## CP VIOLATION PARAMETERS IN $B^+ \to DK^+$ AND SIMILAR DECAYS

The parameters $r_{B^+}$ and $\delta_{B^+}$ are the magnitude ratio and strong phase difference between the amplitudes of $A(B^+ \to \overline{D}^{(*)0}K^{(*)+})$ and $A(B^- \to D^{(*)0}K^{(*)-})$. The measured observables are defined as $x_\pm = r_{B^+}\cos(\delta_{B^+} \pm \gamma)$ and $y_\pm = r_{B^+}\sin(\delta_{B^+} \pm \gamma)$, and can be used to measure the CKM angle $\gamma$.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV). It is derived from combinations of their results on $B^+ \to DK^+$ and related processes.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

## $\gamma$

For angle $\gamma(\phi_3)$ of the CKM unitarity triangle, see the review on "*CP* Violation" in the Reviews section.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV).

[1] Uses binned analysis of $D \to K^0_S\pi^+\pi^-\pi^0$ from $B^\pm \to DK^\pm$ modes over the phase space. Strong phase measurements from RESMI 18 analysis of CLEO-c data of the $D$ decay over the phase space binning are used as input.

[2] Uses binned Dalitz plot analysis of $D \to K^0_S\pi^+\pi^-$ and $K^0_S K^+K^-$ from $B^\pm \to DK^\pm$ modes. Strong phase measurements from CLEO-c of the $D$ decay over the Dalitz plot are used as input.

[3] Measured in $B^0_s \to D^\mp_s K^\pm$ decays, constraining $-2\beta_s$ by the measurement of $\phi_s = 0.030 \pm 0.033$ from HFLAV. The value is modulo 180°.

[4] AAIJ 18Z reports the intervals (5–86)° or (185–266)° at 68% C.L. The extraction uses the time dependent CP violation measurement in $B^0 \to D^\mp\pi^\pm$ decays with external input and some theoretical assumptions.

[5] Uses Dalitz plot analysis of $D \to K^0_S\pi^+\pi^-$ decays coming from $B^0 \to DK^*(892)^0$ modes. Measures $r_{B^0} = 0.39 \pm 0.13$, and $\delta_{B^0} = 197^{+24}_{-20}$ degrees.

[6] A combination of measurements from analyses of time-integrated $B^+ \to DK^+$, $B^0 \to DK^{(*)0}$, $B^0 \to DK^+\pi^-$, and $B^+ \to DK^+\pi^+\pi^-$ tree-level decays. In addition, results from a time-dependent analysis of $B^0_s \to D_sK$ decays are included.

[7] A model-independent binned Dalitz plot analysis of the decays $B^0 \to DK^{*0}$, with $D \to K^0_S\pi^+\pi^-$ and $D \to K^0_S K^+K^-$. The results cannot be combined with the model-dependent analysis of the same dataset reported in AAIJ 16AA.

[8] Angle $\gamma$ required to satisfy $0 < \gamma < 180$ degrees.

[9] Obtained by measuring time-dependent *CP* asymmetry in $B^0_s \to K^+K^-$ and using a U-spin relation between $B^0_s \to K^+K^-$ and $B^0 \to \pi^+\pi^-$.

[10] Results are also presented using additional inputs on $B^0 \to \pi^0\pi^0$ and $B^+ \to \pi^+\pi^0$ decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.

[11] Uses binned Dalitz plot analysis of $B^+ \to DK^+$ decays, with $D \to K^0_S\pi^+\pi^-$ and $D \to K^0_S K^+K^-$. Strong phase measurements from CLEO-c (LIBBY 10) of the $D$ decay over the Dalitz plot are used as input. Solution that satisfies $0 < \gamma < 180$ is chosen.

[12] AAIJ 14BE uses model-dependent analysis of $D \to K^0_S\pi^+\pi^-$ amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.

[13] Measured in $B^0_s \to D^\mp_s K^\pm$ decays, constraining $-2\beta_s$ by the measurement of $\phi_s = 0.01 \pm 0.07 \pm 0.0$ from AAIJ 13AR. The value is modulo 180° at 68% CL.

[14] Presents a confidence region $55.4° < \gamma < 82.3°$ at 68% CL with best fit value 72.6° and includes both statistical and systematic uncertainties. The corresponding 95% CL is $40.2\ ° < \gamma < 92.7°$. The value is determined from combination of measuremets using $D$ meson decaying to $K^+K^-$, $\pi^+\pi^-$, $K^\pm\pi^\mp$, $K^0_S\pi^+\pi^-$, $K^0_S K^+K^-$, and $K^\pm\pi^\mp\pi^\pm\pi^\mp$. Combines $B^\pm \to DK^\pm$ and $B^\pm \to D\pi^\pm$.

[15] Reports combination of published measurements using GGSZ, GLW, and ADS methods. Reports also $2\sigma$ range of 41–102° and a $5.9\sigma$ significance for $\gamma(B^+ \to D^{(*)0}K^{(*)+}) \neq 0$ hypothesis.

[16] Reports combined statistical and systematic uncertainties.

[17] Uses binned Dalitz plot of $\overline{D}^0 \to K^0_S\pi^+\pi^-$ decays from $B^+ \to \overline{D}^0K^+$. Measurement of strong phases in $\overline{D}^0 \to K^0_S\pi^+\pi^-$ Dalitz plot from LIBBY 10 is used as input.

[18] We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between $D^0$ and $\overline{D}^0$ amplitudes.

[19] Uses Dalitz plot analysis of $\overline{D}^0 \to K^0_S\pi^+\pi^-$, $K^0_S K^+K^-$ decays from $B^+ \to D^{(*)}K^+$, $DK^{*+}$ modes. The corresponding two standard deviation interval for $\gamma$ is $39° < \gamma < 98°$. CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.

[20] Reports confidence intervals for the CKM angle $\gamma$ from the measured values of the GLW parameters using $B^\pm \to DK^\pm$ decays with $D$ mesons decaying to non-$CP(K\pi)$, $CP$-even ($K^+K^-$, $\pi^+\pi^-$), and $CP$-odd ($K^0_S\pi^0$, $K^0_S\omega$) states.

[21] Uses Dalitz plot analysis of $\overline{D}^0 \to K^0_S\pi^+\pi^-$ decays from $B^+ \to D^{(*)}K^+$ modes. The corresponding two standard deviation interval for $\gamma$ is $54.2° < \gamma < 100.5°$. CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.

[22] Uses Dalitz plot analysis of $D^0 \to K^0_S\pi^+\pi^-$ decays coming from $B^0 \to D^0K^{*0}$ modes. The corresponding 95% CL interval is $77° < \gamma < 247°$. A 180 degree ambiguity is implied.

[23] Uses Dalitz plot analysis of $\overline{D}^0 \to K^0_S\pi^+\pi^-$ and $\overline{D}^0 \to K^0_S K^+K^-$ decays coming from $B^\pm \to D^{(*)}K^{(*)\pm}$ modes. The corresponding two standard deviation interval is $29° < \gamma < 122°$.

[24] Uses a Dalitz plot analysis of the $\overline{D}^0 \to K^0_S\pi^+\pi^-$ decays; Combines the $DK^+$, $D^*K^+$ and $DK^{*+}$ modes. The corresponding two standard deviations interval for gamma is $8° < \gamma < 111°$.

[25] Uses a Dalitz plot analysis of neutral $D \to K^0_S\pi^+\pi^-$ decays coming from $B^\pm \to DK^\pm$ and $B^\pm \to D^{*0}K^\pm$ followed by $D^{*0} \to D\pi^0$, $D\gamma$. The corresponding two standard deviations interval for gamma is $12° < \gamma < 137°$. AUBERT,B 05Y also reports the amplitude ratios and the strong phases.

[26] Uses a Dalitz plot analysis of the 3-body $D \to K^0_S\pi^+\pi^-$ decays coming from $B^\pm \to DK^\pm$ and $B^\pm \to D^*K^\pm$ followed by $D^* \to D\pi^0$; here we use $D$ to denote that the neutral $D$ meson produced in the decay is an admixture of $D^0$ and $\overline{D}^0$. The corresponding two standard deviations interval for $\gamma$ is $26^\circ < \gamma < 126^\circ$. POLUEKTOV 04 also reports the amplitude ratios and the strong phases.

## $r_B(B^+ \to D^0K^+)$

$r_B$ and $\delta_B$ are the amplitude ratio and relative strong phase between the amplitudes of $A(B^+ \to D^0K^+)$ and $A(B^+ \to \overline{D}^0K^+)$,

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV).

[1] Uses binned analysis of $D \to K^0_S\pi^+\pi^-\pi^0$ from $B^\pm \to DK^\pm$ modes over the phase space. Strong phase measurements from RESMI 18 analysis of CLEO-c data of the $D$ decay over the phase space binning are used as input.

[2] Uses binned Dalitz plot analysis of $D \to K^0_S\pi^+\pi^-$ and $K^0_S K^+K^-$ from $B^\pm \to DK^\pm$ modes. Strong phase measurements from CLEO-c of the $D$ decay over the Dalitz plot are used as input.

[3] Uses binned Dalitz plot analysis of $B^+ \to DK^+$ decays, with $D \to K^0_S\pi^+\pi^-$ and $D \to K^0_S K^+K^-$. Strong phase measurements from CLEO-c (LIBBY 10) of the $D$ decay over the Dalitz plot are used as input.

[4] AAIJ 14BE uses model-dependent analysis of $D \to K^0_S\pi^+\pi^-$ amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.

[5] Uses $B^\pm \to [K^\pm\pi^\mp\pi^+\pi^-]_D h^\pm$ mode.

[6] Reports combination of published measurements using GGSZ, GLW, and ADS methods.

[7] Reports combined statistical and systematic uncertainties.

[8] Uses binned Dalitz plot of $\overline{D}^0 \to K^0_S\pi^+\pi^-$ decays from $B^+ \to \overline{D}^0K^+$. Measurement of strong phases in $\overline{D}^0 \to K^0_S\pi^+\pi^-$ Dalitz plot from LIBBY 10 is used as input.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[9] We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between $D^0$ and $\overline{D}^0$ amplitudes.
[10] Uses decays of neutral $D$ to $K^-\pi^+\pi^0$.
[11] Uses Dalitz plot analysis of $\overline{D}^0 \to K^0_S\pi^+\pi^-$, $K^0_S K^+K^-$ decays from $B^+ \to D^{(*)}K^{(*)+}$ modes. The corresponding two standard deviation interval is $0.037 < r_B < 0.155$.
[12] Uses the Cabibbo suppressed decay of $B^+ \to \overline{D}K^+$ followed by $\overline{D} \to K^-\pi^+$.
[13] Uses Dalitz plot analysis of $\overline{D}^0 \to K^0_S\pi^+\pi^-$ decays from $B^+ \to D^0K^+$ modes. The corresponding two standard deviation interval is $0.084 < r_B < 0.239$.
[14] Uses Dalitz plot analysis of $\overline{D}^0 \to K^0_S\pi^+\pi^-$ and $\overline{D}^0 \to K^0_S K^+K^-$ decays coming from $B^\pm \to D^{(*)}K^{(*)\pm}$ modes.
[15] Uses a Dalitz plot analysis of the $\overline{D}^0 \to K^0_S\pi^+\pi^-$ decays; Combines the $DK^+$, $D^*K^+$ and $DK^{*+}$ modes.
[16] Uses a Dalitz analysis of neutral $D$ decays to $K^0_S\pi^+\pi^-$ in the processes $B^\pm \to D^{(*)}K^\pm$, $D^* \to D\pi^0$, $D\gamma$.

[1] Uses binned analysis of $D \to K^0_S\pi^+\pi^-\pi^0$ from $B^\pm \to DK^\pm$ modes over the phase space. Strong phase measurements from RESMI 18 analysis of CLEO-c data of the $D$ decay over the phase space binning are used as input.
[2] Uses binned Dalitz plot analysis of $D \to K^0_S\pi^+\pi^-$ and $K^0_S K^+K^-$ from $B^\pm \to DK^\pm$ modes. Strong phase measurements from CLEO-c of the $D$ decay over the Dalitz plot are used as input.
[3] Uses binned Dalitz plot analysis of $B^+ \to DK^+$ decays, with $D \to K^0_S\pi^+\pi^-$ and $D \to K^0_S K^+K^-$. Strong phase measurements from CLEO-c (LIBBY 10) of the $D$ decay over the Dalitz plot are used as input.
[4] AAIJ 14BE uses model-dependent analysis of $D \to K^0_S\pi^+\pi^-$ amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.
[5] Reports combination of published measurements using GGSZ, GLW, and ADS methods.
[6] Reports combined statistical and systematic uncertainties.
[7] Uses binned Dalitz plot of $\overline{D}^0 \to K^0_S\pi^+\pi^-$ decays from $B^+ \to \overline{D}^0K^+$. Measurement of strong phases in $\overline{D}^0 \to K^0_S\pi^+\pi^-$ Dalitz plot from LIBBY 10 is used as input.
[8] We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between $D^0$ and $\overline{D}^0$ amplitudes.
[9] Uses Dalitz plot analysis of $\overline{D}^0 \to K^0_S\pi^+\pi^-$, $K^0_S K^+K^-$ decays from $B^+ \to D^{(*)}K^{(*)+}$ modes. The corresponding two standard deviation interval is $75^\circ < \delta_B < 157^\circ$.
[10] Uses Dalitz plot analysis of $\overline{D}^0 \to K^0_S\pi^+\pi^-$ decays from $B^+ \to \overline{D}^0K^+$ modes. The corresponding two standard deviation interval is $102.2^\circ < \delta_B < 162.3^\circ$.
[11] Uses Dalitz plot analysis of $\overline{D}^0 \to K^0_S\pi^+\pi^-$ and $\overline{D}^0 \to K^0_S K^+K^-$ decays coming from $B^\pm \to D^{(*)}K^{(*)\pm}$ modes.
[12] Uses a Dalitz plot analysis of the $\overline{D}^0 \to K^0_S\pi^+\pi^-$ decays; Combines the $DK^+$, $D^*K^+$ and $DK^{*+}$ modes.
[13] Uses a Dalitz analysis of neutral $D$ decays to $K^0_S\pi^+\pi^-$ in the processes $B^\pm \to D^{(*)}K^\pm$, $D^* \to D\pi^0$, $D\gamma$.

### $r_B(B^+ \to D^0K^{*+})$

$r_B$ and $\delta_B$ are the amplitude ratio and relative strong phase between the amplitudes of $A_{CP}(B^+ \to D^0K^{*+})$ and $A_{CP}(B^+ \to \overline{D}^0K^{*+})$,

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV).

[1] Measured by taking the ratio of the branching fraction from $B^+ \to K^+ e^+ e^-$ and $B^+ \to J/\psi(e^+ e^-) K^+$ decays and multiplying it by the measured value of $B^+ \to J/\psi K^+$ and $J/\psi \to e^+ e^-$ as in PDG 18. The branching fraction of $B^+ \to K^+ e^+ e^-$ is determined in the region $1.1 < q^2 < 6$ GeV$^2/c^4$.

[2] Uses B($B^+ \to J/\psi(1S) K^+$) = (0.998 ± 0.014 ± 0.040) × $10^{-3}$ for normalization and $\mu^+ \mu^-$ for leptons. Measured for $1.1 < q^2 < 6.0$ GeV$^2/c^4$.

[3] Measured by taking the ratio of the branching fraction from $B^+ \to K^+ e^+ e^-$ and $B^+ \to J/\psi(e^+ e^-) K^+$decays and multiplying it by the measured value of $B^+ \to J/\psi K^+$ and $J/\psi \to e^+ e^-$ as in PDG 12.The branching fraction of $B^+ \to K^+ e^+ e^-$ is determined in the region $1 < q^2 < 6$ GeV$^2/c^4$.

### B($B^+ \to K^+ \mu^+ \mu^-$) / B($B^+ \to K^+ e^+ e^-$) ($1.0 < q^2 < 6.0$ GeV$^2/c^4$)

## FORWARD-BACKWARD ASYMMETRIES

The forward-backward assymmetry is defined as $A_{FB} = [\ N(q_{FB} > 0) - N(q_{FB} < 0)]\ /\ [N(q_{FB} > 0) + N(q_{FB} < 0)\ ]$, where $q_{FB} = -\,q_B \cdot \text{sgn}(\eta_B)$ with $q_B$ as the $B$ hadron electric charge, $\eta_B$ as its pseudorapidity, and $\text{sgn}(\eta_B)$ as a sign function of $\eta_B$.

# $B^0$

$I(J^P) = \frac{1}{2}(0^-)$

Quantum numbers not measured. Values shown are quark-model predictions.

See also the $B^{\pm}/B^0$ ADMIXTURE and $B^{\pm}/B^0/B_s^0$/$b$-baryon ADMIXTURE sections.

See the Note "Production and Decay of $b$-flavored Hadrons" at the beginning of the $B^{\pm}$ Particle Listings and the Note on "$B^0$-$\overline{B}^0$ Mixing" near the end of the $B^0$ Particle Listings.

## $B^0$ MASS

The fit uses $m_{B^+}$, $(m_{B^0} - m_{B^+})$, and $m_{B^0}$ to determine $m_{B^+}$, $m_{B^0}$, and the mass difference.

[1] Uses $B^0 \to J/\psi p\overline{p}$ decays.
[2] Measured with $B_d^0 \to J/\psi(\mu^+\mu^-)\, K_S^0(\pi^+\pi^-)$ decays.
[3] Uses $B^0 \to J/\psi K^0$ fully reconstructed decays.
[4] Uses exclusively reconstructed final states containing a $J/\psi \to \mu^+\mu^-$ decays.
[5] CSORNA 00 uses fully reconstructed 135 $B^0 \to J/\psi^{(\prime)}\, K_S^0$ events and invariant masses without beam constraint.
[6] ALBRECHT 90J assumes 10580 for $\Upsilon(4S)$ mass. Supersedes ALBRECHT 87C and ALBRECHT 87D.
[7] Found using fully reconstructed decays with $J/\psi$. ALBRECHT 87D assume $m_{\Upsilon(4S)} =$ 10577 MeV.

## $m_{B^0} - m_{B^+}$

[1] Uses exclusively reconstructed final states containing a $J/\psi \to \mu^+\mu^-$ decay.
[2] Uses the $B$-momentum distributions in the $e^+e^-$ rest frame.
[3] Uses exclusively reconstructed final states containing a $J/\psi \to \mu^+\mu^-$ decays.
[4] BEBEK 87 actually measure the difference between half of $E_{cm}$ and the $B^{\pm}$ or $B^0$ mass, so the $m_{B^0} - m_{B^{\pm}}$ is more accurate. Assume $m_{\Upsilon(4S)} =$ 10580 MeV.

## $m_{B_H^0} - m_{B_L^0}$

See the $B^0$-$\overline{B}^0$ MIXING PARAMETERS section near the end of these $B^0$ Listings.

## $B^0$ MEAN LIFE

See $B^{\pm}/B^0/B_s^0$/$b$-baryon ADMIXTURE section for data on $B$-hadron mean life averaged over species of bottom particles.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

[1] Measured using $B^0 \to J/\psi K^*(892)^0$ and $B^0 \to J/\psi K^0_S$ decays.
[2] Measured using $B^0 \to D^-\mu^+\nu X$ decays.
[3] Measured mean life using $B^0 \to J/\psi K^0_S$ decays.
[4] Measured using $B^0 \to J/\psi K^{*0}$ decays.
[5] Measured using $B^0 \to K^+\pi^-$ decays.
[6] Measured with $B^0_d \to J/\psi(\mu^+\mu^-)\, K^0_S(\pi^+\pi^-)$ decays.
[7] Measured mean life using fully reconstructed decays ($J/\psi K^{(*)}$).
[8] Measured mean life using $B^0 \to J/\psi K^{*0}$ decays.
[9] Measured using a simultaneous fit of the $B^0$ lifetime and $\overline{B}{}^0 B^0$ oscillation frequency $\Delta m_d$ in the partially reconstructed $B^0 \to D^{*-}\ell\nu$ decays.
[10] Measurement performed using a combined fit of *CP*-violation, mixing and lifetimes.
[11] Measurement performed using an inclusive reconstruction and $B$ flavor identification technique.
[12] AUBERT 03C uses a sample of approximately 14,000 exclusively reconstructed $B^0 \to D^*(2010)^-\ell\nu$ and simultaneously measures the lifetime and oscillation frequency.
[13] Measurement performed with decays $B^0 \to D^{*-}\pi^+$ and $B^0 \to D^{*-}\rho^+$ using a partial reconstruction technique.
[14] Measured mean life using fully reconstructed decays.
[15] Data analyzed using partially reconstructed $\overline{B}{}^0 \to D^{*+}\ell^-\overline{\nu}$ decays.
[16] Events are selected in which one $B$ meson is fully reconstructed while the second $B$ meson is reconstructed inclusively.
[17] Data analyzed using $D/D^*\ell$X event vertices.
[18] Data analyzed using charge of secondary vertex.
[19] Data analyzed using inclusive $D/D^*\ell X$.
[20] Measured mean life using partially reconstructed $D^{*-}\pi^+$X vertices.
[21] ABREU 95Q assumes $B(B^0 \to D^{**-}\ell^+\nu_\ell) = 3.2 \pm 1.7\%$.
[22] Data analyzed using vertex-charge technique to tag $B$ charge.
[23] AKERS 95T assumes $B(B^0 \to D_s^{(*)} D^{0(*)}) = 5.0 \pm 0.9\%$ to find $B^+/B^0$ yield.
[24] Measured using the time-dependent angular analysis of $B^0_d \to J/\psi K^{*0}$ decays.
[25] Combined result of $D/D^*\ell$x analysis, fully reconstructed $B$ analysis, and partially reconstructed $D^{*-}\pi^+$X analysis.
[26] Combined ABREU 95Q and ADAM 95 result.
[27] WAGNER 90 tagged $B^0$ mesons by their decays into $D^{*-}e^+\nu$ and $D^{*-}\mu^+\nu$ where the $D^{*-}$ is tagged by its decay into $\pi^-\overline{D}{}^0$.
[28] AVERILL 89 is an estimate of the $B^0$ mean lifetime assuming that $B^0 \to D^{*+}$ + X always.

