^0_S}$ measurement in the $K^0_L$ listings. The correlation coefficient $\rho(\tau_S, \Delta m) = -0.670$.
[4] Fit to the proper time distribution.
[5] This ALAVI-HARATI 03 fit has $\Delta m$ and $\tau_S$ free but constrains $\phi_{+-}$ to the Superweak value, i.e. assumes $CPT$. This $\tau_S$ value is correlated with their $\Delta m = m_{K^0_L} - m_{K^0_S}$ measurement in the $K^0_L$ listings. The correlation coefficient $\rho(\tau_S, \Delta m) = -0.396$. Superseded by ABOUZAID 11.
[6] This ALAVI-HARATI 03 fit has $\Delta m$, $\phi_{+-}$, and $\tau_{K_S}$ free. See $\phi_{+-}$ in the "$K_L$ $CP$ violation" section for correlation information. Superseded by ABOUZAID 11.
[7] ARONSON 82 find that $K^0_S$ mean life may depend on the kaon energy.
[8] CARITHERS 75 measures the $\Delta m$ dependence of the total decay rate (inverse mean life) to be $\Gamma(K^0_S) = [(1.122 \pm 0.004) + 0.16(\Delta m - 0.5348)/\Delta m] 10^{10}$/s, or, in terms of mean life, CARITHERS 75 measures $\tau_S = (0.8913 \pm 0.0032) - 0.238\,[\Delta m - 0.5348]$ ($10^{-10}$ s). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}$ $\hbar$ s$^{-1}$). Our first error is their experiment's error and our second error is the systematic error from using our best values.
[9] HILL 68 has been changed by the authors from the published value ($0.865 \pm 0.009$) because of a correction in the shift due to $\eta_{+-}$. SKJEGGESTAD 72 and HILL 68 give detailed discussions of systematics encountered in this type of experiment.
[10] Pre-1971 experiments are excluded from the average because of disagreement with later more precise experiments.

### $K^0_S$ DECAY MODES

| | Mode | | Fraction ($\Gamma_i/\Gamma$) | Scale factor/ Confidence level |
|---|---|---|---|---|
| | **Hadronic modes** | | | |
| $\Gamma_1$ | $\pi^0\pi^0$ | | (30.69 $\pm$0.05) % | |
| $\Gamma_2$ | $\pi^+\pi^-$ | | (69.20 $\pm$0.05) % | |
| $\Gamma_3$ | $\pi^+\pi^-\pi^0$ | | ( 3.5 $^{+1.1}_{-0.9}$ ) $\times 10^{-7}$ | |
| | **Modes with photons or $\ell\overline{\ell}$ pairs** | | | |
| $\Gamma_4$ | $\pi^+\pi^-\gamma$ | [a,b] | ( 1.79 $\pm$0.05) $\times 10^{-3}$ | |
| $\Gamma_5$ | $\pi^+\pi^- e^+ e^-$ | | ( 4.79 $\pm$0.15) $\times 10^{-5}$ | |
| $\Gamma_6$ | $\pi^0\gamma\gamma$ | [a] | ( 4.9 $\pm$1.8 ) $\times 10^{-8}$ | |
| $\Gamma_7$ | $\gamma\gamma$ | | ( 2.63 $\pm$0.17) $\times 10^{-6}$ | S=3.0 |
| | **Semileptonic modes** | | | |
| $\Gamma_8$ | $\pi^\pm e^\mp \nu_e$ | [c] | ( 7.04 $\pm$0.08) $\times 10^{-4}$ | |
| $\Gamma_9$ | $\pi^\pm \mu^\mp \nu_\mu$ | [c,d] | ( 4.69 $\pm$0.05) $\times 10^{-4}$ | |

### *CP* violating (*CP*) and $\Delta S = 1$ weak neutral current (*S1*) modes

| | | | | | | |
|---|---|---|---|---|---|---|
| $\Gamma_{10}$ | $3\pi^0$ | *CP* | < | 2.6 | $\times 10^{-8}$ | CL=90% |
| $\Gamma_{11}$ | $\mu^+\mu^-$ | *S1* | < | 8 | $\times 10^{-10}$ | CL=90% |
| $\Gamma_{12}$ | $e^+e^-$ | *S1* | < | 9 | $\times 10^{-9}$ | CL=90% |
| $\Gamma_{13}$ | $\pi^0 e^+ e^-$ | *S1* | [a] | $( 3.0\ ^{+1.5}_{-1.2} ) \times 10^{-9}$ | | |
| $\Gamma_{14}$ | $\pi^0\mu^+\mu^-$ | *S1* | | $( 2.9\ ^{+1.5}_{-1.2} ) \times 10^{-9}$ | | |

[a] See the Particle Listings below for the energy limits used in this measurement.

[b] Most of this radiative mode, the low-momentum $\gamma$ part, is also included in the parent mode listed without $\gamma$'s.

[c] The value is for the sum of the charge states or particle/antiparticle states indicated.

[d] Not a measurement. Calculated as $0.666 \cdot B(\pi^\pm e^\mp \nu_e)$.

### CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 5 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 0.1$ for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

| $4.1\ ^{+2.5}_{-1.9} \pm 0.5$ | | [4] ADLER | 96E | CPLR | Sup. by ADLER 97B |
| $3.9\ ^{+5.4}_{-1.8} \pm 0.9$ | | [5] THOMSON | 94 | E621 | Sup. by ZOU 96 |

[1] BATLEY 05 is obtained by measuring the interference parameters in $K_S$, $K_L \to \pi^+\pi^-\pi^0$: $\mathrm{Re}(\lambda) = 0.038 \pm 0.008 \pm 0.006$ and $\mathrm{Im}(\lambda) = -0.013 \pm 0.005 \pm 0.004$; the correlation coeff. between $\mathrm{Re}(\lambda)$ and $\mathrm{Im}(\lambda)$ is 0.66 (statistical only).

[2] ADLER 97B find the *CP*-conserving parameters $\mathrm{Re}(\lambda) = (28 \pm 7 \pm 3) \times 10^{-3}$, $\mathrm{Im}(\lambda) = (-10 \pm 8 \pm 2) \times 10^{-3}$. They estimate $B(K^0_S \to \pi^+\pi^-\pi^0)$ from $\mathrm{Re}(\lambda)$ and the $K^0_L$ decay parameters. See also ANGELOPOULOS 98C.

[3] ZOU 96 is from the the measured quantities $|\rho_{+-0}| = 0.039\ ^{+0.009}_{-0.006} \pm 0.005$ and $\phi_\rho = (-9 \pm 18)^\circ$.

[4] ADLER 96E is from the measured quantities $\mathrm{Re}(\lambda) = 0.036 \pm 0.010\ ^{+0.002}_{-0.003}$ and $\mathrm{Im}(\lambda)$ consistent with zero. Note that the quantity $\lambda$ is the same as $\rho_{+-0}$ used in other footnotes.

[5] THOMSON 94 calculates this branching ratio from their measurements $|\rho_{+-0}| = 0.035\ ^{+0.019}_{-0.011} \pm 0.004$ and $\phi_\rho = (-59 \pm 48)^\circ$ where $|\rho_{+-0}| e^{i\phi_\rho} = A(K^0_S \to \pi^+\pi^-\pi^0, I = 2)/A(K^0_L \to \pi^+\pi^-\pi^0)$.

### Modes with photons or $\ell\bar{\ell}$ pairs

| 4.5 ±0.7 ±0.4 | 56 | LAI | 00B | NA48 | 1998 data |

[1] BATLEY 11 reports $[\Gamma(K^0_S \to \pi^+\pi^-e^+e^-)/\Gamma_{total}] / [B(K^0_L \to \pi^+\pi^-\pi^0)] / [B(\pi^0 \to e^+e^-\gamma)] = (3.28 \pm 0.06 \pm 0.04) \times 10^{-2}$ which we multiply by our best values $B(K^0_L \to \pi^+\pi^-\pi^0) = (12.54 \pm 0.05) \times 10^{-2}$, $B(\pi^0 \to e^+e^-\gamma) = (1.174 \pm 0.035) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best values. Also a limit on the absolute value of the interference between bremsstrahlung and E1 transition is given : $< 4 \times 10^{-7}$ at 90% C.L.

[2] Uses normalization $BR(K_L \to \pi^+\pi^-\pi^0) * BR(\pi^0 \to e^+e^-) = (1.505 \pm 0.047) \times 10^{-3}$ from our 2000 Edition.

[3] Second error is 0.16(syst) ±0.15(norm) combined in quadrature.

[1] AMBROSINO 08C reports $(2.26 \pm 0.12 \pm 0.06) \times 10^{-6}$ from a measurement of $[\Gamma(K^0_S \to \gamma\gamma)/\Gamma_{total}] \times [B(K^0_S \to \pi^0\pi^0)]$ assuming $B(K^0_S \to \pi^0\pi^0) = (30.69 \pm 0.05) \times 10^{-2}$.

[2] LAI 03 reports $[\Gamma(K^0_S \to \gamma\gamma)/\Gamma_{total}] / [B(K^0_S \to \pi^0\pi^0)] = (8.84 \pm 0.18 \pm 0.10) \times 10^{-6}$ which we multiply by our best value $B(K^0_S \to \pi^0\pi^0) = (30.69 \pm 0.05) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] BARR 95B result is calculated using $B(K_L \to \gamma\gamma) = (5.86 \pm 0.17) \times 10^{-4}$.

[4] BARR 95B quotes this as the combined BARR 95B + BURKHARDT 87 result after rescaling BURKHARDT 87 to use same branching ratios and lifetimes as BARR 95B.

## Semileptonic modes

| 7.2 ±1.4 | 75 | AKHMETSHIN | 99 | CMD2 | Tagged $K^0_S$ using $\phi \to K^0_L K^0_S$ |

[1] Reconstructed from $K^0(\overline{K}^0)(t) \to \pi e \nu$ distributions using PDG values of $B(K^0_L \to \pi e \nu) = 0.4053 \pm 0.0015$, $\tau_L = (5.114 \pm 0.021) \times 10^{-8}$ s and $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$ s.

[2] Uses the PDG 00 value for $B(K^0_S \to \pi^+\pi^-)$.

[3] Obtained by imposing $\Sigma_i B(K^0_S \to i) = 1$, where $i$ runs over all the four branching ratios $\pi^+\pi^-$, $\pi^0\pi^0$, $\pi e \nu$, and $\pi\mu\nu$. Input value of $B(K^0_S \to \pi^+\pi^-) / B(K^0_S \to \pi^0\pi^0)$ from AMBROSINO 06C is used. To derive $\Gamma(K^0_S \to \pi^+\mu\nu) / \Gamma(K^0_S \to \pi^+ e\nu)$, lepton universality is assumed, radiative corrections from ANDRE 07 are used, and phase space integrals are taken from KTeV, ALEXOPOULOS 04A. This branching fraction enters our fit via their $\Gamma(\pi^\pm e^\mp \nu_e) / \Gamma(\pi^+\pi^-)$ branching ratio measurement.

### $\Gamma(\pi^\pm \mu^\mp \nu_\mu)/\Gamma_{total}$ $\Gamma_9/\Gamma$

The PDG 06 value below has not been measured but is computed to be 0.666 times the $K_S \to \pi^\pm e^\mp \nu_e$ branching fraction. It is included in the fit that constrains the four branching ratios $\pi^+\pi^-$, $\pi^0\pi^0$, $\pi e \nu$, and $\pi\mu\nu$ to sum to 1. This treatment, used by AMBROSINO 06E, is preferable to our previous practice of constraining the $\pi^+\pi^-$ and $\pi^0\pi^0$ modes to sum to 1. The 0.666 factor is obtained from AMBROSINO 06E and assumes lepton universality, radiative corrections from ANDRE 07, and phase space integrals from KTeV, ALEXOPOULOS 04A.

| <370 | 90 | | BARMIN | 83 | HLBC | |

[1] BABUSCI 13C uses 1.7 fb$^{-1}$ of data of $\phi \to K^0_L K^0_S$ decays with $K^0_L$ interaction in the calorimeter, collected from 2004 to 2005. No candidate events were found in the data with an expected background of $0.04^{+0.15}_{-0.03}$ events. Upper limit is obtained by normalizing to $K^0_S \to 2\pi^0$ decays.

[2] LAI 05A value is obtained from their bound on $|\eta_{000}|$ (not assuming *CPT*) and $B(K^0_L \to 3\pi^0) = 0.211 \pm 0.003$, and PDG 04 values for $K^0_L$ and $K^0_S$ lifetimes. If *CPT* is assumed then $B(K^0_S \to 3\pi^0)_{CPT} < 2.3 \times 10^{-7}$ at 90% CL

[3] ANGELOPOULOS 98B is from $\mathrm{Im}(\eta_{000}) = -0.05 \pm 0.12 \pm 0.05$, assuming $\mathrm{Re}(\eta_{000}) = \mathrm{Re}(\epsilon) = 1.635 \times 10^{-3}$ and using the value $B(K^0_L \to \pi^0\pi^0\pi^0) = 0.2112 \pm 0.0027$.

### $\Gamma(\mu^+\mu^-)/\Gamma_{total}$ $\Gamma_{11}/\Gamma$

Test for $\Delta S = 1$ weak neutral current. Allowed by first-order weak interaction combined with electromagnetic interaction.

## $K^0_S$ FORM FACTORS

For discussion, see note on $K_{\ell 3}$ form factors in the $K^\pm$ section of the Particle Listings above. Because the semileptonic branching fraction is smaller in $K^0_S$ than $K^0_L$ by the ratio of the mean lives, the $K^0_S$ semileptonic form factor has so far been measured only in the $K_{e3}$ mode using the linear expansion $f_+(t) = f_+(0)\ (1 + \lambda_+ t\ /m^2_{\pi^+})$, which gives the vector form factor $f_+(t)$ relative to its value at $t = 0$.

## $CP$ VIOLATION IN $K_S \to 3\pi$

Written 1996 by T. Nakada (Paul Scherrer Institute) and L. Wolfenstein (Carnegie-Mellon University).

The possible final states for the decay $K^0 \to \pi^+\pi^-\pi^0$ have isospin $I = 0$, 1, 2, and 3. The $I = 0$ and $I = 2$ states have $CP = +1$ and $K_S$ can decay into them without violating $CP$ symmetry, but they are expected to be strongly suppressed by centrifugal barrier effects. The $I = 1$ and $I = 3$ states, which have no centrifugal barrier, have $CP = -1$ so that the $K_S$ decay to these requires $CP$ violation.

In order to see $CP$ violation in $K_S \to \pi^+\pi^-\pi^0$, it is necessary to observe the interference between $K_S$ and $K_L$ decay, which determines the amplitude ratio

$$\eta_{+-0} = \frac{A(K_S \to \pi^+\pi^-\pi^0)}{A(K_L \to \pi^+\pi^-\pi^0)} \ . \qquad (1)$$

If $\eta_{+-0}$ is obtained from an integration over the whole Dalitz plot, there is no contribution from the $I = 0$ and $I = 2$ final states and a nonzero value of $\eta_{+-0}$ is entirely due to $CP$ violation.

Only $I = 1$ and $I = 3$ states, which are $CP = -1$, are allowed for $K^0 \to \pi^0\pi^0\pi^0$ decays and the decay of $K_S$ into $3\pi^0$ is an unambiguous sign of $CP$ violation. Similarly to $\eta_{+-0}$, $\eta_{000}$ is defined as

$$\eta_{000} = \frac{A(K_S \to \pi^0\pi^0\pi^0)}{A(K_L \to \pi^0\pi^0\pi^0)} \ . \qquad (2)$$

If one assumes that $CPT$ invariance holds and that there are no transitions to $I = 3$ (or to nonsymmetric $I = 1$ states), it can be shown that

$$\eta_{+-0} = \eta_{000} = \epsilon + i\frac{\mathrm{Im}\ a_1}{\mathrm{Re}\ a_1} \ . \qquad (3)$$

With the Wu-Yang phase convention, $a_1$ is the weak decay amplitude for $K^0$ into $I = 1$ final states; $\epsilon$ is determined from $CP$ violation in $K_L \to 2\pi$ decays. The real parts of $\eta_{+-0}$ and $\eta_{000}$ are equal to $\mathrm{Re}(\epsilon)$. Since currently-known upper limits on $|\eta_{+-0}|$ and $|\eta_{000}|$ are much larger than $|\epsilon|$, they can be interpreted as upper limits on $\mathrm{Im}(\eta_{+-0})$ and $\mathrm{Im}(\eta_{000})$ and so as limits on the $CP$-violating phase of the decay amplitude $a_1$.

## $CP$-VIOLATION PARAMETERS IN $K^0_S$ DECAY

### $A_S = [\,\Gamma(K^0_S \to \pi^- e^+ \nu_e) - \Gamma(K^0_S \to \pi^+ e^- \bar{\nu}_e)\,] \,/\, \mathrm{SUM}$

Such asymmetry violates $CP$. If $CPT$ is assumed then $A_S = 2\,\mathrm{Re}(\epsilon)$.

[1] LAI 05A assumes $\mathrm{Re}(\eta_{000}) = \mathrm{Re}(\epsilon) = 1.66 \times 10^{-3}$. The equivalent limit is $|\eta_{000}|_{CPT} < 0.025$ at 90% CL Without assuming $CPT$ invariance, they obtain $\mathrm{Re}(\eta_{000}) = -0.002 \pm 0.011 \pm 0.015$ and $\mathrm{Im}(\eta_{000}) = -0.003 \pm 0.013 \pm 0.017$ with a statistical correlation coefficient of 0.77 and an overall correlation coefficient of 0.57 between imaginary and real part. The equivalent limit is $|\eta_{000}| < 0.045$ at 90% CL

[2] ANGELOPOULOS 98B assumes $\mathrm{Re}(\eta_{000}) = \mathrm{Re}(\epsilon) = 1.635 \times 10^{-3}$. Without assuming $CPT$ invariance, they obtain $\mathrm{Re}(\eta_{000}) = 0.18 \pm 0.14 \pm 0.06$ and $\mathrm{Im}(\eta_{000}) = 0.15 \pm 0.20 \pm 0.03$.

### $|\eta_{000}| = |A(K^0_S \to 3\pi^0)/A(K^0_L \to 3\pi^0)|$

A non-zero value violates CP invariance.

## DECAY-PLANE ASYMMETRY IN $\pi^+\pi^- e^+ e^-$ DECAYS

This is the $CP$-violating asymmetry

$$A = \frac{N_{\sin\phi\cos\phi>0.0} - N_{\sin\phi\cos\phi<0.0}}{N_{\sin\phi\cos\phi>0.0} + N_{\sin\phi\cos\phi<0.0}}$$

where $\phi$ is the angle between the $e^+e^-$ and $\pi^+\pi^-$ planes in the $K^0_S$ rest frame.

### $CP$ asymmetry $A$ in $K^0_S \to \pi^+\pi^- e^+ e^-$

# $K^0_L$

$I(J^P) = \frac{1}{2}(0^-)$

## $m_{K^0_L} - m_{K^0_S}$

For earlier measurements, beginning with GOOD 61 and FITCH 61, see our 1986 edition, Physics Letters **170B** 132 (1986).

OUR FIT is described in the note on "*CP* violation in $K_L$ decays" in the $K^0_L$ Particle Listings. The result labeled "OUR FIT Assuming *CPT*" ["OUR FIT Not assuming *CPT*"] includes all measurements except those with the comment "Not assuming *CPT*" ["Assuming *CPT*"]. Measurements with neither comment do not assume *CPT* and enter both fits.

[1] The two ABOUZAID 11 values use the same data. The first enters the "assuming *CPT*" fit and the second enters the "not assuming *CPT*" fit.

[2] ABOUZAID 11 fit has $\Delta m$, $\tau_S$, $\phi_\epsilon$, Re($\epsilon'/\epsilon$), and Im($\epsilon'/\epsilon$) as free parameters. See Im($\epsilon'/\epsilon$) in the "$K^0_L$ *CP* violation" section for correlation information.

[3] ABOUZAID 11 fit has $\Delta m$ and $\tau_S$ free but constrains $\phi_\epsilon$ to the Superweak value, i.e. assumes *CPT*. See "$K^0_S$ Mean Life" section for correlation information.

[4] Fits $\Delta m$ and $\phi_{+-}$ simultaneously. GIBBONS 93C systematic error is from B. Winstein via private communication. 20–160 GeV $K$ beams.

[5] GIBBONS 93 value assume $\phi_{+-} = \phi_{00} = \phi_{SW} = (43.7 \pm 0.2)^\circ$, i.e. assumes *CPT*. 20–160 GeV $K$ beams.

[6] These two experiments have a common systematic error due to the uncertainty in the momentum scale, as pointed out in WAHL 89.

[7] GJESDAL 74 uses charge asymmetry in $K^0_{\ell 3}$ decays.

[8] ALAVI-HARATI 03 fit $\Delta m$ and $\tau_{K^0_S}$ simultaneously. $\phi_{+-}$ is constrained to the Superweak value, i.e. *CPT* is assumed. See "$K^0_S$ Mean Life" section for correlation information. Superseded by ABOUZAID 11.

[9] ALAVI-HARATI 03 fit $\Delta m$, $\phi_{+-}$, and $\tau_{K_S}$ simultaneously. See $\phi_{+-}$ in the "$K_L$ *CP* violation" section for correlation information. Superseded by ABOUZAID 11.

[10] ANGELOPOULOS 01 uses strong interactions strangeness tagging at two different times.

[11] Uses $\overline{K}^0_{e3}$ and $K^0_{e3}$ strangeness tagging at production and decay. Assumes *CPT* conservation on $\Delta S = -\Delta Q$ transitions.

[12] ADLER 96C is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value above.

[13] ARONSON 82 find that $\Delta m$ may depend on the kaon energy.

[14] ARONSON 70 and CARNEGIE 71 use $K^0_S$ mean life = $(0.862 \pm 0.006) \times 10^{-10}$ s. We have not attempted to adjust these values for the subsequent change in the $K^0_S$ mean life or in $\eta_{+-}$.

## $K^0_L$ MEAN LIFE

| *VALUE* ($10^{-8}$ s) | *EVTS* | *DOCUMENT ID* | | *TECN* | *COMMENT* |
|---|---|---|---|---|---|
| **5.116±0.021 OUR FIT** | | Error includes scale factor of 1.1. | | | |
| **5.099±0.021 OUR AVERAGE** | | | | | |
| 5.072±0.011±0.035 | 13M | [1] AMBROSINO | 06 | KLOE | $\sum_i B_i = 1$ |
| 5.092±0.017±0.025 | 15M | AMBROSINO | 05C | KLOE | |
| 5.154±0.044 | 0.4M | VOSBURGH | 72 | CNTR | |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 5.15 ±0.14 | | DEVLIN | 67 | CNTR | |

[1] AMBROSINO 06 uses $\phi \to K_L K_S$ with $K_L$ tagged by $K_S \to \pi^+\pi^-$. The four major $K_L$ BR's are measured, the small remainder ($\pi^+\pi^-$,$\pi^0\pi^0$,$\gamma\gamma$) is taken from PDG 04. This KLOE $K_L$ lifetime is obtained by imposing $\sum_i B_i = 1$. The correlation matrix among the four measured $K_L$ BR's and this $K_L$ lifetime is

| | $K_{e3}$ | $K_{\mu 3}$ | $3\pi^0$ | $\pi^+\pi^-\pi^0$ | $\tau_{K_L}$ |
|---|---|---|---|---|---|
| $K_{e3}$ | 1 | −0.25 | −0.56 | −0.07 | 0.25 |
| $K_{\mu 3}$ | | 1 | −0.43 | −0.20 | 0.33 |
| $3\pi^0$ | | | 1 | −0.39 | −0.21 |
| $\pi^+\pi^-\pi^0$ | | | | 1 | −0.39 |
| $\tau_{K_L}$ | | | | | 1 |

These correlations are taken into account in our fit. The average of this KLOE mean life measurement and the independent KLOE measurement in AMBROSINO 05C is $(5.084 \pm 0.023) \times 10^{-8}$ s.

| $\Gamma_{37}$ | $\pi^0\pi^0\mu^\pm e^\mp$ | *LF* | | < 1.7 × $10^{-10}$ | CL=90% |

[a] The value is for the sum of the charge states or particle/antiparticle states indicated.

[b] This mode includes gammas from inner bremsstrahlung but not the direct emission mode $K^0_L \to \pi^+\pi^-\gamma$(DE).

[c] See the Particle Listings below for the energy limits used in this measurement.

[d] Most of this radiative mode, the low-momentum $\gamma$ part, is also included in the parent mode listed without $\gamma$'s.

[e] Allowed by higher-order electroweak interactions.

[f] Violates *CP* in leading order. Test of direct *CP* violation since the indirect *CP*-violating and *CP*-conserving contributions are expected to be suppressed.

## CONSTRAINED FIT INFORMATION

An overall fit to the mean life and 15 branching ratios uses 27 measurements and one constraint to determine 11 parameters. The overall fit has a $\chi^2 = 37.4$ for 17 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

[1] ABOUZAID 08 reports $(1.29 \pm 0.03 \pm 0.05) \times 10^{-6}$ from a measurement of $[\Gamma(K_L^0 \to \pi^0 2\gamma)/\Gamma_{total}]$ / $[B(K_L^0 \to \pi^0\pi^0)]$ assuming $B(K_L^0 \to \pi^0\pi^0) = (8.69 \pm 0.04) \times 10^{-4}$, which we rescale to our best value $B(K_L^0 \to \pi^0\pi^0) = (8.64 \pm 0.06) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] LAI 02B reports $[\Gamma(K_L^0 \to \pi^0 2\gamma)/\Gamma_{total}]$ / $[B(K_L^0 \to \pi^0\pi^0)] = (1.467 \pm 0.032 \pm 0.032) \times 10^{-3}$ which we multiply by our best value $B(K_L^0 \to \pi^0\pi^0) = (8.64 \pm 0.06) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. They also find that $B(\pi^0 2\gamma,\ m_{\gamma\gamma} < 110$ MeV$) < 0.6 \times 10^{-8}$(90% CL).

[3] ALAVI-HARATI 99B finds that $\Gamma(\pi^0 2\gamma,\ m_{\gamma\gamma} < 240$ MeV)) / $\Gamma(\pi^0 2\gamma) = (17.3 \pm 1.3 \pm 1.5)$%. Superseded by ABOUZAID 08.

[4] BARR 92 find that $\Gamma(\pi^0 2\gamma,\ m_{\gamma\gamma} < 240$ MeV)$/\Gamma(\pi^0 2\gamma) < 0.09$ (90% CL).

[5] BARR 90C superseded by BARR 92.

| <59 | 90 | ALAVI-HARATI | 00 | KTEV |

[1] AHN 19 result is based on data collected in 2015, which corresponds to 2.2×$10^{19}$ protons on target. A single event sensitivity of (1.30 ± 0.01 ± 0.14) × $10^{-9}$ was achieved with no candidate events observed. An upper limit of < 2.4 × $10^{-9}$ at the 90% C.L. for the $K_L \to \pi^0X^0$ decay was also set, where $X^0$ is an invisible particle with a mass of 135 MeV/$c^2$.

[2] AHN 17 result is based on the first 100 hours of physics running in 2013. One candidate event was observed with an expected background of 0.34 ± 0.16 events. An upper limit of < 3.7 × $10^{-8}$ at the 90% C.L. for the $K_L \to \pi^0X^0$ decay was also set, where $X^0$ is an invisible particle with a mass of 135 MeV/$c^2$.

[3] Obtained combining Run-2 (AHN 08) and Run-3 data.

[4] Value obtained using data from February to April 2005.

[5] Value obtained analyzing 10% of data of RUN 1 (performed in 2004).

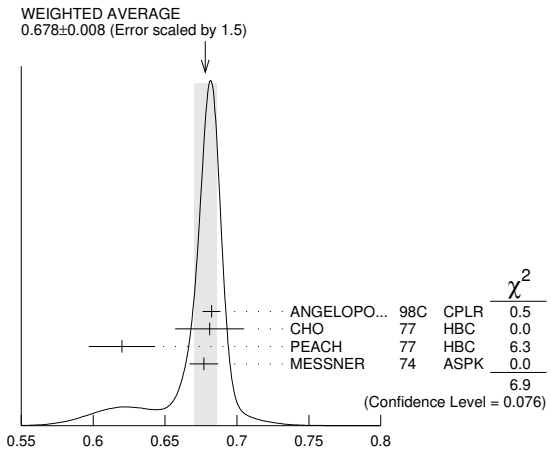
[1] Quadratic dependence required by some experiments. (See sections on "QUADRATIC COEFFICIENT *h*" and "QUADRATIC COEFFICIENT *k*" below.) Correlations prevent us from averaging results of fits not including *g*, *h*, and *k* terms.
[2] BISI 74 value comes from quadratic fit with quad. term consistent with zero. *g* error is thus larger than if linear fit were used.
[3] BUCHANAN 70 result revised by BUCHANAN 75 to include radiative correlations and to use more reliable $K_L^0$ momentum spectrum of second experiment (had same beam).



Linear coeff. *g* for $K_L^0 \to \pi^+\pi^-\pi^0$ matrix element squared

### QUADRATIC COEFFICIENT $h$ FOR $K_L^0 \to \pi^+\pi^-\pi^0$

| −3.3 ±1.1 ±0.7 | 5M | [2,3] SOMALWAR | 92 | E731 |

[1] Result obtained using Cl3pl model of CABIBBO 05 to include $\pi\pi$ rescattering effects. The systematic error includes an external error of $1.06 \times 10^{-3}$ from the parametrization input of $(a_0 - a_2)\, m_{\pi^+} = 0.268 \pm 0.017$ from BATLEY 06B.
[2] LAI 01B and SOMALWAR 92 results do not include $\pi\pi$ final state rescattering effects.
[3] SOMALWAR 92 chose $m_{\pi^+}$ as normalization to make it compatible with the Particle Data Group $K_L^0 \to \pi^+\pi^-\pi^0$ definitions.

### $K_L^0$ FORM FACTORS

For discussion, see note on form factors in the $K^\pm$ section of the Particle Listings above.

In the form factor comments, the following symbols are used.

$f_+$ and $f_-$ are form factors for the vector matrix element.
$f_S$ and $f_T$ refer to the scalar and tensor term.
$f_0(t) = f_+(t) + f_-(t)\ t/(m^2_{K^0} - m^2_{\pi^+})$.
$t$ = momentum transfer to the $\pi$.
$\lambda_+$ and $\lambda_0$ are the linear expansion coefficients of $f_+$ and $f_0$:
$f_+(t) = f_+(0)\ (1 + \lambda_+ t\ /m^2_{\pi^+})$
For quadratic expansion
$f_+(t) = f_+(0)\ (1 + \lambda'_+ t\ /m^2_{\pi^+} + \frac{\lambda''_+}{2}\ t^2/m^4_{\pi^+}\ )$
as used by KTeV. If there is a non-vanishing quadratic term, then $\lambda_+$ represents an average slope, which is then different from $\lambda'_+$.
NA48 ($K_{e3}$) and ISTRA quadratic expansion coefficients are converted with
$\lambda'_+{}^{PDG} = \lambda_+{}^{NA48}$ and $\lambda''_+{}^{PDG} = 2\,\lambda'_+{}^{NA48}$
$\lambda'_+{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2\ \lambda_+{}^{ISTRA}$ and
$\lambda''_+{}^{PDG} = 2\,(\frac{m_{\pi^+}}{m_{\pi^0}})^4\ \lambda'_+{}^{ISTRA}$
ISTRA linear expansion coefficients are converted with
$\lambda_+{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2\ \lambda_+{}^{ISTRA}$ and $\lambda_0{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2\ \lambda_0{}^{ISTRA}$
The pole parametrization is
$f_+(t) = f_+(0)\ (\frac{M_V^2}{M_V^2 - t}\ )$
$f_0(t) = f_0(0)\ (\frac{M_S^2}{M_S^2 - t}\ )$
where $M_V$ and $M_S$ are the vector and scalar pole masses.
The dispersive parametrization is
$f_+(t) = f_+(0)\ \exp[\ \frac{t}{m_\pi^2}\ (\Lambda_+ + H(t))\ ]$;
$f_0(t) = f_+(0)\ \exp[\ \frac{t}{m_K^2 - m_\pi^2}\ (\ln[C] - G(t))\ ]$,
where $\Lambda_+$ is the slope parameter and $\ln[C] = \ln[\ f_0\ (m_K^2 - m_\pi^2\ )\ ]$ is the logarithm of the scalar form factor at the Callan-Treiman point.
$H(t)$ and $G(t)$ are dispersive integrals.
The following abbreviations are used:
DP = Dalitz plot analysis.
PI = $\pi$ spectrum analysis.
MU = $\mu$ spectrum analysis.
POL = $\mu$ polarization analysis.
BR = $K^0_{\mu 3}/K^0_{e3}$ branching ratio analysis.
E = positron or electron spectrum analysis.
RC = radiative corrections.

[1] Obtained from a sample of 1.9 M $K_{e3}$ and 1.5 M $K_{\mu 3}$. The correlation between $\Lambda_+$ and ln($C$) is −0.269.

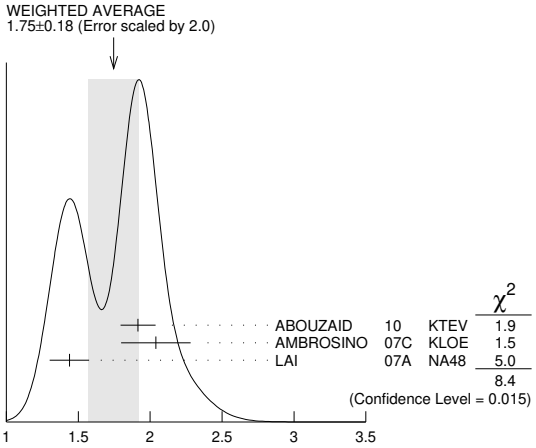
[2] AMBROSINO 07C results include 2M $K_{e3}$ events from AMBROSINO 06D. We convert ($\Lambda_+$, $\Lambda_0$) to ($\Lambda_+$, ln($C$)) parametrization using $\ln(C) = (\Lambda_0 \cdot 11.713 + 0.0398) \pm 0.0041$, where the error is due to theory parametrization of the form factor. The correlation between $\Lambda_+$ and ln($C$) is −0.26.

[3] LAI 07A gives a correlation −0.44 between their $\Lambda_+$ and ln($C$) measurements.



ln($C$) (DISPERSIVE SCALAR FORM FACTOR FOR $K^0_{\mu 3}$ DECAY) (units $10^{-1}$)

### $a_1(t_0, Q^2)$ FORM FACTOR PARAMETER

### $\alpha^{\rm eff}_{K^*}$ DECAY FORM FACTOR FOR $K_L \to e^+e^-e^+e^-$

$\alpha^{\rm eff}_{K^*}$ is the parameter describing the relative strength of an intermediate pseudoscalar decay amplitude and a vector meson decay amplitude in the model of BERGSTROM 83. It takes into account both the radiative effects and the form factor. Since there are two $e^+e^-$ pairs here compared with one in $e^+e^-\gamma$ decays, a factorized expression is used for the $e^+e^-e^+e^-$ decay form factor.

*CP* Violation in $K_L^0$ Decays

## *CP*-VIOLATION PARAMETERS IN $K_L^0$ DECAYS

### CHARGE ASYMMETRY IN $K_{\ell 3}^0$ DECAYS

Such asymmetry violates *CP*. It is related to Re($\epsilon$).

### $A_L$ = weighted average of $A_L(\mu)$ and $A_L(e)$

In previous editions and in the literature the symbol used for this asymmetry was $\delta_L$ or $\delta$. We use $A_L$ for consistency with $B^0$ asymmetry notation and with recent $K_S^0$ notation.

### PARAMETERS FOR $K_L^0 \to 2\pi$ DECAY

$\eta_{+-} = A(K_L^0 \to \pi^+ \pi^-) \; / \; A(K_S^0 \to \pi^+ \pi^-)$
$\eta_{00} = A(K_L^0 \to \pi^0 \pi^0) \; / \; A(K_S^0 \to \pi^0 \pi^0)$

The fitted values of $|\eta_{+-}|$ and $|\eta_{00}|$ given below are the results of a fit to $|\eta_{+-}|$, $|\eta_{00}|$, $|\eta_{00}/\eta_{+-}|$, and Re($\epsilon'/\epsilon$). Independent information on $|\eta_{+-}|$ and $|\eta_{00}|$ can be obtained from the fitted values of the $K_L^0 \to \pi\pi$ and $K_S^0 \to \pi\pi$ branching ratios and the $K_L^0$ and $K_S^0$ lifetimes. This information is included as data in the $|\eta_{+-}|$ and $|\eta_{00}|$ sections with a Document ID "BRFIT." See the note "*CP* violation in $K_L$ decays" above for details.

### $|\eta_{00}| = |A(K_L^0 \to 2\pi^0) \; / \; A(K_S^0 \to 2\pi^0)|$

| VALUE (units $10^{-3}$) | DOCUMENT ID | | TECN | COMMENT |

[1] Value obtained from the NA48 measurements of $\Gamma(K_L^0 \to \pi^+\pi^-)/\Gamma(K_L^0 \to \pi e \nu_e)$ and $\tau_{K_S^0}$ and KLOE measurements of $B(K_S^0 \to \pi^+\pi^-)$ and $\tau_{K_L^0}$. $\Gamma(K_L^0 \to \pi^+\pi^-)$ is defined to include the inner bremsstrahlung component $\Gamma(K_L^0 \to \pi^+\pi^-\gamma(\text{IB}))$ but exclude the direct emission component $B(K_S^0 \to \pi^+\pi^-(\text{DE}))$. Their $|\eta_{+-}|$ value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.
[2] AMBROSINO 06F uses KLOE branching ratios and $\tau_L$ together with $\tau_S$ from PDG 04. Their $|\eta_{+-}|$ value is not directly used in our fit, but enters the fit via their branching ratio and lifetime measurements.
[3] ALEXOPOULOS 04 $|\eta_{+-}|$ uses their $K_L^0 \to \pi\pi$ branching fractions, $\tau_S = (0.8963 \pm 0.0005)\times 10^{-10}$ s from the average of KTeV and NA48 $\tau_S$ measurements, and assumes that $\Gamma(K_S^0 \to \pi\ell\nu_\ell) = \Gamma(K_L^0 \to \pi\ell\nu_\ell)$ giving $B(K_S^0 \to \pi\ell\nu_\ell) = 0.118\%$. Their $\eta_{+-}$ is not directly used in our fit, but enters our fit via their branching ratio measurements.
[4] APOSTOLAKIS 99C report $(2.264 \pm 0.023 \pm 0.026 + 9.1[\tau_S - 0.8934]) \times 10^{-3}$. We evaluate for our 2006 best value $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$ s.
[5] ADLER 95B report $(2.312 \pm 0.043 \pm 0.030 - 1[\Delta m - 0.5274] + 9.1[\tau_S - 0.8926]) \times 10^{-3}$. We evaluate for our 1996 best values $\Delta m = (0.5304 \pm 0.0014) \times 10^{-10}$ $\hbar$s$^{-1}$ and $\tau_S = (0.8927 \pm 0.0009) \times 10^{-10}$ s. Superseded by APOSTOLAKIS 99C.

### $|\epsilon| = (2|\eta_{+-}| + |\eta_{00}|)/3$

This expression is a very good approximation, good to about one part in $10^{-4}$ because of the small measured value of $\phi_{00} - \phi_{+-}$ and small theoretical ambiguities.

| 0.9939±0.0013±0.0015 | 1M | [1] BARR | 93D | NA31 |
| 0.9899±0.0020±0.0025 | | [1] BURKHARDT | 88 | NA31 |

[1] This is the square root of the ratio $R$ given by BURKHARDT 88 and BARR 93D.
[2] This is the combined results from BARR 93D and BURKHARDT 88, taking into account a common systematic uncertainty of 0.0014.
[3] We calculate $|\eta_{00}/\eta_{+-}| = 1-3(\epsilon'/\epsilon)$ from WOODS 88 ($\epsilon'/\epsilon$) value.

### Re($\epsilon'/\epsilon$) = (1−|$\eta_{00}/\eta_{+-}$|)/3

We have neglected terms of order $\omega \cdot$Re($\epsilon'/\epsilon$), where $\omega =$ Re($A_2$)/Re($A_0$) $\simeq 1/22$. If included, this correction would lower Re($\epsilon'/\epsilon$) by about $0.04 \times 10^{-3}$. See SOZZI 04.

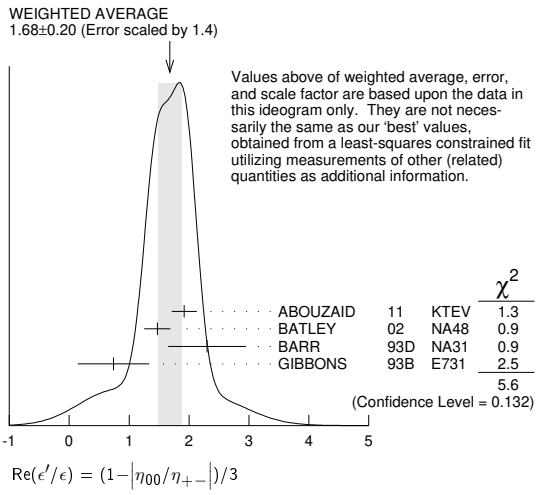
Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[2] These values are derived from $|\eta_{00}/\eta_{+-}|$ measurements. They enter the average in this section but enter the fit via the $|\eta_{00}/\eta_{+-}|$ only.

[3] This is the combined results from BARR 93D and BURKHARDT 88, taking into account their common systematic uncertainty.

[4] We use ABOUZAID 11 Re($\epsilon'/\epsilon$) value with *CPT* assumption in our fits for $|\eta_{+-}|$, $|\eta_{00}|$, and Re($\epsilon'/\epsilon$).

[5] These values are derived from $|\eta_{00}/\eta_{+-}|$ measurements.



## $\phi_{+-}$, PHASE of $\eta_{+-}$

The dependence of the phase on $\Delta m$ and $\tau_S$ is given for each experiment in the comments below, where $\Delta m$ is the $K^0_L - K^0_S$ mass difference in units $10^{10}\ \hbar s^{-1}$ and $\tau_S$ is the $K_S$ mean life in units $10^{-10}$ s. We also give the regeneration phase $\phi_f$ in the comments below.

OUR FIT is described in the note on "*CP* violation in $K_L$ decays" in the $K^0_L$ Particle Listings. Most experiments in this section are included in both the "Not Assuming *CPT*" and "Assuming *CPT*" fits. In the latter fit, they have little direct influence on $\phi_{+-}$ because their errors are large compared to that assuming *CPT*, but they influence $\Delta m$ and $\tau_S$ through their dependencies on these parameters, which are given in the footnotes.

| 44.3 ±2.8 ±0.2 | | [14] CARITHERS | 75 | SPEC | C regenerator |

[1] APOSTOLAKIS 99C measures $\phi_{+-} = (43.19 \pm 0.53 \pm 0.28) + 300\ [\Delta m - 0.5301]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$). Our first error is their experiment's error and our second error is the systematic error from using our best values.

[2] SCHWINGENHEUER 95 measures $\phi_{+-} = (43.53 \pm 0.76) + 173\ [\Delta m - 0.5282] - 275\ [\tau_S - 0.8926]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$), ($\tau_S = 0.8954 \pm 0.0004$) ($10^{-10}$ s). Our first error is their experiment's error and our second error is the systematic error from using our best values.

[3] These experiments measure $\phi_{+-}$-$\phi_f$ and calculate the regeneration phase from the power law momentum dependence of the regeneration amplitude using analyticity and dispersion relations. SCHWINGENHEUER 95 [GIBBONS 93] includes a systematic error of 0.35° [0.5°] for uncertainties in their modeling of the regeneration amplitude.

[4] GIBBONS 93 measures $\phi_{+-} = (42.21 \pm 0.9) + 189\ [\Delta m - 0.5257] - 460\ [\tau_S - 0.8922]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$), ($\tau_S = 0.8954 \pm 0.0004$) ($10^{-10}$ s). Our first error is their experiment's error and our second error is the systematic error from using our best values. This is actually reported in SCHWINGENHEUER 95, footnote 8. GIBBONS 93 reports $\phi_{+-}$ (42.2 ± 1.4)°. They measure $\phi_+$-$\phi_f$ and calculate the regeneration phase $\phi_f$ from the power law momentum dependence of the regeneration amplitude using analyticity. An error of 0.6° is included for possible uncertainties in the regeneration phase.

[5] CAROSI 90 measures $\phi_{+-} = (46.9 \pm 1.4 \pm 0.7) + 579\ [\Delta m - 0.5351] + 303\ [\tau_S - 0.8922]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$), ($\tau_S = 0.8954 \pm 0.0004$) ($10^{-10}$ s). Our first error is their experiment's error and our second error is the systematic error from using our best values.

[6] GEWENIGER 74B measures $\phi_{+-} = (49.4 \pm 1.0) + 565\ [\Delta m - 0.540]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$). Our first error is their experiment's error and our second error is the systematic error from using our best values.

[7] Not independent of other phase parameters reported in ABOUZAID 11.

[8] ALAVI-HARATI 03 $\phi_{+-}$ is correlated with their $\Delta m = m_{K^0_L} - m_{K^0_S}$ and $\tau_{K_S}$ measurements in the $K^0_L$ and $K^0_S$ sections respectively. The correlation coefficients are $\rho(\phi_{+-},\Delta m)$=+0.955, $\rho(\phi_{+-},\tau_S)$=−0.871, and $\rho(\tau_S,\Delta m)$=−0.840. *CPT* is not assumed. Uses scintillator Pb regenerator. Superseded by ABOUZAID 11.

[9] ADLER 96C measures $\phi_{+-} = (43.82 \pm 0.41) + 339\ [\Delta m - 0.5307] - 252\ [\tau_S - 0.8922]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$), ($\tau_S = 0.8954 \pm 0.0004$) ($10^{-10}$ s). Our first error is their experiment's error and our second error is the systematic error from using our best values.

[10] ADLER 96C is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value in the 1996 edition of this Review (Physical Review **D54** 1 (1996)).

[11] ADLER 95B measures $\phi_{+-} = (42.7 \pm 0.9 \pm 0.6) + 316\ [\Delta m - 0.5274] + 30\ [\tau_S - 0.8926]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$), ($\tau_S = 0.8954 \pm 0.0004$) ($10^{-10}$ s). Our first error is their experiment's error and our second error is the systematic error from using our best values.