[7] Events are selected in which one $B$ meson is fully reconstructed while the second $B$ meson is reconstructed inclusively.
[8] Data analyzed using charge of secondary vertex.
[9] ABREU 95Q assumes $B(B^0 \to D^{**-}\ell^+\nu_\ell) = 3.2 \pm 1.7\%$.
[10] Data analyzed using vertex-charge technique to tag $B$ charge.
[11] AKERS 95T assumes $B(B^0 \to D_s^{(*)} D^{0(*)}) = 5.0 \pm 0.9\%$ to find $B^+/B^0$ yield.
[12] Combined result of $D/D^*\ell$X analysis and fully reconstructed $B$ analysis.

### $\tau_{B^+}/\tau_{B^0}$ (inferred from branching fractions)

These measurements are inferred from the branching fractions for semileptonic decay or other spectator-dominated decays by assuming that the rates for such decays are equal for $B^0$ and $B^+$. We do not use measurements which assume equal production of $B^0$ and $B^+$ because of the large uncertainty in the production ratio.

"OUR EVALUATION" has been obtained by the Heavy Flavor Averaging Group (HFLAV) by taking into account correlations between measurements.

[1] ARTUSO 97 uses partial reconstruction of $B \to D^*\ell\nu_\ell$ and independent of $B^0$ and $B^+$ production fraction.
[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[3] ATHANAS 94 uses events tagged by fully reconstructed $B^-$ decays and partially or fully reconstructed $B^0$ decays.
[4] Assumes equal production of $B^0$ and $B^+$.
[5] ALBRECHT 92G data analyzed using $B \to D_s\overline{D}$, $D_s\overline{D}{}^*$, $D_s^*\overline{D}$, $D_s^*\overline{D}{}^*$ events.
[6] BEAN 87B assume the fraction of $B^0\overline{B}{}^0$ events at the $\Upsilon(4S)$ is 0.41.

## $\Delta\Gamma_{B^0_d}$ / $\Gamma_{B^0_d}$

$\Gamma_{B^0_d}$ and $\Delta\Gamma_{B^0_d}$ are the decay rate average and difference between two $B^0_d$ *CP* eigenstates (light − heavy). The $\lambda_{CP}$ characterizes $B^0$ and $\overline{B}{}^0$ decays to states of charmonium plus $K^0_L$, see the review on "*CP* Violation" in the reviews section.

"OUR EVALUATION" has been obtained by the Heavy Flavor Averaging Group (HFLAV) by taking into account correlations between measurements.

| | | | | | | |
|---|---|---|---|---|---|---|
| 0.50±1.38 | | ABAZOV | 14 | D0 | $p\overline{p}$ at 1.96 TeV | |
| < 80 | 95 | [7] BEHRENS | 00B | CLE2 | $e^+e^- \to \Upsilon(4S)$ | |

[1] Measured using $B^0 \to J/\psi K^*(892)^0$ and $B^0 \to J/\psi K^0_S$ decays, and assuming $\beta = 21.9 \pm 0.7$ degrees.

[2] Measured from the ratio of decay time distributions of $B^0 \to J/\psi K^0_S$ and $B^0 \to J/\psi K^{*0}$ decays.

[3] Measured using the effective lifetimes of $B^0 \to J/\psi K^0_S$ and $B^0 \to J/\psi K^{*0}$ decays.

[4] Reports $-\Delta\Gamma_d/\Gamma_d$ using $B^0 \to J/\psi K^0_S$, $J/\psi K^0_L$, $D^-\pi^+$, $D^{*-}\pi^+$, $D^{*-}\rho^+$, and $D^{*-}\ell^+\nu$ decays.

[5] Corresponds to 90% confidence range [−0.084, 0.068].

[6] Used the measured $\tau_{B^0} = 1.55 \pm 0.03$ ps. Corresponds to an upper limit of $< 0.18$ at 95% C.L.

[7] BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\overline{B}^0 \to D^{*+}\pi^-$, $\rho^-$ decays to determine the flavor of the $B$ meson. Assumes $\Delta_{md}$=0.478 ± 0.018 ps$^{-1}$ and $\tau_{B^0}$=1.548 ± 0.032 ps.

## $B^0$ DECAY MODES

$\overline{B}^0$ modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing. Modes which do not identify the charge state of the $B$ are listed in the $B^\pm/B^0$ ADMIXTURE section.

The branching fractions listed below assume 50% $B^0\overline{B}^0$ and 50% $B^+B^-$ production at the $\Upsilon(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $\Upsilon(4S)$ production ratio to 50:50 and their assumed $D$, $D_s$, $D^*$, and $\psi$ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, *e.g.*, $B \to D^\pm X$, the values usually are multiplicities, not branching fractions. They can be greater than one.

| $\Gamma_{562}$ | $\Lambda_c^+ e^-$ | $L,B$ | < | 4 | $\times 10^{-6}$ | CL=90% |

[a] An $\ell$ indicates an $e$ or a $\mu$ mode, not a sum over these modes.

[b] $\overline{D}^{**}$ represents an excited state with mass $2.2 < M < 2.8$ GeV/$c^2$.

[c] $\chi_{c1}(3872)^+$ is a hypothetical charged partner of the $\chi_{c1}(3872)$.

[d] Stands for the possible candidates of $K^*(1410)$, $K_0^*(1430)$ and $K_2^*(1430)$.

[e] $B^0$ and $B_s^0$ contributions not separated. Limit is on weighted average of the two decay rates.

[f] This decay refers to the coherent sum of resonant and nonresonant $J^P = 0^+$ $K\pi$ components with $1.60 < m_{K\pi} < 2.15$ GeV/$c^2$.

[g] $X(214)$ is a hypothetical particle of mass 214 MeV/$c^2$ reported by the HyperCP experiment, Physical Review Letters **94** 021801 (2005)

[h] The value is for the sum of the charge states or particle/antiparticle states indicated.

[i] $\Theta(1540)^+$ denotes a possible narrow pentaquark state.

[j] Here $S$ and $P$ are the hypothetical scalar and pseudoscalar particles with masses of 2.5 GeV/$c^2$ and 214.3 MeV/$c^2$, respectively.

## CONSTRAINED FIT INFORMATION

An overall fit to 34 branching ratios uses 89 measurements and one constraint to determine 22 parameters. The overall fit has a $\chi^2 = 64.3$ for 68 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

[1] URQUIJO 07 report a measurement of (9.80 ± 0.29 ± 0.21)% for the partial branching fraction of $B \to e\nu_e X_c$ decay with electron energy above 0.6 GeV. We converted the result to $B \to e\nu_e X$ branching fraction.

[2] The measurements are obtained for charged and neutral $B$ mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the $B$ rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV: $B(B^+ \to e^+\nu_e X) / B(B^0 \to e^+\nu_e X) = 1.074 \pm 0.041 \pm 0.026$.

[3] ARTUSO 97 uses partial reconstruction of $B \to D^* \ell\nu_\ell$ and inclusive semileptonic branching ratio from BARISH 96B (0.1049 ± 0.0017 ± 0.0043).

[4] The measurements are obtained for charged and neutral $B$ mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the $B$ rest frame, and their ratio of $B(B^+ \to e^+\nu_e X)/B(B^0 \to e^+\nu_e X) = 1.08 \pm 0.05 \pm 0.02$.

### $\Gamma(e^+ \nu_e X_c)/\Gamma_{total}$ $\Gamma_2/\Gamma$

[1] Uses fully reconstructed $D^{*-}\ell^+\nu$ events ($\ell = e$ or $\mu$).
[2] Uses a fully reconstructed $B$ meson as a tag on the recoil side.
[3] Measured using fully reconstructed $D^*$ sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters: $\rho^2 = 1.191 \pm 0.048 \pm 0.028$, $R_1(1) = 1.429 \pm 0.061 \pm 0.044$, and $R_2(1) = 0.827 \pm 0.038 \pm 0.022$.
[4] Measured using fully reconstructed $D^*$ sample.
[5] Uses the combined fit of both $B^0 \to D^*(2010)^-\ell\nu$ and $B^+ \to \overline{D}(2007)^0\ell\nu$ samples.
[6] ABREU 01H measured using about 5000 partial reconstructed $D^*$ sample.
[7] ABBIENDI 00Q assumes the fraction $B(b \to B^0) = (39.7^{+1.8}_{-2.2})\%$. This result is an average of two methods using exclusive and partial $D^*$ reconstruction.
[8] BUSKULIC 97 assumes fraction $(B^+)$ = fraction $(B^0) = (37.8 \pm 2.2)\%$ and PDG 96 values for $B$ lifetime and $D^*$ and $D$ branching fractions.
[9] Combines with previous partial reconstructed $D^*$ measurement.
[10] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[11] The results are based on the same analysis and data sample reported in ADAM 03.
[12] ACKERSTAFF 97G assumes fraction $(B^+)$ = fraction $(B^0) = (37.8 \pm 2.2)\%$ and PDG 96 values for $B$ lifetime and branching ratio of $D^*$ and $D$ decays.
[13] ABREU 96P result is the average of two methods using exclusive and partial $D^*$ reconstruction.
[14] BARISH 95 use $B(D^0 \to K^-\pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$ and $B(D^{*+} \to D^0\pi^+) = (68.1 \pm 1.0 \pm 1.3)\%$.
[15] BUSKULIC 95N assumes fraction $(B^+)$ = fraction $(B^0) = 38.2 \pm 1.3 \pm 2.2\%$ and $\tau_{B^0} = 1.58 \pm 0.06$ ps. $\Gamma(D^{*-}\ell^+\nu_\ell)$/total = [5.18 − 0.13(fraction$(B^0)$−38.2)−1.5($\tau_{B^0}$ − 1.58)]%.
[16] ALBRECHT 94 assumes $B(D^{*+} \to D^0\pi^+) = 68.1 \pm 1.0 \pm 1.3\%$. Uses partial reconstruction of $D^{*+}$ and is independent of $D^0$ branching ratios.
[17] ALBRECHT 93 reports $0.052 \pm 0.005 \pm 0.006$. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \to K^-\pi^+)$. We have taken their average $e$ and $\mu$ value. They also obtain $\alpha = 2*\Gamma^0/(\Gamma^- + \Gamma^+) - 1 = 1.1 \pm 0.4 \pm 0.2$, $A_{AF} = 3/4*(\Gamma^- - \Gamma^+)/\Gamma = 0.2 \pm 0.08 \pm 0.06$ and a value of $|V_{cb}| = 0.036$–$0.045$ depending on model assumptions.
[18] Combining $\overline{D}^{*0}\ell^+\nu_\ell$ and $\overline{D}^{*-}\ell^+\nu_\ell$ SANGHERA 93 test $V-A$ structure and fit the decay angular distributions to obtain $A_{FB} = 3/4*(\Gamma^- - \Gamma^+)/\Gamma = 0.14 \pm 0.06 \pm 0.03$. Assuming a value of $V_{cb}$, they measure $V$, $A_1$, and $A_2$, the three form factors for the $D^*\ell\nu_\ell$ decay, where results are slightly dependent on model assumptions.
[19] ANTREASYAN 90B is average over $B$ and $\overline{D}^*(2010)$ charge states.
[20] The measurement of ALBRECHT 89C suggests a $D^*$ polarization $\gamma_L/\gamma_T$ of $0.85 \pm 0.45$. or $\alpha = 0.7 \pm 0.9$.
[21] ALBRECHT 89J is ALBRECHT 87J value rescaled using $B(D^*(2010)^- \to D^0\pi^-) = 0.57 \pm 0.04 \pm 0.04$. Superseded by ALBRECHT 93.
[22] We have taken average of the the BORTOLETTO 89B values for electrons and muons, $0.046 \pm 0.005 \pm 0.007$. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \to K^-\pi^+)$. The measurement suggests a $D^*$ polarization parameter value $\alpha = 0.65 \pm 0.66 \pm 0.25$.
[23] ALBRECHT 87J assume $\mu$-$e$ universality, the $B(\Upsilon(4S) \to B^0\overline{B}^0) = 0.45$, the $B(D^0 \to K^-\pi^+) = (0.042 \pm 0.004 \pm 0.004)$, and the $B(D^*(2010)^- \to D^0\pi^-) = 0.49 \pm 0.08$. Superseded by ALBRECHT 89J.

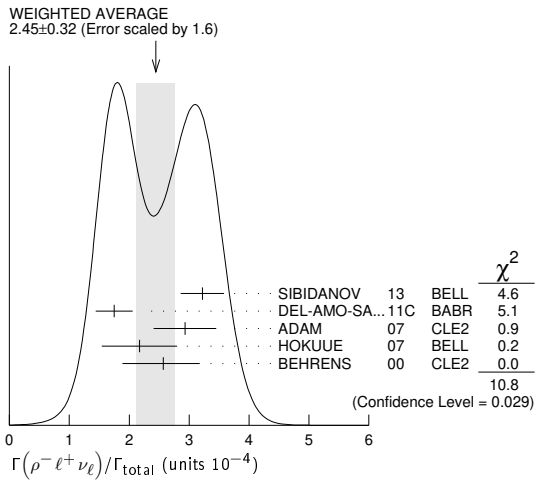
| <4.1 | 90 | [10] BEAN | 93B | CLE2 | $e^+e^- \to \Upsilon(4S)$ |

[1] The signal events are tagged by a second $B$ meson reconstructed in the fully hadronic decays.
[2] $B^+$ and $B^0$ decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.
[3] The $B^0$ and $B^+$ results are combined assuming the isospin, $B$ lifetimes, and relative charged/neutral $B$ production at the $\Upsilon(4S)$.
[4] The signal events are tagged by a second $B$ meson reconstructed in the semileptonic mode $B \to D^{(*)}\ell\nu_\ell$.
[5] Averaging with ALEXANDER 96T results including experimental and theoretical correlations considered, BEHRENS 00 reports systematic errors $^{+0.33}_{-0.46} \pm 0.41$, where the second error is theoretical model dependence. We combine these in quadrature.
[6] ATHAR 03 reports systematic errors $^{+0.47}_{-0.50} \pm 0.41 \pm 0.01$, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.
[7] Uses isospin constraints and extrapolation to all electron energies according to five different form-factor calculations. The second error combines the systematic and theoretical uncertainties in quadrature.
[8] BEHRENS 00 reports $^{+0.35}_{-0.40} \pm 0.50$, where the second error is the theoretical model dependence. We combine these in quadrature. $B^+$ and $B^0$ decays combined using isospin symmetry: $\Gamma(B^0 \to \rho^-\ell^+\nu) = 2\Gamma(B^+ \to \rho^0\ell^+\nu) \approx 2\Gamma(B^+ \to \omega\ell^+\nu)$. No evidence for $\omega\ell\nu$ is reported.
[9] ALEXANDER 96T reports $^{+0.5}_{-0.7} \pm 0.5$ where the second error is the theoretical model dependence. We combine these in quadrature. $B^+$ and $B^0$ decays combined using isospin symmetry: $\Gamma(B^0 \to \rho^-\ell^+\nu) = 2\Gamma(B^+ \to \rho^0\ell^+\nu) \approx 2\Gamma(B^+ \to \omega\ell^+\nu)$. No evidence for $\omega\ell\nu$ is reported.
[10] BEAN 93B limit set using ISGW Model. Using isospin and the quark model to combine $\Gamma(\rho^0\ell^+\nu_\ell)$ and $\Gamma(\omega\ell^+\nu_\ell)$ with this result, they obtain a limit $<(1.6\text{–}2.7) \times 10^{-4}$ at 90% CL for $B^+ \to (\omega \text{ or } \rho^0)\ell^+\nu_\ell$. The range corresponds to the ISGW, WSB, and KS models. An upper limit on $|V_{ub}/V_{cb}| < 0.08\text{–}0.13$ at 90% CL is derived as well.



### $\Gamma(\pi^-\ell^+\nu_\ell)/\Gamma_{total}$ $\Gamma_{19}/\Gamma$

[1] The signal events are tagged by a second $B$ meson reconstructed in the fully hadronic decays.

[2] Uses loose neutrino reconstruction technique. Assumes $B(\Upsilon(4S) \to B^+B^-) = (51.6 \pm 0.6)\%$ and $B(\Upsilon(4S) \to B^0\overline{B}^0) = (48.4 \pm 0.6)\%$.

[3] Reports also a branching fraction value $B(B^0 \to \pi^-\ell^+\nu) = (1.45 \pm 0.04 \pm 0.06) \times 10^{-4}$ from the decays of $B^+$ and $B^0$ that are combined using the isospin symmetry relation.

[4] Using the isospin symmetry relation, $B^+$ and $B^0$ branching fractions are combined.

[5] The $B^0$ and $B^+$ results are combined assuming the isospin, $B$ lifetimes, and relative charged/neutral $B$ production at the $\Upsilon(4S)$.

[6] Also report the rate for $q^2 > 16$ GeV$^2$ of $(0.41 \pm 0.08 \pm 0.04) \times 10^{-4}$ from which they obtain $|V_{ub}| = 3.6 \pm 0.4 \pm 0.2^{+0.6}_{-0.4}$ (last error is from theory).

[7] The signal events are tagged by a second $B$ meson reconstructed in the semileptonic mode $B \to D^{(*)}\ell\nu_\ell$.

[8] The analysis uses events in which the signal $B$ decays are reconstructed with an innovative loose neutrino reconstruction technique.

[9] The signals are tagged by a second $B$ meson reconstructed in a semileptonic or hadronic decay. The $B^0$ and $B^+$ results are combined assuming the isospin symmetry.

[10] $B^+$ and $B^0$ decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.

[11] ATHAR 03 reports systematic errors $0.11 \pm 0.01 \pm 0.07$, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.

[12] ALEXANDER 96T gives systematic errors $\pm 0.3 \pm 0.2$ where the second error reflects the estimated model dependence. We combine these in quadrature. Assumes isospin symmetry: $\Gamma(B^0 \to \pi^-\ell^+\nu) = 2 \times \Gamma(B^+ \to \pi^0\ell^+\nu)$.

[1] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[2] Uses a missing-mass method. Does not depend on $D$ branching fractions or $B^+/B^0$ production rates.
[3] AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of $B^0$ and $B^+$, which is not included here.
[4] BORTOLETTO 92 assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses Mark III branching fractions for the $D$.
[5] ALBRECHT 88K assumes $B^0\overline{B}^0$:$B^+B^-$ production ratio is 45:55. Superseded by ALBRECHT 90J which assumes 50:50.
[6] BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.
[7] AUBERT,B 04O reports $[\Gamma(B^0 \to D^-\pi^+)/\Gamma_{total}] \times [B(D^+ \to K^0_S\pi^+)] = (42.7 \pm 2.1 \pm 2.2) \times 10^{-6}$ which we divide by our best value $B(D^+ \to K^0_S\pi^+) = (1.562 \pm 0.031) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
[8] ALAM 94 reports $[\Gamma(B^0 \to D^-\pi^+)/\Gamma_{total}] \times [B(D^+ \to K^-2\pi^+)] = (0.265 \pm 0.032 \pm 0.023) \times 10^{-3}$ which we divide by our best value $B(D^+ \to K^-2\pi^+) = (9.38 \pm 0.16) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

| $8.0\ \pm0.6\ \pm1.5$ | | | [2,3] SATPATHY | 03 | BELL | Repl. by KUZMIN 07 |
| $< 16$ | 90 | | [2] ALAM | 94 | CLE2 | $e^+e^- \to \Upsilon(4S)$ |
| $< 70$ | 90 | | [4] BORTOLETTO | 92 | CLEO | $e^+e^- \to \Upsilon(4S)$ |
| $<340$ | 90 | | [5] BEBEK | 87 | CLEO | $e^+e^- \to \Upsilon(4S)$ |
| $700 \pm 500$ | | 5 | [6] BEHRENDS | 83 | CLEO | $e^+e^- \to \Upsilon(4S)$ |

[1] The second uncertainty combines in quadrature all systematic uncertainties quoted in the paper. AAIJ 15Y reports $B(B^0 \to \overline{D}^0\pi^+\pi^-) = (8.46 \pm 0.14 \pm 0.49) \times 10^{-4}$ in the kinematic region $m(\overline{D}^0\pi^\pm) > 2.1$ GeV which we corrected to the full phase-space dividing by 0.945 from Belle.
[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[3] No assumption about the intermediate mechanism is made in the analysis.
[4] BORTOLETTO 92 assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses Mark III branching fractions for the $D$. The product branching fraction into $D^*_0(2340)\pi$ followed by $D^*_0(2340) \to D^0\pi$ is $< 0.0001$ at 90% CL and into $D^*_2(2460)$ followed by $D^*_2(2460) \to D^0\pi$ is $< 0.0004$ at 90% CL.
[5] BEBEK 87 assume the $\Upsilon(4S)$ decays 43% to $B^0\overline{B}^0$. We rescale to 50%. $B(D^0 \to K^-\pi^+) = (4.2 \pm 0.4 \pm 0.4)\%$ and $B(D^0 \to K^-\pi^+\pi^+\pi^-) = (9.1 \pm 0.8 \pm 0.8)\%$ were used.
[6] Corrected by us using assumptions: $B(D^0 \to K^-\pi^+) = (0.042 \pm 0.006)$ and $B(\Upsilon(4S) \to B^0\overline{B}^0) = 50\%$. The product branching ratio is $B(B^0 \to \overline{D}^0\pi^+\pi^-)B(\overline{D}^0 \to K^+\pi^-) = (0.39 \pm 0.26) \times 10^{-2}$.