[12] ADLER 92B quote separately two systematic errors: ±0.4 from their experiment and ±1.0 degrees due to the uncertainty in the value of $\Delta m$.

[13] KARLSSON 90 systematic error does not include regeneration phase uncertainty.

[14] CARITHERS 75 measures $\phi_{+-} = (45.5 \pm 2.8) + 224\ [\Delta m - 0.5348]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$). Our first error is their experiment's error and our second error is the systematic error from using our best values. $\phi_f = -40.9 \pm 2.6$°.

## $\phi_{00}$, PHASE OF $\eta_{00}$

See comment in $\phi_{+-}$ header above for treatment of $\Delta m$ and $\tau_S$ dependence, as well as for the inclusion of data in both the "Assuming *CPT*" and "Not Assuming *CPT*" fits.

OUR FIT is described in the note on "*CP* violation in $K_L$ decays" in the $K^0_L$ Particle Listings.

| VALUE (°) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **43.52±0.05 OUR FIT** | Error includes scale factor of 1.3. Assuming *CPT* | | | |
| **43.7 ±0.6 OUR FIT** | Error includes scale factor of 1.2. Not assuming *CPT* | | | |
| 44.5 ±2.3 ±0.5 | [1] CAROSI | 90 | NA31 | |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| 44.06±0.68 | [2] ABOUZAID | 11 | KTEV | Not assuming *CPT* |

| 50.8 ±7.1 ±1.7 | [4] ADLER | 96B | CPLR | Sup. by ANGELOPOULOS 98 |
| 47.4 ±1.4 ±0.9 | [5] KARLSSON | 90 | E731 | |

[1] CAROSI 90 measures $\phi_{00} = (47.1 \pm 2.1 \pm 1.0) + 579\ [\Delta m - 0.5351] + 252\ [\tau_S - 0.8922]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$), ($\tau_S = 0.8954 \pm 0.0004$) ($10^{-10}$ s). Our first error is their experiment's error and our second error is the systematic error from using our best values.

[2] Not independent of other phase parameters reported in ABOUZAID 11.

[3] ANGELOPOULOS 98 measures $\phi_{00} = (42.0 \pm 5.6 \pm 1.9) + 240\ [\Delta m - 0.5307]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$). Our first error is their experiment's error and our second error is the systematic error from using our best values. The $\tau_S$ dependence is negligible.

[4] ADLER 96B identified initial neutral kaon individually as being a $K^0$ or a $\overline{K}^0$. The systematic uncertainty is ±1.5° combined in quadrature with ±0.8° due to $\Delta m$.

[5] KARLSSON 90 systematic error does not include regeneration phase uncertainty.

## $\phi_\epsilon = (2\phi_{+-} + \phi_{00})/3$

This expression is a very good approximation, good to about $10^{-3}$ degrees because of the small measured values of $\phi_{00}-\phi_{+-}$ and Re $\epsilon'/\epsilon$, and small theoretical ambiguities.

| VALUE (°) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **43.52 ±0.05 OUR FIT** | Error includes scale factor of 1.2. Assuming *CPT* | | | |
| **43.5 ±0.5 OUR FIT** | Error includes scale factor of 1.3. Not assuming *CPT* | | | |
| 43.5164±0.0002±0.0518 | [1] SUPERWEAK | 16 | | Assuming *CPT* |
| 43.86 ±0.63 | [2] ABOUZAID | 11 | KTEV | Not assuming *CPT* |

[1] SUPERWEAK 16 is a fake measurement used to impose the *CPT* or Superweak constraint $\phi_{+-} = \phi_{SW} = \tan^{-1}[2\ \frac{\Delta m}{\hbar}\ (\frac{\tau_S \tau_L}{\tau_L - \tau_S})]$. This "measurement" is linearized using values near the PDG 04 edition values of $\Delta m$, $\tau_S$ and $\tau_L$, and then adjusted to our current values as described in the following "measurement". SUPERWEAK 16 measures $\phi_\epsilon = (43.50258 \pm 0.00021) + 54.1\ [\Delta m - 0.5289] + 32.0\ [\tau_S - 0.89564]$ (°). We have adjusted the measurement to use our best values of ($\Delta m = 0.5293 \pm 0.0009$) ($10^{10}\ \hbar\ s^{-1}$), ($\tau_S = 0.8954 \pm 0.0004$) ($10^{-10}$ s). Our first error is their experiment's error and our second error is the systematic error from using our best values.

[2] ABOUZAID 11 uses the full KTeV dataset collected in 1996, 1997, and 1999. See Im($\epsilon'/\epsilon$) section for correlation information.

## Im($\epsilon'/\epsilon$) = −($\phi_{00} - \phi_{+-}$)/3

For small $|\epsilon'/\epsilon|$, Im($\epsilon'/\epsilon$) is related to the phases of $\eta_{00}$ and $\eta_{+-}$ by the above expression.

| VALUE (°) | DOCUMENT ID | | TECN | COMMENT |

### *CPT*-INVARIANCE TESTS IN $K_L^0$ DECAYS

#### PHASE DIFFERENCE $\phi_{00} - \phi_{+-}$

Test of *CPT*.

OUR FIT is described in the note on "*CP* violation in $K_L$ decays" in the $K_L^0$ Particle Listings.

| VALUE (°) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.006±0.014 OUR FIT** | Error includes scale factor of 1.7. Assuming *CPT* | | | |
| **0.34 ±0.32 OUR FIT** | Not assuming *CPT* | | | |
| 0.006±0.008 | [1] SUPERWEAK | 16 | | Assuming *CPT* |
| −0.30 ±0.88 | [2] SCHWINGEN... | 95 | | Combined E731, E773 |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| 0.30 ±0.35 | [3] ABOUZAID | 11 | KTEV | Not assuming *CPT* |
| 0.39 ±0.22 ±0.45 | [4] ALAVI-HARATI | 03 | KTEV | |
| 0.62 ±0.71 ±0.75 | SCHWINGEN... | 95 | E773 | |
| −1.6 ±1.2 | [5] GIBBONS | 93 | E731 | |
| 0.2 ±2.6 ±1.2 | [6] CAROSI | 90 | NA31 | |
| −0.3 ±2.4 ±1.2 | KARLSSON | 90 | E731 | |

[1] SUPERWEAK 16 is a fake experiment to constrain $\phi_{00} - \phi_{+-}$ to a small value as described in the note "*CP* violation in $K_L$ decays."

[2] This SCHWINGENHEUER 95 values is the combined result of SCHWINGENHEUER 95 and GIBBONS 93, accounting for correlated systematic errors.

[3] Not independent of other phase parameters reported in ABOUZAID 11.

[4] ALAVI-HARATI 03 fit Re($\epsilon'/\epsilon$), Im($\epsilon'/\epsilon$), $\Delta m$, $\tau_S$, and $\phi_{+-}$ simultaneously, not assuming *CPT*. Phase difference is obtained from $\phi_{00} - \phi_{+-} \approx -3\mathrm{Im}(\epsilon'/\epsilon)$ for small $|\epsilon'/\epsilon|$. Superseded by ABOUZAID 11.

[5] GIBBONS 93 give detailed dependence of systematic error on lifetime (see the section on the $K_S^0$ mean life) and mass difference (see the section on $m_{K_L^0} - m_{K_S^0}$).

[6] CAROSI 90 is excluded from the fit because it it is not independent of $\phi_{+-}$ and $\phi_{00}$ values.

#### PHASE DIFFERENCE $\phi_{+-} - \phi_{SW}$

Test of *CPT*. The Superweak phase $\phi_{SW} \equiv \tan^{-1}(2\Delta m/\Delta\Gamma)$ where $\Delta m = m_{K_L^0} - m_{K_S^0}$ and $\Delta\Gamma = \hbar(\tau_L - \tau_S)/(\tau_L\tau_S)$.

| VALUE (°) | DOCUMENT ID | | TECN |
|---|---|---|---|
| **0.61±0.62±1.01** | [1] ALAVI-HARATI | 03 | KTEV |

[1] ALAVI-HARATI 03 fit is the same as their $\phi_{+-}$, $\tau_{K_S}$, $\Delta m$ fit, except that the parameter $\phi_{+-} - \phi_{SW}$ is used in place of $\phi$.

#### Re($\frac{2}{3}\eta_{+-} + \frac{1}{3}\eta_{00}$) − $\frac{A_L}{2}$

Test of *CPT*

| VALUE (units $10^{-6}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **−3±35** | [1] ALAVI-HARATI | 02 | E799 | Uses $A_L$ from $K_{e3}$ decays |

[1] ALAVI-HARATI 02 uses PDG 00 values of $\eta_{+-}$ and $\eta_{00}$.

## $\Delta S = \Delta Q$ IN $K^0$ DECAYS

The relative amount of $\Delta S \neq \Delta Q$ component present is measured by the parameter $x$, defined as

$$x = A(\overline{K}^0 \to \pi^-\ell^+\nu)/A(K^0 \to \pi^-\ell^+\nu) \ .$$

We list Re{$x$} and Im{$x$} for $K_{e3}$ and $K_{\mu3}$ combined.

#### $x = A(\overline{K}^0 \to \pi^-\ell^+\nu)/A(K^0 \to \pi^-\ell^+\nu) = A(\Delta S{=}-\Delta Q)/A(\Delta S{=}\Delta Q)$

#### REAL PART OF *x*

# $K^*_0(700)$

$I(J^P) = \frac{1}{2}(0^+)$

also known as $\kappa$; was $K^*_0(800)$

Needs confirmation. See the mini-review on scalar mesons under $f_0(500)$ (see the index for the page number).

## $K^*_0(700)$ T-Matrix Pole $\sqrt{s}$

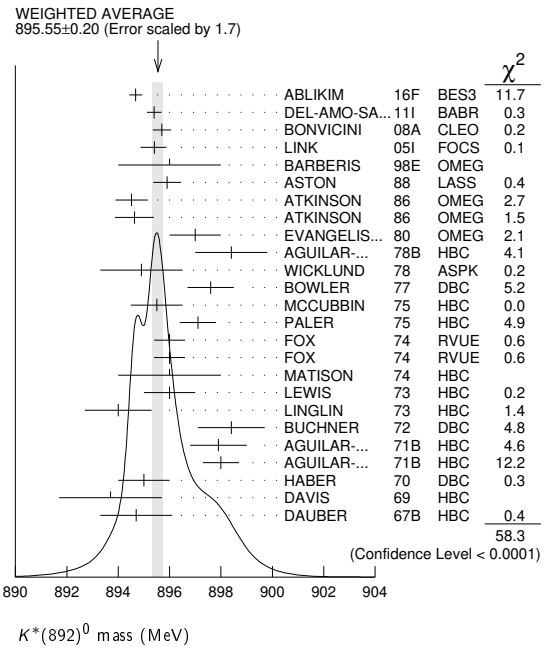
[1] Taking also into account the $K^*_0(1430)^0$ and $K^*_2(1430)^0$.
[2] Taking into account the $K^*(892)^0$, $S$-wave and $P$-wave ($K^*(1410)^0$).
[3] From the isobar model with a complex pole for the $\kappa$.
[4] Fit to $K\pi$ mass spectrum includes a non-resonant scalar component.
[5] Inclusive reaction. Complicated background and phase-space effects.
[6] From pole extrapolation.
[7] Mass errors enlarged by us to $\Gamma/\sqrt{N}$. See note.
[8] Number of events in peak reevaluated by us.
[9] From a Dalitz plot analysis in an isobar model with charged and neutral $K^*(892)$ masses and widths floating.
[10] This value comes from a fit with $\chi^2$ of 178/117.
[11] Systematic uncertainties not estimated.



### $K^*(892)$ MASSES AND MASS DIFFERENCES

Unrealistically small errors have been reported by some experiments. We use simple "realistic" tests for the minimum errors on the determination of a mass and width from a sample of $N$ events:

$$\delta_{\min}(m) = \frac{\Gamma}{\sqrt{N}}, \quad \delta_{\min}(\Gamma) = 4\frac{\Gamma}{\sqrt{N}} \ . \tag{1}$$

We consistently increase unrealistic errors before averaging. For a detailed discussion, see the 1971 edition of this Note.

### CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 13 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 7.8$ for 11 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

| ~ 1450.0 | MARTIN | 78 | SPEC | 10 $K^\pm p \to K^0_S \pi p$ |

[1] Using both $\eta \to \gamma\gamma$ and $\eta \to \pi^+\pi^-\pi^0$. From a likelihood scan in the presence of several interfering scalar-meson resonances with fixed width $\Gamma(K_0^*(1430)) = 210$ MeV.

[2] S-Matrix pole. Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06C, AITALA 06, and LINK 09 using an s-dependent width with couplings to $K\pi$ and $K\eta'$, and the Adler zero near thresholds.

[3] From the isobar model with a complex pole for the $\kappa$.

[4] From a non-parametric analysis.

[5] A Breit-Wigner mass and width.

[6] S-matrix pole. Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06C including the $\kappa$ with an s-dependent width and an Adler zero near threshold.

[7] S-matrix pole. Using ASTON 88 and assuming $K_0^*(700)$, $K_0^*(1950)$.

[8] Using ASTON 88 and assuming $K_0^*(700)$.

[9] T-matrix pole. Reanalysis of ASTON 88 data.

[10] Breit-Wigner fit. Using ASTON 88.

[11] Assuming a low-mass scalar $K\pi$ resonance, $\kappa(700)$.

[12] T-matrix pole. Using data from ESTABROOKS 78 and ASTON 88.

[13] $J^P$ not determined, could be $K_2^*(1430)$.

[14] T-matrix pole.

[15] Uses a model for the background, without this background they get a mass 1340 MeV, where the phase shift passes 90°.

[16] Mass defined by pole position. From elastic $K\pi$ partial-wave analysis.

## $K_2^*(1430)$

$I(J^P) = \frac{1}{2}(2^+)$

We consider that phase-shift analyses provide more reliable determinations of the mass and width.

| $\Gamma_9$ | $K^0\gamma$ | < 9 $\times 10^{-4}$ | CL=90% |

### CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 10 branching ratios uses 32 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 21.1$ for 25 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

|---|---|---|---|---|---|---|
| **<0.72** | 95 | 0 | JONGEJANS | 78 | HBC | 4 $K^-p \to p\overline{K}^0 4\pi$ |

[14] From phase shift analysis.
[15] ASTON 88B quote < 0.0092 at CL=95%. We convert this to a central value and 1 sigma error in order to be able to use it in our constrained fit.
[16] Restated by us.
[17] Assuming $\pi\pi$ system has isospin 1, which is supported by the data.

| $\Gamma_4$ | $K\phi$ | seen |

### CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 4 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 2.9$ for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

| $\Gamma_4$ | $K\eta$ | (30 ±13 ) % | |
| $\Gamma_5$ | $K_2^*(1430)\pi$ | < 16 % | 95% |

### CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 4 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 0.0$ for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

## $K(3100)$

$I^G(J^{PC}) = ?^?(?^{??})$

OMITTED FROM SUMMARY TABLE

Narrow peak observed in several ($\Lambda\overline{p}$ + pions) and ($\overline{\Lambda}p$ + pions) states in $\Sigma^-$ Be reactions by BOURQUIN 86 and in $np$ and $nA$ reactions by ALEEV 93. Not seen by BOEHNLEIN 91. If due to strong decays, this state has exotic quantum numbers ($B$=0,$Q$=+1,$S$=−1 for $\Lambda\overline{p}\pi^+\pi^+$ and $I \geq 3/2$ for $\Lambda\overline{p}\pi^-$). Needs confirmation.

[1] BARLAG 90C estimates the systematic error to be negligible.

### $D^+$ DECAY MODES

Most decay modes (other than the semileptonic modes) that involve a neutral $K$ meson are now given as $K^0_S$ modes, not as $\overline{K}^0$ modes. Nearly always it is a $K^0_S$ that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K^0_S) = \Gamma(\overline{K}^0)$.

| | Mode | Fraction ($\Gamma_i/\Gamma$) | Scale factor/ Confidence level |
|---|---|---|---|
| | **Inclusive modes** | | |
| $\Gamma_1$ | $e^+$ semileptonic | (16.07 ± 0.30 ) % | |

| | | | | |
|---|---|---|---|---|
| $\Gamma_{162}$ | Unaccounted decay modes | (63.3 ± 0.4 ) % | | S=1.3 |

[a] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.

[b] These subfractions of the $K^-2\pi^+$ mode are uncertain: see the Particle Listings.

[c] Submodes of the $D^+ \to K^-2\pi^+\pi^0$ and $K^0_S 2\pi^+\pi^-$ modes were studied by ANJOS 92C and COFFMAN 92B, but with at most 142 events for the first mode and 229 for the second – not enough for precise results. With nothing new for 18 years, we refer to our 2008 edition, Physics Letters **B667** 1 (2008), for those results.

[d] The unseen decay modes of the resonances are included.

[e] This is *not* a test for the $\Delta C$=1 weak neutral current, but leads to the $\pi^+\ell^+\ell^-$ final state.

[f] This mode is not a useful test for a $\Delta C$=1 weak neutral current because both quarks must change flavor in this decay.

### CONSTRAINED FIT INFORMATION

An overall fit to 31 branching ratios uses 41 measurements and one constraint to determine 17 parameters. The overall fit has a $\chi^2 = 62.8$ for 25 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

[1] ABLIKIM 14F obtain $|V_{cd}|\cdot f_{D^+} = (45.75 \pm 1.20 \pm 0.39)$ MeV, and using $|V_{cd}| = 0.22520 \pm 0.00065$ gets $f_{D^+} = (203.2 \pm 5.3 \pm 1.8)$ MeV.

[2] EISENSTEIN 08, using the $D^+$ lifetime and assuming $|V_{cd}| = |V_{us}|$, gets $f_{D^+} = (205.8 \pm 8.5 \pm 2.5)$ MeV from this measurement.

[3] ABLIKIM 05D finds a background-subtracted $2.67 \pm 1.74$ $D^+\to\mu^+\nu_\mu$ events, and from this obtains $f_{D^+} = 371^{+129}_{-119} \pm 25$ MeV.

[4] ARTUSO 05A obtains $f_{D^+} = 222.6 \pm 16.7^{+2.8}_{-3.4}$ MeV from this measurement.

[5] BONVICINI 04A finds eight events with an estimated background of one, and from the branching fraction obtains $f_{D^+} = 202 \pm 41 \pm 17$ MeV.

[6] BAI 98B obtains $f_{D^+} = (300^{+180}_{-150}{}^{+80}_{-40})$ MeV from this measurement.

| 8.53 ±0.13 ±0.23 | | [4] DOBBS | 08 | CLEO | See BESSON 09 |
| 8.71 ±0.38 ±0.37 | 545 | HUANG | 05B | CLEO | See DOBBS 08 |

[1] ABLIKIM 15AF report $\Gamma(D^+\to K_L e^+\nu_e)/\Gamma_{\text{total}} = (4.481 \pm 0.027 \pm 0.103)\%$. See also the form-factor parameters near the end of this $D^+$ Listing.

[2] See the form-factor parameters near the end of this $D^+$ Listing.

[3] The ABLIKIM 05A result together with the $D^0\to K^-e^+\nu_e$ branching fraction of ABLIKIM 04C and Particle Data Group lifetimes gives $\Gamma(D^0\to K^-e^+\nu_e)\,/\,\Gamma(D^+\to\overline{K}^0e^+\nu_e) = 1.08 \pm 0.22 \pm 0.07$; isospin invariance predicts the ratio is 1.0.

[4] DOBBS 08 establishes $|\frac{V_{cd}}{V_{cs}}\cdot\frac{f_+^\pi(0)}{f_+^K(0)}| = 0.188 \pm 0.008 \pm 0.002$ from the $D^+$ and $D^0$ decays to $\overline{K}e^+\nu_e$ and $\pi e^+\nu_e$. It also finds $\Gamma(D^0\to K^-e^+\nu_e)\,/\,\Gamma(D^+\to\overline{K}^0e^+\nu_e) = 1.06 \pm 0.02 \pm 0.03$; isospin invariance predicts the ratio is 1.0.

| 0.8323±0.0150±0.0008 | [3] LINK | 07B | FOCS | See LINK 09 |

[1] This LINK 09 model-independent partial-wave analysis of the $K^-\pi^+$ $S$-wave slices the $K^-\pi^+$ mass range into 39 bins.

[2] The BONVICINI 08A QMIPWA (quasi-model-independent partial-wave analysis) of the $K^-\pi^+$ $S$-wave amplitude slices the $K^-\pi^+$ mass range into 26 bins but keeps the Breit-Wigner $\overline{K}^*_0(1430)^0$.

[3] This LINK 07B fit uses a K matrix. The $K^-\pi^+$ $S$-wave fit fraction given above breaks down into $(207.3 \pm 25.5 \pm 12.4)\%$ isospin-1/2 and $(40.5 \pm 9.6 \pm 3.2)\%$ isospin-3/2 — with large interference between the two. The isospin-1/2 component includes the $\kappa$ (or $\overline{K}^*_0(700)^0$) and $\overline{K}^*_0(1430)^0$.

### $\Gamma(\overline{K}^*_0(700)^0\pi^+, \overline{K}^*_0(700) \to K^-\pi^+)/\Gamma(K^-2\pi^+)$ $\Gamma_{50}/\Gamma_{48}$

| **0.5600±0.0324±0.0214** | [1] LINK | 04 | FOCS | Dalitz fit, 1527 ± 51 evts |

[1] LINK 04 borrows a K-matrix parametrization from ANISOVICH 03 of the full $\pi$-$\pi$ $S$-wave isoscalar scattering amplitude to describe the $\pi^+\pi^-$ $S$-wave component of the $\pi^+\pi^+\pi^-$ state. The fit fraction given above is a sum over five $f_0$ mesons, the $f_0(980)$, $f_0(1300)$, $f_0(1200$–$1600)$, $f_0(1500)$, and $f_0(1750)$. See LINK 04 for details and discussion.

### $\Gamma(\sigma\pi^+, \sigma \to \pi^+\pi^-)/\Gamma(2\pi^+\pi^-)$ $\Gamma_{84}/\Gamma_{81}$

This is the "fit fraction" from the Dalitz-plot analysis.

## $D^{\pm}$ $CP$-VIOLATING DECAY-RATE ASYMMETRIES

This is the difference between $D^+$ and $D^-$ partial widths for the decay to state $f$, divided by the sum of the widths:
$A_{CP}(f) = [\Gamma(D^+ \to f) - \Gamma(D^- \to \overline{f})]/[\Gamma(D^+ \to f) + \Gamma(D^- \to \overline{f})]$.

### $A_{CP}(\mu^{\pm}\nu)$ in $D^+ \to \mu^+\nu_\mu$, $D^- \to \mu^-\overline{\nu}_\mu$

[1] This is the integrated $CP$ asymmetry. LEES 13F also searches for $CP$ asymmetries in four regions of the Dalitz plots (two of which are listed below); in comparisons of binned $D^+$ and $D^-$ Dalitz plots; in parametrized fits to those plots, including 2-body submodes; and in comparisons of Legendre-polynomial distributions for the $K^+K^-$ and $K^-\pi^+$ systems.

[2] AUBERT 05S measures $N(D^+ \to K^+K^-\pi^+)/N(D^+_s \to K^+K^-\pi^+)$, the ratio of the numbers of events observed, and similarly for the $D^-$.