[1] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[2] AUBERT,BE 06J reports $[\Gamma(B^0 \to D^*(2010)^-\pi^+)/\Gamma_{total}]$ / $[B(B^0 \to D^-\pi^+)]$ = 0.99 ± 0.11 ± 0.08 which we multiply by our best value $B(B^0 \to D^-\pi^+) = (2.52 \pm 0.13) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] Uses a missing-mass method. Does not depend on $D$ branching fractions or $B^+/B^0$ production rates.

[4] BRANDENBURG 98 assume equal production of $B^+$ and $B^0$ at $\Upsilon(4S)$ and use the $D^*$ reconstruction technique. The first error is their experiment's error and the second error is the systematic error from the PDG 96 value of $B(D^* \to D\pi)$.

[5] ALAM 94 assume equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and use the CLEO II $B(D^*(2010)^+ \to D^0\pi^+)$ and absolute $B(D^0 \to K^-\pi^+)$ and the PDG 1992 $B(D^0 \to K^-\pi^+\pi^0)/B(D^0 \to K^-\pi^+)$ and $B(D^0 \to K^-2\pi^+\pi^-)/B(D^0 \to K^-\pi^+)$.

[6] BORTOLETTO 92 reports $(4.0 \pm 1.0 \pm 0.7) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to D^*(2010)^-\pi^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \to D^0\pi^+)]$ assuming $B(D^*(2010)^+ \to D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \to D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses MarkIII branching fractions for the $D$.

[7] ALBRECHT 90J reports $(2.8 \pm 0.9 \pm 0.6) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to D^*(2010)^-\pi^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \to D^0\pi^+)]$ assuming $B(D^*(2010)^+ \to D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \to D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses MarkIII branching fractions for the $D$.

[8] BEBEK 87 reports $(2.8^{+1.5}_{-1.2}{}^{+1.0}_{-0.6}) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to D^*(2010)^-\pi^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \to D^0\pi^+)]$ assuming $B(D^*(2010)^+ \to D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \to D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92 and ALBRECHT 90J.

[9] Assumes $B(Z \to b\overline{b}) = 0.217$ and 38% $B_d$ production fraction.

[10] ALBRECHT 87C use PDG 86 branching ratios for $D$ and $D^*(2010)$ and assume $B(\Upsilon(4S) \to B^+B^-) = 55\%$ and $B(\Upsilon(4S) \to B^0\overline{B}{}^0) = 45\%$. Superseded by ALBRECHT 90J.

[11] ALBRECHT 86F uses pseudomass that is independent of $D^0$ and $D^+$ branching ratios.

[12] Assumes $B(D^*(2010)^+ \to D^0\pi^+) = 0.60^{+0.08}_{-0.15}$. Assumes $B(\Upsilon(4S) \to B^0\overline{B}{}^0) = 0.40 \pm 0.02$ Does not depend on $D$ branching ratios.

[1] The second error combines the systematic and theoretical uncertainties in quadrature. CSORNA 03 includes data used in ALAM 94. A full angular fit to three complex helicity amplitudes is performed.

[2] Assumes equal production of $B^0$ and $B^+$ at the $\Upsilon(4S)$ resonance.

[3] BORTOLETTO 92 reports 0.019 ± 0.008 ± 0.011 from a measurement of $[\Gamma(B^0 \to D^*(2010)^-\rho^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \to D^0\pi^+)]$ assuming $B(D^*(2010)^+ \to D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \to D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses MarkIII branching fractions for the $D$.

[4] ALBRECHT 90J reports 0.007 ± 0.003 ± 0.003 from a measurement of $[\Gamma(B^0 \to D^*(2010)^-\rho^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \to D^0\pi^+)]$ assuming $B(D^*(2010)^+ \to D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \to D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses MarkIII branching fractions for the $D$.

[5] MATVIENKO 15 reports $B(B^0 \to D^*(2010)^-\rho^+,\ \rho^+ \to \omega\pi^+) = (1.48 \pm 0.27^{+0.15}_{-0.09}{}^{+0.21}_{-0.56}) \times 10^{-3}$. The last uncertainty is a model one.

[6] ALAM 94 assume equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and use the CLEO II $B(D^*(2010)^+ \to D^0\pi^+)$ and absolute $B(D^0 \to K^-\pi^+)$ and the PDG 1992 $B(D^0 \to K^-\pi^+\pi^0)/B(D^0 \to K^-\pi^+)$ and $B(D^0 \to K^-2\pi^+\pi^-)/B(D^0 \to K^-\pi^+)$.

[7] This decay is nearly completely longitudinally polarized, $\Gamma_L/\Gamma = (93 \pm 5 \pm 5)\%$, as expected from the factorization hypothesis (ROSNER 90). The nonresonant $\pi^+\pi^0$ contribution under the $\rho^+$ is less than 9% at 90% CL.

[8] Uses $B(D^* \to D^0\pi^+) = 0.6 \pm 0.15$ and $B(\Upsilon(4S) \to B^0\overline{B}{}^0) = 0.4$. Does not depend on $D$ branching ratios.

### $\Gamma(D^*(2010)^-K^+)/\Gamma_{total}$ $\Gamma_{52}/\Gamma$

| 0.0172±0.0014±0.0024 | | [1] ALEXANDER | 01B | CLE2 | $e^+e^- \to \Upsilon(4S)$ |
| 0.0345±0.0181±0.0003 | 28 | [2] ALBRECHT | 90J | ARG | $e^+e^- \to \Upsilon(4S)$ |

[1] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$. The signal is consistent with all observed $\omega\pi^+$ having proceeded through the $\rho'^+$ resonance at mass $1349 \pm 25^{+10}_{-5}$ MeV and width $547 \pm 86^{+46}_{-45}$ MeV.
[2] ALBRECHT 90J reports $0.041 \pm 0.015 \pm 0.016$ from a measurement of $[\Gamma(B^0 \to D^*(2010)^-\pi^+\pi^+\pi^-\pi^0)/\Gamma_{total}] \times [B(D^*(2010)^+ \to D^0\pi^+)]$ assuming $B(D^*(2010)^+ \to D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \to D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses Mark III branching fractions for the $D$.

[5] BORTOLETTO 92 reports $0.016 \pm 0.009 \pm 0.006$ from a measurement of $[\Gamma(B^0 \to D^*(2010)^- D_s^+)/\Gamma_{total}] \times [B(D_s^+ \to \phi\pi^+)]$ assuming $B(D_s^+ \to \phi\pi^+) = 0.030 \pm 0.011$, which we rescale to our best value $B(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses Mark III branching fractions for the $D$ and $D^*(2010)$.

[6] GIBAUT 96 reports $0.0093 \pm 0.0023 \pm 0.0016$ from a measurement of $[\Gamma(B^0 \to D^*(2010)^- D_s^+)/\Gamma_{total}] \times [B(D_s^+ \to \phi\pi^+)]$ assuming $B(D_s^+ \to \phi\pi^+) = 0.035$, which we rescale to our best value $B(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[7] BORTOLETTO 90 assume $B(D_s \to \phi\pi^+) = 2\%$. Superseded by BORTOLETTO 92.

### $\Gamma(D^- D_s^{*+})/\Gamma_{total}$ $\Gamma_{84}/\Gamma$

[1] Uses a missing-mass method in the events that one of the $B$ mesons is fully reconstructed.

[2] AUBERT,B 04S reports $[\Gamma(B^0 \to D^*(2010)^- D_{sJ}(2457)^+)/\Gamma_{total}] \times [B(D_{s1}(2460)^+ \to D_s^{*+}\pi^0)] = (5.5 \pm 1.2^{+2.2}_{-1.6}) \times 10^{-3}$ which we divide by our best value $B(D_{s1}(2460)^+ \to D_s^{*+}\pi^0) = (48 \pm 11) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

### $\Gamma(D_{sJ}(2457)^+ D^*(2010),\ D_{sJ}^+ \to D_s^+\gamma)/\Gamma_{total}$ $\Gamma_{102}/\Gamma$

| <27.0 | 90 | [7] ALBRECHT | 88K | ARG | $e^+e^- \to \Upsilon(4S)$ |

[1] Measured using isobar formalism in the decay chain $B^0 \to \overline{D}^0\rho(770)$, $\rho \to \pi^+\pi^-$ assuming $B(\rho(770) \to \pi^+\pi^-) = 1$. The second uncertainty combines in quadrature all systematic uncertainties quoted in the paper.
[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[3] Our second uncertainty combines systematics and model errors quoted in the paper.
[4] NEMATI 98 assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and use the PDG 96 values for $D^0$, $D^{*0}$, $\eta$, $\eta'$, and $\omega$ branching fractions.
[5] ALAM 94 assume equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and use the CLEO II absolute $B(D^0 \to K^-\pi^+)$ and the PDG 1992 $B(D^0 \to K^-\pi^+\pi^0)/B(D^0 \to K^-\pi^+)$ and $B(D^0 \to K^-2\pi^+\pi^-)/B(D^0 \to K^-\pi^+)$.
[6] BORTOLETTO 92 assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$ and uses Mark III branching fractions for the $D$.
[7] ALBRECHT 88K reports < 0.003 assuming $B^0\overline{B}^0$:$B^+B^-$ production ratio is 45:55. We rescale to 50%.

[1] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[2] AUBERT 02M also assumes the measured $CP$-odd fraction of the final states is 0.22 ± 0.18 ± 0.03.
[3] ARTUSO 99 uses $B(\Upsilon(4S) \to B^0\overline{B}^0)$=(48 ± 4)%.
[4] BARATE 98Q (ALEPH) observes 2 events with an expected background of 0.10 ± 0.03 which corresponds to a branching ratio of $(2.3^{+1.9}_{-1.2} \pm 0.4)\times10^{-3}$.
[5] ASNER 97 at CLEO observes 1 event with an expected background of 0.022 ± 0.011. This corresponds to a branching ratio of $(5.3^{+7.1}_{-3.7} \pm 1.0)\times10^{-4}$.

[1] AUBERT 07AV reports $[\Gamma(B^0 \to J/\psi(1S)K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \to p\overline{p})] = (2.82^{+0.30+0.36}_{-0.28-0.35}) \times 10^{-6}$ which we divide by our best value $B(J/\psi(1S) \to p\overline{p}) = (2.121 \pm 0.029) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[3] ABE 98O reports $[B(B^0 \to J/\psi(1S)K^*(892)^0)]/[B(B^+ \to J/\psi(1S)K^+)] = 1.76 \pm 0.14 \pm 0.15$. We multiply by our best value $B(B^+ \to J/\psi(1S)K^+) = (9.9 \pm 1.0) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[5] BORTOLETTO 92 reports $(1.1 \pm 0.5 \pm 0.3) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to J/\psi(1S)K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[6] ALBRECHT 90J reports $(1.1 \pm 0.5 \pm 0.2) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to J/\psi(1S)K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[7] BEBEK 87 reports $(3.5 \pm 1.6 \pm 0.3) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \to J/\psi(1S)K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BORTOLETTO 92 to use the same assumptions.

[8] ABE 96H assumes that $B(B^+ \to J/\psi K^+) = (1.02 \pm 0.14) \times 10^{-3}$.

[9] The neutral and charged $B$ events together are predominantly longitudinally polarized, $\Gamma_L/\Gamma = 0.080 \pm 0.08 \pm 0.05$. This can be compared with a prediction using HQET, 0.73 (KRAMER 92). This polarization indicates that the $B \to \psi K^*$ decay is dominated by the $CP = -1$ $CP$ eigenstate. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[10] ALBRECHT 94G measures the polarization in the vector-vector decay to be predominantly longitudinal, $\Gamma_T/\Gamma = 0.03 \pm 0.16 \pm 0.15$ making the neutral decay a $CP$ eigenstate when the $K^{*0}$ decays through $K^0_S\pi^0$.

[11] ALBAJAR 91E assumes $B^0_d$ production fraction of 36%.

[12] ALBRECHT 87D assume $B^+B^-/B^0\overline{B}^0$ ratio is 55/45. Superseded by ALBRECHT 90J.

[13] ALAM 86 assumes $B^\pm/B^0$ ratio is 60/40. The observation of the decay $B^+ \to J/\psi K^*(892)^+$ (HAAS 85) has been retracted in this paper.

[1] Uses Dalitz plot analysis of the $B^0 \to K^0_S\pi^+\pi^-$ final state decays. For the branching fraction of the reference mode, the PDG 18 average $B(B^0 \to K^0_S\pi^+\pi^-) = (4.96 \pm 0.20)\times10^{-5}$ is used.

[2] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[3] LEES 12I reports $[\Gamma(B^0 \to \chi_{c0}K^0)/\Gamma_{\text{total}}] \times [B(\chi_{c0}(1P) \to K^0_S K^0_S)] = (0.46^{+0.25}_{-0.17} \pm 0.21)\times10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P) \to K^0_S K^0_S) = (3.16 \pm 0.17)\times10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] Measured in the $B^0 \to K^0_S K^+K^-$ decay.

[5] Uses Dalitz plot analysis of the $B^0 \to K^0\pi^+\pi^-$ final state decays.

[6] EDWARDS 01 assumes equal production of $B^0$ and $B^+$ at the $\Upsilon(4S)$. The correlated uncertainties (28.3)% from $B(J/\psi(1S) \to \gamma\eta_c)$ in those modes have been accounted for.

[1] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[2] ABE 00C assumes B($Z \to b\overline{b}$)=(21.7 ± 0.1)% and the $B$ fractions $f_{B^0}=f_{B^+}=(39.7^{+1.8}_{-2.2})$% and $f_{B_s}=(10.5^{+1.8}_{-2.2})$%.
[3] ADAM 96D assumes $f_{B^0} = f_{B^-} = 0.39$ and $f_{B_s} = 0.12$. Contributions from $B^0$ and $B_s$ decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral $B$ mesons.
[4] BUSKULIC 96V assumes PDG 96 production fractions for $B^0$, $B^+$, $B_s$, $b$ baryons.
[5] Assumes a $B^0$, $B^-$ production fraction of 0.39 and a $B_s$ production fraction of 0.12. Contributions from $B^0$ and $B_s^0$ decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral $B$ mesons.
[6] Assumes B($Z \to b\overline{b}$) = 0.217 and $B_d^0$ ($B_s^0$) fraction 39.5% (12%).
[7] BATTLE 93 assumes equal production of $B^0\overline{B}^0$ and $B^+B^-$ at $\Upsilon(4S)$.
[8] Assumes the $\Upsilon(4S)$ decays 43% to $B^0\overline{B}^0$.

[1] Supercedes results of AAIJ 12AR.
[2] DUH 13 reports also for the same data $B(B^0 \to K^+K^-) < 0.20 \times 10^{-6}$ at 90% CL.
[3] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[4] AAIJ 12AR reports $[\Gamma(B^0 \to K^+K^-)/\Gamma_{total}] / [B(B_s^0 \to K^+K^-)] / [\Gamma(\overline{b} \to B_s^0)/\Gamma(\overline{b} \to B^0)] = 0.018^{+0.008}_{-0.007} \pm 0.009$ which we multiply by our best values $B(B_s^0 \to K^+K^-) = (2.66 \pm 0.22) \times 10^{-5}$, $\Gamma(\overline{b} \to B_s^0)/\Gamma(\overline{b} \to B^0) = 0.246 \pm 0.023$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
[5] Reported a central value of $(0.23 \pm 0.10 \pm 0.10) \times 10^{-6}$ using $B(B^0 \to K^+\pi^-) = (19.4 \pm 0.6) \times 10^{-6}$.
[6] Obtains this result from $B(K^+K^-)/B(K^+\pi^-) = 0.020 \pm 0.008 \pm 0.006$, assuming $B(B^0 \to K^+\pi^-) = (19.4 \pm 0.6) \times 10^{-6}$.
[7] ABULENCIA,A 06D obtains this from $\Gamma(K^+K^-)/\Gamma(K^+\pi^-) < 0.10$ at 90% CL, assuming $B(B^0 \to K^+\pi^-) = (18.9 \pm 0.7) \times 10^{-6}$.
[8] ABE 00C assumes $B(Z \to b\overline{b}) = (21.7 \pm 0.1)\%$ and the $B$ fractions $f_{B^0} = f_{B^+} = (39.7^{+1.8}_{-2.2})\%$ and $f_{B_s} = (10.5^{+1.8}_{-2.2})\%$.
[9] ADAM 96D assumes $f_{B^0} = f_{B^-} = 0.39$ and $f_{B_s} = 0.12$. Contributions from $B^0$ and $B_s$ decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral $B$ mesons.
[10] BUSKULIC 96V assumes PDG 96 production fractions for $B^0$, $B^+$, $B_s$, $b$ baryons.
[11] Assumes a $B^0$, $B^-$ production fraction of 0.39 and a $B_s$ production fraction of 0.12. Contributions from $B^0$ and $B_s^0$ decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral $B$ mesons.

[1] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.
[2] ABE 00C assumes $B(Z \to b\overline{b})=(21.7 \pm 0.1)\%$ and the $B$ fractions $f_{B^0}=f_{B^+}=(39.7^{+1.8}_{-2.2})\%$ and $f_{B_s}=(10.5^{+1.8}_{-2.2})\%$.
[3] ADAM 96D assumes $f_{B^0} = f_{B^-} = 0.39$ and $f_{B_s} = 0.12$.
[4] BUSKULIC 96V assumes PDG 96 production fractions for $B^0$, $B^+$, $B_s$, $b$ baryons.
[5] Assumes a $B^0$, $B^-$ production fraction of 0.39 and a $B_s$ production fraction of 0.12.
[6] Assumes $B(Z \to b\overline{b}) = 0.217$ and $B_d^0$ ($B_s^0$) fraction 39.5% (12%).
[7] Paper assumes the $\Upsilon(4S)$ decays 43% to $B^0\overline{B}^0$. We rescale to 50%.

[1] Corresponds to a 95% CL upper limit of $< 2.1 \times 10^{-10}$.

[2] Uses normalization mode $B(B^+ \to J/\psi K^+) = (1.010 \pm 0.029) \times 10^{-3}$ and $B$ production ratio $f(b \to B_s^0)/f(b \to B^0) = 0.256 \pm 0.013$.

[3] Corresponds to a 95% CL upper limit of $< 3.4 \times 10^{-10}$.

[4] Reports also a limit of $< 9.2 \times 10^{-10}$ at 90% CL. and uses $B(B^+ \to J/\psi K^+ \to \mu^+\mu^- K^+) = (6.0 \pm 0.2) \times 10^{-5}$ for normalization.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[5] This value is obtained from a profile-likelihood fit, see Fig. 9. It corresponds to an uppper limit of $< 0.42 \times 10^{-9}$ at 95% C.L.
[6] Derived from the combined fit to CMS and LHCb data. Uncertainty includes both statistical and systematic component. Also reports $B(B^0 \to \mu^+\mu^-)/B(B_s \to \mu^+\mu^-) = 0.14^{+0.08}_{-0.06}$.
[7] Uses $B(B^+ \to J/\psi K^+ \to \mu^+\mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$ and $B(B^0 \to K^+\pi^-) = (1.94 \pm 0.06) \times 10^{-5}$ for normalization.
[8] Reports also a limit of $< 7.4 \times 10^{-10}$ at 95% CL. Uses normalization modes $B^+ \to J/\psi K^+ \to \mu^+\mu^- K^+$ and $B^0 \to K^+\pi^-$.
[9] Uses normalization mode $B(B^+ \to J/\psi K^+) = (10.22 \pm 0.35) \times 10^{-4}$.
[10] Uses $B(B^+ \to J/\psi K^+ \to \mu^+\mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$.
[11] Uses $B$ production ratio $f(\overline{b} \to B^+)/f(\overline{b} \to B^0_s) = 3.71 \pm 0.47$ and three normalization modes.

Polarization in $B$ Decays

## POLARIZATION IN $B^0$ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ($L$) or both are transverse and parallel ($\|$) or perpendicular ($\perp$) to each other with the parameters $\Gamma_L/\Gamma$, $\Gamma_\perp/\Gamma$, and the relative phases $\phi_\|$ and $\phi_\perp$. See the definitions in the note on "Polarization in $B$ Decays" review in the $B^0$ Particle Listings.

[1] AAIJ 13AT obtains $\Gamma_\|/\Gamma = 0.227 \pm 0.004 \pm 0.011$. The relation $1 = (\Gamma_L + \Gamma_\perp + \Gamma_\|)/\Gamma$ is used to obtain $\Gamma_L/\Gamma$.
[2] Measured the angular and lifetime parameters for the time-dependent angular untagged decays $B_d^0 \to J/\psi K^{*0}$ and $B_s^0 \to J/\psi\phi$.
[3] Obtained by combining the $B^0$ and $B^+$ modes.
[4] AFFOLDER 00N measurements are based on 190 $B^0$ candidates obtained from a data sample of 89 $pb^{-1}$. The $P$-wave fraction is found to be $0.13^{+0.12}_{-0.09} \pm 0.06$.
[5] JESSOP 97 is the average over a mixture of $B^0$ and $B^+$ decays. The $P$-wave fraction is found to be $0.16 \pm 0.08 \pm 0.04$.
[6] Averaged over an admixture of $B^0$ and $B^+$ decays.
[7] Averaged over an admixture of $B^0$ and $B^+$ decays and the $P$ wave fraction is $(19 \pm 2 \pm 3)\%$.
[8] Averaged over an admixture of $B^0$ and $B^-$ decays and the $P$ wave fraction is $(16.0 \pm 3.2 \pm 1.4) \times 10^{-2}$.

$B^0$ — $\overline{B}^0$ Mixing

## $B^0$-$\overline{B}^0$ MIXING PARAMETERS

For a discussion of $B^0$-$\overline{B}^0$ mixing see the note on "$B^0$-$\overline{B}^0$ Mixing" in the $B^0$ Particle Listings above.

$\chi_d$ is a measure of the time-integrated $B^0$-$\overline{B}^0$ mixing probability that a produced $B^0(\overline{B}^0)$ decays as a $\overline{B}^0(B^0)$. Mixing violates $\Delta B \neq 2$ rule.

$$\chi_d = \frac{x_d^2}{2(1+x_d^2)}$$

$$x_d = \frac{\Delta m_{B^0}}{\Gamma_{B^0}} = (m_{B_H^0} - m_{B_L^0})\,\tau_{B^0}\ ,$$

where $H$, $L$ stand for heavy and light states of two $B^0$ $CP$ eigenstates and $\tau_{B^0} = \frac{1}{0.5(\Gamma_{B_H^0}+\Gamma_{B_L^0})}$.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

## $\chi_d$

This $B^0$-$\overline{B}^0$ mixing parameter is the probability (integrated over time) that a produced $B^0$ (or $\overline{B}^0$) decays as a $\overline{B}^0$ (or $B^0$), e.g. for inclusive lepton decays

$$\chi_d = \Gamma(B^0 \to \ell^- X \text{ (via } \overline{B}^0))/\Gamma(B^0 \to \ell^{\pm} X)$$
$$= \Gamma(\overline{B}^0 \to \ell^+ X \text{ (via } B^0))/\Gamma(\overline{B}^0 \to \ell^{\pm} X)$$

Where experiments have measured the parameter $r = \chi/(1-\chi)$, we have converted to $\chi$. Mixing violates the $\Delta B \neq 2$ rule.

Note that the measurement of $\chi$ at energies higher than the $\Upsilon(4S)$ have not separated $\chi_d$ from $\chi_s$ where the subscripts indicate $B^0(\overline{b}d)$ or $B_s^0(\overline{b}s)$. They are listed in the $B^{\pm}/B^0/B_s^0$/$b$-baryon ADMIXTURE section.

The experiments at $\Upsilon(4S)$ make an assumption about the $B^0\overline{B}^0$ fraction and about the ratio of the $B^{\pm}$ and $B^0$ semileptonic branching ratios (usually that it equals one).

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements, includes $\chi_d$ calculated from $\Delta m_{B^0}$ and $\tau_{B^0}$.

[1] BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\overline{B}^0 \to D^{*+}\pi^-$, $\rho^-$ decays to determine the flavor of the $B$ meson.
[2] ALBRECHT 94 reports $r$=0.194 ± 0.062 ± 0.054. We convert to $\chi$ for comparison. Uses tagged events (lepton + pion from $D^*$).
[3] BARTELT 93 analysis performed using tagged events (lepton+pion from $D^*$). Using dilepton events they obtain $0.157 \pm 0.016\ ^{+0.033}_{-0.028}$.
[4] ALBRECHT 92L is a combined measurement employing several lepton-based techniques. It uses all previous ARGUS data in addition to new data and therefore supersedes ALBRECHT 87I. A value of $r = 20.6 \pm 7.0\%$ is directly measured. The value can be used to measure $x = \Delta M/\Gamma = 0.72 \pm 0.15$ for the $B_d$ meson. Assumes $f_{+-}/f_0 = 1.0 \pm 0.05$ and uses $\tau_{B^{\pm}}/\tau_{B^0} = (0.95 \pm 0.14)$ ($f_{+-}/f_0$).
[5] Uses $D^{*+}K^{\pm}$ correlations.
[6] Uses $(D^{*+}\ell^-)\ K^{\pm}$ correlations.
[7] These experiments see a combination of $B_s$ and $B_d$ mesons.
[8] ALBRECHT 87I is inclusive measurement with like-sign dileptons, with tagged $B$ decays plus leptons, and one fully reconstructed event. Measures $r$=0.21 ± 0.08. We convert to $\chi$ for comparison. Superseded by ALBRECHT 92L.
[9] BEAN 87B measured $r <$ 0.24; we converted to $\chi$.
[10] Same-sign dilepton events. Limit assumes semileptonic BR for $B^+$ and $B^0$ equal. If $B^0/B^{\pm}$ ratio <0.58, no limit exists. The limit was corrected in BEAN 87B from $r <$ 0.30 to $r <$ 0.37. We converted this limit to $\chi$.

## $\Delta m_{B^0} = m_{B^0_H} - m_{B^0_L}$

$\Delta m_{B^0}$ is a measure of $2\pi$ times the $B^0$-$\overline{B}^0$ oscillation frequency in time-dependent mixing experiments.

The second "OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements.

The first "OUR EVALUATION", also provided by the HFLAV, includes $\Delta m_d$ calculated from $\chi_d$ measured at $\Upsilon(4S)$.

[1] Uses semileptonic decays of $B^0 \to D^-\mu^+\nu_\mu X$ and $B^0 \to D^{(*)-}\mu^+\nu_\mu X$, where the $D$ mesons are reconstructed in $D^- \to K^+\pi^-\pi^-$ and $D^{(*)-} \to \overline{D}^0\pi^-$ with $\overline{D}^0 \to K^+\pi^-$.
[2] Uses semileptonic decays of $B^0 \to D^-\mu^+\nu_\mu X$ where the $D^-$ mesons are reconstructed in $D^- \to K^+K^-\pi^-$.
[3] Measured using $B^0 \to D^-\pi^+$ and $B^0 \to J/\psi K^*(892)^0$ decays.
[4] Measured using $B^0 \to D^-\pi^+$.
[5] Uses opposite-side flavor-tagging with $B \to D^{(*)}\mu\nu_\mu X$ events.
[6] Measured using a simultaneous fit of the $B^0$ lifetime and $\overline{B}^0B^0$ oscillation frequency $\Delta m_d$ in the partially reconstructed $B^0 \to D^{*-}\ell\nu$ decays.
[7] Measurement performed using a combined fit of $CP$-violation, mixing and lifetimes.
[8] Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.
[9] AUBERT 03C uses a sample of approximately 14,000 exclusively reconstructed $B^0 \to D^*(2010)^-\ell\nu$ and simultaneously measures the lifetime and oscillation frequency.
[10] HASTINGS 03 measurement based on the time evolution of dilepton events. It also reports $f_+/f_0 = 1.01 \pm 0.03 \pm 0.09$ and $CPT$ violation parameters in $B^0$-$\overline{B}^0$ mixing.
[11] ZHENG 03 data analyzed using partially reconstructed $\overline{B}^0 \to D^{*-}\pi^+$ decay and a flavor tag based on the charge of the lepton from the accompanying $B$ decay.
[12] Uses a tagged sample of fully-reconstructed neutral $B$ decays at $\Upsilon(4S)$.
[13] Measured based on the time evolution of dilepton events in $\Upsilon(4S)$ decays.
[14] Data analyzed using partially reconstructed $\overline{B}^0 \to D^{*+}\ell^-\overline{\nu}$ decay and a combination of flavor tags from the rest of the event.
[15] Uses di-muon events.
[16] Uses jet-charge and lepton-flavor tagging.
[17] Uses $\ell^-D^{*+}-\ell$ events.
[18] Uses $\pi$-$B$ in the same side.
[19] Uses $\ell$-$\ell$.
[20] Uses $\ell$-$Q_{\rm hem}$.
[21] Uses $\ell$-$\ell$ with impact parameters.
[22] Uses $D^{*\pm}$-$Q_{\rm hem}$.
[23] Uses $\pi_s^{\pm}\ell$-$Q_{\rm hem}$.
[24] Uses $D^{*\pm}$-$\ell$/$Q_{\rm hem}$.
[25] Uses $D^{*\pm}\ell$-$Q_{\rm hem}$.
[26] Uses $D^{*\pm}$-$\ell$.
[27] AUBERT 02N result based on the same analysis and data sample reported in AUBERT 02I.
[28] Uses a tagged sample of $B^0$ decays reconstructed in the mode $B^0 \to D^*\ell\nu$.
[29] Uses a tagged sample of fully-reconstructed hadronic $B^0$ decays at $\Upsilon(4S)$.
[30] ACCIARRI 98D combines results from $\ell$-$\ell$, $\ell$-$Q_{\rm hem}$, and $\ell$-$\ell$ with impact parameters.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[31] ABREU 97N combines results from $D^{*\pm}$-$Q_{\rm hem}$, $\ell$-$Q_{\rm hem}$, $\pi_s^{\pm}$ $\ell$-$Q_{\rm hem}$, and $\ell$-$\ell$.
[32] ACKERSTAFF 97V combines results from $\ell$-$\ell$, $\ell$-$Q_{\rm hem}$, $D^*$-$\ell$, and $D^{*\pm}$-$Q_{\rm hem}$.
[33] BUSKULIC 97D combines results from $D^{*\pm}$-$\ell$/$Q_{\rm hem}$, $\ell$-$Q_{\rm hem}$, and $\ell$-$\ell$.
[34] ABREU 96Q analysis performed using lepton, kaon, and jet-charge tags.
[35] ALEXANDER 96V combines results from $D^{*\pm}$-$\ell$ and $D^{*\pm}$ $\ell$-$Q_{\rm hem}$.
[36] AKERS 95J combines results from charge measurement, $D^{*\pm}$ $\ell$-$Q_{\rm hem}$ and $\ell$-$\ell$.

### $x_d = \Delta m_{B^0}/\Gamma_{B^0}$

The second "OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements.

The first "OUR EVALUATION", also provided by the HFLAV, includes $\chi_d$ measured at $\Upsilon(4S)$.

### Re($\lambda_{CP}$ / $|\lambda_{CP}|$) Re(z)

The $\lambda_{CP}$ characterizes $B^0$ and $\overline{B}^0$ decays to states of charmonium plus $K^0_L$. Parameter z is used to describe $CPT$ violation in mixing, see the review on "$CP$ Violation" in the reviews section.

[4] Corresponds to 90% confidence range [−0.028, 0.104].
[5] Measured using inclusive dilepton events from $B^0$ decay.

## $CP$ VIOLATION PARAMETERS

### Re($\epsilon_{B^0}$)/(1+$|\epsilon_{B^0}|^2$)

$CP$ impurity in $B^0_d$ system. It is obtained from either $a_{\ell\ell}$, the charge asymmetry in like-sign dilepton events or $a_{cp}$, the time-dependent asymmetry of inclusive $B^0$ and $\overline{B}^0$ decays.

"OUR EVALUATION" is an average obtained by the Heavy Flavor Averaging Group (HFLAV) and described at https://hflav.web.cern.ch/. It is the result of a fit to $B_d$ and $B_s$ $CP$ asymmetries, which includes the $B_d$ measurements listed below and the $B_s$ measurements listed in the $B_s$ section, taking into account correlations between those measurements.

[1] AAIJ 15F uses semileptonic $B^0$ decays in the inclusive final states $D^-\mu^+$ and $D^{*-}\mu^+$, where the $D^-$ meson decays into the $K^+\pi^-\pi^-$ final state, and the $D^{*-}$ meson into the $\overline{D}^0(\to K^+\pi^-)\pi^-$ final state. Reports $A^d_{SL} = (-0.02 \pm 0.19 \pm 0.30)\%$, which equals to 4Re($\epsilon_{B^0}$)/(1+$|\epsilon_{B^0}|^2$).
[2] Uses the charge asymmetry in like-sign dilepton events. LEES 15A reports $A^d_{SL} = (-3.9 \pm 3.5 \pm 1.9) \times 10^{-3}$.
[3] ABAZOV 14 uses the dimuon charge asymmetry with different impact parameters from which it reports $A^d_{SL} = (-0.62 \pm 0.42) \times 10^{-2}$.
[4] Uses $B^0 \to D^{*-}X\ell^+\nu_\ell$ and a kaon-tagged sample which yields measurement of $A^d_{SL} = (0.06 \pm 0.17^{+0.38}_{-0.32})\%$, corresponding to $\Delta_{CP} = 1-|q/p| = (0.29 \pm 0.84^{+1.88}_{-1.61}) \times 10^{-3}$.
[5] ABAZOV 12AC uses $B^0 \to D^-\mu^+X$ and $B^0 \to D^*(2010)^-\mu^+X$ decays without initial state flavor tagging which yields measurement of $A^d_{SL} = (6.8 \pm 4.5 \pm 1.4) \times 10^{-3}$.
[6] AUBERT 06T reports $|q/p|-1 = (-0.8 \pm 2.7 \pm 1.9) \times 10^{-3}$. We convert to $(1-|q/p|^2)/4$.
[7] Uses the charge asymmetry in like-sign dilepton events and reports $|q/p| = 1.0005 \pm 0.0040 \pm 0.0043$.
[8] JAFFE 01 finds $a_{\ell\ell} = 0.013 \pm 0.050 \pm 0.005$ and combines with the previous BEHRENS 00B independent measurement.
[9] ABAZOV 11U uses the dimuon charge asymmetry with different impact parameters from which it reports $A^d_{SL} = (-1.2 \pm 5.2) \times 10^{-3}$.
[10] Uses the dimuon charge asymmetry.
[11] AUBERT 04C reports $|q/p| = 1.029 \pm 0.013 \pm 0.011$ and we converted it to $(1-|q/p|^2)/4$.
[12] BARATE 01D measured by investigating time-dependent asymmetries in semileptonic and fully inclusive $B^0_d$ decays.
[13] BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\overline{B}^0 \to D^{*+}\pi^-$, $\rho^-$ decays to determine the flavor of the $B$ meson.
[14] Data analyzed using the time-dependent asymmetry of inclusive $B^0$ decay. The production flavor of $B^0$ mesons is determined using both the jet charge and the charge of secondary vertex in the opposite hemisphere.
[15] ACKERSTAFF 97U assumes $CPT$ and is based on measuring the charge asymmetry in a sample of $B^0$ decays defined by lepton and $Q_{\rm hem}$ tags. If $CPT$ is not invoked, Re($\epsilon_B$) = $-0.006 \pm 0.010 \pm 0.006$ is found. The indirect $CPT$ violation parameter is determined to Im($\delta B$) = $-0.020 \pm 0.016 \pm 0.006$.
[16] BARTELT 93 finds $a_{\ell\ell} = 0.031 \pm 0.096 \pm 0.032$ which corresponds to $|a_{\ell\ell}| < 0.18$, which yields the above $|$Re($\epsilon_{B^0}$)/(1+$|\epsilon_{B^0}|^2$)$|$.

### $A_{T/CP}$

$A_{T/CP}$ is defined as

$$\frac{P(\overline{B}^0 \to B^0) - P(B^0 \to \overline{B}^0)}{P(\overline{B}^0 \to B^0) + P(B^0 \to \overline{B}^0)},$$

the $CPT$ invariant asymmetry between the oscillation probabilities P($\overline{B}^0 \to B^0$) and P($B^0 \to \overline{B}^0$).

[1] AUBERT 02K uses the charge asymmetry in like-sign dilepton events.

### $A_{CP}(B^0 \to D^*(2010)^+D^-)$

$A_{CP}$ is defined as

$$\frac{B(\overline{B}^0 \to \overline{f}) - B(B^0 \to f)}{B(\overline{B}^0 \to \overline{f}) + B(B^0 \to f)},$$

the $CP$-violation charge asymmetry of exclusive $B^0$ and $\overline{B}^0$ decay.

[1] Measured partially reconstructed candidates when one $D^0$ meson is not excplicitely reconstructed. Analysis does not separate $CP$-even and $CP$-odd component. Value is obtained from $S = -0.34 \pm 0.12 \pm 0.05$ using $S = S_+ (1 - 2 R_\perp)$ with $R_\perp = 0.158 \pm 0.029$.
[2] AUBERT,BE 05A reports a $CP$-odd fraction $R_\perp = 0.125 \pm 0.044 \pm 0.007$.

### $C_-$ ($B^0 \to D^{*+} D^{*-}$)

See the note in the $C_{\pi\pi}$ datablock, but for $CP$ odd final state.

[1] Analyzes joint data sample of Belle and BaBar using Dalitz plot analysis of $D \to K^0_S \pi^+\pi^-$; the second error combines experimental systematic uncertainty and the Dalitz plot model uncertainty.
[2] A model-independent measurement uses the binned Dalitz plot technique.
[3] AUBERT 07BH evaluates the likelihoods for the positive and negative solutions assuming $\sin(2\beta_{eff}) = 0.678$. It quotes $L_+ / (L_+ + L_-) = 0.86$ corresponding to a likelihood ratio of $L_+/L_- = 6.14$ in favor of the positive solution.
[4] KROKOVNY 06 evaluates the likelihoods for the positive and negative solutions assuming $\sin(2\beta_{eff}) = 0.689$. It quotes $L_+ / (L_+ + L_-) = 0.983$ corresponding to a likelihood ratio of $L_+/L_- = 57.8$ in favor of the positive solution.

### $(S_+ + S_-)/2$ ($B^0 \to D^{*-}\pi^+$)

$S_\pm = -\frac{2Im(\lambda_\pm)}{1+|\lambda_\pm|^2}$ where $\lambda_+$ and $\lambda_-$ are defined in the $C_{\pi\pi}$ datablock above for $B^0 \to D^{*-}\pi^+$ and $\overline{B}^0 \to D^{*+}\pi^-$.

[1] Measurement based on $B^0 \to J/\psi K^0_S$, $B^0 \to \psi(2S) K^0_S$ with $J/\psi \to \mu^+\mu^-$, $J/\psi \to e^+e^-$ and $\psi(2S) \to \mu^+\mu^-$.

[2] AAIJ 17BN provides the correlation coefficient $\rho = 0.42$ between the uncertainties of $\sin(2\beta)$ and $\cos(2\beta)$ measurements.

[3] Measurement based on $B^0 \to J/\psi K^0_S$, $B^0 \to \psi(2S) K^0_S$, $B^0 \to J/\psi K^0_L$, and $B^0 \to \chi_{c1}(1P) K^0_S$ decays.

[4] SATO 12 uses 121 fb$^{-1}$ data collected on $\Upsilon(5S)$ resonance. Uses the "$B-\pi$ tagging" where $B\pi^+$ and $B\pi^-$ tagged $J/\psi K^0_S$ events are compared.

[5] Uses Dalitz plot analysis of $B^0 \to K^0\pi^+\pi^-$ decays and the first of two equivalent solutions.

[6] Measurement based on $B^0 \to c\overline{c}K(*)0$ decays.

[7] Measurement in which the $J/\psi$ decays to hadrons or to muons that do not satisfy the standard identification criteria.

[8] AFFOLDER 00C uses about 400 $B^0 \to J/\psi(1S) K^0_S$ events. The production flavor of $B^0$ was determined using three tagging algorithms: a same-side tag, a jet-charge tag, and a soft-lepton tag.

[9] BARATE 00Q uses 23 candidates for $B^0 \to J/\psi(1S) K^0_S$ decays. A combination of jet-charge, vertex-charge, and same-side tagging techniques were used to determine the $B^0$ production flavor.

[10] ACKERSTAFF 98Z uses 24 candidates for $B^0_d \to J/\psi(1S) K^0_S$ decay. A combination of jet-charge and vertex-charge techniques were used to tag the $B^0_d$ production flavor.

[11] Based on $B^0 \to \psi(2S) K^0_S$ decays.

[12] Measurement based on $152 \times 10^6$ $B\overline{B}$ pairs.

[13] Measurement based on $227 \times 10^6$ $B\overline{B}$ pairs.

[14] ABE 02U result is based on the same analysis and data sample reported in ABE 01G.

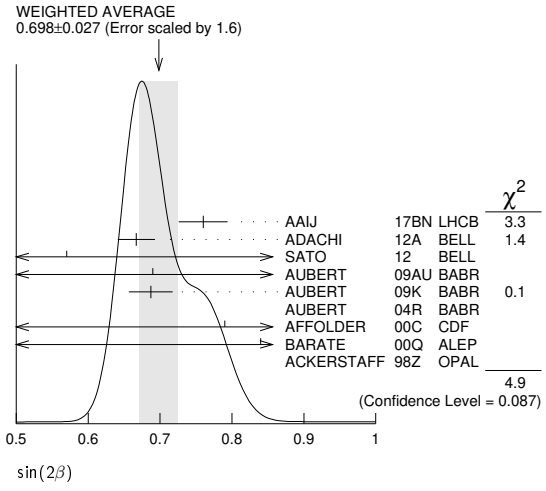
[15] ABE 02Z result is based on $85 \times 10^6$ $B\overline{B}$ pairs.