[3] FRABETTI 94I, AITALA 98C, and LINK 00B measure $N(D^+ \to K^-K^+\pi^+)/N(D^+ \to K^-\pi^+\pi^+)$, the ratio of numbers of events observed, and similarly for the $D^-$.

[4] RUBIN 08 performs a dedicated analysis of this decay mode on the same dataset, with slightly better precision. We therefore take it that BONVICINI 14 does not supersede RUBIN 08's $A_{CP}$ result.

### $A_{CP}(K^{\pm}K^{*0})$ in $D^+ \to K^+\overline{K}^{*0}$, $D^- \to K^-K^{*0}$

## $D^{\pm}$ $\chi^2$ TESTS OF $CP$-VIOLATION ($CPV$)

We list model-independent searches for local $CP$ violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a $\chi^2$ test comparing normalised yields $N_i$, $\overline{N}_i$ in $CP$-conjugate bin pairs $i$: $\chi^2 = \Sigma_i(N_i - \alpha\overline{N}_i)/\sigma(N_i - \alpha\overline{N}_i)$. The factor $\alpha = (\Sigma_i N_i)/(\Sigma_i \overline{N}_i)$ removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured $\chi^2$ or larger under the assumption of CP conservation [AUBERT 08AO, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14C]. Results can be combined using Fisher's method [MOSTELLER 48].

### Local $CPV$ in $D^{\pm} \to \pi^+\pi^-\pi^{\pm}$

| p-value (%) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **78.1** | 3.1M | [1] AAIJ | 14C | LHCB | $\chi^2$ |

[1] AAIJ 14C uses binned and unbinned methods, and finds slightly better sensitivity with the former. We took the first value in the table of results for the binned method.

### *CP* VIOLATING ASYMMETRIES OF *P*-ODD (*T*-ODD) MOMENTS

#### $A_{TViol}(K^0_S K^{\pm}\pi^+\pi^-)$ in $D^{\pm} \to K^0_S K^{\pm}\pi^+\pi^-$

$C_T \equiv \vec{p}_{K^+} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$ is a parity-odd correlation of the $K^+$, $\pi^+$, and $\pi^-$ momenta for the $D^+$. $\overline{C}_T \equiv \vec{p}_{K^-} \cdot (\vec{p}_{\pi^-} \times \vec{p}_{\pi^+})$ is the corresponding quantity for the $D^-$. Then
$A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] \,/\, [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$, and
$\overline{A}_T \equiv [\Gamma(-\overline{C}_T > 0) - \Gamma(-\overline{C}_T < 0)] \,/\, [\Gamma(-\overline{C}_T > 0) + \Gamma(-\overline{C}_T < 0)]$, and
$A_{Tviol} \equiv \frac{1}{2}(A_T - \overline{A}_T)$. $C_T$ and $\overline{C}_T$ are commonly referred to as *T*-odd moments, because they are odd under *T* reversal. However, the *T*-conjugate process $K^0_S K^{\pm}\pi^+\pi^- \to D^{\pm}$ is not accessible, while the *P*-conjugate process is.

## $D^0$

$I(J^P) = \frac{1}{2}(0^-)$

### $D^0$ MASS

The fit includes $D^{\pm}$, $D^0$, $D_s^{\pm}$, $D^{*\pm}$, $D^{*0}$, $D_s^{*\pm}$, $D_1(2420)^0$, $D_2^*(2460)^0$, and $D_{s1}(2536)^{\pm}$ mass and mass difference measurements.

Given the recent addition of much more precise measurements, we have omitted all those masses published up through 1990. See any Review before 2015 for those earlier results.

| 1864.847±0.150±0.095 | 0.3k | CAWLFIELD | 07 | CLEO | $D^0 \to K^0_S\phi$ |

[1] Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration. The largest source of error in the TOMARADZE 14 value is from the uncertainties in the $K^-$ and $K^0_S$ masses. The systematic error given above is the addition in quadrature of $\pm 0.022 \pm 0.053$ MeV, where the second error is from those mass uncertainties.

[2] The largest source of error in the LEES 13S value is from the uncertainty of the $K^+$ mass. The quoted systematic error is in fact $\pm 0.043 + 3\,(m_{K^+} - 493.677)$, in MeV.

### $m_{D^{\pm}} - m_{D^0}$

The fit includes $D^{\pm}$, $D^0$, $D_s^{\pm}$, $D^{*\pm}$, $D^{*0}$, $D_s^{*\pm}$, $D_1(2420)^0$, $D_2^*(2460)^0$, and $D_{s1}(2536)^{\pm}$ mass and mass difference measurements.

$D^0$ — $\overline{D}^0$ Mixing

### $|m_{D_1^0} - m_{D_2^0}| = x\,\Gamma$

The $D_1^0$ and $D_2^0$ are the mass eigenstates of the $D^0$ meson, as described in the note on "$D^0$-$\overline{D}^0$ Mixing," above. The experiments usually present $x \equiv \Delta m/\Gamma$. Then $\Delta m = x\,\Gamma = x\,\hbar/\tau$.

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group, see the note on "$D^0$-$\overline{D}^0$ Mixing."

[1] AAIJ 19X $D^0$ come from $D^{*+}$ and $\overline{B} \to D^0\mu^-X$ decays (and c.c.) in $pp$ collisions at 7 and 8 TeV. Measurement allows for $CP$ violation (none seen).

[2] The result was established with $D^0$ from prompt and secondary $D^*$. Based on 5 fb$^{-1}$ of data collected at $\sqrt{s} = 7$, 8, 13 TeV. Assumes no $CP$ violation. Reported $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$ and $y' = (5.28 \pm 0.52) \times 10^{-3}$, where $x' = x\cos(\delta) + y\sin(\delta)$, $y' = y$

[3] Model-independent measurement of the charm mixing parameters in the decay $D^0 \to K^0_S\pi^+\pi^-$ using 1.0 fb$^{-1}$ of LHCb data at $\sqrt{s} = 7$ TeV.

[4] Time-dependent amplitude analysis of $D^0 \to \pi^+\pi^-\pi^0$.

[5] Based on 976 fb$^{-1}$ of data collected at $\Upsilon(nS)$ resonances. Assumes no $CP$ violation. Reported $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$ and $y' = (4.6 \pm 3.4) \times 10^{-3}$, where $x' = x\cos(\delta) + y\sin(\delta)$, $y' = y\cos(\delta) - x\sin(\delta)$ and $\delta$ is the strong phase between $D^0 \to K^+\pi^-$ and $\overline{D}^0 \to K^+\pi^-$.

[6] The time-dependent Dalitz-plot analysis of $D^0 \to K^0_S\pi^+\pi^-$ is emplored. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \to K^{*+}\pi^-$ and $\overline{D}^0 \to K^{*+}\pi^-$. This value allows $CP$ violation and is sensitive to the sign of $\Delta m$.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[7] Based on 9.6 fb$^{-1}$ of data collected at the Tevatron. Assumes no *CP* violation. Reported $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$ and $y' = (4.3 \pm 4.3) \times 10^{-3}$, where $x' = x\cos(\delta) + y\sin(\delta)$, $y' = y\cos(\delta) - x\sin(\delta)$ and $\delta$ is the strong phase between the $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$.

[8] DEL-AMO-SANCHEZ 10D uses 540,800 ± 800 $K^0_S\pi^+\pi^-$ and 79,900 ± 300 $K^0_S K^+K^-$ events in a time-dependent amplitude analysis of the $D^0$ and $\overline{D}{}^0$ Dalitz plots. No evidence was found for *CP* violation, and the values here assume no such violation.

[9] The result was established with $D^0$ from prompt and secondary $D^*$. Based on 3 fb$^{-1}$ of data collected at $\sqrt{s} = 7$, 8 TeV. Assumes no *CP* violation. Reported $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$ and $y' = (5.23 \pm 0.84) \times 10^{-3}$, where $x' = x\cos(\delta) + y\sin(\delta)$, $y' = y\cos(\delta) - x\sin(\delta)$ and $\delta$ is the strong phase between the $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$.

[10] Based on 3 fb$^{-1}$ of data collected at $\sqrt{s} = 7$, 8 TeV. Assumes no *CP* violation. Reported $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$ and $y' = (4.8 \pm 1.0) \times 10^{-3}$, where $x' = x\cos(\delta) + y\sin(\delta)$, $y' = y\cos(\delta) - x\sin(\delta)$ and $\delta$ is the strong phase between the $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$.

[11] Based on 1 fb$^{-1}$ of data collected at $\sqrt{s} = 7$ TeV in 2011. Assumes no *CP* violation. Reported $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$ and $y' = (7.2 \pm 2.4) \times 10^{-3}$, where $x' = x\cos(\delta) + y\sin(\delta)$, $y' = y\cos(\delta) - x\sin(\delta)$ and $\delta$ is the strong phase between the $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$.

[12] The AUBERT 09AN values are inferred from the branching ratio $\Gamma(D^0 \to K^+\pi^-\pi^0$ via $\overline{D}{}^0)/\Gamma(D^0 \to K^-\pi^+\pi^0)$ given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between $D^0 \to K^+\pi^-\pi^0$ and $\overline{D}{}^0 \to K^+\pi^-\pi^0$ is assumed to be small. The width difference here is $y''$, which is not the same as $y_{CP}$ in the note on $D^0$-$\overline{D}{}^0$ mixing.

[13] LOWREY 09 uses quantum correlations in $e^+e^- \to D^0\overline{D}{}^0$ at the $\psi(3770)$. See below for coherence factors and average relative strong phases for both $D^0 \to K^-\pi^+\pi^0$ and $D^0 \to K^-\pi^-2\pi^+$. A fit that includes external measurements of charm mixing parameters gets $\Delta m = (2.34 \pm 0.61) \times 10^{10}\ \hbar\,\mathrm{s}^{-1}$.

[14] The ASNER 05 and ZHANG 07B values are from the time-dependent Dalitz-plot analysis of $D^0 \to K^0_S\pi^+\pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \to K^{*+}\pi^-$ and $\overline{D}{}^0 \to K^{*+}\pi^-$. This value allows *CP* violation and is sensitive to the sign of $\Delta m$.

[15] The AUBERT 03Z, LI 05A, and ZHANG 06 limits are inferred from the $D^0$-$\overline{D}{}^0$ mixing ratio $\Gamma(K^+\pi^-$ (via $\overline{D}{}^0))/\Gamma(K^-\pi^+)$ given near the end of this $D^0$ Listings. Decay-time information is used to distinguish DCS decays from $D^0$-$\overline{D}{}^0$ mixing. The limit allows interference between the DCS and mixing ratios, and also allows *CP* violation. AUBERT 03Z assumes the strong phase between $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$ amplitudes is small; if an arbitrary phase is allowed, the limit degrades by 20%. The LI 05A and ZHANG 06 limits are valid for an arbitrary strong phase.

[16] This LINK 05H limit is inferred from the $D^0$-$\overline{D}{}^0$ mixing ratio $\Gamma(K^+\pi^-$ (via $\overline{D}{}^0))/\Gamma(K^-\pi^+)$ given near the end of this $D^0$ Listings. Decay-time information is used to distinguish DCS decays from $D^0$-$\overline{D}{}^0$ mixing. The limit allows interference between the DCS and mixing ratios, and also allows *CP* violation. The strong phase between $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$ is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by 25%.

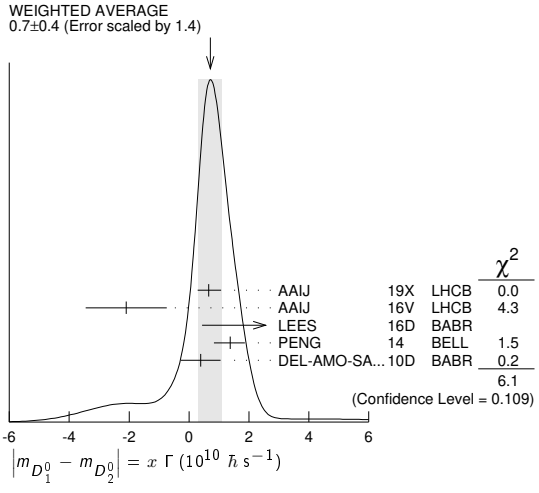
[17] This GODANG 00 limit is inferred from the $D^0$-$\overline{D}{}^0$ mixing ratio $\Gamma(K^+\pi^-$ (via $\overline{D}{}^0))/\Gamma(K^-\pi^+)$ given near the end of this $D^0$ Listings. Decay-time information is used to distinguish DCS decays from $D^0$-$\overline{D}{}^0$ mixing. The limit allows interference between the DCS and mixing ratios, and also allows *CP* violation. The strong phase between $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$ is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by a factor of two.

[18] AITALA 98 allows interference between the doubly Cabibbo-suppressed and mixing amplitudes, and also allows *CP* violation in this term, but assumes that $A_D = A_R = 0$. See the note on "$D^0$-$\overline{D}{}^0$ Mixing," above.

[19] This limit is inferred from $R_M$ for $f = K^+\pi^-$ and $f = K^+\pi^-\pi^+\pi^-$. See the note on "$D^0$-$\overline{D}{}^0$ Mixing," above. Decay-time information is used to distinguish doubly Cabibbo-suppressed decays from $D^0$-$\overline{D}{}^0$ mixing.

[20] This limit is inferred from $R_M$ for $f = K^+\ell^-\overline{\nu}_\ell$. See the note on "$D^0$-$\overline{D}{}^0$ Mixing," above.

[21] ANJOS 88C assumes that $y = 0$. See the note on "$D^0$-$\overline{D}{}^0$ Mixing," above. Without this assumption, the limit degrades by about a factor of two.



## $(\Gamma_{D^0_1} - \Gamma_{D^0_2})/\Gamma = 2y$

The $D^0_1$ and $D^0_2$ are the mass eigenstates of the $D^0$ meson, as described in the note on "$D^0$-$\overline{D}{}^0$ Mixing," above.

Due to the strong phase difference between $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$, we exclude from the average those measurements of $y'$ that are inferred from the $D^0$-$\overline{D}{}^0$ mixing ratio $\Gamma(K^+\pi^-$ via $\overline{D}{}^0)$ / $\Gamma(K^+\pi^-)$ given near the end of this $D^0$ Listings.

Some early results have been omitted. See our 2006 *Review* (Journal of Physics **G33** 1 (2006)).

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group, see the note on "$D^0$-$\overline{D}{}^0$ Mixing."

[1] Based on 3 fb$^{-1}$ of data collected at $\sqrt{s} = 7$, 8 TeV. Measures the lifetime difference between $D^0 \to K^-K^+$ and $D^0 \to \pi^-\pi^+$ (*CP* even) decays and $D^0 \to K^-\pi^+$ (*CP* mixed) decays, or $y_{CP} = (\Gamma_{CP+} - \Gamma_{CP-})\ /\ (\Gamma_{CP+} + \Gamma_{CP-})$. The $D^0$ mesons are required to originate from semimuonic decays of $B$ mesons. We list $2y_{CP} = \Delta\Gamma/\Gamma$.

[2] AAIJ 19X $D^0$ come from $D^{*+}$ and $\overline{B} \to D^0\mu^-X$ decays (and c.c.) in $pp$ collisions at 7 and 8 TeV. Measurement allows for *CP* violation (none seen).

[3] The result was established with $D^0$ from prompt and secondary $D^*$. Based on 5 fb$^{-1}$ of data collected at $\sqrt{s} = 7$, 8, 13 TeV. Assumes no *CP* violation. Reported $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$ and $y' = (5.28 \pm 0.52) \times 10^{-3}$, where $x' = x\cos(\delta) + y\sin(\delta)$, $y' = y\cos(\delta) - x\sin(\delta)$ and $\delta$ is the strong phase between the $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$.

[4] Model-independent measurement of the charm mixing parameters in the decay $D^0 \to K^0_S\pi^+\pi^-$ using 1.0 fb$^{-1}$ of LHCb data at $\sqrt{s} = 7$ TeV.

[5] Time-dependent amplitude analysis of $D^0 \to \pi^+\pi^-\pi^0$.

[6] An improved measurement of $\overline{D}{}^0 - D^0$ mixing and a search for *CP* violation in $D^0$ decays to *CP*-even final states $K^+K^-$ and $\pi^+\pi^-$ using the final Belle data sample of 976 fb$^{-1}$.

[7] ABLIKIM 15D uses quantum correlations in $e^+e^- \to D^0\overline{D}{}^0$ at the $\psi(3770)$.

[8] Based on 976 fb$^{-1}$ of data collected at $\Upsilon(\mathrm{nS})$ resonances. Assumes no *CP* violation. Reported $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$ and $y' = (4.6 \pm 3.4) \times 10^{-3}$, where $x' = x\cos(\delta) + y\sin(\delta)$, $y' = y\cos(\delta) - x\sin(\delta)$ and $\delta$ is the strong phase between $D^0 \to K^+\pi^-$ and $\overline{D}{}^0 \to K^+\pi^-$.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[9] The time-dependent Dalitz-plot analysis of $D^0 \to K^0_S \pi^+ \pi^-$ is emplored. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \to K^{*+} \pi^-$ and $\overline{D}{}^0 \to K^{*+} \pi^-$. This value allows *CP* violation and is sensitive to the sign of $\Delta m$.

[10] Based on 9.6 fb$^{-1}$ of data collected at the Tevatron. Assumes no *CP* violation. Reported $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$ and $y' = (4.3 \pm 4.3) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and $\delta$ is the strong phase between the $D^0 \to K^+ \pi^-$ and $\overline{D}{}^0 \to K^+ \pi^-$.

[11] Obtained $y_{CP} = (0.72 \pm 0.18 \pm 0.12)\%$ based on three effective $D^0$ lifetimes measured in $K^\mp \pi^\pm$, $K^- K^+$, and $\pi^- \pi^+$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.

[12] Compared the lifetimes of $D^0$ decay to the *CP* eigenstate $K^+ K^-$ with $D^0$ decay to $\pi^+ K^-$. The values here assume no *CP* violation.

[13] DEL-AMO-SANCHEZ 10D uses 540,800 $\pm$ 800 $K^0_S \pi^+ \pi^-$ and 79,900 $\pm$ 300 $K^0_S K^+ K^-$ events in a time-dependent amplitude analyses of the $D^0$ and $\overline{D}{}^0$ Dalitz plots. No evidence was found for *CP* violation, and the values here assume no such violation.

[14] ZUPANC 09 uses a method based on measuring the mean decay time of $D^0 \to K^0_S K^+ K^-$ events for different $K^+ K^-$ mass intervals.

[15] LINK 00, AITALA 99E, and ABE 02I measure the lifetime difference between $D^0 \to K^- K^+$ (*CP* even) decays and $D^0 \to K^- \pi^+$ (*CP* mixed) decays, or $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)]/[\Gamma(CP+) + \Gamma(CP-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.

[16] CSORNA 02 measures the lifetime difference between $D^0 \to K^- K^+$ and $\pi^- \pi^+$ (*CP* even) decays and $D^0 \to K^- \pi^+$ (*CP* mixed) decays, or $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)]/[\Gamma(CP+) + \Gamma(CP-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.

[17] The result was established with $D^0$ from prompt and secondary $D^*$. Based on 3 fb$^{-1}$ of data collected at $\sqrt{s} = 7$, 8 TeV. Assumes no *CP* violation. Reported $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$ and $y' = (5.23 \pm 0.84) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and $\delta$ is the strong phase between the $D^0 \to K^+ \pi^-$ and $\overline{D}{}^0 \to K^+ \pi^-$.

[18] Based on 3 fb$^{-1}$ of data collected at $\sqrt{s} = 7$, 8 TeV. Assumes no *CP* violation. Reported $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$ and $y' = (4.8 \pm 1.0) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and $\delta$ is the strong phase between the $D^0 \to K^+ \pi^-$ and $\overline{D}{}^0 \to K^+ \pi^-$.

[19] Based on 1 fb$^{-1}$ of data collected at $\sqrt{s} = 7$ TeV in 2011. Assumes no *CP* violation. Reported $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$ and $y' = (7.2 \pm 2.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and $\delta$ is the strong phase between the $D^0 \to K^+ \pi^-$ and $\overline{D}{}^0 \to K^+ \pi^-$.

[20] This combines the $y_{CP} = (\tau_{K\pi}/\tau_{KK}) - 1$ using untagged $K^- \pi^+$ and $K^- K^+$ events of AUBERT 09AI with the disjoint $y_{CP}$ using tagged $K^- \pi^+$, $K^- K^+$, and $\pi^- \pi^+$ events of AUBERT 08U.

[21] The AUBERT 09AN values are inferred from the branching ratio $\Gamma(D^0 \to K^+ \pi^- \pi^0$ via $\overline{D}{}^0)/\Gamma(D^0 \to K^- \pi^+ \pi^0)$ given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between $D^0 \to K^+ \pi^- \pi^0$ and $\overline{D}{}^0 \to K^+ \pi^- \pi^0$ is assumed to be small. The width difference here is $y''$, which is not the same as $y_{CP}$ in the note on $D^0$-$\overline{D}{}^0$ mixing.

[22] LOWREY 09 uses quantum correlations in $e^+ e^- \to D^0 \overline{D}{}^0$ at the $\psi(3770)$. See below for coherence factors and average relative strong phases for both $D^0 \to K^- \pi^+ \pi^0$ and $D^0 \to K^- \pi^- 2\pi^+$. A fit that includes external measurements of charm mixing parameters gets $2y = (1.62 \pm 0.32) \times 10^{-2}$.

[23] The GODANG 00, AUBERT 03Z, LINK 05H, LI 05A, ZHANG 06, AUBERT 07W, and AALTONEN 08E limits are inferred from the $D^0$-$\overline{D}{}^0$ mixing ratio $\Gamma(K^+ \pi^-$ (via $\overline{D}{}^0))/\Gamma(K^- \pi^+)$ given near the end of this $D^0$ Listings. Decay-time information is used to distinguish DCS decays from $D^0$-$\overline{D}{}^0$ mixing. The limits allow interference between the DCS and mixing ratios, and all except AUBERT 07W and AALTONEN 08E also allow *CP* violation. The phase between $D^0 \to K^+ \pi^-$ and $\overline{D}{}^0 \to K^+ \pi^-$ is assumed to be small. This is a measurement of $y'$ and is not the same as the $y_{CP}$ of our note above on "$D^0$-$\overline{D}{}^0$ Mixing."

[24] This value combines the results of AUBERT 08U and AUBERT 03P.

[25] STARIC 07 compares the lifetimes of $D^0$ decay to the *CP* eigenstates $K^+ K^-$ and $\pi^+ \pi^-$ with $D^0$ decay to $K^- \pi^+$.

[26] The ASNER 05 and ZHANG 07B values are from the time-dependent Dalitz-plot analysis of $D^0 \to K^0_S \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \to K^{*+} \pi^-$ and $\overline{D}{}^0 \to K^{*+} \pi^-$. This limit allows *CP* violation.

[27] The ranges of AUBERT 03Z, LINK 05H, LI 05A, and ZHANG 06 measurements are for 95% confidence level.