[16] AUBERT 02N result based on the same analysis and data sample reported in AUBERT 01B.

[17] AUBERT 02P result is based on $88 \times 10^6$ $B\overline{B}$ pairs.

[18] First observation of $CP$ violation in $B^0$ meson system.

[19] ABE 98U uses $198 \pm 17$ $B^0_d \to J/\psi(1S) K^0$ events. The production flavor of $B^0$ was determined using the same side tagging technique.



## $C_{J/\psi(nS)K^0}$ ($B^0 \to J/\psi(nS)K^0$)

[1] Measurement based on $B^0 \to J/\psi K^0_S$, $B^0 \to \psi(2S) K^0_S$ with $J/\psi \to \mu^+\mu^-$, $J/\psi \to e^+e^-$ and $\psi(2S) \to \mu^+\mu^-$.

[2] AAIJ 17BN provides the correlation coefficient $\rho = 0.42$ between the uncertainties of $S_{J/\psi(nS)K^0}$ ($B^0 \to J/\psi(nS)K^0$) and $C_{J/\psi(nS)K^0}$ ($B^0 \to J/\psi(nS)K^0$) measurements.

[3] Uses $B^0 \to J/\psi K^0_S$ decays.

[4] The paper reports $A$, which is equal to $-C$.

[5] Uses $B^0 \to \psi(2S) K^0_S$ decays.

[6] Uses $B^0 \to J/\psi K^0_L$ decays.

[7] Measurement based on $B^0 \to J/\psi K^0_S$ with $J/\psi \to \mu^+\mu^-$ and $J/\psi \to e^+e^-$.

[8] Measurement based on $B^0 \to \psi(2S) K^0_S$ with $\psi(2S) \to \mu^+\mu^-$.

[9] AAIJ 15N uses 41,560 flavor-tagged $B_d \to J/\psi K^0_S$ events from 3 fb$^{-1}$ of integrated luminosity. Provides the correlation coefficient $\rho = 0.483$ between the statistical uncertainties of and measurements.

[10] AAIJ 13K uses 8200 flavor-tagged $B_d \to J/\psi K^0_S$ events from 1 fb$^{-1}$ of integrated luminosity. Provides the correlation coefficient $\rho = 0.42$ between the statistical uncertainties of $S_{J/\psi(nS)K^0}$ ($B^0 \to J/\psi(nS)K^0$) and $C_{J/\psi(nS)K^0}$ ($B^0 \to J/\psi(nS)K^0$) measurements.

## $S_{J/\psi(nS)K^0}$ ($B^0 \to J/\psi(nS)K^0$)

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements.

[1] Measurement based on $B^0 \to J/\psi K^0_S$, $B^0 \to \psi(2S) K^0_S$ with $J/\psi \to \mu^+\mu^-$, $J/\psi \to e^+e^-$ and $\psi(2S) \to \mu^+\mu^-$.

[2] AAIJ 17BN provides the correlation coefficient $\rho = 0.42$ between the uncertainties of $S_{J/\psi(nS)K^0}$ ($B^0 \to J/\psi(nS)K^0$) and $C_{J/\psi(nS)K^0}$ ($B^0 \to J/\psi(nS)K^0$) measurements.

[3] Uses $B^0 \to J/\psi K^0_S$ decays.

[4] Based on $B^0 \to \psi(2S) K^0_S$ decays.

[5] Uses $B^0 \to J/\psi K^0_L$ decays.

[6] SATO 12 uses 121 fb$^{-1}$ data collected at $\Upsilon(5S)$ resonance. Uses the "$B-\pi$ tagging" where $B\pi^+$ and $B\pi^-$ tagged $J/\psi K^0_S$ events are compared.

[7] AFFOLDER 00C uses about 400 $B^0 \to J/\psi(1S) K^0_S$ events. The production flavor of $B^0$ was determined using three tagging algorithms: a same-side tag, a jet-charge tag, and a soft-lepton tag.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[8] BARATE 00Q uses 23 candidates for $B^0 \to J/\psi(1S)K^0_S$ decays. A combination of jet-charge, vertex-charge, and same-side tagging techniques were used to determine the $B^0$ production flavor.
[9] ACKERSTAFF 98Z uses 24 candidates for $B^0_d \to J/\psi(1S)K^0_S$ decay. A combination of jet-charge and vertex-charge techniques were used to tag the $B^0_d$ production flavor.
[10] Measurement based on $B^0 \to J/\psi K^0_S$ with $J/\psi \to \mu^+\mu^-$ and $J/\psi \to e^+e^-$.
[11] Measurement based on $B^0 \to \psi(2S)K^0_S$ with $\psi(2S) \to \mu^+\mu^-$.
[12] AAIJ 15N uses 41,560 flavor-tagged $B_d \to J/\psi K^0_S$ events from 3 fb$^{-1}$ of integrated luminosity. Provides the correlation coefficient $\rho = 0.483$ between the statistical uncertainties of and measurements.
[13] AAIJ 13K uses 8200 flavor-tagged $B_d \to J/\psi K^0_S$ events from 1 fb$^{-1}$ of integrated luminosity. Provides the correlation coefficient $\rho = 0.42$ between the statistical uncertainties of $S_{J/\psi(\mathrm{nS})K^0}$ ($B^0 \to J/\psi(\mathrm{nS})K^0$) and $C_{J/\psi(\mathrm{nS})K^0}$ ($B^0 \to J/\psi(\mathrm{nS})K^0$) measurements.
[14] Combined result of CHEN 07 and SAHOO 08.

[1] Based on an isospin analysis of the $B \to \rho\rho$ system.
[2] Obtained using the time dependent analysis of $B^0 \to a_1(1260)^\pm\pi^\mp$ and branching fraction measurements of $B \to a_1(1260)K$ and $B \to K_1\pi$. Uses SU(3) flavor relations.
[3] The angle $\alpha_{\rm eff}$ is obtained using the measured *CP* parameters of $B^0 \to a_1(1260)^\pm\pi^\mp$ and choosing one of the four solutions that is compatible with the result of SM-based fits.
[4] Obtained using isospin relation and selecting a solution closest to the CKM best fit average; the 90% CL allowed interval is $59^\circ < \phi_2\ (\equiv\alpha) < 115^\circ$.
[5] Obtained using isospin relation and selecting a solution closest to the CKM best fit average; 90% CL allowed interval is $79^\circ < \alpha < 123^\circ$.
[6] Obtained from the measured *CP* parameters of the longitudinal polarization by selecting the solution closest to the CKM best fit central value of $\alpha = 95^\circ - 98^\circ$.

## *CP* VIOLATION PARAMETERS IN $B^0 \to D^0K^{*0}$ DECAY

The parameters $r_{B^0}$ and $\delta_{B^0}$ are the magnitude ratio and strong phase difference between the amplitudes of $A(B^0 \to D^0K^{*0})$ and $A(B^0 \to \overline{D}^0K^{*0})$. The measured observables and are defined as $x_\pm = r_{B^0}\cos(\delta_{B^0} \pm \gamma)$ and $y_\pm = r_{B^0}\sin(\delta_{B^0} \pm \gamma)$ where $\gamma$ is the CKM angle $\gamma$.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV). The CKM angle $\gamma$ is listed in the $B^+$ section for "*CP* VIOLATION PARAMETERS IN $B^+ \to DK^+$ AND SIMILAR DECAYS."

## *T* and *CPT* VIOLATION PARAMETERS

Measured values of the *T*-, *CP*-, and *CPT*-asymmetry parameters, defined as the differences in $S^\pm_{\alpha,\beta}$ and $C^\pm_{\alpha,\beta}$ between symmetry-transformed transitions. The indices $\alpha = \ell^+$, $\ell^-$ and $\beta = K^0_S$, $K^0_L$ stand for reconstructed the flavor final state and the *CP* final states from $\Upsilon(4S)$ decay. The sign $\pm$ indicates whether the decay to the flavor final state $\alpha$ occurs before or after the decay to the *CP* final state.

Alternatively, violations of *CPT* symmetry and Lorentz invariance are searched for by studying interference effects in $B^0$ mixing. Results are expressed in terms of the standard model extension parameter $\Delta a$, which describes the difference between the couplings of the valence quarks within $B^0$ meson with the Lorentz-violating fields.

|---|---|---|---|---|
| **4.02±0.44±0.31** | [1,2] AAIJ | 16AP | LHCB | $pp$ at 7, 8 TeV |

[1] Measured the differential branching fraction and angular moments of the decay $B^0 \to K^+\pi^-\mu^+\mu^-$ in the $K^+\pi^-$ invariant mass range 1330 < m($K^+\pi^-$) < 1530 MeV/$c^2$.
[2] The reported value is converted from the measured $dB/dq^2 = (0.82 \pm 0.09 \pm 0.063) \times 10^{-8}$ (GeV$^2/c^4)^{-1}$ by multiplying by the $\Delta q^2 = 4.9$ GeV$^2/c^4$ range.

### $F_H$($B^0 \to K^0\mu^+\mu^-$) (1.1 < $q^2$ < 6.0 GeV$^2/c^4$)

$F_H$ is a fractional contribution of (pseudo) scalar and tensor amplitudes to the decay width in the massless muon approximation.

# $B^\pm/B^0$ ADMIXTURE

## $B$ DECAY MODES

The branching fraction measurements are for an admixture of $B$ mesons at the $\Upsilon(4S)$. The values quoted assume that $\mathrm{B}(\Upsilon(4S) \to B\overline{B}) = 100\%$.

For inclusive branching fractions, *e.g.*, $B \to D^\pm$ *anything*, the treatment of multiple $D$'s in the final state must be defined. One possibility would be to count the number of events with one-or-more $D$'s and divide by the total number of $B$'s. Another possibility would be to count the total number of $D$'s and divide by the total number of $B$'s, which is the definition of average multiplicity. The two definitions are identical if only one $D$ is allowed in the final state. Even though the "one-or-more" definition seems sensible, for practical reasons inclusive branching fractions are almost always measured using the multiplicity definition. For heavy final state particles, authors call their results inclusive branching fractions while for light particles some authors call their results multiplicities. In the $B$ sections, we list all results as inclusive branching fractions, adopting a multiplicity definition. This means that inclusive branching fractions can exceed 100% and that inclusive partial widths can exceed total widths, just as inclusive cross sections can exceed total cross section.

$\overline{B}$ modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing.

| | Mode | Fraction ($\Gamma_i/\Gamma$) | Scale factor/ Confidence level |
|---|---|---|---|
| | **Semileptonic and leptonic modes** | | |
| $\Gamma_1$ | $e^+\nu_e$ anything | [a] | |
| $\Gamma_2$ | $\mu^+\nu_\mu$ anything | [a] | |
| $\Gamma_3$ | $\ell^+\nu_\ell$ anything | [a,b] | ( 10.86 ± 0.16 ) % |
| $\Gamma_4$ | $D^-\ell^+\nu_\ell$ anything | [b] | ( 2.6 ± 0.5 ) % |
| $\Gamma_5$ | $\overline{D}^0\ell^+\nu_\ell$ anything | [b] | ( 7.3 ± 1.5 ) % |
| $\Gamma_6$ | $\overline{D}\ell^+\nu_\ell$ | | ( 2.42 ± 0.12 ) % |
| $\Gamma_7$ | $D^{*-}\ell^+\nu_\ell$ anything | [c] | ( 6.7 ± 1.3 ) $\times 10^{-3}$ |
| $\Gamma_8$ | $D^{*0}\ell^+\nu_\ell$ anything | | |
| $\Gamma_9$ | $\overline{D}^*\ell^+\nu_\ell$ | [d] | ( 4.95 ± 0.11 ) % |
| $\Gamma_{10}$ | $\overline{D}^{**}\ell^+\nu_\ell$ | [b,e] | ( 2.7 ± 0.7 ) % |

[a] These values are model dependent.

[b] An $\ell$ indicates an $e$ or a $\mu$ mode, not a sum over these modes.

[c] Here "anything" means at least one particle observed.

[d] This is a B($B^0 \to D^{*-}\ell^+\nu_\ell$) value.

[e] $D^{**}$ stands for the sum of the $D(1\,^1P_1)$, $D(1\,^3P_0)$, $D(1\,^3P_1)$, $D(1\,^3P_2)$, $D(2\,^1S_0)$, and $D(2\,^1S_1)$ resonances.

[f] The value is for the sum of the charge states or particle/antiparticle states indicated.

[g] $D^{(*)}\overline{D}^{(*)}$ stands for the sum of $D^*\overline{D}^*$, $D^*\overline{D}$, $D\overline{D}^*$, and $D\overline{D}$.

[h] $X(3915)$ denotes a near-threshold enhancement in the $\omega J/\psi$ mass spectrum.

[i] Inclusive branching fractions have a multiplicity definition and can be greater than 100%.

## $B^{\pm}/B^0$ ADMIXTURE BRANCHING RATIOS

### $\Gamma(\ell^+\nu_\ell \text{anything})/\Gamma_{\text{total}}$ $\Gamma_3/\Gamma$

These branching fraction values are model dependent.

"OUR EVALUATION" assumes lepton universality and is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements.

[1] LEES 17B measurement is obtained from semileptonic decays to electrons. The result is averaged over $B^{\pm}$ and $B^0$ mesons, assuming lepton universality.

[2] URQUIJO 07 report a measurement of (10.07 ± 0.18 ± 0.21)% for the partial branching fraction of $B \to e\nu_e X_c$ decay with electron energy above 0.6 GeV. We converted the result to $B \to e\nu_e X$ branching fraction.

[3] Uses charge and angular correlations in $\Upsilon(4S)$ events with a high-momentum lepton and an additional electron.

[4] ALBRECHT 93H analysis performed using tagged semileptonic decays of the $B$. This technique is almost model independent for the lepton branching ratio.

[5] The measurements are obtained for charged and neutral $B$ mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the $B$ rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV: B($B^+ \to e^+\nu_e X$) / B($B^0 \to e^+\nu_e X$) = 1.074 ± 0.041 ± 0.026.

[6] The measurements are obtained for charged and neutral $B$ mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the $B$ rest frame, and their ratio of B($B^+ \to e^+\nu_e X$)/B($B^0 \to e^+\nu_e X$) = 1.08 ± 0.05 ± 0.02.

[7] The semileptonic branching ratio, $|V_{cb}|$ and other heavy-quark parameters are determined from a simultaneous fit to moments of the hadronic-mass and lepton-energy distribution.

[8] Uses the high-momentum lepton tag method and requires the electron energy above 0.6 GeV.

[9] Uses the high-momentum lepton tag method. They also report $|V_{cb}| = 0.0423 \pm 0.0007(\text{exp}) \pm 0.0020(\text{theo.})$.

[10] Uses the high-momentum lepton tag method. ABE 02Y also reports $|V_{cb}| = 0.0408 \pm 0.0010(\text{exp}) \pm 0.0025(\text{theo.})$. The second error is due to uncertainties of theoretical inputs.

[11] BARISH 96B analysis performed using tagged semileptonic decays of the $B$. This technique is almost model independent for the lepton branching ratio.

[12] HENDERSON 92 measurement employs $e$ and $\mu$. The systematic error contains 0.004 in quadrature from model dependence. The authors average a variation of the Isgur, Scora, Grinstein, and Wise model with that of the Altarelli-Cabibbo-Corbò-Maiani-Martinelli model for semileptonic decays to correct the acceptance.

[13] YANAGISAWA 91 also measures an average semileptonic branching ratio at the $\Upsilon(5S)$ of 9.6–10.5% depending on assumptions about the relative production of different $B$ meson species.

[14] ALBRECHT 90H uses the model of ALTARELLI 82 to correct over all lepton momenta. 0.099 ± 0.006 is obtained using ISGUR 89B.

[15] ALBRECHT 90H uses the model of ALTARELLI 82 to correct over all lepton momenta. 0.097 ± 0.006 is obtained using ISGUR 89B.

[16] Using data above $p(e) = 2.4$ GeV, WACHS 89 determine $\sigma(B \to e\nu\text{up})/\sigma(B \to e\nu\text{charm}) < 0.065$ at 90% CL.

[17] Ratio $\sigma(b \to e\nu\text{up})/\sigma(b \to e\nu\text{charm}) < 0.055$ at CL = 90%.

[1] The measurement is obtained from semileptonic decays to electrons $B \to X e\nu$, and using a theoretical model (GAMBINO 07, GAMBINO 11) to predict the contribution from $B \to X_u e\nu$. The result is averaged over $B^\pm$ and $B^0$ mesons, assuming lepton universality.

[2] Measured the independent $B^+$ and $B^0$ partial branching fractions with electron energy above 0.4 GeV.

[3] Obtained from a combined fit to the moments of observed spectra in inclusive $B \to X_c\ell^+\nu_\ell$ decay.

[4] The semileptonic branching ratio, $|V_{cb}|$ and other heavy-quark parameters are determined from a simultaneous fit to moments of the hadronic-mass and lepton-energy distribution.

[1] Obtained from the partial rate $\Delta B = (1.554 \pm 0.082^{+0.095}_{-0.086}) \times 10^{-3}$ for the electron momentum interval of 0.8–2.7 GeV/c based on GGOU1 method ($X_c\ell\nu$, $m_c$ constraint fit of SF parameters).

[2] Measures several partial branching fractions in different phase space regions. The most precise result on the full branching fraction is obtained in the region for lepton momentum in $B$ rest frame $p_\ell^* > 1$ GeV/c, where the measured partial branching fraction is $\Delta B = (1.80 \pm 0.13 \pm 0.15) \times 10^{-3}$. The acceptance in that region is reported in a private communication by the Authors to be 0.894. The corresponding $|V_{ub}|$ from the BLNP method is $(4.28 \pm 0.15 \pm 0.18 \pm 0.19) \times 10^{-3}$, where the last uncertainty comes from theoretical prediction.

[3] Determined from the partial rate $\Delta B = (4.41 \pm 0.42 \pm 0.42) \times 10^{-4}$ measured for electron energy > 2 GeV and hadronic mass squared < 3.5 GeV$^2$, and calculated acceptance 0.174 in that region. The $V_{ub}$ is measured as $(4.41 \pm 0.30^{+0.65}_{-0.47} \pm 0.28) \times 10^{-3}$.

[4] Uses electrons in the momentum interval 1.9–2.6 GeV/c in the center-of-mass frame. The $V_{ub}$ is found to be $(5.08 \pm 0.47^{+0.49}_{-0.48}) \times 10^{-3}$.

[5] BORNHEIM 02 uses the observed yield of leptons from semileptonic $B$ decays in the end-point momentum interval 2.2–2.6 GeV/c with recent CLEO-2 data on $B \to X_s\gamma$. The $V_{ub}$ is found to be $(4.08 \pm 0.34 \pm 0.53) \times 10^{-3}$.

[6] Uses a multivariate analysis method and requires lepton momentum in the $B$ rest frame, $p_l^{*B} > 1.0$ GeV/c.

[7] Measures several partial branching fractions in different phase space regions. The most precise result is obtained in the region for hadronic mass $M_X < 1.55$ GeV/c$^2$, and is $\Delta B = (1.18 \pm 0.09 \pm 0.07) \times 10^{-3}$. The corresponding $|V_{ub}|$ from the BLNP method

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

is $(4.27 \pm 0.16 \pm 0.13 \pm 0.30) \times 10^{-3}$, where the last uncertainty comes from the theoretical prediction of the partial rate in the given phase-space region.

[8] Obtained from the partial rate $\Delta B = (0.572 \pm 0.041 \pm 0.065) \times 10^{-3}$ for the electron momentum interval of 2.0–2.6 GeV/c based on BLNP method.

[9] Used BaBar measurement of Semileptonic branching fraction $B(B \to X \ell \nu_\ell) = (10.87 \pm 0.18 \pm 0.30)\%$ to convert the ratio of rates to branching fraction.

[10] The third error includes the systematics and theoretical errors summed in quadrature.

## $\Gamma(X_u \ell^+ \nu_\ell)/\Gamma(\ell^+ \nu_\ell \text{anything})$ $\Gamma_{23}/\Gamma_3$

$\ell$ denotes $e$ or $\mu$, not the sum. These experiments measure this ratio in very limited momentum intervals.

| <4.0 | 90 | | [7] BEHRENDS | 87 | CLEO | $e^+e^- \to \Upsilon(4S)$ |
| <4.0 | 90 | | CHEN | 84 | CLEO | Direct $e$ at $\Upsilon(4S)$ |
| <5.5 | 90 | | KLOPFEN... | 83B | CUSB | Direct $e$ at $\Upsilon(4S)$ |

[1] The third error includes the systematics and theoretical errors summed in quadrature.

[2] ALBRECHT 94C find $\Gamma(b \to c)/\Gamma(b \to \text{all}) = 0.99 \pm 0.02 \pm 0.04$.

[3] BARTELT 93B (CLEO II) measures an excess of $107 \pm 15 \pm 11$ leptons in the lepton momentum interval 2.3–2.6 GeV/$c$ which is attributed to $b \to u \ell \nu_\ell$. This corresponds to a model-dependent partial branching ratio $\Delta B_{ub}$ between $(1.15 \pm 0.16 \pm 0.15) \times 10^{-4}$, as evaluated using the KS model (KOERNER 88), and $(1.54 \pm 0.22 \pm 0.20) \times 10^{-4}$ using the ACCMM model (ARTUSO 93). The corresponding values of $|V_{ub}|/|V_{cb}|$ are $0.056 \pm 0.006$ and $0.076 \pm 0.008$, respectively.

[4] ALBRECHT 91C result supersedes ALBRECHT 90. Two events are fully reconstructed providing evidence for the $b \to u$ transition. Using the model of ALTARELLI 82, they obtain $|V_{ub}/V_{cb}| = 0.11 \pm 0.012$ from 77 leptons in the 2.3–2.6 GeV momentum range.

[5] ALBRECHT 90 observes $41 \pm 10$ excess $e$ and $\mu$ (lepton) events in the momentum interval $p = 2.3$–2.6 GeV signaling the presence of the $b \to u$ transition. The events correspond to a model-dependent measurement of $|V_{ub}/V_{cb}| = 0.10 \pm 0.01$.

[6] FULTON 90 observe $76 \pm 20$ excess $e$ and $\mu$ (lepton) events in the momentum interval $p = 2.4$–2.6 GeV signaling the presence of the $b \to u$ transition. The average branching ratio, $(1.8 \pm 0.4 \pm 0.3) \times 10^{-4}$, corresponds to a model-dependent measurement of approximately $|V_{ub}/V_{cb}| = 0.1$ using $B(b \to c \ell \nu) = 10.2 \pm 0.2 \pm 0.7\%$.

[7] The quoted possible limits range from 0.018 to 0.04 for the ratio, depending on which model or momentum range is chosen. We select the most conservative limit they have calculated. This corresponds to a limit on $|V_{ub}|/|V_{cb}| < 0.20$. While the endpoint technique employed is more robust than their previous results in CHEN 84, these results do not provide a numerical improvement in the limit.

[1] GIBBONS 97B reports $B(B \to D^*(2010)^+\,\text{anything}) = 0.239 \pm 0.015 \pm 0.014 \pm 0.009$ using CLEO measured $D$ and $D^*$ branching fractions. We rescale to our PDG 96 values of $D$ and $D^*$ branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] ALBRECHT 96D reports $B(B \to D^*(2010)^+\,\text{anything})$ 0.196 ± 0.019 using CLEO measured $B(D^*(2010)^+ \to D^0\pi^+) = 0.681 \pm 0.01 \pm 0.013$, $B(D^0 \to K^-\pi^+) = 0.0401 \pm 0.0014$, $B(D^0 \to K^-\pi^+\pi^+\pi^-) = 0.081 \pm 0.005$., We rescale to our PDG 96 values of $D$ and $D^*$ branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] BORTOLETTO 92 reports $B(B \to D^*(2010)^+\,\text{anything}) = 0.25 \pm 0.03 \pm 0.04$ using MARK II $B(D^*(2010)^+ \to D^0\pi^+) = 0.57 \pm 0.06$ and $B(D^0 \to K^-\pi^+) = 0.042 \pm 0.008$. We rescale to our PDG 96 values of $D$ and $D^*$ branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] ALBRECHT 91H reports $0.348 \pm 0.060 \pm 0.035$ from a measurement of $[\Gamma(B \to D^*(2010)^{\pm}\,\text{anything})/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \to D^0\pi^+)]$ assuming $B(D^*(2010)^+ \to D^0\pi^+) = 0.55 \pm 0.04$, which we rescale to our best value $B(D^*(2010)^+ \to D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Uses the PDG 90 $B(D^0 \to K^-\pi^+) = 0.0371 \pm 0.0025$.

[5] BORTOLETTO 87 uses old MARK III (BALTRUSAITIS 86E) branching ratios $B(D^0 \to K^-\pi^+) = 0.056 \pm 0.004 \pm 0.003$ and also assumes $B(D^*(2010)^+ \to D^0\pi^+) = 0.60^{+0.08}_{-0.15}$. The product branching ratio for $B(B \to D^*(2010)^+)\,B(D^*(2010)^+ \to D^0\pi^+)$ is $0.13 \pm 0.02 \pm 0.012$. Superseded by BORTOLETTO 92.

[6] $V-A$ momentum spectrum used to extrapolate below $p = 1$ GeV. We correct the value assuming $B(D^0 \to K^-\pi^+) = 0.042 \pm 0.006$ and $B(D^{*+} \to D^0\pi^+) = 0.6^{+0.08}_{-0.15}$. The product branching fraction is $B(B \to D^{*+}X) \cdot B(D^{*+} \to \pi^+ D^0) \cdot B(D^0 \to K^-\pi^+) = (68 \pm 15 \pm 9) \times 10^{-4}$.

[1] ARTUSO 05B reports $0.0905 \pm 0.0025 \pm 0.0140$ from a measurement of $[\Gamma(B \to D_s^{\pm}\,\text{anything})/\Gamma_{\text{total}}] \times [B(D_s^+ \to \phi\pi^+)]$ assuming $B(D_s^+ \to \phi\pi^+) = (4.4 \pm 0.5) \times 10^{-2}$, which we rescale to our best value $B(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] AUBERT 02G reports $[\Gamma(B \to D_s^{\pm}\,\text{anything})/\Gamma_{\text{total}}] \times [B(D_s^+ \to \phi\pi^+)] = 0.00393 \pm 0.00007 \pm 0.00021$ which we divide by our best value $B(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] ALBRECHT 92G reports $[\Gamma(B \to D_s^{\pm}\,\text{anything})/\Gamma_{\text{total}}] \times [B(D_s^+ \to \phi\pi^+)] = 0.00292 \pm 0.00039 \pm 0.00031$ which we divide by our best value $B(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] BORTOLETTO 90 reports $[\Gamma(B \to D_s^{\pm}\,\text{anything})/\Gamma_{\text{total}}] \times [B(D_s^+ \to \phi\pi^+)] = 0.00306 \pm 0.00047$ which we divide by our best value $B(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[5] HAAS 86 reports $[\Gamma(B \to D_s^{\pm}\,\text{anything})/\Gamma_{\text{total}}] \times [B(D_s^+ \to \phi\pi^+)] = 0.0038 \pm 0.0010$ which we divide by our best value $B(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. 64 ± 22% decays are 2-body.

[6] GIBAUT 96 reports $0.1211 \pm 0.0039 \pm 0.0088$ from a measurement of $[\Gamma(B \to D_s^{\pm}\,\text{anything})/\Gamma_{\text{total}}] \times [B(D_s^+ \to \phi\pi^+)]$ assuming $B(D_s^+ \to \phi\pi^+) = 0.035$, which we rescale to our best value $B(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[7] ALBRECHT 87H reports $[\Gamma(B \to D_s^{\pm}\,\text{anything})/\Gamma_{\text{total}}] \times [B(D_s^+ \to \phi\pi^+)] = 0.0042 \pm 0.0009 \pm 0.0006$ which we divide by our best value $B(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. 46 ± 16% of $B \to D_s X$ decays are 2-body. Superseded by ALBRECHT 92G.

[1] AUBERT 03F also reports the momentum distribution and helicity of $J/\psi \to \ell^+\ell^-$ in the $\Upsilon(4S)$ center-of-mass frame.

[2] MASCHMANN 90 reports $(1.12 \pm 0.33 \pm 0.25) \times 10^{-2}$ from a measurement of $[\Gamma(B \to J/\psi(1S)\text{anything})/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] ALBRECHT 87D reports $(1.07 \pm 0.16 \pm 0.22) \times 10^{-2}$ from a measurement of $[\Gamma(B \to J/\psi(1S)\text{anything})/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. ALBRECHT 87D find the branching ratio for $J/\psi$ not from $\psi(2S)$ to be 0.0081 ± 0.0023.

[4] ALAM 86 reports $(1.09 \pm 0.16 \pm 0.21) \times 10^{-2}$ from a measurement of $[\Gamma(B \to J/\psi(1S)\text{anything})/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to \mu^+\mu^-)]$ assuming $B(J/\psi(1S) \to \mu^+\mu^-) = 0.074 \pm 0.012$, which we rescale to our best value $B(J/\psi(1S) \to \mu^+\mu^-) = (5.961 \pm 0.033) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[5] BALEST 95B reports $(1.12 \pm 0.04 \pm 0.06) \times 10^{-2}$ from a measurement of $[\Gamma(B \to J/\psi(1S)\text{anything})/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to e^+e^-)]$ assuming $B(J/\psi(1S) \to e^+e^-) = 0.0599 \pm 0.0025$, which we rescale to our best value $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. They measure $J/\psi(1S) \to e^+e^-$ and $\mu^+\mu^-$ and use PDG 1994 values for the branching fractions. The rescaling is the same for either mode so we use $e^+e^-$.

[6] Statistical and systematic errors were added in quadrature. ALBRECHT 85H also report a CL = 90% limit of 0.007 for $B \to J/\psi(1S) + X$ where $m_X < 1$ GeV.

[7] Dimuon and dielectron events used.

[1] AUBERT 03F also reports the helicity of $J/\psi \to \ell^+\ell^-$ produced directly in $B$ decay.

[2] Also reports the measurement of $J/\psi \to \ell^+\ell^-$ polarization produced directly from B decay.

[3] BALEST 95B assume PDG 1994 values for sub mode branching ratios. $J/\psi(1S)$ mesons are reconstructed in $J/\psi(1S) \to e^+e^-$ and $J/\psi(1S) \to \mu^+\mu^-$. The $B \to J/\psi(1S)X$ branching ratio contains $J/\psi(1S)$ mesons directly from $B$ decays and also from feeddown through $\psi(2S) \to J/\psi(1S)$, $\chi_{c1}(1P) \to J/\psi(1S)$, or $\chi_{c2}(1P) \to J/\psi(1S)$. Using the measured inclusive rates, BALEST 95B corrects for the feeddown and finds the $B \to J/\psi(1S)$ (direct) X branching ratio.

[1] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[2] ABE 02L uses PDG 01 values for $B(J/\psi(1S) \to \ell^+\ell^-)$ and $B(\chi_{c1,c2} \to J/\psi(1S)\gamma)$.

[3] CHEN 01 reports $0.00414 \pm 0.00031 \pm 0.00040$ from a measurement of $[\Gamma(B \to \chi_{c1}(1P)\text{anything})/\Gamma_{\text{total}}] \times [B(\chi_{c1}(1P) \to \gamma J/\psi(1S))]$ assuming $B(\chi_{c1}(1P) \to \gamma J/\psi(1S)) = 0.273 \pm 0.016$, which we rescale to our best value $B(\chi_{c1}(1P) \to \gamma J/\psi(1S)) = (34.3 \pm 1.0) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[4] BALEST 95B assume $B(\chi_{c1}(1P) \to J/\psi(1S)\gamma) = (27.3 \pm 1.6) \times 10^{-2}$, the PDG 1994 value. Fit to $\psi$-photon invariant mass distribution allows for a $\chi_{c1}(1P)$ and a $\chi_{c2}(1P)$ component.

[5] ALBRECHT 92E assumes no $\chi_{c2}(1P)$ production.

### $\Gamma(\chi_{c1}(1P)(\text{direct})\,\text{anything})/\Gamma_{\text{total}}$ $\Gamma_{52}/\Gamma$

[1] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[2] CHEN 01 reports $0.00383 \pm 0.00031 \pm 0.00040$ from a measurement of $[\Gamma(B \to \chi_{c1}(1P)(\text{direct})\ \text{anything})/\Gamma_{\text{total}}] \times [B(\chi_{c1}(1P) \to \gamma J/\psi(1S))]$ assuming $B(\chi_{c1}(1P) \to \gamma J/\psi(1S)) = 0.273 \pm 0.016$, which we rescale to our best value $B(\chi_{c1}(1P) \to \gamma J/\psi(1S)) = (34.3 \pm 1.0) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

[3] ABE 02L uses PDG 01 values for $B(J/\psi(1S) \to \ell^+\ell^-)$ and $B(\chi_{c1,c2} \to J/\psi(1S)\gamma)$.

[4] BALEST 95B assume PDG 1994 values. $J/\psi(1S)$ mesons are reconstructed in the $e^+e^-$ and $\mu^+\mu^-$ modes. The $B \to \chi_{c1}(1P)$X branching ratio contains $\chi_{c1}(1P)$ mesons directly from $B$ decays and also from feeddown through $\psi(2S) \to \chi_{c1}(1P)\gamma$. Using the measured inclusive rates, BALEST 95B corrects for the feeddown and finds the $B \to \chi_{c1}(1P)(\text{direct})$ X branching ratio.

| seen | [3] GIANNINI | 82 | CUSB | $e^+e^- \to \Upsilon(4S)$ |

[1] ALBRECHT 93I value is not independent of the sum of $B \to K^+$ anything and $B \to K^-$ anything ALBRECHT 94C values.

[2] Assuming $\Upsilon(4S) \to B\overline{B}$, a total of $3.38 \pm 0.34 \pm 0.68$ kaons per $\Upsilon(4S)$ decay is found (the second error is systematic). In the context of the standard $B$-decay model, this leads to a value for ($b$-quark $\to$ $c$-quark)/($b$-quark $\to$ all) of $1.09 \pm 0.33 \pm 0.13$.

[3] GIANNINI 82 at CESR-CUSB observed $1.58 \pm 0.35$ $K^0$ per hadronic event much higher than $0.82 \pm 0.10$ below threshold. Consistent with predominant $b \to c$X decay.

[1] We extrapolate the measured value to $E_\gamma > 1.6$ GeV using the method of BUCHMUELLER 06 (average of three theoretical models).

[2] SAITO 15 measured $(3.51 \pm 0.17 \pm 0.33)\times10^{-4}$ using a sum-of-exclusive approach in which 38 of the hadronic final states with $m_{X_s} < 2.8$ GeV/$c^2$ are reconstructed. The cut of minimum photon energy is $E_\gamma > 1.9$ GeV.

[3] Reports $(3.29 \pm 0.19 \pm 0.48)\times10^{-4}$ for $E_\gamma > 1.9$ GeV.

[4] Reports $(3.21 \pm 0.15 \pm 0.29 \pm 0.08)\times10^{-4}$ for $1.8 < E_\gamma < 2.8$ GeV, where the last systematic uncertainty is for model dependency. Results with other cutoffs are also reported.

[5] The measurement reported is $(3.45 \pm 0.15 \pm 0.40)\times10^{-4}$ for $E_\gamma > 1.7$ GeV.

[6] Uses a fully reconstructed $B$ meson as a tag on the recoil side. The measurement reported is $(3.66 \pm 0.85 \pm 0.60)\times10^{-4}$ for $E_\gamma > 1.9$ GeV.

[7] The measurement reported is $(3.21 \pm 0.43^{+0.32}_{-0.29})\times10^{-4}$ for $E_\gamma > 2.0$ GeV.

[8] Measured using sums of seven exclusive final states $B \to X_{d(s)}\gamma$ where $X_{d(s)}$ is a nonstrange (strange) charmless hadronic system in mass range 0.5–2.0 GeV/$c^2$.

[9] Measured using sums of seven exclusive final states $B \to X_{d(s)}\gamma$ where $X_{d(s)}$ is a nonstrange (strange) charmless hadronic system in mass range 0.6–1.8 GeV/$c^2$.

[10] The measurement reported is $(3.67 \pm 0.29 \pm 0.45)\times10^{-4}$ for $E_\gamma > 1.9$ GeV.

[11] The measurement reported is $(3.27 \pm 0.18^{+0.55}_{-0.42})\times10^{-4}$ for $E_\gamma > 1.9$ GeV.

[12] The measurement reported is $(3.55 \pm 0.32 \pm 0.32)\times10^{-4}$ for $E_\gamma > 1.8$ GeV.

[13] ABE 01F reports their systematic errors $(\pm0.42^{+0.50}_{-0.54})\times10^{-4}$, where the second error is due to the theoretical uncertainty. We combine them in quadrature.

| <0.08 | 2 | | [2] ALBRECHT | 95D | ARG | $e^+e^-\to\Upsilon(4S)$ |

[1] COAN 98 uses $D$-$\ell$ correlation.
[2] ALBRECHT 95D use full reconstruction of one $B$ decay as tag. Two candidate events for charmless $B$ decay can be interpreted as either $b\to$ sgluon or $b\to u$ transition. If interpreted as $b\to$ sgluon they find a branching ratio of $\sim 0.026$ or the upper limit quoted above. Result is highly model dependent.

[3] BROWDER 98 search for high momentum $B\to\eta X_s$ between 2.1 and 2.7 GeV/$c$.

### $\Gamma(\eta'\text{ anything})/\Gamma_{\text{total}}$ $\Gamma_{82}/\Gamma$

| VALUE (units $10^{-4}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **4.2±0.9 OUR AVERAGE** | | | | |
| 3.9±0.8±0.9 | [1] AUBERT,B | 04F | BABR | $e^+e^-\to\Upsilon(4S)$ |
| 4.6±1.1±0.6 | [2] BONVICINI | 03 | CLE2 | $e^+e^-\to\Upsilon(4S)$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| $6.2\pm1.6^{+1.3}_{-2.0}$ | [3] BROWDER | 98 | CLE2 | $e^+e^-\to\Upsilon(4S)$ |

[1] AUBERT,B 04F reports branching ratio $B\to\eta' X_s$ for high momentum $\eta'$ between 2.0 and 2.7 GeV/$c$ in the $\Upsilon(4S)$ center-of-mass frame. $X_s$ represents a recoil system consisting of a kaon and zero to four pions.
[2] BONVICINI 03 observed a signal of $61.2\pm13.9$ events in $B\to\eta' X_{nc}$ production for high momentum $\eta'$ between 2.0 and 2.7 GeV/$c$ in the $\Upsilon(4S)$ center-of-mass frame. The $X_{nc}$ denotes "charmless" hadronic states recoiling against $\eta'$. The second error combines systematic and background subtraction uncertainties in quadrature.
[3] BROWDER 98 observed a signal of $39.0\pm11.6$ events in high momentum $B\to\eta' X_s$ production between 2.0 and 2.7 GeV/$c$. The branching fraction is based on the interpretation of $b\to sg$, where the last error includes additional uncertainties due to the color-suppressed $b\to$ backgrounds.

| <11.2 | 90 | [4] ALAM | 87 | CLEO | $e^+e^- \to \Upsilon(4S)$ |

[1] AUBERT 07C reports $0.045 \pm 0.003 \pm 0.012$ from a measurement of $[\Gamma(B \to \Lambda_c^+ / \overline{\Lambda}_c^-\text{ anything})/\Gamma_{\text{total}}] \times [B(\Lambda_c^+ \to pK^-\pi^+)]$ assuming $B(\Lambda_c^+ \to pK^-\pi^+) = (5.0 \pm 1.3) \times 10^{-2}$, which we rescale to our best value $B(\Lambda_c^+ \to pK^-\pi^+) = (6.28 \pm 0.32) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] CRAWFORD 92 result derived from lepton baryon correlations. Assumes all charmed baryons in $B^0$ and $B^{\pm}$ decay are $\Lambda_c$.

[3] ALBRECHT 88E measured $B(B \to \Lambda_c^+ X)\cdot B(\Lambda_c^+ \to pK^-\pi^+) = (0.30\pm0.12\pm0.06)\%$ and used $B(\Lambda_c^+ \to pK^-\pi^+) = (2.2\pm1.0)\%$ from ABRAMS 80 to obtain above number.

[4] Assuming all baryons result from charmed baryons, ALAM 86 conclude the branching fraction is $7.4 \pm 2.9\%$. The limit given above is model independent.

### $\Gamma$(baryons anything)/$\Gamma_{total}$ $\Gamma_{117}/\Gamma$

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.068±0.005±0.003** | [1] ALBRECHT | 92O | ARG | $e^+e^- \to \Upsilon(4S)$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| 0.076±0.014 | [2] ALBRECHT | 89K | ARG | $e^+e^- \to \Upsilon(4S)$ |

[1] ALBRECHT 92O result is from simultaneous analysis of $p$ and $\Lambda$ yields, $p\overline{p}$ and $\Lambda\overline{p}$ correlations, and various lepton-baryon and lepton-baryon-antibaryon correlations. Supersedes ALBRECHT 89K.
[2] ALBRECHT 89K obtain this result by adding their their measurements (5.5 ± 1.6)% for direct protons and (4.2 ± 0.5 ± 0.6)% for inclusive $\Lambda$ production. They then assume (5.5 ± 1.6)% for neutron production and add it in also. Since each $B$ decay has two baryons, they divide by 2 to obtain (7.6 ± 1.4)%.

### $\Gamma(p\overline{p}$ anything)/$\Gamma_{total}$ $\Gamma_{118}/\Gamma$

| **$0.0091\pm0.0121\pm0.0013$** | [1] WATANUKI | 19 | BELL | $e^+e^-\to\Upsilon(4S)$ |

[1] Using a sum-of-exclusive technique with $m_{X_s}<2.8$ GeV/$c^2$.

### $\Delta A_{CP}(B\to K^*\gamma)=A_{CP}(B^+\to K^{*+}\gamma)-A_{CP}(B^0\to K^{*0}\gamma)$

This is the isospin difference of the *CP* asymmetries.

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **$0.024\pm0.028\pm0.005$** | [1] HORIGUCHI | 17 | BELL | $e^+e^-\to\Upsilon(4S)$ |

[1] Uses $B(\Upsilon(4S)\to B^+B^-)=(51.4\pm0.6)\%$ and $B(\Upsilon(4S)\to B^0\overline{B}^0)=(48.6\pm0.6)\%$.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

### $\overline{A}_{CP}(B \to K^*\gamma) = (A_{CP}(B^+ \to K^{*+}\gamma) + A_{CP}(B^0 \to K^{*0}\gamma))/2$

This is the average $CP$ asymmetry.