[28] AUBERT 03P measures $Y \equiv 2\tau^0 / (\tau^+ + \tau^-) - 1$, where $\tau^0$ is the $D^0 \to K^- \pi^+$ (and $\overline{D}{}^0 \to K^+ \pi^-$) lifetime, and $\tau^+$ and $\tau^-$ are the $D^0$ and $\overline{D}{}^0$ lifetimes to *CP*-even states (here $K^- K^+$ and $\pi^- \pi^+$). In the limit of *CP* conservation, $Y = y \equiv \Delta\Gamma / 2\Gamma$ (we list $2y = \Delta\Gamma/\Gamma$). AUBERT 03P also uses $\tau^+ - \tau^-$ to get $\Delta Y = -0.008 \pm 0.006 \pm 0.002$.

## |q/p|

The mass eigenstates $D^0_1$ and $D^0_2$ are related to the $C = \pm 1$ states by $|D_{1,2}> = p\,|D^0> + q\,|\overline{D}{}^0>$. See the note on "$D^0$-$\overline{D}{}^0$ Mixing" above.

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group. This would include as-yet-unpublished results, see the note on "$D^0$-$\overline{D}{}^0$ Mixing."

[1] AAIJ 19X $D^0$ come from $D^{*+}$ and $\overline{B} \to D^0 \mu^- X$ decays (and c.c.) in $pp$ collisions at 7 and 8 TeV.

[2] Based on 5 fb$^{-1}$ of data collected at $\sqrt{s} = 7$, 8, 13 TeV. Allowing for *CP* violation, the direct *CP* violation in mixing is reported $1.00 < |q/p| < 1.35$ at the 68.3% CL for the $D^0 \to K^+ \pi^-$ and $\overline{D}{}^0 \to K^+ \pi^-$.

[3] The time-dependent Dalitz-plot analysis of $D^0 \to K^0_S \pi^+ \pi^-$ is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \to K^{*+} \pi^-$ and $\overline{D}{}^0 \to K^{*+} \pi^-$. This value allows *CP* violation and is sensitive to the sign of $\Delta m$.

[4] Based on 3 fb$^{-1}$ of data collected at $\sqrt{s} = 7$, 8 TeV. Allowing for *CP* violation, the direct *CP* violation in mixing is reported $0.75 < |q/p| < 1.24$ at the 68.3% CL for the $D^0 \to K^+ \pi^-$ and $\overline{D}{}^0 \to K^+ \pi^-$.

[5] The phase of p/q is $(-14^{+16}_{-18} \pm 5)^\circ$. The ZHANG 07B value is from the time-dependent Dalitz-plot analysis of $D^0 \to K^0_S \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \to K^{*+} \pi^-$ and $\overline{D}{}^0 \to K^{*+} \pi^-$. This value allows *CP* violation.

## $A_\Gamma$

$A_\Gamma$ is the decay-rate asymmetry for *CP*-even final states $A_\Gamma = (\overline{\tau}_{+-} - \tau_{+-}) / (\overline{\tau}_{+-} + \tau_{+-})$. See the note on "$D^0$-$\overline{D}{}^0$ Mixing" above.

[3] An improved measurement of $\overline{D}{}^0 - D^0$ mixing and a search for *CP* violation in $D^0$ decays to *CP*-even final states $K^+ K^-$ and $\pi^+ \pi^-$ using the final Belle data sample of 976 fb$^{-1}$.

[4] Combined result from $D^0 \to K^+ K^-$ and $D^0 \to \pi^+ \pi^-$, with $D^0$ from $D^{*+} \to D^0 \pi^+$ (and cc).

[5] Measured using $D^{*+} \to D^0 \pi^+$, $D^0 \to K^+ K^-$ decays (and cc).

[6] Measured using $D^{*+} \to D^0 \pi^+$, $D^0 \to \pi^+ \pi^-$ decays (and cc).

[7] Measured using $D^0 \to K^+ K^-$ decays, with $D^0$ from partially reconstructed semileptonic $B$ hadron decays.

[8] Measured using $D^0 \to \pi^+ \pi^-$ decays, with $D^0$ from partially reconstructed semileptonic $B$ hadron decays.

## $\phi^{K^0_S \pi\pi}$

Parametrizes *CP* violation in the interference between $D^0$ mixing and decay. The mass eigenstates $D^0_1$ and $D^0_2$ are related to the $C = \pm 1$ states by $|D_{1,2}> = p\,|D^0> + q\,|\overline{D}{}^0>$. In the absence of *CP* violation in the decay, and using the usual phase convention where *CP* conservation implies q/p is real, $\phi^{K^0_S \pi\pi}$ is identical to the decay-mode-independent parameter $\phi = \arg(q/p)$.

[1] Uses quantum correlations in $e^+e^- \to D^0\overline{D}^0$ at the ψ(3770) to measure the asymmetry of the branching fraction of $D^0 \to K^-\pi^+$ in *CP*-odd and *CP*-even eigenstates to be (12.7 ± 1.3 ± 0.7)%. A fit that includes external measurements of charm mixing parameters finds the value quoted above.

[2] Uses quantum correlations in $e^+e^- \to D^0\overline{D}^0$ at the ψ(3770), where decay rates of *CP*-tagged $K\pi$ final states depend on the strong phases between the decays of $D^0 \to K^+\pi^-$ and $\overline{D}^0 \to K^+\pi^-$. The measurements obtained $\sin(\delta) = -0.01 \pm 0.41 \pm 0.04$ and $|\delta| = (10^{+28+13}_{-53-00})^\circ$ as well. A fit that includes external measurements of charm mixing parameters finds $\cos(\delta) = 1.15^{+0.19+0.00}_{-0.17-0.08}$, $\sin(\delta) = 0.56^{+0.32+0.21}_{-0.31-0.20}$, and $|\delta| = (18^{+11}_{-17})^\circ$.

[3] ASNER 08 uses quantum correlations in $e^+e^- \to D^0\overline{D}^0$ at the ψ(3770), where decay rates of *CP*-tagged $K\pi$ final states depend on cos δ because of interfering amplitudes. The above measurement implies $|\delta| < 75^\circ$ with a confidence level of 95%. A fit that includes external measurements of charm mixing parameters finds $\cos\delta = 1.10 \pm 0.35 \pm 0.07$. See also the note on "$D^0$–$\overline{D}^0$ Mixing" p. 783 in our 2008 Review (PDG 08).

### $D^0 \to K^-\pi^+\pi^0$ COHERENCE FACTOR $R_{K\pi\pi^0}$

See the note on '$D^0$-$\overline{D}^0$ Mixing' for the definition. $R_{K\pi\pi^0}$ can have any value between 0 and 1. A value near 1 indicates the decay is dominated by a few intermediate states with limited interference.

[4] LOWREY 09 uses quantum correlations in $e^+e^- \to D^0\overline{D}^0$ at the ψ(3770), where the decay rates of *CP*-tagged $K^-\pi^-2\pi^+$ final states depend on $R_{K3\pi}$ and $\delta^{K3\pi}$. A fit that includes external measurements of charm mixing parameters gets $\delta^{K3\pi} = (114^{+26}_{-23})^\circ$.

### $D^0 \to K^-\pi^-2\pi^+$, $R_{K3\pi}$ (y cos$\delta^{K3\pi}$ − x sin$\delta^{K3\pi}$)

| VALUE ($10^{-3}$ TeV$^{-1}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **−3.0±0.7** | 42.5k | [1] AAIJ | 16F | LHCB | *pp* at 7, 8 TeV |

[1] From a time-dependent analysis of *D* mixing in $D^0 \to K^+\pi^-\pi^+\pi^-$. This result uses external constraints on $R_M = 1/2\ (x^2 + y^2)$. Without such constraints, AAIJ 16F measure (0.3 ± 1.8) × $10^{-3}$, with a large correlation coefficient to $R_M$.

### $D^0 \to K^0_S K^+\pi^-$ COHERENCE FACTOR $R_{K^0_S K\pi}$

## $D^0$ DECAY MODES

Most decay modes (other than the semileptonic modes) that involve a neutral *K* meson are now given as $K^0_S$ modes, not as $\overline{K}^0$ modes. Nearly always it is a $K^0_S$ that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\,\Gamma(K^0_S) = \Gamma(\overline{K}^0)$.

| $\Gamma_{322}$ | Unaccounted decay modes | | (36.9 ± 1.2 ) | % | S=1.1 |

[a] This value is obtained by subtracting the branching fractions for 2-, 4- and 6-prongs from unity.

[b] This is the sum of our $K^-2\pi^+\pi^-$, $K^-2\pi^+\pi^-\pi^0$, $\overline{K}^02\pi^+2\pi^-$, $K^+2K^-\pi^+$, $2\pi^+2\pi^-$, $2\pi^+2\pi^-\pi^0$, $K^+K^-\pi^+\pi^-$, and $K^+K^-\pi^+\pi^-\pi^0$, branching fractions.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[c] This is the sum of our $K^-3\pi^+2\pi^-$ and $3\pi^+3\pi^-$ branching fractions.

[d] The branching fractions for the $K^-e^+\nu_e$, $K^*(892)^-e^+\nu_e$, $\pi^-e^+\nu_e$, and $\rho^-e^+\nu_e$ modes add up to 6.17 ± 0.17 %.

[e] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.

[f] This is a doubly Cabibbo-suppressed mode.

[g] Submodes of the $D^0 \to K^0_S\pi^+\pi^-\pi^0$ mode with a $K^*$ and/or $\rho$ were studied by COFFMAN 92B, but with only 140 events. With nothing new for 18 years, we refer to our 2008 edition, Physics Letters **B667** 1 (2008), for those results.

[h] This branching fraction includes all the decay modes of the resonance in the final state.

[i] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.

[j] The value is for the sum of the charge states or particle/antiparticle states indicated.

[k] This limit is for either $D^0$ or $\overline{D}^0$ to $pe^-$.

[l] This limit is for either $D^0$ or $\overline{D}^0$ to $\overline{p}e^+$.

### CONSTRAINED FIT INFORMATION

An overall fit to 64 branching ratios uses 126 measurements and one constraint to determine 32 parameters. The overall fit has a $\chi^2 = 141.9$ for 95 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

[1] The event samples in this AUBERT 07BG result include radiative photons. The $D^0 \to K^-e^+\nu_e$ form factor at $q^2 = 0$ is $f_+(0) = 0.727 \pm 0.007 \pm 0.005 \pm 0.007$.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[2] BEAN 93C uses $K^-\mu^+\nu_\mu$ as well as $K^-e^+\nu_e$ events and makes a small phase-space adjustment to the number of the $\mu^+$ events to use them as $e^+$ events. A pole mass of $2.00 \pm 0.12 \pm 0.18$ GeV/$c^2$ is obtained from the $q^2$ dependence of the decay rate.

[3] CRAWFORD 91B uses $K^-e^+\nu_e$ and $K^-\mu^+\nu_\mu$ candidates to measure a pole mass of $2.1^{+0.4}_{-0.2}{}^{+0.3}_{-0.2}$ GeV/$c^2$ from the $q^2$ dependence of the decay rate.

[4] ANJOS 89F measures a pole mass of $2.1^{+0.4}_{-0.2} \pm 0.2$ GeV/$c^2$ from the $q^2$ dependence of the decay rate.

|---|---|---|---|---|---|
| **1.50 ±0.12 OUR AVERAGE** | | Error includes scale factor of 1.9. | | | |
| 1.445±0.058±0.039 | 1.1k | [1] ABLIKIM | 19C | BES3 | $e^+e^-$ at 3773 MeV |
| 1.77 ±0.12 ±0.10 | 305 ± 21 | [2,3] DOBBS | 13 | CLEO | $e^+e^-$ at $\psi(3770)$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 1.94 ±0.39 ±0.13 | 31 ± 6 | COAN | 05 | CLEO | See DOBBS 13 |

[1] This result is the same as the one reported for $D^0 \to \pi^-\pi^0 e^+\nu_e$ which ABLIKIM 19C found to proceed 100% via $D^0 \to \rho(770)^- e^+\nu_e$.

[2] DOBBS 13 finds $\Gamma(D^0 \to \rho^- e^+\nu_e) / 2\,\Gamma(D^+ \to \rho^0 e^+\nu_e) = 1.03 \pm 0.09^{+0.08}_{-0.02}$; isospin invariance predicts the ratio is 1.0.

[3] See the $D^+$ Listings for $D \to \rho e^+\nu_e$ form factors.

| 4.3 ±1.0 | 130 | [10] PERUZZI | 77 | LGW | $e^+e^-$ 3.77 GeV |

[1] ABLIKIM 18W measured the combined $K^\mp\pi^\pm$ branching fraction to be 3.898%. We have subtracted off the doubly Cabibbo-suppressed branching fraction $B(D^0 \to K^+\pi^-) = (1.50 \pm 0.07) \times 10^{-4}$, even though it is less than one-third of the uncertainty of the combined measurement, in order to treat this as a measurement of $B(D^0 \to K^-\pi^+)$.

[2] This combines the CLEO results of ARTUSO 98, COAN 98, and AKERIB 93.

[3] ABACHI 88, DECAMP 91J, AKERIB 93, ALBRECHT 94F, and BARATE 97C use $D^*(2010)^+ \to D^0\pi^+$ decays. The $\pi^+$ is both slow and of low $p_T$ with respect to the event thrust axis or nearest jet ($\approx D^{*+}$ direction). The excess number of such $\pi^+$'s over background gives the number of $D^*(2010)^+ \to D^0\pi^+$ events, and the fraction with $D^0 \to K^-\pi^+$ gives the $D^0 \to K^-\pi^+$ branching fraction.

[4] DOBBS 07 and HE 05 use single- and double-tagged events in an overall fit. DOBBS 07 supersedes HE 05.

[5] ARTUSO 98, following ALBRECHT 94, uses $D^0$ mesons from $\overline{B}{}^0 \to D^*(2010)^+ X \ell^-\overline{\nu}_\ell$ decays. Our average uses the CLEO average of this value with the values of COAN 98 and AKERIB 93.

[6] COAN 98 assumes that $\Gamma(B \to \overline{D} X \ell^+\nu)/\Gamma(B \to X\ell^+\nu) = 1.0 - 3|V_{ub}/V_{cb}|^2 - 0.010 \pm 0.005$, the last term accounting for $\overline{B} \to D_s^+ K X \ell^-\overline{\nu}$. COAN 98 is included in the CLEO average in ARTUSO 98.

[7] ALBRECHT 94 uses $D^0$ mesons from $\overline{B}{}^0 \to D^{*+}\ell^-\overline{\nu}_\ell$ decays. This is a different set of events than used by ALBRECHT 94F.

[8] This AKERIB 93 value includes radiative corrections; without them, the value is $0.0391 \pm 0.0008 \pm 0.0017$. AKERIB 93 is included in the CLEO average in ARTUSO 98.

[9] SCHINDLER 81 (MARK-2) measures $\sigma(e^+e^- \to \psi(3770)) \times$ branching fraction to be $0.24 \pm 0.02$ nb. We use the MARK-3 (ADLER 88C) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

[10] PERUZZI 77 (MARK-1) measures $\sigma(e^+e^- \to \psi(3770)) \times$ branching fraction to be $0.25 \pm 0.05$ nb. We use the MARK-3 (ADLER 88C) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

| 24.2 ±2.5 ±6.0 | 1.2k | COFFMAN | 92B | MRK3 | $D^0\to K^-2\pi^+\pi^-$ |

[1] The 3rd error is due to the uncertainty in the amplitude model composition.
[2] In addition to the 14 ABLIKIM 17O branching ratios we have listed, the paper gives 15 more ratios for mostly non-resonant modes. Four of the 15 have less than 2-standard-deviation significance. Here are some of the omitted modes, with S, P, V, A, and T for scalar, pseudo-scalar, vector, axial-vector, and tensor spin sub-structures: $\pi^+(K^-\rho^0)_P$, $\pi^+(K^-\rho^0)_V$, $\pi^+(\overline{K}^{*0}\pi^-)_P$, $\pi^+(\overline{K}^{*0}\pi^-)_V$, $\pi^+(\pi^-(K^-\pi^+)_{S-wave})_A$, $(K^-\pi^+)_V(\pi^+\pi^-)_S$, $(K^-\pi^+)_T(\pi^+\pi^-)_S\cdots$

[1] BARLAG 92C computes the branching fraction using topological normalization.

### $\Gamma(K_S^0\pi^+\pi^-\pi^0)/\Gamma(K_S^0\pi^+\pi^-)$ $\Gamma_{81}/\Gamma_{38}$

Branching fractions for submodes of this mode with narrow resonances (the $\eta$, $\omega$, $\eta'$) are fairly well determined (see below). COFFMAN 92B gives fractions of $K^*$ and $\rho$ submodes, but with only 140 ± 28 events above background could not determine them with much accuracy. We omit those measurements here; they are in our 2008 Review (Physics Letters **B667** 1 (2008)).

### $\Gamma(\rho^+\pi^-)/\Gamma(\pi^+\pi^-\pi^0)$ $\Gamma_{126}/\Gamma_{125}$

This is the "fit fraction" from the Dalitz-plot analysis, with interference. See GASPERO 08 and BHATTACHARYA 10A for isospin decompositions of the $D^0 \to \pi^+\pi^0\pi^-$ Dalitz plot, both based on the amplitudes of AUBERT 07BJ. They quantify the conclusion that the final state is dominantly isospin 0.

| $<50 \times 10^{-4}$ | 90 | [2] AITALA | 96C | E791 | $\pi^-$ nucleus, 500 GeV |

[1] The BITENC 08 right-sign sample includes about 15% of $D^0 \to K^-\pi^0\ell^+\nu_\ell$ and other decays.
[2] AITALA 96C uses $D^{*+} \to D^0\pi^+$ (and charge conjugate) decays to identify the charm at production and $D^0 \to K^-\ell^+\nu_\ell$ (and charge conjugate) decays to identify the charm at decay.

### $\Gamma(K^+$ or $K^*(892)^+ e^-\overline{\nu}_e$ via $\overline{D}^0)/[\Gamma(K^-e^+\nu_e) + \Gamma(K^*(892)^- e^+\nu_e)]$ $\Gamma_{255}/(\Gamma_{19}+\Gamma_{21})$

This is a limit on $R_M$ without the complications of possible doubly Cabibbo-suppressed decays that occur when using hadronic modes. The experiments use $D^{*+} \to D^0\pi^+$ (and charge conjugate) decays to identify the charm at production and the charge of the $e$ to identify the charm at decay. These limits do not allow $CP$ violation. For the limits on $|m_1 - m_2|$ and $(\Gamma_1 - \Gamma_2)/\Gamma$ that come from the best mixing limit, see near the beginning of these $D^0$ Listings.

### $\Gamma(K^+\pi^-)/\Gamma(K^-\pi^+)$ $\Gamma_{256}/\Gamma_{35}$

This is $R$, the time-integrated wrong-sign rate compared to the right-sign rate. See the note on "$D^0$-$\overline{D}^0$ Mixing," near the start of the $D^0$ Listings.

The experiments here use the charge of the pion in $D^*(2010)^\pm \to (D^0$ or $\overline{D}^0)\,\pi^\pm$ decay to tell whether a $D^0$ or a $\overline{D}^0$ was born. The $D^0 \to K^+\pi^-$ decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by $D^0 \to \overline{D}^0$ mixing followed by $\overline{D}^0 \to K^+\pi^-$ decay. Some of the experiments can use the decay-time information to disentangle the two mechanisms. Here, we list the experimental branching ratio, which if there is no mixing is the DCS ratio. See the next data block for values of the DCS ratio $R_D$, and the following data block for limits on the mixing ratio $R_M$. See the section on $CP$-violating asymmetries near the end of this $D^0$ Listing for values of $A_D$, and the note on "$D^0$-$\overline{D}^0$ Mixing" for limits on x' and y'.

Some early limits have been omitted from this Listing; see our 1998 edition (The European Physical Journal **C3** 1 (1998)) and our 2006 edition (Journal of Physics **G33** 1 (2006)).

[1] AAIJ 16F result comes from time-dependent analysis that uses external input on the mixing parameters x, y. Without this input, the result is $(3.29 \pm 0.08) \times 10^{-3}$.
[2] AMMAR 91 cannot and DYTMAN 01, TIAN 05 do not distinguish between doublyCabibbo-suppressed decay and $D^0$-$\overline{D}^0$ mixing.
[3] This AITALA 98result assumes no $D^0$-$\overline{D}^0$ mixing ($R_M$ in the note on "$D^0$-$\overline{D}^0$ Mixing").It becomes $-0.0020^{+0.0117}_{-0.0106} \pm 0.0035$ whenmixing is allowed and decay-time information is used todistinguish doubly Cabibbo-suppressed decays from mixing.
[4] ANJOS 88C uses decay-time information to distinguish doubly Cabibbo-suppressed (DCS) decays from $D^0$-$\overline{D}^0$ mixing. However, the result assumes no interference between the DCS and mixing amplitudes ($y' = 0$ in the note on "$D^0$-$\overline{D}^0$ Mixing" near the start of the $D^0$ Listings). When interference is allowed, the limit degrades to 0.033.

### $\Gamma(K^+\pi^+2\pi^-$ via $\overline{D}^0)/\Gamma(K^-2\pi^+\pi^-)$ $\Gamma_{267}/\Gamma_{70}$

This is a $D^0$-$\overline{D}^0$ mixing limit. The experiments here (1) use the charge of the pion in $D^*(2010)^\pm \to (D^0$ or $\overline{D}^0)\,\pi^\pm$ decay to tell whether a $D^0$ or a $\overline{D}^0$ was born; and (2) use the decay-time distribution to disentangle doubly Cabibbo-suppressed decay and mixing. For the limits on $|m_{D_1^0} - m_{D_2^0}|$ and $(\Gamma_{D_1^0} - \Gamma_{D_2^0})/\Gamma_{D^0}$ that come from the best mixing limit, see near the beginning of these $D^0$ Listings.

| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| <0.0085 | 90 | [1] AITALA | 98 | E791 | $\pi^-$ nucleus, 500 GeV |
| <0.0037 | 90 | [2] ANJOS | 88C | E691 | Photoproduction |

[1] AITALA 98 uses decay-time information to distinguish doubly Cabibbo-suppressed decays from $D^0$-$\overline{D}^0$ mixing. The fit allows interference between the two amplitudes, and also allows $CP$ violation in this term. The central value obtained is $0.0039^{+0.0036}_{-0.0032} \pm 0.0016$. When interference is disallowed, the result becomes $0.0021 \pm 0.0009 \pm 0.0002$.
[2] This combines results of ANJOS 88C on $K^+\pi^-$ and $K^+\pi^-\pi^+\pi^-$ (via $\overline{D}^0$) reported in the data block above (see footnotes there). It assumes no interference.

### $\Gamma(\mu^-$ anything via $\overline{D}^0)/\Gamma(\mu^+$ anything) $\Gamma_{269}/\Gamma_6$

This is a $D^0$-$\overline{D}^0$ mixing limit. See the somewhat better limits above.

## $D^0$ CP-VIOLATING DECAY-RATE ASYMMETRIES

This is the difference between $D^0$ and $\overline{D}^0$ partial widths for the decay to state $f$, divided by the sum of the widths:
$A_{CP}(f) = [\Gamma(D^0 \to f) - \Gamma(\overline{D}^0 \to \overline{f})] / [\Gamma(D^0 \to f) + \Gamma(\overline{D}^0 \to \overline{f})]$.