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| $-0.001 \pm 0.014 \pm 0.003$ | [1] HORIGUCHI | 17 | BELL | $e^+e^- \to \Upsilon(4S)$ |

[1] Uses B($\Upsilon(4S) \to B^+B^-$) = (51.4 ± 0.6)% and B($\Upsilon(4S) \to B^0\overline{B}^0$) = (48.6 ± 0.6)%.

## POLARIZATION IN $B$ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ($L$) or both are transverse and parallel ($\|$) or perpendicular ($\perp$) to each other with the parameters $\Gamma_L/\Gamma$, $\Gamma_\perp/\Gamma$, and the relative phases $\phi_\|$ and $\phi_\perp$. See the definitions in the note on "Polarization in $B$ Decays" review in the $B^0$ Particle Listings.

## LEPTON (HADRON) FORWARD-BACKWARD ASYMMETRY IN $B \to K^{(*)}\ell^+\ell^-$ ($B \to K/\pi h^+h^-$) DECAY

The forward-backward angular asymmetry of the lepton pair in $B \to K^{(*)}\ell^+\ell^-$ ($B \to K/\pi h^+h^-$) decay is defined as

$$A_{FB}(s) = \frac{N(cos\theta>0)-N(cos\theta<0)}{N(cos\theta>0)+N(cos\theta<0)},$$

where $s=q^2/m_B^2$, and $\theta$ is the angle of the $\ell^-$ ($h^-$) with respect to the flight direction of the $B$ meson, measured in the dilepton (dihadron) rest frame. In addition, the fraction of longitudinal polarization $F_L$ of the $K^*$ and $F_S$, the relative contribution from scalar and pseudoscalar penguin amplitudes in $B \to K\ell^+\ell^-$, can be measured from the angular distribution of its decay products.

$A_{FB}(B \to K^* \ell^+ \ell^-)$ $(1.0 < q^2 < 6.0\ \text{GeV}^2/c^4)$

[1] Measured in $1.1 < q^2 < 6.0\ \text{GeV}^2/c^4$.
[2] Measured by combining $B^0$ and $B^+$ with $e$ and $\mu$ as leptons. Results are also provided separately for $B^0$ and $B^+$.
[3] Uses $K^* \to K^-\pi^+$, $K^-\pi^0$, $K^0_S\pi^-$ in the range $M(K\pi) < 1.1\ \text{GeV}/c^2$. Uncertainty is statistical only.

## ISOSPIN ASYMMETRY

$\Delta_{0-}$ is defined as

$$\frac{\Gamma(\overline{B}^0 \to f_d) - \Gamma(B^- \to f_u)}{\Gamma(\overline{B}^0 \to f_d) + \Gamma(B^- \to f_u)},$$

the isospin asymmetry of inclusive neutral and charged B decay.

### $\Delta_{0-}(B(B \to X_s\gamma))$

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|

[1] For $1.1 < q^2 < 6.0$ GeV$^2/c^4$ using $\mu^+\mu^-$ as a lepton pair and assuming isospin symmetry for the $B \to J/\psi(1S)K$. Measurements in other $q^2$ bins are also reported.
[2] For $15.0 < q^2 < 19.0$ GeV$^2/c^4$ using $\mu^+\mu^-$ as a lepton pair and assuming isospin symmetry for the $B \to J/\psi(1S)K$. Measurements in other $q^2$ bins are also reported.
[3] For $0.10 < q^2 < 8.12$ GeV$^2/c^4$. Measurements in other $q^2$ bins are also reported.
[4] For $q^2 < 8.68$ GeV$^2/c^4$.
[5] For $1 < q^2 < 6$ GeV$^2/c^4$.
[6] For $0.1 < m^2_{\ell^+\ell^-} < 7.02$ GeV$^2/c^4$.
[7] Assumes equal production of $B^+$ and $B^0$ at the $\Upsilon(4S)$.

| 2.288±0.025±0.023 | [3] AUBERT,BE | 06B | BABR | Repl. by LEES 12V |

[1] LEES 12U uses $E_\gamma > 1.897$ GeV to calculate the moments; the moments are used to calculate the HQET parameters $m_b = 4.579^{+0.032}_{-0.029}$ GeV/c$^2$ and $\mu_\pi^2 = 0.257^{+0.034}_{-0.039}$ GeV$^2$ in the shape function model. The same HQET parameters are also determined in the kinetic model.
[2] Results for different $E_\gamma$ threshold values are also measured.
[3] The result is for $E_\gamma > 1.9$ GeV.
[4] Uses a fully reconstructed $B$ meson as a tag on the recoil side.

### $\langle E_\gamma^2 \rangle - \langle E_\gamma \rangle^2$

# $B^{\pm}/B^0/B_s^0/b$-baryon ADMIXTURE

## $B^{\pm}/B^0/B_s^0/b$-baryon ADMIXTURE MEAN LIFE

Each measurement of the $B$ mean life is an average over an admixture of various bottom mesons and baryons which decay weakly. Different techniques emphasize different admixtures of produced particles, which could result in a different $B$ mean life.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. This is a weighted average of the lifetimes of the five main $b$-hadron species ($B^+$, $B^0$, $B^0_{sH}$, $B^0_{sL}$, and $\Lambda_b$) that assumes the production fractions in $Z$ decays (given at the end of this section) and equal production fractions of $B^0_{sH}$ and $B^0_{sL}$ mesons.

[1] Measurement performed using an inclusive reconstruction and $B$ flavor identification technique.

[2] Measured using inclusive $J/\psi(1S) \to \mu^+\mu^-$ vertex.

[3] ACCIARRI 98 uses inclusively reconstructed secondary vertex and lepton impact parameter.

[4] ACKERSTAFF 97F uses inclusively reconstructed secondary vertices.

[5] Combines ABREU 96E secondary vertex result with ABREU 94L impact parameter result.

[6] BUSKULIC 96F analyzed using 3D impact parameter.

[7] ABE,K 95B uses an inclusive topological technique.

[8] ABREU 94L uses charged particle impact parameters. Their result from inclusively reconstructed secondary vertices is superseded by ABREU 96E.

[9] From proper time distribution of $b \to J/\psi(1S)$ anything.

[10] ABE 93J analyzed using $J/\psi(1S) \to \mu\mu$ vertices.

[11] ABREU 93D data analyzed using $D/D^*\ell$ anything event vertices.

[12] ABREU 93G data analyzed using charged and neutral vertices.

[13] ACTON 93C analysed using $D/D^*\ell$ anything event vertices.

[14] ACTON 93L and ADRIANI 93K analyzed using lepton ($e$ and $\mu$) impact parameter at $Z$.

[15] BUSKULIC 93O analyzed using dipole method.

[16] ABREU 92 is combined result of muon and hadron impact parameter analyses. Hadron tracks gave $(12.7 \pm 0.4 \pm 1.2) \times 10^{-13}$ s for an admixture of $B$ species weighted by production fraction and mean charge multiplicity, while muon tracks gave $(13.0 \pm 1.0 \pm 0.8) \times 10^{-13}$ s for an admixture weighted by production fraction and semileptonic branching fraction.

[17] ACTON 92 is combined result of muon and electron impact parameter analyses.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

[18] BUSKULIC 92F uses the lepton impact parameter distribution for data from the 1991 run.
[19] BUSKULIC 92G use $J/\psi(1S)$ tags to measure the average $b$ lifetime. This is comparable to other methods only if the $J/\psi(1S)$ branching fractions of the different $b$-flavored hadrons are in the same ratio.
[20] Using $Z \to e^+X$ or $\mu^+X$, ADEVA 91H determined the average lifetime for an admixture of $B$ hadrons from the impact parameter distribution of the lepton.
[21] Using $Z \to J/\psi(1S)X$, $J/\psi(1S) \to \ell^+\ell^-$, ALEXANDER 91G determined the average lifetime for an admixture of $B$ hadrons from the decay point of the $J/\psi(1S)$.
[22] Using $Z \to eX$ or $\mu X$, DECAMP 91C determines the average lifetime for an admixture of $B$ hadrons from the signed impact parameter distribution of the lepton.
[23] HAGEMANN 90 uses electrons and muons in an impact parameter analysis.
[24] LYONS 90 combine the results of the $B$ lifetime measurements of ONG 89, BRAUNSCHWEIG 89B, KLEM 88, and ASH 87, and JADE data by private communication. They use statistical techniques which include variation of the error with the mean life, and possible correlations between the systematic errors. This result is not independent of the measured results used in our average.
[25] We have combined an overall scale error of 15% in quadrature with the systematic error of $\pm 0.7$ to obtain $\pm 2.1$ systematic error.
[26] Statistical and systematic errors were combined by BROM 87.

## CHARGED $b$-HADRON ADMIXTURE MEAN LIFE

| VALUE ($10^{-12}$ s) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|

## $\overline{b}$ PRODUCTION FRACTIONS AND DECAY MODES

The branching fraction measurements are for an admixture of $B$ mesons and baryons at energies above the $\Upsilon(4S)$. Only the highest energy results (LHC, LEP, Tevatron, S$p\overline{p}$S) are used in the branching fraction averages. In the following, we assume that the production fractions are the same at the LHC, LEP, and at the Tevatron.

For inclusive branching fractions, *e.g.*, $B \to D^{\pm}$ anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

The modes below are listed for a $\overline{b}$ initial state. $b$ modes are their charge conjugates. Reactions indicate the weak decay vertex and do not include mixing.

| Mode | Fraction ($\Gamma_i/\Gamma$) | Scale factor/ Confidence level |
|---|---|---|

### PRODUCTION FRACTIONS

The production fractions for weakly decaying $b$-hadrons at high energy have been calculated from the best values of mean lives, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFLAV) as described in the note "$B^0$-$\overline{B}^0$ Mixing" in the $B^0$ Particle Listings. We no longer provide world averages of the $b$-hadron production fractions, where results from LEP, Tevatron and LHC are averaged together; indeed the available data (from CDF and LHCb) shows that the fractions depend on the kinematics (in particular the $p_T$) of the produced $b$ hadron. Hence we would like to list the fractions in $Z$ decays instead, which are well-defined physics observables. The production fractions in $p\overline{p}$ collisions at the Tevatron are also listed at the end of the section. Values assume

$$B(\overline{b} \to B^+) = B(\overline{b} \to B^0)$$
$$B(\overline{b} \to B^+) + B(\overline{b} \to B^0) + B(\overline{b} \to B_s^0) + B(b \to b\text{-baryon}) = 100\%.$$

The correlation coefficients between production fractions are also reported:

$cor(B_s^0, b\text{-baryon}) = 0.064$
$cor(B_s^0, B^{\pm}{=}B^0) = -0.633$
$cor(b\text{-baryon}, B^{\pm}{=}B^0) = -0.813$.

The notation for production fractions varies in the literature ($f_d$, $d_{B^0}$, $f(b \to \overline{B}^0)$, $\mathrm{Br}(b \to \overline{B}^0)$). We use our own branching fraction notation here, $B(\overline{b} \to B^0)$.

Note these production fractions are $b$-hadronization fractions, not the conventional branching fractions of $b$-quark to a $B$-hadron, which may have considerable dependence on the initial and final state kinematic and production environment.

[a] An $\ell$ indicates an $e$ or a $\mu$ mode, not a sum over these modes.

[b] $D_j$ represents an unresolved mixture of pseudoscalar and tensor $D^{**}$ ($P$-wave) states.

[c] The value is for the sum of the charge states or particle/antiparticle states indicated.

[d] Inclusive branching fractions have a multiplicity definition and can be greater than 100%.

| 0.21 ±0.036 $^{+0.038}_{-0.030}$ | [6] ABE | 99P | CDF | $p\overline{p}$ at 1.8 TeV |

[1] AAIJ 19AD measured the average value using $b$-hadron semileptonic decays and assuming isospin symmetry for $b$-hadron $p_T$ of 4 and 25 GeV and $\eta$ of 2 and 5.

[2] AAIJ 12J measured this value using $b$-hadron semileptonic decays and assuming isospin symmetry.

[3] AAIJ 11F measured $f_s/f_d = 0.253 \pm 0.017 \pm 0.017 \pm 0.020$, where the errors are statistical, systematic, and theoretical. We divide their value by 2. Our second error combines systematic and theoretical uncertainties.

[4] AALTONEN 08N reports $[\Gamma(\overline{b} \to B^0_s)/\left[\Gamma(\overline{b} \to B^+) + \Gamma(\overline{b} \to B^0)\right]] \times [\mathrm{B}(D_s^+ \to \phi\pi^+)] = (5.76 \pm 0.18^{+0.45}_{-0.42}) \times 10^{-3}$ which we divide by our best value $\mathrm{B}(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[5] AFFOLDER 00E uses several electron-charm final states in $b \to ce^-$X.

[6] ABE 99P uses the numbers of $K^*(892)^0$, $K^*(892)^+$, and $\phi(1020)$ events produced in association with the double semileptonic decays $b \to c\mu^-$X with $c \to s\mu^+$X.

### $\Gamma(B^0_s)/\Gamma(B^0)$ $\Gamma_3/\Gamma_2$

"OUR EVALUATION" has been provided by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/).

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.246±0.023 OUR EVALUATION** | | | | |
| **0.239±0.016 OUR AVERAGE** | | | | |
| 0.240±0.004±0.020 | [1] AAD | 15CM | ATLS | $pp$ at 7 TeV |
| 0.238±0.004±0.015±0.021 | [2] AAIJ | 13P | LHCB | $pp$ at 7 TeV |

[1] The measurement is derived from the observed $B^0_s \to J/\psi\phi$ and $B^0_d \to J/\psi K^{*0}$ yields and a recent theory prediction of $\mathrm{B}(B^0_s \to J/\psi\phi)/\mathrm{B}(B^0_d \to J/\psi K^{*0})$. The second uncertainty combines in quadrature systematic and theoretical uncertainties.

[2] AAIJ 13P studies also separately the $p_T(B)$ and $\eta(B)$ dependency of $\Gamma(\overline{b} \to B^0_s)/\Gamma(\overline{b} \to B^0)$, finding $f_s/f_d(p_T) = (0.256 \pm 0.020) + (-2.0 \pm 0.6)\ 10^{-3}$ /GeV/c $(p_T - \langle p_T \rangle)$ and $f_s/f_d(\eta) = (0.256 \pm 0.020) + (0.005 \pm 0.006)\ (\eta - \langle\eta\rangle)$, where $\langle p_T \rangle = 10.4$ GeV/c and $\langle\eta\rangle = 3.28$.

[1] Uses the combination of lepton transverse momentum spectrum and the correlation between the charge of the lepton and opposite jet charge. The first error is statistic and the second error is the total systematic error including the modeling.
[2] The experimental systematic and model uncertainties are combined in quadrature.
[3] ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged $Z \to b\overline{b}$ sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.
[4] ACCIARRI 00 result obtained from a combined fit of $R_b = \Gamma(Z \to b\overline{b})/\Gamma(Z \to \text{hadrons})$ and $B(b \to \ell\nu X)$, using double-tagging method.
[5] ACCIARRI 96C result obtained by a fit to the single lepton spectrum.
[6] Assumes Standard Model value for $R_B$.
[7] ABREU 95D give systematic errors ±0.0019 (model) and 0.0012 ($R_c$). We combine these in quadrature.
[8] BUSKULIC 94G uses $e$ and $\mu$ events. This value is from a global fit to the lepton $p$ and $p_T$ (relative to jet) spectra which also determines the $b$ and $c$ production fractions, the fragmentation functions, and the forward-backward asymmetries. This branching ratio depends primarily on the ratio of dileptons to single leptons at high $p_T$, but the lower $p_T$ portion of the lepton spectrum is included in the global fit to reduce the model dependence. The model dependence is ±0.0026 and is included in the systematic error.
[9] ABREU 93C event count includes $ee$ events. Combining $ee$, $\mu\mu$, and $e\mu$ events, they obtain 0.100 ± 0.007 ± 0.007.
[10] AKERS 93B analysis performed using single and dilepton events.

[1] Uses the combination of lepton transverse momentum spectrum and the correlation between the charge of the lepton and opposite jet charge. The first error is statistic and the second error is the total systematic error including the modeling.

[2] The experimental systematic and model uncertainties are combined in quadrature.

[3] ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged $Z\to b\overline{b}$ sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.

[4] ABREU 95D give systematic errors ±0.0033 (model) and 0.0032 ($R_C$). We combine these in quadrature. This result is from the same global fit as their $\Gamma(\overline{b}\to\ell^+\nu_\ell X)$ data.

[5] BUSKULIC 94G uses $e$ and $\mu$ events. This value is from the same global fit as their $\Gamma(\overline{b}\to\ell^+\nu_\ell\text{anything})/\Gamma_{\text{total}}$ data.

[6] AKERS 93B analysis performed using single and dilepton events.

## $\chi_b$ AT HIGH ENERGY

For a discussion of $B$-$\overline{B}$ mixing, see the note on "$B^0$-$\overline{B}^0$ Mixing" in the $B^0$ Particle Listings.

$\chi_b$ is the average $B$-$\overline{B}$ mixing parameter at high-energy $\chi_b = f'_d\chi_d + f'_s\chi_s$ where $f'_d$ and $f'_s$ are the fractions of $B^0$ and $B_s^0$ hadrons in an unbiased sample of semileptonic $b$-hadron decays.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements.

[1] Uses the dimuon charge asymmetry. Averaged over the mix of $b$-flavored hadrons.
[2] Measurement performed using events containing a dimuon or an $e/\mu$ pair.
[3] The average $B$ mixing parameter is determined simultaneously with $b$ and $c$ forward-backward asymmetries in the fit.
[4] The experimental systematic and model uncertainties are combined in quadrature.
[5] ACCIARRI 99D uses maximum-likelihood fits to extract $\chi_b$ as well as the $A_{FB}^b$ in $Z \to b\overline{b}$ events containing prompt leptons.
[6] This ABREU 94J result is from 5182 $\ell\ell$ and 279 $\Lambda\ell$ events. The systematic error includes 0.004 for model dependence.
[7] BUSKULIC 94G data analyzed using $ee$, $e\mu$, and $\mu\mu$ events.
[8] BUSKULIC 92B uses a jet charge technique combined with electrons and muons.
[9] ABE 91G measurement of $\chi$ is done with $e\mu$ and $ee$ events.
[10] ALBAJAR 91D measurement of $\chi$ is done with dimuons.
[11] Uses di-muon events.
[12] ALEXANDER 96 uses a maximum likelihood fit to simultaneously extract $\chi$ as well as the forward-backward asymmetries in $e^+e^- \to Z \to b\overline{b}$ and $c\overline{c}$.
[13] UENO 96 extracted $\chi$ from the energy dependence of the forward-backward asymmetry.
[14] ABREU 94F uses the average electric charge sum of the jets recoiling against a $b$-quark jet tagged by a high $p_T$ muon. The result is for $\overline{\chi} = f_d\chi_d + 0.9 f_s\chi_s$.
[15] This ABREU 94J result combines $\ell\ell$, $\Lambda\ell$, and jet-charge $\ell$ (ABREU 94F) analyses. It is for $\overline{\chi} = f_d\chi_d + 0.96 f_s\chi_s$.
[16] ALBAJAR 94 uses dimuon events. Not independent of ALBAJAR 91D.
[17] ABREU 93C data analyzed using $ee$, $e\mu$, and $\mu\mu$ events.
[18] AKERS 93B analysis performed using dilepton events.
[19] ACTON 92C uses electrons and muons. Superseded by AKERS 93B.
[20] ADEVA 92C uses electrons and muons.
[21] DECAMP 91 done with opposite and like-sign dileptons. Superseded by BUSKULIC 92B.
[22] ADEVA 90P measurement uses $ee$, $\mu\mu$, and $e\mu$ events from 118k events at the $Z$. Superseded by ADEVA 92C.
[23] These experiments are not in the average because the combination of $B_s$ and $B_d$ mesons which they see could differ from those at higher energy.
[24] The WEIR 90 measurement supersedes the limit obtained in SCHAAD 85. The 90% CL are 0.06 and 0.38.
[25] ALBAJAR 87C measured $\chi = (\overline{B}^0 \to B^0 \to \mu^+ X)$ divided by the average production weighted semileptonic branching fraction for $B$ hadrons at 546 and 630 GeV.
[26] Limit is average probability for hadron containing $B$ quark to produce a positive lepton.

## $CP$ VIOLATION PARAMETERS in semileptonic $b$-hadron decays.

### $\text{Re}(\epsilon_b) / (1 + |\epsilon_b|^2)$

CP impurity in semileptonic $b$-hadron decays.

| VALUE (units 10$^{-3}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| −6.2 ±5.2 ±4.7 | [1] AABOUD | 17E | ATLS | $pp$ at 8 TeV |
| −1.24±0.38±0.18 | [2] ABAZOV | 14 | D0 | $p\overline{p}$ at 1.96 TeV |

| −2.39±0.63±0.37 | [4] ABAZOV | 10H | D0 | Repl. by ABAZOV 11U |

[1] AABOUD 17E reports a measurement of charge asymmetry of $A_{SL}^b = (-25 \pm 21 \pm 19) \times 10^{-3}$ in lepton + jets $t\overline{t}$ events in which a $b$-hadron decays semileptonically to a soft muon.
[2] ABAZOV 14 reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^b = (-4.96 \pm 1.53 \pm 0.72) \times 10^{-3}$ in semileptonic $b$-hadron decays.
[3] ABAZOV 11U reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^b = (-7.87 \pm 1.72 \pm 0.93) \times 10^{-3}$ in semileptonic $b$-hadron decays.
[4] ABAZOV 10H reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^b = (-9.57 \pm 2.51 \pm 1.46) \times 10^{-3}$ in semileptonic $b$-hadron decays. Using the measured production ratio of $B_d^0$ and $B_s^0$, and the asymmetry of $B_d^0$ $A_{SL}^d = (-4.7 \pm 4.6) \times 10^{-3}$ measured from $B$-factories, they obtain the asymmetry for $B_s^0$ as $A_{SL}^s = (-14.6 \pm 7.5) \times 10^{-3}$.