[1] Based on 3 fb$^{-1}$ of data collected at $\sqrt{s}$ = 7, 8 TeV. Allowing for *CP* violation, the direct *CP*-violation in mixing is reported for the $D^0 \to K^+\pi^-$ and $\overline{D}^0 \to K^+\pi^-$.
[2] The *CPV* is derived from $A_{CP} = (R^+_D - R^-_D)/(R^+_D + R^-_D)$.
[3] This ZHANG 06 result allows mixing.
[4] This LINK 05H result assumes no mixing. If mixing is allowed, it becomes $0.13^{+0.33}_{-0.25} \pm 0.10$.
[5] This AUBERT 03Z limit assumes no mixing. If mixing is allowed, the 95% confidence-level interval is $(-2.8 < A_D < 4.9)\times10^{-3}$.
[6] This GODANG 00 result assumes no $D^0$-$\overline{D}^0$ mixing and becomes $-0.43 < A_{CP} < +0.34$ at 95% CL. If mixing is allowd $A_{CP} = -0.01^{+0.16}_{-0.17} \pm 0.01$.
[7] This LI 05A result allows mixing.

## $D^0$ $CP$-EVEN FRACTIONS

The $CP$-even fraction $F_+$, defined for self-conjugate final states, like the coherence factor is useful for measuring the unitary triangle angle $\gamma$ in $B \to DK$ decays. A purely $CP$-even state has $F_+ = 1$, a $CP$-odd one has $F_+ = 0$. For details, see NAYAK 15.

## $D^0$ $CP$-VIOLATING ASYMMETRY DIFFERENCES

### $\Delta A_{CP} = A_{CP}(K^+K^-) - A_{CP}(\pi^+\pi^-)$

$CP$ violation in these modes can come from the decay amplitudes (direct) and/or from mixing or interference of mixing and decay (indirect). The difference $\Delta A_{CP}$ is primarily sensitive to the direct component, and only retains a second-order dependence on the indirect component for measurements where the mean decay time of the $K^+K^-$ and $\pi^+\pi^-$ samples are not identical. The results below are averaged assuming the indirect component can be neglected.

## $D^0$ TESTS OF LOCAL *CP*-VIOLATION (*CPV*)

We list model-independent searches for local *CP* violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a $\chi^2$ test comparing normalised yields $N_i$, $\overline{N}_i$ in *CP*-conjugate bin pairs $i$: $\chi^2 = \Sigma_i (N_i - \alpha\,\overline{N}_i)/\sigma(N_i - \alpha\,\overline{N}_i)$. The factor $\alpha = (\Sigma_i N_i)/(\Sigma_i \overline{N}_i)$ removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured $\chi^2$ or larger under the assumption of CP conservation [AUBERT 08AO, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14C]. Results can be combined using Fisher's method [MOSTELLER 48].

## *CP* VIOLATING ASYMMETRIES OF *P*-ODD (*T*-ODD) MOMENTS

The *CP*-sensitive *P*-odd (*T*-odd) correlation in $D^0$, $\overline{D}^0$ decays. The $D^0$ and $\overline{D}^0$ are distinguished by the charge of the parent $D^*$: $D^{*+} \to D^0\pi^+$ and $D^{*-} \to \overline{D}^0\pi^-$.

### $A_{Tviol}(K^+K^-\pi^+\pi^-)$ in $D^0, \overline{D}^0 \to K^+K^-\pi^+\pi^-$

$C_T \equiv \vec{p}_{K^+} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$ is a parity-odd correlation of the $K^+$, $\pi^+$, and $\pi^-$ momenta (evaluated in the $D^0$ rest frame) for the $D^0$. $\overline{C}_T \equiv \vec{p}_{K^-} \cdot (\vec{p}_{\pi^-} \times \vec{p}_{\pi^+})$ is the corresponding quantity for the $\overline{D}^0$. Then
$A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] \,/\, [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$, and
$\overline{A}_T \equiv [\Gamma(-\overline{C}_T > 0) - \Gamma(-\overline{C}_T < 0)] \,/\, [\Gamma(-\overline{C}_T > 0) + \Gamma(-\overline{C}_T < 0)]$, and
$A_{Tviol} \equiv \frac{1}{2}(A_T - \overline{A}_T)$. $C_T$ and $\overline{C}_T$ are commonly referred to as *T*-odd moments, because they are odd under *T* reversal. However, the *T*-conjugate process $K^+K^-\pi^+\pi^- \to D^0$ is not accessible, while the *P*-conjugate process is.

### $A_{Tviol}(K_S\pi^+\pi^-\pi^0)$ in $D^0, \overline{D}^0 \to K_S\pi^+\pi^-\pi^0$

| VALUE (units $10^{-3}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| $-0.28 \pm 1.38 \pm^{0.23}_{0.76}$ | 745k | [1] PRASANTH | 17 | BELL | $e^+e^-$ at $\Upsilon$(nS)'s |

[1] PRASANTH 17 also measures $A_{Tviol}$ in sub-regions of the $D^0 \to K_S\pi^+\pi^-\pi^0$ phase-space. No evidence of *T* violation is found.

## $D^0$ *CPT*-VIOLATING DECAY-RATE ASYMMETRIES

### $A_{CPT}(K^\mp\pi^\pm)$ in $D^0 \to K^-\pi^+$, $\overline{D}^0 \to K^+\pi^-$

$A_{CPT}(t)$ is defined in terms of the time-dependent decay probabilities $P(D^0 \to K^-\pi^+)$ and $\overline{P}(\overline{D}^0 \to K^+\pi^-)$ by $A_{CPT}(t) = (\overline{P} - P)/(\overline{P} + P)$. For small mixing parameters $x \equiv \Delta m/\Gamma$ and $y \equiv \Delta\Gamma/2\Gamma$ (as is the case), and times t, $A_{CPT}(t)$ reduces to [ y *Re* $\xi$ - x *Im* $\xi$ ] Γt, where $\xi$ is the *CPT*-violating parameter.

The following is actually y *Re* $\xi$ - x *Im* $\xi$.

### $D^*(2007)^0$ DECAY MODES

$\overline{D}{}^*(2007)^0$ modes are charge conjugates of modes below.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $D^0\pi^0$ | (64.7±0.9) % |
| $\Gamma_2$ | $D^0\gamma$ | (35.3±0.9) % |

### CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 5 measurements and one constraint to determine 2 parameters. The overall fit has a $\chi^2 =$ 2.5 for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

$x_2$ | −100

$x_1$

### $D^*(2010)^\pm$ DECAY MODES

$D^*(2010)^-$ modes are charge conjugates of the modes below.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $D^0\pi^+$ | (67.7±0.5) % |
| $\Gamma_2$ | $D^+\pi^0$ | (30.7±0.5) % |
| $\Gamma_3$ | $D^+\gamma$ | ( 1.6±0.4) % |

### CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2$ = 0.3 for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

## $D_1(2420)^0$ POLARIZATION AMPLITUDE $A_{D_1}$

A polarization amplitude $A_{D_1}$ is a parameter that depends on the initial polarization of the $D_1$ and is sensitive to a possible $S$-wave contribution to its decay. For $D_1$ decays the helicity angle, $\theta_h$, distribution varies like $1 + A_{D_1}\cos^2\theta_h$, where $\theta_h$ is the angle in the $D^*$ rest frame between the two pions emitted by the $D_1 \to D^*\pi$ and the $D^* \to D\pi$.

Unpolarized $D_1$ decaying purely via $D$-wave is predicted to give $A_{D_1} = 3$.

## $D_1(2420)^\pm$ POLARIZATION AMPLITUDE $A_{D_1}$

A polarization amplitude $A_{D_1}$ is a parameter that depends on the initial polarization of the $D_1$ and is sensitive to a possible $S$-wave contribution to its decay. For $D_1$ decays the helicity angle, $\theta_h$, distribution varies like

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

$1 + A_{D_1}\cos^2\theta_h$, where $\theta_h$ is the angle in the $D^*$ rest frame between the two pions emitted by the $D_1 \to D^*\pi$ and the $D^* \to D\pi$.

Unpolarized $D_1$ decaying purely via $D$-wave is predicted to give $A_{D_1} = 3$.

# $D_2^*(2460)^0$

$I(J^P) = \frac{1}{2}(2^+)$

$J^P = 2^+$ assignment strongly favored (ALBRECHT 89B, ALBRECHT 89H), natural parity confirmed by the helicity analysis (DEL-AMO-SANCHEZ 10P). AAIJ 13CC confirms $J^P = 2^+$ and natural parity.

## $D_2^*(2460)0$ MASS

The fit includes $D^{\pm}$, $D^0$, $D_s^{\pm}$, $D^{*\pm}$, $D^{*0}$, $D_s^{*\pm}$, $D_1(2420)^0$, $D_2^*(2460)^0$, and $D_{s1}(2536)^{\pm}$ mass and mass difference measurements.

[5] From the amplitude analysis in the model describing the $D^+\pi^-$ wave together with virtual contributions from the $D^*(2007)^0$ and $B^{*0}$ states, and components corresponding to the $D_2^*(2460)^0$, $D_1^*(2680)^0$, $D_3^*(2760)^0$, and $D_2^*(3000)^0$ resonances.
[6] Systematic uncertainty not estimated.
[7] Unnatural parity preferred.
[8] Natural parity state. A state $D(3000)^+$ is possibly seen in $D^0\pi^+$ final state.

## $D(3000)^0$ DECAY MODES

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $D^{*+}\pi^-$ | seen |

## $D(3000)^0$ POLARIZATION AMPLITUDE $A_{D_J}$

A polarization amplitude $A_{D_J}$ is a parameter that depends on the initial polarization of the $D_J$. For $D_J$ decays the helicity angle, $\theta_H$, distribution varies like $1 + A_{D_J} \cos^2(\theta_H)$, where $\theta_H$ is the angle in the $D_J$ rest frame between the two pions emitted in the $D_J \to D^*\pi$ and $D^* \to D\pi$ decays.

# CHARMED, STRANGE MESONS ($C = S = \pm 1$)

$D_s^+ = c\bar{s}$, $D_s^- = \bar{c}s$, similarly for $D_s^*$'s

## $D_s^\pm$

$I(J^P) = 0(0^-)$

The angular distributions of the decays of the $\phi$ and $\overline{K}^*(892)^0$ in the $\phi\pi^+$ and $K^+\overline{K}^*(892)^0$ modes strongly indicate that the spin is zero. The parity given is that expected of a $c\bar{s}$ ground state.

### $D_s^\pm$ MASS

The fit includes $D^\pm$, $D^0$, $D_s^\pm$, $D^{*\pm}$, $D^{*0}$, $D_s^{*\pm}$, $D_1(2420)^0$, $D_2^*(2460)^0$, and $D_{s1}(2536)^\pm$ mass and mass difference measurements. Measurements of the $D_s^\pm$ mass with an error greater than 10 MeV are omitted from the fit and average. A number of early measurements have been omitted altogether.

[1] This AAIJ 17AN value is derived from the difference between the $D_s^-$ and $D^-$ widths. The 3rd uncertainty, $\pm 1.7 \times 10^{-15}$ s, arises from the uncertainty of the $D^-$ width.
[2] BONVICINI 99 obtains 1.19 ± 0.04 for the ratio of $D_s^+$ to $D^0$ lifetimes.

### $D_s^+$ DECAY MODES

Unless otherwise noted, the branching fractions for modes with a resonance in the final state include all the decay modes of the resonance. $D_s^-$ modes are charge conjugates of the modes below.

| | Mode | | Fraction ($\Gamma_i/\Gamma$) | | Scale factor/ Confidence level |

[a] This is the purely $e^+$ semileptonic branching fraction: the $e^+$ fraction from $\tau^+$ decays has been subtracted off. The sum of our (non-$\tau$) $e^+$ exclusive fractions — an $e^+\nu_e$ with an $\eta$, $\eta'$, $\phi$, $K^0$, or $K^{*0}$ — is 5.99 ± 0.31 %.

[b] This fraction includes $\eta$ from $\eta'$ decays.

[c] The sum of our exclusive $\eta'$ fractions — $\eta' e^+\nu_e$, $\eta'\mu^+\nu_\mu$, $\eta'\pi^+$, $\eta'\rho^+$, and $\eta' K^+$ — is 11.8 ± 1.6%.

[d] This branching fraction includes all the decay modes of the final-state resonance.

[e] A test for $u\overline{u}$ or $d\overline{d}$ content in the $D_s^+$. Neither Cabibbo-favored nor Cabibbo-suppressed decays can contribute, and $\omega$–$\phi$ mixing is an unlikely explanation for any fraction above about $2 \times 10^{-4}$.

[f] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.

[g] We decouple the $D_s^+ \to \phi\pi^+$ branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the $D_s^+ \to \phi\pi^+$, $\phi \to K^+K^-$ branching fraction obtained from the Dalitz-plot analysis of $D_s^+ \to K^+K^-\pi^+$. That is, the ratio of these two branching fractions is not exactly the $\phi \to K^+K^-$ branching fraction 0.491.

[h] This is the average of a model-independent and a $K$-matrix parametrization of the $\pi^+\pi^-$ $S$-wave and is a sum over several $f_0$ mesons.

[i] This mode is not a useful test for a $\Delta C$=1 weak neutral current because both quarks must change flavor in this decay.

[j] This is *not* a test for the $\Delta C$=1 weak neutral current, but leads to the $\pi^+\ell^+\ell^-$ final state.

## CONSTRAINED FIT INFORMATION

An overall fit to 13 branching ratios uses 18 measurements and one constraint to determine 10 parameters. The overall fit has a $\chi^2 = 6.8$ for 9 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

$D_s^+$ Branching Fractions

### $D_s^+$ BRANCHING RATIOS

A number of older, now obsolete results have been omitted. They may be found in earlier editions.

#### Inclusive modes

**$\Gamma(e^+ \text{semileptonic})/\Gamma_{total}$** $\Gamma_1/\Gamma$

This is the purely $e^+$ semileptonic branching fraction: the $e^+$ fraction from $\tau^+$ decays has been subtracted off. The sum of our (non-$\tau$) $e^+$ exclusive fractions — an $e^+\nu_e$ with an $\eta$, $\eta'$, $\phi$, $K^0$, or $K^{*0}$ — is 5.99 ± 0.31 %.

| 6.8 ±1.1 ±1.8 | 553 | [6] HEISTER | 02I | ALEP | $Z$ decays |

[1] ABLIKIM 16O value is constrained by the Standard Model ratio of $\Gamma(D_s^+ \to \tau^+\nu_\tau)/\Gamma(D_s^+ \to \mu^+\nu_\mu) = 9.76$; the unconstrained value is (0.517 ± 0.075 ± 0.021)%. The constrained value is used to obtain the decay constant, $f_{D_s^+}$ = (241.0 ± 16.3 ± 6.6) MeV.

[2] ZUPANC 13 uses both $\mu^+\nu$ and $\tau^+\nu$ events to get $f_{D_s}$ = (255.5 ± 4.2 ± 5.1) MeV.

[3] DEL-AMO-SANCHEZ 10J uses $\mu^+\nu_\mu$ and $\tau^+\nu_\tau$ events together to get $f_{D_s}$ = (258.6 ± 6.4 ± 7.5) MeV.

[4] WIDHALM 08 gets $f_{D_s}$ = (275 ± 16 ± 12) MeV from the branching fraction.

[5] PEDLAR 07A also fits $\mu^+$ and $\tau^+$ events together and gets an effective $\mu^+\nu_\mu$ branching fraction of (6.38 ± 0.59 ± 0.33) × 10$^{-3}$

[6] This HEISTER 02I result is not actually an independent measurement of the absolute $\mu^+\nu_\mu$ branching fraction, but is in fact based on our $\phi\pi^+$ branching fraction of 3.6 ± 0.9%, so it cannot be included in our overall fit. HEISTER 02I combines its $D_s^+ \to \tau^+\nu_\tau$ and $\mu^+\nu_\mu$ branching fractions to get $f_{D_s}$ = (285 ± 19 ± 40) MeV.

**$\Gamma(\mu^+\nu_\mu)/\Gamma(\phi\pi^+)$** $\Gamma_{20}/\Gamma_{39}$

See the note on "Decay Constants of Charged Pseudoscalar Mesons" above.

| 0.245±0.052±0.074 | 39 | [4] ACOSTA | 94 | CLE2 | See CHADHA 98 |

[1] AUBERT 07V gets $f_{D_s^+}$ = (283 ± 17 ± 16) MeV, using $\Gamma(D_s^+ \to \phi\pi^+)/\Gamma(\text{total})$ = (4.71 ± 0.46)%.

[2] ALEXANDROV 00 uses $f_D^2/f_{D_s}^2 = 0.82 \pm 0.09$ from a lattice-gauge-theory calculation to get the relative numbers of $D^+ \to \mu^+\nu_\mu$ and $D_s^+ \to \mu^+\nu_\mu$ events. The present result leads to $f_{D_s}$ = (323 ± 44 ± 36) MeV.

[3] CHADHA 98 obtains $f_{D_s}$ = (280 ± 19 ± 28 ± 34) MeV from this measurement, using $\Gamma(D_s^+ \to \phi\pi^+)/\Gamma(\text{total}) = 0.036 \pm 0.009$.

[4] ACOSTA 94 obtains $f_{D_s}$ = (344 ± 37 ± 52 ± 42) MeV from this measurement, using $\Gamma(D_s^+ \to \phi\pi^+)/\Gamma(\text{total}) = 0.037 \pm 0.009$.

## $\Gamma(\tau^+\nu_\tau)/\Gamma_{\text{total}}$ $\Gamma_{21}/\Gamma$

| 7.4 ±2.8 ±2.4 | 16 | [8] ACCIARRI | 97F | L3 | $D_s^{*+} \to \gamma D_s^+$ from $Z$'s |

[1] ABLIKIM 16O value is constrained by the Standard Model ratio of $\Gamma(D_s^+ \to \tau^+\nu_\tau)/\Gamma(D_s^+ \to \mu^+\nu_\mu) = 9.76$; the unconstrained value is (3.28 ± 1.83 ± 0.37)%.

[2] ZUPANC 13 uses both $\mu^+\nu$ and $\tau^+\nu$ events to get $f_{D_s}$ = (255.5 ± 4.2 ± 5.1) MeV.

[3] DEL-AMO-SANCHEZ 10J (with a small correction; see LEES 15D) uses $\mu^+\nu_\mu$ and $\tau^+\nu_\tau$ events together to get $f_{D_s}$ = (259.9 ± 6.6 ± 7.6) MeV.

[4] ALEXANDER 09, NAIK 09A, and ONYISI 09 use different $\tau$ decay modes and are independent. The three papers combined give $f_{D_s}$ = (259.7 ± 7.8 ± 3.4) MeV.

[5] ECKLUND 08 and PEDLAR 07A are independent: ECKLUND 08 uses $\tau^+ \to e^+\nu_e\overline{\nu}_\tau$ events, PEDLAR 07A uses $\tau^+ \to \pi^+\overline{\nu}_\tau$ events.

[6] HEISTER 02I combines its $D_s^+ \to \tau^+\nu_\tau$ and $\mu^+\nu_\mu$ branching fractions to get $f_{D_s}$ = (285 ± 19 ± 40) MeV.

[7] This ABBIENDI 01L value gives a decay constant $f_{D_s}$ of (286 ± 44 ± 41) MeV.

[8] The second ACCIARRI 97F error here combines in quadrature systematic (0.016) and normalization (0.018) errors. The branching fraction gives $f_{D_s}$ = (309 ± 58 ± 33 ± 38) MeV.

### $\Gamma(\phi\pi^+)/\Gamma_{total}$ $\Gamma_{39}/\Gamma$

The results here are model-independent. For earlier, model-dependent results, see our PDG 06 edition. We decouple the $D_s^+\to\phi\pi^+$ branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the $D_s^+\to\phi\pi^+$, $\phi\to K^+K^-$ branching fraction obtained from the Dalitz-plot analysis of $D_s^+\to K^+K^-\pi^+$. That is, the ratio of these two branching fractions is not exactly the $\phi\to K^+K^-$ branching fraction 0.491.

| VALUE (%) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **4.5 ±0.4 OUR AVERAGE** | | | | | |
| 4.62±0.36±0.51 | | [1] AUBERT | 06N | BABR | $e^+e^-$ at $\Upsilon(4S)$ |
| 4.81±0.52±0.38 | 212±19 | [2] AUBERT | 05V | BABR | $e^+e^-\approx\Upsilon(4S)$ |
| 3.59±0.77±0.48 | | [3] ARTUSO | 96 | CLE2 | $e^+e^-$ at $\Upsilon(4S)$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| $3.9\ ^{+5.1}_{-1.9}\ ^{+1.8}_{-1.1}$ | | [4] BAI | 95C | BES | $e^+e^-$ 4.03 GeV |

[1] This AUBERT 06N measurement uses $\overline{B}^0\to D_s^{(*)-}D^{(*)+}$ and $B^-\to D_s^{(*)-}D^{(*)0}$ decays, including some from other papers. However, the result is independent of AUBERT 05V.

[2] AUBERT 05V uses the ratio of $B^0\to D^{*-}D_s^{*+}$ events seen in two different ways, in both of which the $D^{*-}\to\overline{D}^0\pi^-$ decay is fully reconstructed: (1) The $D_s^{*+}\to D_s^+\gamma$, $D_s^+\to\phi\pi^+$ decay is fully reconstructed. (2) The number of events in the $D_s^+$ peak in the missing mass spectrum against the $D^{*-}\gamma$ is measured.

[3] ARTUSO 96 uses partially reconstructed $\overline{B}^0\to D^{*+}D_s^{*-}$ decays to get a model-independent value for $\Gamma(D_s^-\to\phi\pi^-)/\Gamma(D^0\to K^-\pi^+)$ of 0.92 ± 0.20 ± 0.11.

[4] BAI 95C uses $e^+e^-\to D_s^+D_s^-$ events in which one or both of the $D_s^\pm$ are observed to obtain the first model-independent measurement of the $D_s^+\to\phi\pi^+$ branching fraction, without assumptions about $\sigma(D_s^\pm)$. However, with only two "doubly-tagged" events, the statistical error is very large.

### $\Gamma(\phi\pi^+,\phi\to K^+K^-)/\Gamma(K^+K^-\pi^+)$ $\Gamma_{40}/\Gamma_{38}$

This is the "fit fraction" from the Dalitz-plot analysis. We decouple the $D_s^+\to\phi\pi^+$ branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the $D_s^+\to\phi\pi^+$, $\phi\to K^+K^-$ branching fraction obtained from the Dalitz-plot analysis of $D_s^+\to K^+K^-\pi^+$. That is, the ratio of these two branching fractions is not exactly the $\phi\to K^+K^-$ branching fraction 0.491.

### $\Gamma(\pi^+(\pi^+\pi^-)_{S-wave})/\Gamma(2\pi^+\pi^-)$ $\Gamma_{66}/\Gamma_{64}$

This is the "fit fraction" from the Dalitz-plot analysis. See also KLEMPT 08, which uses 568 $D_s^+ \to 3\pi$ decays (over 280 background events) from FNAL E791 to study various parametrizations of the decay amplitudes. The emphasis there is more on $S$-wave $\pi\pi$ decay products — 20 different solutions are given — than on $D_s^+$ fit fractions.

[1] AUBERT 09O gives the amplitude and phase of the $\pi^+\pi^-$ $S$-wave in 29 $\pi^+\pi^-$ invariant-mass bins.

[2] LINK 04 borrows a K-matrix parametrization from ANISOVICH 03 of the full $\pi$-$\pi$ $S$-wave isoscalar scattering amplitude to describe the $\pi^+\pi^-$ $S$-wave component of the $\pi^+\pi^+\pi^-$ state. The fit fraction given above is a sum over five $f_0$ mesons, the $f_0(980)$, $f_0(1300)$, $f_0(1200$–$1600)$, $f_0(1500)$, and $f_0(1750)$. See LINK 04 for details and discussion.

## $D_s^+ - D_s^-$ *CP*-VIOLATING DECAY-RATE ASYMMETRIES

This is the difference between $D_s^+$ and $D_s^-$ partial widths for the decay to state $f$, divided by the sum of the widths:

$A_{CP}(f) = [\Gamma(D_s^+ \to f) - \Gamma(D_s^- \to \overline{f})] / [\Gamma(D_s^+ \to f) + \Gamma(D_s^- \to \overline{f})]$.

## $CP$ VIOLATING ASYMMETRIES OF $P$-ODD ($T$-ODD) MOMENTS

### $A_{Tviol}(K_S^0K^\pm\pi^+\pi^-)$ in $D_s^\pm \to K_S^0K^\pm\pi^+\pi^-$

$C_T \equiv \vec{p}_{K^+} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$ is a parity-odd correlation of the $K^+$, $\pi^+$, and $\pi^-$ momenta for the $D_s^+$. $\overline{C}_T \equiv \vec{p}_{K^-} \cdot (\vec{p}_{\pi^-} \times \vec{p}_{\pi^+})$ is the corresponding quantity for the $D_s^-$. Then

$A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T \le 0)] \,/\, [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$, and

$\overline{A}_T \equiv [\Gamma(-\overline{C}_T > 0) - \Gamma(-\overline{C}_T < 0)] \,/\, [\Gamma(-\overline{C}_T > 0) + \Gamma(-\overline{C}_T < 0)]$, and

$A_{Tviol} \equiv \frac{1}{2}(A_T - \overline{A}_T)$. $C_T$ and $\overline{C}_T$ are commonly referred to as $T$-odd moments, because they are odd under $T$ reversal. However, the $T$-conjugate process $K_S^0K^\pm\pi^+\pi^- \to D_s^\pm$ is not accessible, while the $P$-conjugate process is.

### $D_s^{*+}$ DECAY MODES

$D_s^{*-}$ modes are charge conjugates of the modes below.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $D_s^+\gamma$ | (93.5±0.7) % |
| $\Gamma_2$ | $D_s^+\pi^0$ | ( 5.8±0.7) % |
| $\Gamma_3$ | $D_s^+ e^+ e^-$ | ( 6.7±1.6) × $10^{-3}$ |

### CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 3 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2$ = 0.0 for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

## $D_{s0}^*(2317)^\pm$

$I(J^P) = 0(0^+)$

$J$, $P$ need confirmation.

AUBERT 06P and CHOI 15A do not observe neutral and doubly charged partners of the $D_{s0}^*(2317)^+$.

### $D_{s0}^*(2317)^\pm$ MASS

The fit includes $D^\pm$, $D^0$, $D_s^\pm$, $D^{*\pm}$, $D^{*0}$, $D_s^{*\pm}$, $D_1(2420)^0$, $D_2^*(2460)^0$, and $D_{s1}(2536)^\pm$ mass and mass difference measurements.

| $\Gamma_7$ | $D_s^+\pi^0\pi^0$ | | |
| $\Gamma_8$ | $D_s^+\gamma\gamma$ | | |

### CONSTRAINED FIT INFORMATION

An overall fit to 7 branching ratios uses 8 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 3.4$ for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

| | | | |
|---|---|---|---|
| $x_2$ | 80 | | |
| $x_3$ | 68 | 62 | |
| $x_5$ | −3 | 25 | 26 |
| | $x_1$ | $x_2$ | $x_3$ |

## $D_{s1}(2536)^{\pm}$

$I(J^P) = 0(1^+)$
$J$, $P$ need confirmation.

Seen in $D^*(2010)^+K^0$, $D^*(2007)^0K^+$, and $D_s^+\pi^+\pi^-$. Not seen in $D^+K^0$ or $D^0K^+$. $J^P = 1^+$ assignment strongly favored.

### $D_{s1}(2536)^{\pm}$ MASS

The fit includes $D^{\pm}$, $D^0$, $D_s^{\pm}$, $D^{*\pm}$, $D^{*0}$, $D_s^{*\pm}$, $D_1(2420)^0$, $D_2^*(2460)^0$, and $D_{s1}(2536)^{\pm}$ mass and mass difference measurements.

[1] From a fit of the $D_s^+$ recoil mass distribution with an incoherent sum of the *S*-wave and *D*-wave Breit-Wigner line shapes.
[2] Using the $D^*(2010)^{\pm}$ mass of 2010.0 ± 0.4 MeV from PDG 06.
[3] Calculated using $m(D^*(2010)^{\pm}) = 2010.0 \pm 0.5$ MeV, $m(D^*(2007)^0) = 2006.7 \pm 0.5$ MeV, and the mass difference below.
[4] Systematic uncertainties not evaluated.
[5] Calculated using the mass difference $m(D_{s1}^+) - m(D^{*+})_{PDG}$ below and $m(D^{*+})_{PDG}$ = 2010.25 ± 0.14 MeV. Assuming *S*-wave decay of the $D_{s1}(2536)$ to $D^{*+} K^0_S$, using a Breit-Wigner line shape corresponding to L=0.
[6] Calculated using the mass difference $m(D_{s1}^+) - m(D^{*+})_{PDG}$ reported below and $m(D^{*+})_{PDG}$ = 2010.27 ± 0.17 MeV.
[7] Calculated using $m(D^*(2007)^0)$=2006.6 ± 0.5 MeV and the mass difference below.
[8] Calculated using $m(D^*(2010)^{\pm})$=2010.1 ± 0.6 MeV and the mass difference below.
[9] Not seen in $D^* K$.

### $m_{D_{s1}(2536)^{\pm}} - m_{D_s^*(2111)}$

## $D^*_{s2}(2573)$

$I(J^P) = 0(2^+)$

$J^P$ is natural, width and decay modes consistent with $2^+$. AAIJ 14AW confirms $J^P = 2^+$.

# BOTTOM MESONS ($B = \pm 1$)

$B^+ = u\overline{b}$, $B^0 = d\overline{b}$, $\overline{B}^0 = \overline{d}b$, $B^- = \overline{u}b$, similarly for $B^*$'s

## *B*-particle organization

Many measurements of $B$ decays involve admixtures of $B$ hadrons. Previously we arbitrarily included such admixtures in the $B^\pm$ section, but because of their importance we have created two new sections: "$B^\pm/B^0$ Admixture" for $\Upsilon(4S)$ results and "$B^\pm/B^0/B_s^0$/$b$-baryon Admixture" for results at higher energies. Most inclusive decay branching fractions and $\chi_b$ at high energy are found in the Admixture sections. $B^0$-$\overline{B}^0$ mixing data are found in the $B^0$ section, while $B_s^0$-$\overline{B}_s^0$ mixing data and $B$-$\overline{B}$ mixing data for a $B^0/B_s^0$ admixture are found in the $B_s^0$ section. $CP$-violation data are found in the $B^\pm$, $B^0$, and $B^\pm$ $B^0$ Admixture sections. $b$-baryons are found near the end of the Baryon section. Recently, we also created a new section: "$V_{cb}$ and $V_{ub}$ CKM Matrix Elements."

The organization of the $B$ sections is now as follows, where bullets indicate particle sections and brackets indicate reviews.

[Production and Decay of $b$-flavored Hadrons]
[A Short Note on HFLAV Activities]
- $B^\pm$
  - mass, mean life
  - branching fractions
  - polarization in $B^\pm$ decay
  - $CP$ violation
- $B^0$
  - mass, mean life
  - branching fractions
  - [Polarization in $B$ decay]
  - polarization in $B^0$ decay
  - [$B$-$\overline{B}$ Mixing]
  - $B^0$-$\overline{B}^0$ mixing
  - $CP$ violation
- $B^\pm$ $B^0$ Admixture
  - branching fractions, $CP$ violation
  - $CP$ violation
- $B^\pm/B^0/B_s^0$/$b$-baryon Admixture
  - mean life
  - production fractions
  - branching fractions
  - $\chi_b$ at high energy
  - production fractions in hadronic $Z$ decay
- $V_{cb}$ and $V_{ub}$ CKM Matrix Elements
  - [Determination of $V_{cb}$ and $V_{ub}$]

- $B^*$
  - mass
- $B_1(5721)^0$
  - mass
- $B_J^*(5732)$
  - mass, width
- $B_2(5747)^0$

Production and Decay of *b*-flavored Hadrons

## HEAVY FLAVOR AVERAGING GROUP

Revised August 2019 by U. Egede (Monash University) and A. Soffer (Tel Aviv University)

The Heavy Flavor Averaging Group (HFLAV)* is an international collaboration of physicists from experiments measuring properties of heavy flavored particles, *i.e.*, hadrons containing $b$ and $c$ quarks, and $\tau$ leptons. HFLAV calculates and publishes [1] world average values of quantities such as lifetimes, branching fractions, form factors, mixing parameters, and $CP$-violating asymmetries. Most parameters concern decays of $B$ and $D$ mesons, and many are related to elements of the Cabibbo-Kobayashi-Maskawa (CKM) quark mixing matrix [2], [3].

HFLAV was originally formed in 2002 to continue the activities of the LEP Heavy Flavor Steering group. Since its inception, a wide range of results have become available from increasingly larger data sets. Consequently, HFLAV has expanded to include seven subgroups:

- $b$-hadron lifetimes and oscillations, including parameters of $CP$ violation in $b$ mixing;
- decay-time-dependent $CP$ violation in $B$ decays, and angles of the CKM Unitarity Triangle;
- semileptonic decays of $b$-hadrons ($B \to X\ell\nu$, $\ell = e, \mu, \tau$), including determinations of the CKM matrix elements $|V_{cb}|$ and $|V_{ub}|$;
- $b$-hadron decays to hadronic final states containing $c$-quarks (open charm and charmonium);
- (rarer) $b$-hadron decays to final states not containing $c$-quarks, including fully hadronic, semileptonic ($B \to X\ell\ell, X\nu\bar{\nu}$), leptonic, and radiative decays;
- $c$-hadron physics including branching fractions, $CP$- and $T$-violating asymmetries, $D^0$–$\bar{D}^0$ mixing, semileptonic decays, and properties of excited $D$ states and charm baryons;
- $\tau$-lepton physics including branching fractions, tests of lepton universality, determination of the CKM matrix element $|V_{us}|$, and searches for lepton flavor violation.

* The group was originally referred to as "HFAG." This acronym was changed to "HFLAV" in 2017.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

Each subgroup has one or two conveners and typically a half-dozen members representing experiments that conduct measurements in that area. Most groups contain representatives from the BABAR, Belle, Belle II and LHCb experiments, and some groups have representatives from the ATLAS, BESIII, CLEO(c), CDF, CMS and D0 experiments. Members of HFLAV are appointed by their respective experimental collaborations. HFLAV has two co-leaders, who are appointed by the managements of Belle II and LHCb.

The averaging procedures used by HFLAV are similar to those of the PDG [4]. When calculating world averages, common parameters used for different input measurements are adjusted (rescaled) to common values. The confidence level of the fit is provided to indicate the consistency of the measurements included in the average. However, unlike the PDG, when obtaining a world average with a small confidence level (*i.e.*, a large $\chi^2$ per degree of freedom), HFLAV does not usually scale the resulting uncertainty. Rather, the systematic uncertainties of the measurements are reviewed with experts from the experiments to understand the discrepancy. Unless inconsistencies among measurements are found, no correction is made to the calculated uncertainty. Close communication between representatives of the experiments and HFLAV members who perform averages helps ensure that measurement uncertainties, known correlations, and systematic effects are properly accounted for. If a special treatment is needed to calculate an average, or if an approximation used in an average calculation might not be sufficiently accurate (*e.g.*, assuming Gaussian uncertainties when the likelihood function is non-Gaussian), a note is included in the HFLAV publication and online documentation to describe this.

In general, HFLAV uses all publicly available results that have written documentation such as a journal publication, preprint, or conference note. These include preliminary results presented at conferences and workshops. However, preliminary results that remain unpublished for an extended period of time, or for which no publication is planned, are not included. A special subset of HFLAV averages are included in the PDG listings; for these averages, only measurements that are published or accepted for publication are used. The averages provided by HFLAV are listed by the PDG as "OUR EVALUATION" with a corresponding note.

All HFLAV averages and input measurements are documented in an approximately biennial journal paper or preprint; the most recent version is Ref. [1]. The latest results and plots are posted on an extensive set of webpages that are updated several times per year; these are available at

`https://hflav.web.cern.ch`.

## $B^{\pm}$

$I(J^P) = \frac{1}{2}(0^-)$

Quantum numbers not measured. Values shown are quark-model predictions.

See also the $B^{\pm}/B^0$ ADMIXTURE and $B^{\pm}/B^0/B_s^0$/*b*-baryon ADMIXTURE sections.

### $B^{\pm}$ MASS

The fit uses $m_{B^+}$, $(m_{B^0} - m_{B^+})$, and $m_{B^0}$ to determine $m_{B^+}$, $m_{B^0}$, and the mass difference.

[1] Uses $B^+ \to J/\psi K^+$ fully reconstructed decays.
[2] Uses exclusively reconstructed final states containing a $J/\psi \to \mu^+\mu^-$ decays.
[3] CSORNA 00 uses fully reconstructed 526 $B^+ \to J/\psi^{(\prime)} K^+$ events and invariant masses without beam constraint.
[4] ALBRECHT 90J assumes 10580 for $\Upsilon(4S)$ mass. Supersedes ALBRECHT 87C and ALBRECHT 87D.
[5] Found using fully reconstructed decays with $J/\psi(1S)$. ALBRECHT 87D assume $m_{\Upsilon(4S)}$ = 10577 MeV.

### $B^{\pm}$ MEAN LIFE

See $B^{\pm}/B^0/B_s^0$/*b*-baryon ADMIXTURE section for data on *B*-hadron mean life averaged over species of bottom particles.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

[1] Measured mean life using fully reconstructed decays ($J/\psi K^{(*)}$).
[2] Measured using $B^- \to D^0\pi^-$ with $D^0 \to K^-\pi^+$ events that were selected using a silicon vertex trigger.
[3] Measurement performed using a combined fit of *CP*-violation, mixing and lifetimes.
[4] Measurement performed using an inclusive reconstruction and $B$ flavor identification technique.
[5] Measured mean life using fully reconstructed decays.
[6] Events are selected in which one $B$ meson is fully reconstructed while the second $B$ meson is reconstructed inclusively.
[7] Data analyzed using $D/D^*\ell$X event vertices.
[8] Data analyzed using charge of secondary vertex.
[9] ABREU 95Q assumes $B(B^0 \to D^{**-}\ell^+\nu_\ell) = 3.2 \pm 1.7\%$.
[10] Data analyzed using vertex-charge technique to tag $B$ charge.
[11] Combined result of $D/D^*\ell$X analysis and fully reconstructed $B$ analysis.
[12] Combined ABREU 95Q and ADAM 95 result.

### $\tau_{B^+}/\tau_{B^-}$

[1] Measured using $B^{\pm} \to J/\psi K^{\pm}$ decays.

## $B^+$ DECAY MODES

$B^-$ modes are charge conjugates of the modes below. Modes which do not identify the charge state of the $B$ are listed in the $B^{\pm}/B^0$ ADMIXTURE section.

The branching fractions listed below assume 50% $B^0\overline{B}^0$ and 50% $B^+B^-$ production at the $\Upsilon(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $\Upsilon(4S)$ production ratio to 50:50 and their assumed $D$, $D_s$, $D^*$, and $\psi$ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, *e.g.*, $B \to D^{\pm}X$, the values usually are multiplicities, not branching fractions. They can be greater than one.

[a] An $\ell$ indicates an $e$ or a $\mu$ mode, not a sum over these modes.

[b] An $CP(\pm 1)$ indicates the $CP{=}+1$ and $CP{=}-1$ eigenstates of the $D^0$-$\overline{D}^0$ system.

[c] $D$ denotes $D^0$ or $\overline{D}^0$.

[d] $D^{*0}_{CP+}$ decays into $D^0\pi^0$ with the $D^0$ reconstructed in $CP$-even eigenstates $K^+K^-$ and $\pi^+\pi^-$.

[e] $\overline{D}^{**}$ represents an excited state with mass $2.2 < M < 2.8$ GeV/c$^2$.

[f] $\chi_{c1}(3872)^+$ is a hypothetical charged partner of the $\chi_{c1}(3872)$.

[g] $\Theta(1710)^{++}$ is a possible narrow pentaquark state and $G(2220)$ is a possible glueball resonance.

[h] $(\overline{\Lambda}_c^- p)_s$ denotes a low-mass enhancement near 3.35 GeV/c$^2$.

### CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 3.7$ for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

[1] URQUIJO 07 report a measurement of (10.34 ± 023 ± 0.25)% for the partial branching fraction of $B^+ \to e^+ \nu_e X_c$ decay with electron energy above 0.6 GeV. We converted the result to $B^+ \to e^+ \nu_e X$ branching fraction.

[2] The measurements are obtained for charged and neutral $B$ mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the $B$ rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV: $B(B^+ \to e^+ \nu_e X) / B(B^0 \to e^+ \nu_e X) = 1.074 \pm 0.041 \pm 0.026$.

[3] ARTUSO 97 uses partial reconstruction of $B \to D^* \ell \nu_\ell$ and inclusive semileptonic branching ratio from BARISH 96B (0.1049 ± 0.0017 ± 0.0043).

[4] The measurements are obtained for charged and neutral $B$ mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the $B$ rest frame, and their ratio of $B(B^+ \to e^+ \nu_e X)/B(B^0 \to e^+ \nu_e X) = 1.08 \pm 0.05 \pm 0.02$.

[1] Measured using the dependence of $B^- \to D^{*0}e^-\overline{\nu}_e$ decay differential rate and the form factor description by CAPRINI 98.
[2] Simultaneous measurements of both $B^0 \to D^*(2010)^-\ell\nu$ and $B^+ \to \overline{D}(2007)^0\ell\nu$.
[3] ALBRECHT 92C reports 0.058±0.014±0.013. We rescale using the method described in STONE 94 but with the updated PDG 94 B($D^0 \to K^-\pi^+$). Assumes equal production of $B^0\overline{B}^0$ and $B^+B^-$ at the $\Upsilon(4S)$.
[4] Uses a fully reconstructed $B$ meson as a tag on the recoil side.
[5] The results are based on the same analysis and data sample reported in ADAM 03.
[6] BARISH 95 use B($D^0 \to K^-\pi^+$) = (3.91 ± 0.08 ± 0.17)% and B($D^{*0} \to D^0\pi^0$) = (63.6 ± 2.3 ± 3.3)%.
[7] Combining $\overline{D}^{*0}\ell^+\nu_\ell$ and $\overline{D}^{*-}\ell^+\nu_\ell$ SANGHERA 93 test $V-A$ structure and fit the decay angular distributions to obtain $A_{FB} = 3/4*(\Gamma^- - \Gamma^+)/\Gamma = 0.14 \pm 0.06 \pm 0.03$. Assuming a value of $V_{cb}$, they measure $V$, $A_1$, and $A_2$, the three form factors for the $D^*\ell\nu_\ell$ decay, where results are slightly dependent on model assumptions.
[8] Assumes equal production of $B^0\overline{B}^0$ and $B^+B^-$ at the $\Upsilon(4S)$. Uncorrected for $D$ and $D^*$ branching ratio assumptions.
[9] ANTREASYAN 90B is average over $B$ and $\overline{D}^*(2010)$ charge states.

| $<2.1$ | 90 | [7] BEAN | 93B | CLE2 | $e^+e^- \to \Upsilon(4S)$ | |

[1] LEES 13A reports $(1.21 \pm 0.14 \pm 0.08) \times 10^{-4}$ from a measurement of $[\Gamma(B^+ \to \omega\ell^+\nu_\ell)/\Gamma_{\text{total}}] \times [B(\omega(782) \to \pi^+\pi^-\pi^0)]$ assuming $B(\omega(782) \to \pi^+\pi^-\pi^0) = (89.2 \pm 0.7) \times 10^{-2}$, which we rescale to our best value $B(\omega(782) \to \pi^+\pi^-\pi^0) = (89.3 \pm 0.6) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
[2] Uses $B(\Upsilon(4S) \to B^+B^-) = (51.6 \pm 0.6)\%$ and $B(\Upsilon(4S) \to B^0\overline{B}^0) = (48.4 \pm 0.6)\%$.
[3] Uses semileptonic tagging. Assumes $B(\omega \to \pi^+\pi^-\pi^0) = (89.2 \pm 0.7)\%$ and that the production ratio of $B^+B^-$ to $B^0\overline{B}^0$ from $\Upsilon(4S)$ is $1.056 \pm 0.028$. The partial branching fractions in three bins of $q^2$ are also reported.
[4] The signal events are tagged by a second $B$ meson reconstructed in the fully hadronic decays.
[5] Uses loose neutrino reconstruction technique.
[6] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[7] BEAN 93B limit set using ISGW Model. Using isospin and the quark model to combine $\Gamma(\rho^0\ell^+\nu_\ell)$ and $\Gamma(\rho^-\ell^+\nu_\ell)$ with this result, they obtain a limit $<(1.6\text{–}2.7) \times 10^{-4}$ at 90% CL for $B^+ \to \omega\ell^+\nu_\ell$. The range corresponds to the ISGW, WSB, and KS models. An upper limit on $|V_{ub}/V_{cb}| < 0.8\text{–}0.13$ at 90% CL is derived as well.

| seen | [1] ALBRECHT | 91C | ARG |

[1] In ALBRECHT 91C, one event is fully reconstructed providing evidence for the $b \to u$ transition.

## $\Gamma(\rho^0\ell^+\nu_\ell)/\Gamma_{\text{total}}$ $\Gamma_{27}/\Gamma$

$\ell = e$ or $\mu$, not sum over $e$ and $\mu$ modes.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

[1] Requires one reconstructed semileptonic $B$ decay $B^- \to D^{(*)0}\ell^-\overline{\nu}_\ell$ in the recoil.
[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[3] The authors combine their result with that from HARA 10 obtaining $B(B^- \to \tau^-\overline{\nu}_\tau) = (0.96 \pm 0.26) \times 10^{-4}$ and deriving $f_B\,|V_{ub}| = (7.4 \pm 0.8 \pm 0.5) \times 10^{-4}$ GeV.
[4] Requires a fully reconstructed hadronic $B$-decay in the recoil. Reports that this result combined with AUBERT 10E value gives $B(B^- \to \tau^-\overline{\nu}_\tau) = (1.79 \pm 0.48) \times 10^{-4}$.
[5] Requires one reconstructed semileptonic B decay $B^- \to D^0\ell^-\overline{\nu}_\ell X$ in the recoil.
[6] Requires one reconstructed semileptonic B decay $B^- \to D^{(*)0}\ell^-\overline{\nu}_\ell X$ in the recoil.
[7] The analysis is based on a sample of events with one fully reconstructed tag $B$ in a hadronic decay mode $B^- \to D^{(*)0}X^-$.
[8] The energy-flow and $b$-tagging algorithms were used.
[9] ACCIARRI 97F uses missing-energy technique and $f(b \to B^-) = (38.2 \pm 2.5)\%$.
[10] ALBRECHT 95D uses full reconstruction of one $B$ decay as tag.
[11] BUSKULIC 95 uses same missing-energy technique as in $\overline{b} \to \tau^+\nu_\tau$X, but analysis is restricted to endpoint region of missing-energy distribution.

[1] Measures absolute branching fractions using a missing-mass technique.
[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[3] ABULENCIA 06J reports $[\Gamma(B^+ \to \overline{D}^0\pi^+)/\Gamma_{total}] / [B(B^0 \to D^-\pi^+)] = 1.97 \pm 0.10 \pm 0.21$ which we multiply by our best value $B(B^0 \to D^-\pi^+) = (2.52 \pm 0.13) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
[4] Uses a missing-mass method. Does not depend on $D$ branching fractions or $B^+/B^0$ production rates.
[5] AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of $B^0$ and $B^+$, which is not included here.
[6] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses the MarkIII branching fractions for the $D$.
[7] BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.
[8] AUBERT,B 04P reports $[\Gamma(B^+ \to \overline{D}^0\pi^+)/\Gamma_{total}] \times [B(D^0 \to K^-\pi^+)] = (1.846 \pm 0.032 \pm 0.097) \times 10^{-4}$ which we divide by our best value $B(D^0 \to K^-\pi^+) = (3.950 \pm 0.031) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
[9] ALAM 94 assume equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and use the CLEO II absolute $B(D^0 \to K^-\pi^+)$ and the PDG 1992 $B(D^0 \to K^-\pi^+\pi^0)/B(D^0 \to K^-\pi^+)$ and $B(D^0 \to K^-2\pi^+\pi^-)/B(D^0 \to K^-\pi^+)$.
[10] ALBRECHT 88K assumes $B^0\overline{B}^0$:$B^+B^-$ ratio is 45:55. Superseded by ALBRECHT 90J.

[1] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[2] ALAM 94 assume equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and use the CLEO II $B(D^*(2010)^+ \to D^0\pi^+)$ and absolute $B(D^0 \to K^-\pi^+)$ and the PDG 1992 $B(D^0 \to K^-\pi^+\pi^0)/B(D^0 \to K^-\pi^+)$ and $B(D^0 \to K^-2\pi^+\pi^-)/B(D^0 \to K^-\pi^+)$.
[3] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses the Mark III branching fractions for the $D$.
[4] BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.
[5] BORTOLETTO 92 assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses Mark III branching fractions for the $D$ and $D^*(2010)$. The authors also find the product branching fraction into $D^{**}\pi$ followed by $D^{**} \to D^*(2010)\pi$ to be $0.0014^{+0.0008}_{-0.0006} \pm 0.0003$ where $D^{**}$ represents all orbitally excited $D$ mesons.
[6] ALBRECHT 87C use PDG 86 branching ratios for $D$ and $D^*(2010)$ and assume $B(\Upsilon(4S) \to B^+B^-) = 55\%$ and $B(\Upsilon(4S) \to B^0\overline{B}^0) = 45\%$. Superseded by ALBRECHT 90J.

[1] Measures absolute branching fractions using a missing-mass technique.
[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[3] AUBERT,BE 06J reports $[\Gamma(B^+ \to \overline{D}^*(2007)^0\pi^+)/\Gamma_{\text{total}}] / [B(B^+ \to \overline{D}^0\pi^+)] = 1.14 \pm 0.07 \pm 0.04$ which we multiply by our best value $B(B^+ \to \overline{D}^0\pi^+) = (4.68 \pm 0.13) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[4] Uses a missing-mass method. Does not depend on $D$ branching fractions or $B^+/B^0$ production rates.

[5] BRANDENBURG 98 assume equal production of $B^+$ and $B^0$ at $\Upsilon(4S)$ and use the $D^*$ reconstruction technique. The first error is their experiment's error and the second error is the systematic error from the PDG 96 value of $B(D^* \to D\pi)$.

[6] ALAM 94 assume equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and use the CLEO II $B(D^*(2007)^0 \to D^0\pi^0)$ and absolute $B(D^0 \to K^-\pi^+)$ and the PDG 1992 $B(D^0 \to K^-\pi^+\pi^0)/B(D^0 \to K^-\pi^+)$ and $B(D^0 \to K^-2\pi^+\pi^-)/B(D^0 \to K^-\pi^+)$.

[7] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses Mark III branching fractions for the $D$ and $D^*(2010)$.

[8] This is a derived branching ratio, using the inclusive pion spectrum and other two-body $B$ decays. BEBEK 87 assume the $\Upsilon(4S)$ decays 43% to $B^0\overline{B}^0$.

### $\Gamma(\overline{D}^*(2007)^0\omega\pi^+)/\Gamma_{\text{total}}$ $\Gamma_{127}/\Gamma$

[1] CHILIKIN 19 reports $[\Gamma(B^+ \to J/\psi(1S) K^+)/\Gamma_{total}] \times [B(J/\psi(1S) \to p\overline{p}\pi^+\pi^-)] = (56.4^{+3.3}_{-3.2}{}^{+2.7}_{-2.5}) \times 10^{-7}$ which we divide by our best value $B(J/\psi(1S) \to p\overline{p}\pi^+\pi^-) = (6.0 \pm 0.5) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Measures absolute branching fractions using a missing-mass technique.

[3] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[4] AUBERT,B 05L reports $[\Gamma(B^+ \to J/\psi(1S) K^+)/\Gamma_{total}] \times [B(J/\psi(1S) \to p\overline{p})] = (2.2 \pm 0.2 \pm 0.1) \times 10^{-6}$ which we divide by our best value $B(J/\psi(1S) \to p\overline{p}) = (2.121 \pm 0.029) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[5] BORTOLETTO 92 reports $(8 \pm 2 \pm 2) \times 10^{-4}$ from a measurement of $[\Gamma(B^+ \to J/\psi(1S) K^+)/\Gamma_{total}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[6] ALBRECHT 90J reports $(7 \pm 3 \pm 1) \times 10^{-4}$ from a measurement of $[\Gamma(B^+ \to J/\psi(1S) K^+)/\Gamma_{total}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[7] ALBRECHT 87D assume $B^+B^-/B^0\overline{B}^0$ ratio is 55/45. Superseded by ALBRECHT 90J.

[8] BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.

[9] ALAM 86 assumes $B^{\pm}/B^0$ ratio is 60/40.

[2] ACOSTA 02F uses as reference of $B(B \to J/\psi(1S) K^+) = (10.1 \pm 0.6) \times 10^{-4}$. The second error includes the systematic error and the uncertainties of the branching ratio.

[3] BORTOLETTO 92 reports $(1.2 \pm 0.6 \pm 0.4) \times 10^{-3}$ from a measurement of $[\Gamma(B^+ \to J/\psi(1S) K^+\pi^+\pi^-)/\Gamma_{total}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

B($J/\psi(1S) \to e^+e^-$) = (5.971 ± 0.032) × $10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[4] ALBRECHT 87D reports (1.2 ± 0.8) × $10^{-3}$ from a measurement of [$\Gamma(B^+ \to J/\psi(1S)K^+\pi^+\pi^-)/\Gamma_{total}$] × [B($J/\psi(1S) \to e^+e^-$)] assuming B($J/\psi(1S) \to e^+e^-$) = 0.069 ± 0.009, which we rescale to our best value B($J/\psi(1S) \to e^+e^-$) = (5.971 ± 0.032) × $10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. They actually report 0.0011 ± 0.0007 assuming $B^+B^-/B^0\overline{B}^0$ ratio is 55/45. We rescale to 50/50. Analysis explicitly removes $B^+ \to \psi(2S)K^+$.

[5] ALBRECHT 90J reports < 1.6 × $10^{-3}$ from a measurement of [$\Gamma(B^+ \to J/\psi(1S)K^+\pi^+\pi^-)/\Gamma_{total}$] × [B($J/\psi(1S) \to e^+e^-$)] assuming B($J/\psi(1S) \to e^+e^-$) = 0.069, which we rescale to our best value B($J/\psi(1S) \to e^+e^-$) = 5.971 × $10^{-2}$. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[1] AUBERT 07AV reports $[\Gamma(B^+ \to J/\psi(1S) K^*(892)^+)/\Gamma_{total}] \times [B(J/\psi(1S) \to p\overline{p})] = (3.78^{+0.72}_{-0.64} \pm^{0.28}_{0.23}) \times 10^{-6}$ which we divide by our best value $B(J/\psi(1S) \to p\overline{p}) = (2.121 \pm 0.029) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[3] ABE 96H assumes that $B(B^+ \to J/\psi K^+) = (1.02 \pm 0.14) \times 10^{-3}$.
[4] BORTOLETTO 92 reports $(1.3 \pm 0.9 \pm 0.3) \times 10^{-3}$ from a measurement of $[\Gamma(B^+ \to J/\psi(1S) K^*(892)^+)/\Gamma_{total}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[5] ALBRECHT 90J reports $(1.6 \pm 1.1 \pm 0.3) \times 10^{-3}$ from a measurement of $[\Gamma(B^+ \to J/\psi(1S) K^*(892)^+)/\Gamma_{total}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[1] CHILIKIN 19 reports $[\Gamma(B^+\to\chi_{c0}K^+)/\Gamma_{total}]\times[B(\chi_{c0}(1P)\to p\overline{p}\pi^+\pi^-)]=(3.7^{+1.2+0.2}_{-1.0-0.3})\times10^{-7}$ which we divide by our best value $B(\chi_{c0}(1P)\to p\overline{p}\pi^+\pi^-)=(2.1\pm0.7)\times10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[3] Measured in the $B^+\to K^+K^-K^+$ decay.

[4] Measured in the $B^+\to K^+K^0_SK^0_S$ decay.

[5] LEES 11I reports $[\Gamma(B^+\to\chi_{c0}K^+)/\Gamma_{total}]\times[B(\chi_{c0}(1P)\to\pi\pi)]=(1.53\pm0.66\pm0.27)\times10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P)\to\pi\pi)=(8.51\pm0.33)\times10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[6] AUBERT 08AI reports $(0.70\pm0.10^{+0.12}_{-0.10})\times10^{-6}$ for $B(B^+\to\chi_{c0}K^+)\times B(\chi_{c0}\to\pi^+\pi^-)$. We compute $B(B^+\to\chi_{c0}K^+)$ using the PDG value $B(\chi_{c0}\to\pi\pi)=(8.51\pm0.33)\times10^{-3}$ and 2/3 for the $\pi^+\pi^-$ fraction. Our first error is their experiment's error and the second error is systematic error from using our best value.

[7] AUBERT,BE 06M reports $[\Gamma(B^+\to\chi_{c0}K^+)/\Gamma_{total}]\times[B(\chi_{c0}(1P)\to\gamma J/\psi(1S))]=(6.1\pm2.6\pm1.1)\times10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P)\to\gamma J/\psi(1S))=(1.40\pm0.05)\times10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. The significance of the observed signal is 2.4 $\sigma$.

[8] Measures absolute branching fractions using a missing-mass technique.

[9] AAIJ 13S reports $[\Gamma(B^+\to\chi_{c0}K^+)/\Gamma_{total}]\times[B(\chi_{c0}(1P)\to p\overline{p})]<6\times10^{-8}$ which we divide by our best value $B(\chi_{c0}(1P)\to p\overline{p})=2.21\times10^{-4}$.

[10] WICHT 08 reports $[\Gamma(B^+\to\chi_{c0}K^+)/\Gamma_{total}]\times[B(\chi_{c0}(1P)\to\gamma\gamma)]<0.11\times10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P)\to\gamma\gamma)=2.04\times10^{-4}$.

[11] Measured in the $B^+\to K^+K^-K^+$ decay.

[12] AUBERT,B 05N reports $(0.66\pm0.22\pm0.08)\times10^{-6}$ for $B(B^+\to\chi^0_cK^+)\times B(\chi^0_c\to\pi^+\pi^-)$. We compute $B(B^+\to\chi^0_cK^+)$ using the PDG value $B(\chi^0_c\to\pi^+\pi^-)=(7.1\pm0.6)\times10^{-3}$ and 2/3 for the $\pi^+\pi^-$ fraction.

[13] The measurement performed using decay channels $\chi_{c0}\to\pi^+\pi^-$ and $\chi_{c0}\to K^+K^-$. The ratio of the branching ratios for these channels is found to be consistent with world average.

[14] AUBERT 04P reports $B(B^+\to\chi_{c0}K^+)\times B(\chi_{c0}\to\pi^+\pi^-)=(1.5\pm0.4\pm0.1)\times10^{-6}$ and used PDG value of $B(\chi_{c0}\to\pi\pi)=(7.4\pm0.8)\times10^{-3}$ and Clebsh-Gordan coefficient to compute $B(B^\pm->\chi_{c0}K^+)$.

[15] ABE 02B measures the ratio of $B(B^+\to\chi_{c0}K^+)/B(B^+\to J/\psi(1S)K^+)=0.60+0.21-0.18\pm0.05\pm0.08$, where the third error is due to the uncertainty in the $B(\chi_{c0}\to\pi^+\pi^-)$, and uses $B(B^+\to J/\psi(1S)K^+)=(10.0\pm1.0)\times10^{-4}$ to obtain the result.

[16] EDWARDS 01 assumes equal production of $B^0$ and $B^+$ at the $\Upsilon(4S)$. The correlated uncertainties (28.3)% from $B(J/\psi(1S)\to\gamma\eta_c)$ in those modes have been accounted for.

[1] AAIJ 19AL reports $(7.5 \pm 0.6 \pm 0.5) \times 10^{-2}$ fit fraction for $B^+ \to K^+\overline{K}^*(892)^0$ from the amplitude analysis of $B^{\pm} \to \pi^{\pm}K^+K^-$ decays. We use the PDG 19 value $B(B^+ \to K^+K^-\pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \to K^+\overline{K}^*(892)^0$, $\overline{K}^*(892)^0 \to K^+\pi^-)$. We compute $B(B^+ \to K^+\overline{K}^*(892)^0)$ using 2/3 of $B(\overline{K}^*(892)^0 \to (K\pi)^0) = (99.754 \pm 0.021)\%$ for the $K^+\pi^-$ fraction. Our first error is the experiment's error and the second error is systematic error from using our best value.
[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[3] ABE 00C assumes $B(Z \to b\overline{b}) = (21.7 \pm 0.1)\%$ and the $B$ fractions $f_{B^0} = f_{B^+} = (39.7^{+1.8}_{-2.2})\%$ and $f_{B_s} = (10.5^{+1.8}_{-2.2})\%$.

## $B^{\pm}$

### $\Gamma(K^+\overline{K}_0^*(1430)^0)/\Gamma_{total}$ $\Gamma_{413}/\Gamma$

| VALUE (units $10^{-6}$) | CL% | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.38±0.12±0.05** | | [1] AAIJ | 19AL | LHCB | $pp$ at 7, 8 TeV |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| <2.2 | 90 | [2] AUBERT | 07AR | BABR | $e^+e^- \to \Upsilon(4S)$ |

[1] AAIJ 19AL reports $(4.5 \pm 0.7 \pm 1.2) \times 10^{-2}$ for fit fraction for $B^+ \to K^+\overline{K}_0^*(1430)^0$ from the amplitude analysis of $B^{\pm} \to \pi^{\pm}K^+K^-$ decays. We use the PDG 19 value $B(B^+ \to K^+K^-\pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \to K^+\overline{K}_0^*(1430)^0$, $\overline{K}_0^*(1430)^0 \to K^+\pi^-)$. We compute $B(B^+ \to K^+\overline{K}_0^*(1430)^0)$ using 2/3 of PDG 19 value $B(K_0^*(1430)^0 \to K\pi) = (93 \pm 10)\%$ for the $K^+\pi^-$ fraction. Our first error is the experiment's error and the second error is systematic error from using our best value.
[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

### $\Gamma(\rho(1450)^0\pi^+,\ \rho^0 \to K^+K^-)/\Gamma_{total}$ $\Gamma_{469}/\Gamma$

| VALUE (units $10^{-6}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **1.60±0.08±0.12** | [1] AAIJ | 19AL | LHCB | $pp$ at 7, 8 TeV |

[1] AAIJ 19AL reports $0.307 \pm 0.012 \pm 0.009$ fit fraction for $B^+ \to \rho(1450)\pi^+$ from the amplitude analysis of $B^{\pm} \to \pi^{\pm}K^+K^-$ decays. We use the PDG 19 value $B(B^+ \to K^+K^-\pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \to \rho(1450)\pi^+,\ \rho(1450) \to K^+K^-)$. Our first error is the experiment's error and the second error is systematic error from using our best value.

### $\Gamma(\pi^+(K^+K^-)_{S-wave})/\Gamma_{total}$ $\Gamma_{414}/\Gamma$

| VALUE (units $10^{-7}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **8.53±0.67±0.66** | [1] AAIJ | 19AL | LHCB | $pp$ at 7, 8 TeV |

[1] AAIJ 19AL reports $0.164 \pm 0.008 \pm 0.01$ fit fraction for $B^+ \to \pi^+(K^+K^-)_{S-wave}$ in the region of $0.95 < m(K^+K^-) < 1.42$ GeV/$c^2$ from the amplitude analysis of $B^{\pm} \to \pi^{\pm}K^+K^-$ decays. We use the PDG 19 value $B(B^+ \to K^+K^-\pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \to \pi^+(K^+K^-)_{S-wave})$. Our first error is the experiment's error and the second error is systematic error from using our best value.

### $\Gamma(K^+K^+\pi^-)/\Gamma_{total}$ $\Gamma_{415}/\Gamma$

| $<240$ | 90 | [5] BORTOLETTO | 89 | CLEO | $e^+e^- \to \Upsilon(4S)$ |

[1] AAIJ 19AL reports $0.075 \pm 0.008 \pm 0.007$ fit fraction for $B^+ \to f_2(1270)\pi^+$ from the amplitude analysis of $B^\pm \to \pi^\pm K^+K^-$ decays. We use the PDG 19 value $B(B^+ \to K^+K^-\pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \to f_2(1270)\pi^+$, $f_2(1270) \to K^+K^-)$. We compute $B(B^+ \to f_2(1270)\pi^+)$ using 1/2 of PDG 19 value of $B(f_2(1270) \to K\overline{K}) = (4.6^{+0.5}_{-0.4})\%$ for $K^+K^-$ fraction. Our first error is the experiment's error and the second error is systematic error from using our best value.

[2] AUBERT 09L reports $[\Gamma(B^+ \to \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \to \pi^+\pi^-)] = (0.9 \pm 0.2 \pm 0.1^{+0.3}_{-0.1}) \times 10^{-6}$ which we divide by our best value $B(f_2(1270) \to \pi^+\pi^-) = (56.2^{+1.9}_{-0.6}) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[4] AUBERT,B 05G reports $[\Gamma(B^+ \to \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \to \pi^+\pi^-)] = (2.3 \pm 0.6 \pm 0.4) \times 10^{-6}$ which we divide by our best value $B(f_2(1270) \to \pi^+\pi^-) = (56.2^{+1.9}_{-0.6}) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[5] BORTOLETTO 89 reports $< 2.1 \times 10^{-4}$ assuming the $\Upsilon(4S)$ decays 43% to $B^0\overline{B}{}^0$. We rescale to 50%.

| < 500 | 90 | [3] BERGFELD | 98 | CLE2 | |

[1] AAIJ 19AL reports $(0.3 \pm 0.1 \pm 0.1) \times 10^{-2}$ fit fraction for $B^+ \to \phi(1020)\pi^+$ from the amplitude analysis of $B^{\pm} \to \pi^{\pm}K^+K^-$ decays. We use the PDG 19 value $B(B^+ \to K^+K^-\pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \to \phi(1020)\pi^+,\ \phi(1020) \to K^+K^-)$. We compute $B(B^+ \to \phi(1020)\pi^+)$ using the PDG 19 value of $B(\phi(1020) \to K^+K^-) = (49.2 \pm 0.5)\%$. Our first error is the experiment's error and the second error is systematic error from using our best value.

[2] Measures $B(B^+ \to \phi\pi^+)/B(B^+ \to \phi K^+) < 0.018$ at 90% C.L. and assumes $B(B^+ \to \phi K^+) = (8.8^{+0.7}_{-0.6}) \times 10^{-6}$.

[3] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[4] ABE 00C assumes $B(Z \to b\overline{b}) = (21.7 \pm 0.1)\%$ and the $B$ fractions $f_{B^0} = f_{B^+} = (39.7^{+1.8}_{-2.2})\%$ and $f_{B_s} = (10.5^{+1.8}_{-2.2})\%$.

[1] AAIJ 15AR reports $(1.83 \pm 0.24 \pm 0.05) \times 10^{-8}$ from a measurement of $[\Gamma(B^+ \to \pi^+\mu^+\mu^-)/\Gamma_{\rm total}]$ / $[{\rm B}(B^+ \to J/\psi(1S)K^+)]$ / $[{\rm B}(J/\psi(1S) \to \mu^+\mu^-)]$ assuming ${\rm B}(B^+ \to J/\psi(1S)K^+) = (1.05 \pm 0.05) \times 10^{-3}$,${\rm B}(J/\psi(1S) \to \mu^+\mu^-) = (5.961 \pm 0.033) \times 10^{-2}$, which we rescale to our best values ${\rm B}(B^+ \to J/\psi(1S)K^+) = (1.006 \pm 0.027) \times 10^{-3}$, ${\rm B}(J/\psi(1S) \to \mu^+\mu^-) = (5.961 \pm 0.033) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

## POLARIZATION IN $B^+$ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ($L$) or both are transverse and parallel ($\|$) or perpendicular ($\perp$) to each other with the parameters $\Gamma_L/\Gamma$, $\Gamma_\perp/\Gamma$, and the relative phases $\phi_\|$ and $\phi_\perp$. See the definitions in the note on "Polarization in $B$ Decays" review in the $B^0$ Particle Listings.

## *CP* VIOLATION

$A_{CP}$ is defined as

$$\frac{B(B^- \to \overline{f}) - B(B^+ \to f)}{B(B^- \to \overline{f}) + B(B^+ \to f)},$$

the *CP*-violation charge asymmetry of exclusive $B^-$ and $B^+$ decay.

### $A_{CP}(B^+ \to J/\psi(1S)K^+)$

| VALUE (units $10^{-3}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **1.8± 3.0 OUR AVERAGE** | Error includes scale factor of 1.5. See the ideogram below. | | | |

[1] AAIJ 14BO reports also $CP$ asymmetries in restricted regions of phase space.
[2] AAIJ 14 reports $A_{CP}(B^+ \to \pi^+\pi^-\pi^+) = 0.584 \pm 0.082 \pm 0.027 \pm 0.007$ in the Dalitz plot region of $m^2_{\pi^+\pi^-} > 15$ GeV$^2/c^4$ or $m^2_{\pi^+\pi^-} < 0.4$ GeV$^2/c^4$. The third uncertainty is due to the $CP$ asymmetry of the $B^{\pm} \to J/\psi K^{\pm}$ reference mode uncertainty.

### $A_{CP}(B^+ \to \rho^0\pi^+)$

| VALUE | DOCUMENT ID | | TECN | COMMENT |