## $B$-HADRON PRODUCTION FRACTIONS IN $p\overline{p}$ COLLISIONS AT Tevatron

The production fractions for $b$-hadrons in $p\overline{p}$ collisions at the Tevatron have been calculated from the best values of mean lifetimes, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFLAV) (see https://hflav.web.cern.ch/).

The values reported below assume:

$f(\overline{b} \to B^+) = f(\overline{b} \to B^0)$

$f(\overline{b} \to B^+) + f(\overline{b} \to B^0) + f(\overline{b} \to B_s^0) + f(b \to b\text{-baryon}) = 1$

The values are:

$f(\overline{b} \to B^+) = f(\overline{b} \to B^0) = 0.344 \pm 0.021$

$f(\overline{b} \to B_s^0) = 0.115 \pm 0.013$

$f(b \to b\text{-baryon}) = 0.198 \pm 0.046$

$f(\overline{b} \to B_s^0) / f(\overline{b} \to B_d^0) = 0.334 \pm 0.041$

and their correlation coefficients are:

$cor(B_s^0, b\text{-baryon}) = -0.429$

$cor(B_s^0, B^+ = B^0) = +0.159$

$cor(b\text{-baryon}, B^+ = B^0) = -0.960$

as obtained with the Tevatron average of time-integrated mixing parameter $\overline{\chi} = 0.147 \pm 0.011$.

### PRODUCTION ASYMMETRIES

$A_C^{b\overline{b}}$

$A_C^{b\overline{b}} = [N(\Delta y > 0) - N(\Delta y < 0)] / [N(\Delta y > 0) + N(\Delta y < 0)]$ with $\Delta y = |y_b| - |y_{\overline{b}}|$ where $y_{b/\overline{b}}$ is rapidity of $b$ or $\overline{b}$ quarks.

| VALUE (units $10^{-2}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| Average is meaningless. | | | | |
| $0.4 \pm 0.4 \pm 0.3$ | [1] AAIJ | 14AS | LHCB | $pp$ at 7 TeV |
| $2.0 \pm 0.9 \pm 0.6$ | [2] AAIJ | 14AS | LHCB | $pp$ at 7 TeV |
| $1.6 \pm 1.7 \pm 0.6$ | [3] AAIJ | 14AS | LHCB | $pp$ at 7 TeV |

[1] Measured for $40 < M(b\overline{b}) < 75$ GeV/$c^2$.
[2] Measured for $75 < M(b\overline{b}) < 105$ GeV/$c^2$.
[3] Measured for $M(b\overline{b}) > 105$ GeV/$c^2$.

## $V_{cb}$ and $V_{ub}$ CKM Matrix Elements

OMITTED FROM SUMMARY TABLE

**See the related review(s):**

Semileptonic $B$ Hadron Decays, Determination of $V_{cb}$ and $V_{ub}$

### $V_{cb}$ MEASUREMENTS

For the discussion of $V_{cb}$ measurements, which is not repeated here, see the review on "Determination of $|V_{cb}|$ and $|V_{ub}|$."

The CKM matrix element $|V_{cb}|$ can be determined by studying the rate of the semileptonic decay $B \to D^{(*)} \ell \nu$ as a function of the recoil kinematics of $D^{(*)}$ mesons. Taking advantage of theoretical constraints on the normalization and a linear $\omega$ dependence of the form factors ($F(\omega)$, $G(\omega)$) provided by Heavy Quark Effective Theory (HQET), the $|V_{cb}| \times F(\omega)$ and $\rho^2$ ($a^2$) can be simultaneously extracted from data, where $\omega$ is the scalar product of the two-meson four velocities, $F(1)$ is the form factor at zero recoil ($\omega$=1) and $\rho^2$ is the slope, sometimes denoted as $a^2$. Using the theoretical input of $F(1)$, a value of $|V_{cb}|$ can be obtained.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements.

#### $|V_{cb}| \times F(1)$ (from $B^0 \to D^{*-} \ell^+ \nu$)

[1] Uses fully reconstructed $D^{*-}\ell^+\nu$ events ($\ell = e$ or $\mu$) and $\eta_{EW} = 1.0066$.

[2] Obtained from a global fit to $B \to D^{(*)}\ell\nu_\ell$ events, with reconstructed $D^0\ell$ and $D^+\ell$ final states and $\rho^2 = 1.22 \pm 0.02 \pm 0.07$.

[3] Measurement using fully reconstructed $D^*$ sample with a $\rho^2 = 1.32 \pm 0.15 \pm 0.33$.

[4] Average of the $B^0 \to D^*(2010)^-\ell^+\nu$ and $B^+ \to \overline{D}^*(2007))\ell^+\nu$ modes with $\rho^2 = 1.61 \pm 0.09 \pm 0.21$ and $f_{+-} = 0.521 \pm 0.012$.

[5] ABREU 01H measured using about 5000 partial reconstructed $D^*$ sample with a $\rho^2 = 1.34 \pm 0.14^{+0.24}_{-0.22}$.

[6] ABBIENDI 00Q: measured using both inclusively and exclusively reconstructed $D^{*\pm}$ samples with a $\rho^2 = 1.21 \pm 0.12 \pm 0.20$. The statistical and systematic correlations between $|V_{cb}|\times F(1)$ and $\rho^2$ are 0.90 and 0.54 respectively.

[7] BUSKULIC 97: measured using exclusively reconstructed $D^{*\pm}$ with a $a^2 = 0.31 \pm 0.17 \pm 0.08$. The statistical correlation is 0.92.

[8] Uses fully reconstructed $D^{*-}\ell^+\nu$ events ($\ell = e$ or $\mu$).

[9] Measured using the dependence of $B^- \to D^{*0}e^-\overline{\nu}_e$ decay differential rate and the form factor description by CAPRINI 98 with $\rho^2 = 1.16 \pm 0.06 \pm 0.08$.

[10] Measured using fully reconstructed $D^*$ sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters: $\rho^2 = 1.191 \pm 0.048 \pm 0.028$, $R_1(1) = 1.429 \pm 0.061 \pm 0.044$, and $R_2(1) = 0.827 \pm 0.038 \pm 0.022$.

[11] Measurement using fully reconstructed $D^*$ sample with a $\rho^2 = 1.29 \pm 0.03 \pm 0.27$.

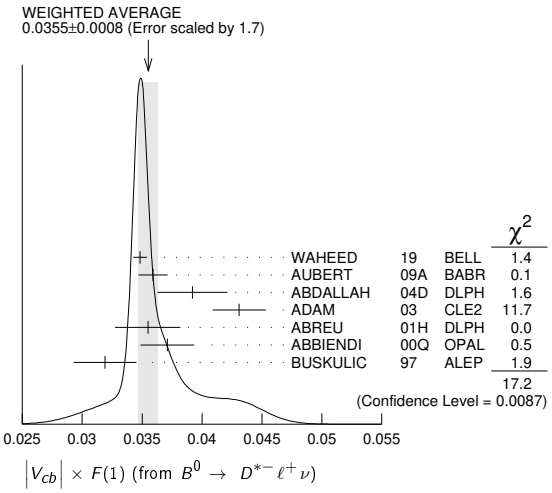
[12] Combines with previous partial reconstructed $D^*$ measurement with a $\rho^2 = 1.39 \pm 0.10 \pm 0.33$.

[13] Measured using exclusive $B^0 \to D^*(892)^-e^+\nu$ decays with $\rho^2 = 1.35 \pm 0.17 \pm 0.19$ and a correlation of 0.91.

[14] BRIERE 02 result is based on the same analysis and data sample reported in ADAM 03.

[15] ABREU 96P: measured using both inclusively and exclusively reconstructed $D^{*\pm}$ samples.

[16] BARISH 95: measured using both exclusive reconstructed $B^0 \to D^{*-}\ell^+\nu$ and $B^+ \to D^{*0}\ell^+\nu$ samples. They report their experiment's uncertainties $\pm 0.0019 \pm 0.0018 \pm 0.0008$, where the first error is statistical, the second is systematic, and the third is the uncertainty in the lifetimes. We combine the last two in quadrature.



### $|V_{cb}| \times G(1)$ (from $B \to D^-\ell^+\nu$)

[1] Obtained from a fit to the combined partially reconstructed $B \to \overline{D}\ell\nu_\ell$ sample while tagged by the other fully reconstructed $B$ meson in the event. Also reports fitted $\rho^2 = 1.09 \pm 0.05$.

[2] Obtained from a fit to the combined $B \to \overline{D}\ell^+\nu_\ell$ sample in which a hadronic decay of the second $B$ meson is fully reconstructed and $\rho^2 = 1.20 \pm 0.09 \pm 0.04$.

[3] Obtained from a global fit to $B \to D^{(*)}\ell\nu_\ell$ events, with reconstructed $D^0\ell$ and $D^+\ell$ final states and $\rho^2 = 1.20 \pm 0.04 \pm 0.07$.

[4] BARTELT 99: measured using both exclusive reconstructed $B^0 \to D^-\ell^+\nu$ and $B^+ \to D^0\ell^+\nu$ samples.

[5] BUSKULIC 97: measured using exclusively reconstructed $D^{\pm}$ with a $a^2 = -0.05 \pm 0.53 \pm 0.38$. The statistical correlation is 0.99.

[6] Using the missing energy and momentum to extract kinematic information about the undetected neutrino in the $B^0 \to D^-\ell^+\nu$ decay.

[7] ATHANAS 97: measured using both exclusive reconstructed $B^0 \to D^-\ell^+\nu$ and $B^+ \to D^0\ell^+\nu$ samples with a $\rho^2 = 0.59 \pm 0.22 \pm 0.12^{+0.59}_{-0}$. They report their experiment's uncertainties $\pm 0.0044 \pm 0.0048^{+0.0053}_{-0.0012}$, where the first error is statistical, the second is systematic, and the third is the uncertainty due to the form factor model variations. We combine the last two in quadrature.

## $V_{ub}$ MEASUREMENTS

For the discussion of $V_{ub}$ measurements, which is not repeated here, see the review on "Determination of $|V_{cb}|$ and $|V_{ub}|$."

The CKM matrix element $|V_{ub}|$ can be determined by studying the rate of the charmless semileptonic decay $b \to u\ell\nu$. The relevant branching ratio measurements based on exclusive and inclusive decays can be found in the $B$ Listings, and are not repeated here.

# Meson Particle Listings

## $B_J^*(5732)$, $B_2^*(5747)^+$, $B_2^*(5747)^0$

• • • We do not use the following data for averages, fits, limits, etc. • • •

5713± 2 [4] ACCIARRI 99N L3 $e^+e^- \to Z$

[1] AFFOLDER 01F uses the reconstructed $B$ meson through semileptonic decay channels. The fraction of light $B$ mesons that are produced at $L$=1 $B^{**}$ states is measured to be 0.28 ± 0.06 ± 0.03.

[2] BARATE 98L uses fully reconstructed $B$ mesons to search for $B^{**}$ production in the $B\pi^\pm$ system. In the framework of heavy quark symmetry (HQS), they also measured the mass of $B_2^*$ to be $5739^{+\ 8}_{-11}{}^{+\ 6}_{-\ 4}$ MeV/$c^2$ and the relative production rate of B($b \to B_2^* \to B^{(*)}\pi$)/B($b \to B_{u,d}$) = $(31 \pm 9^{+6}_{-5})$%.

[3] Using $m_{B\pi} - m_B = 424 \pm 4 \pm 10$ MeV.

[4] ACCIARRI 99N uses inclusive reconstructed $B$ mesons to search for $B^{**}$ production in the $B^{(*)}\pi^\pm$ system. In the framework of HQET, they measured the mass of $B_1^*$ and $B_2^*$ to be 5670 ± 10 ± 13 MeV and 5768 ± 5 ± 6 with the B($b \to B^{**}$) = $(32 \pm 3 \pm 6) \times 10^{-2}$. They also reported the evidence for the existence of an excited $B$-meson state or mixture of states in the region 5.9–6.0 GeV.

## $B_2^*(5747)^0$

$I(J^P) = \frac{1}{2}(2^+)$
$I$, $J$, $P$ need confirmation.

Quantum numbers shown are quark-model predictions.

### $B_2^*(5747)^0$ MASS

OUR FIT uses $m_{B^+}$, $m_{B_1^0} - m_{B^+}$, and $m_{B_2^{*0}} - m_{B_1^0}$ to determine $m_{B_2^*(5747)^0}$. The −0.659 correlation between statistical uncertainties of $m_{B_1^0} - m_{B^+}$ and $m_{B_2^{*0}} - m_{B_1^0}$ measurements reported by ABAZOV 07T is taken into account.

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **691 ±5 OUR FIT** | | | | | |
| **691 ±5 OUR AVERAGE** | | | | | |
| 689.9±2.9± 5.1 | 10K | [1] AAIJ | 15AB | LHCB | $pp$ at 7, 8 TeV |
| 698 ±5 ±12 | 2.6k | [2] AALTONEN | 14I | CDF | $p\overline{p}$ at 1.96 TeV |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 714.3±6.4± 5.1 | 10K | [3] AAIJ | 15AB | LHCB | $pp$ at 7, 8 TeV |

[1] AAIJ 15AB reports $[m_{B_J^0} - m_{B^+}] - m_{\pi^-} = 550.4 \pm 2.9 \pm 5.1$ MeV which we adjust by the $\pi^-$ mass. The masses inside the square brackets were measured for each candidate event. The result assumes $P = (-1)^J$ and uses two relativistic Breit-Wigner functions in the fit for mass difference.
[2] AALTONEN 14I reports $m_{B_J(5970)^0} - m_{B^+} - m_{\pi^-} = 558 \pm 5 \pm 12$ MeV which we adjusted by the $\pi^-$ mass.
[3] AAIJ 15AB reports $[m_{B_J^0} - m_{B^+}] - m_{\pi^-} = 575 \pm 6 \pm 5$ MeV which we adjust by the $\pi^-$ mass. The masses inside the square brackets were measured for each candidate event. The result assumes $P = (-1)^J$ and uses three relativistic Breit-Wigner functions in the fit for mass difference.

#### $m_{B_J(5970)^0} - m_{B^{*+}}$

| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 691.6±3.7±5.1 | 10k | [1] AAIJ | 15AB | LHCB | $pp$ at 7, 8 TeV |

[1] AAIJ 15AB reports $[m_{B_J^0} - m_{B^+}] - (m_{B^{*+}} - m_{B^+}) - m_{\pi^-} = 552 \pm 4 \pm 5$ MeV which we adjust by the $\pi^-$ mass. The masses inside the square brackets were measured for each candidate event. The result assumes $P = -(-1)^J$, $(m_{B^{*+}} - m_{B^+}) = 45.01 \pm 0.30 \pm 0.23$ MeV, and uses three relativistic Breit-Wigner functions in the fit for mass difference.

[1] Uses $B_s^0 \to J/\psi p\overline{p}$ decays.
[2] Uses $B_s \to \chi_{c1} K^+K^-$ mode.
[3] Uses $J/\psi \to \mu^+\mu^-$, $\phi \to K^+K^-$ decays, and observes 128 ± 13 events of $B_s^0 \to J/\psi\phi\phi$.
[4] Uses $B_s^0 \to J/\psi\phi$ fully reconstructed decays.
[5] Uses exclusively reconstructed final states containing a $J/\psi \to \mu^+\mu^-$ decays.
[6] From the decay $B_s \to J/\psi(1S)\,\phi$.
[7] From the decay $B_s \to D_s^-\pi^+$.

### $m_{B_s^0} - m_B$

$m_B$ is the average of our $B$ masses $(m_{B^\pm}+m_{B^0})/2$.

[1] AALTONEN 11AP combines the fully reconstrcuted $B_s^0 \to D_s^-\pi^+$ decays and partially reconstructed $B_s^0 \to D_s X$ decays.
[2] Measured using $D_s\mu^+$ vertices.
[3] Uses $D_s^-\ell^+$, and $\phi\ell^+$ vertices.
[4] Measured using $D_s$ hadron vertices.
[5] Measured using $D_s^-\ell^+$ vertices.
[6] ACKERSTAFF 98F use fully reconstructed $D_s^- \to \phi\pi^-$ and $D_s^- \to K^{*0}K^-$ in the inclusive $B_s^0$ decay.
[7] Combined results from $D_s^-\ell^+$ and $D_s$ hadron.
[8] Measured using $\phi\ell$ vertices.
[9] Measured using inclusive $D_s$ vertices.
[10] Combined result for the four ABREU 96F methods.
[11] Exclusive reconstruction of $B_s \to \psi\phi$.
[12] ABREU 94E uses the flight-distance distribution of $D_s$ vertices, $\phi$-lepton vertices, and $D_s\mu$ vertices.

### $\Gamma_{B_s^0}$

"OUR EVALUATION" is an average performed by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/) as described in our "Review on $B$-$\overline{B}$ Mixing" in the $B^0$ section of these Listings. It includes the measurements of $\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ listed in this section, as well as constraints from effective lifetimes with pure *CP* modes and flavor-specific modes.

[4] Measured using time-dependent angular analysis of $B_s^0 \to \psi(2S)\,\phi$ decays.
[5] The error includes both statistical and systematic uncertainties.
[6] AAIJ 13AR result comes from a combined fit to $B_s^0 \to J/\psi K^+ K^-$ and $B_s^0 \to J/\psi\pi^+\pi^-$ data sets. Also reports $\Delta\Gamma_s = 0.100 \pm 0.016 \pm 0.003$ ps$^{-1}$ from a fit to $B_s^0 \to J/\psi K^+ K^-$ decays.
[7] Uses the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays and assuming $CP$-violating angle $\beta_s(B^0 \to J/\psi\phi) = 0.02$.
[8] Measured the angular and lifetime parameters for the time-dependent angular untagged decays $B_d^0 \to J/\psi K^{*0}$ and $B_s^0 \to J/\psi\phi$.
[9] Measured using the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays and assuming $CP$-violating phase $\phi_s = 0$.
[10] Obtaines 90% CL interval $-0.06 < \Delta\Gamma_s < 0.30$.
[11] ABAZOV 07 reports $0.17 \pm 0.09 \pm 0.02$ with $CP$-violating phase $\phi_s$ as a free parameter.
[12] Combines $D^0$ measurements of time-dependent angular distributions in $B_s^0 \to J/\psi\phi$ and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

## $\Delta\Gamma_{B_s^0}/\Gamma_{B_s^0}$

$\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ are the decay rate average and difference between two $B_s^0$ $CP$ eigenstates (light − heavy).

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/). It is derived from the averages of $\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ (and their correlation).

[1] Assumes $CP$ violation is negligible.
[2] Measured using the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.
[3] Uses the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays and assuming $CP$-violating angle $\beta_s(B^0 \to J/\psi\phi) = 0.02$.
[4] Measured using fully reconstructed $B_s \to J/\psi\phi$ decays.
[5] Assumes 2 B($B_s^0 \to D_s^{(*)}\,D_s^{(*)}$) $\simeq \Delta\Gamma_s^{CP} / \Gamma_s$.
[6] Measured using the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.
[7] Uses $|A_0|^2 - |A_\parallel|^2 = 0.355 \pm 0.066$ from ACOSTA 05.
[8] Uses $D_s^-\ell^+$, and $\phi\ell^+$ vertices.
[9] Measured using $D_s$ hadron vertices.
[10] Uses $\phi\phi$ correlations from $B_s^0 \to D_s^{(*)+} D_s^{(*)-}$.
[11] ABE 99D assumes $\tau_{B_s^0} = 1.55 \pm 0.05$ ps.
[12] ACCIARRI 98S assumes $\tau_{B_s^0} = 1.49 \pm 0.06$ ps and PDG 98 values of $b$ production fraction.

## $B_{sH}^0$ MEAN LIFE

$B_{sH}^0$ is the heavy mass state of two $B_s^0$ $CP$ eigenstates.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/). It is derived from the averages of $\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ (and their correlation).

## $B_s^0$

[1] Measured using $B_s^0 \to J/\psi\pi^+\pi^-$ decays with $0.9240 < m(\pi\pi) < 1.0204$ GeV, which is dominated by the $f_0(980)$ resonance, making it a $CP$-odd state.
[2] Measured using $B_s \to \mu^+\mu^-$ decays which, in the Standard Model, correspond to $B_{sH}^0$ decays. Assumes $-2\,\mathrm{Re}(\lambda)/(1+|\lambda|^2) = 1$.
[3] Measured using $J/\psi\pi^+\pi^-$ mode with $0.880 < m(\pi\pi) < 1.080$ GeV/$c^2$, which is mostly $J/\psi f(0)(980)$ mode, a pure $CP$-odd final state.
[4] Measured using a pure $CP$-odd final state $J/\psi K_S^0$ with the assumption that contributions from penguin diagrams are small.
[5] Measured using $B_s \to J/\psi\pi^+\pi^-$ decays which, in the limit of $\phi_s = 0$ and $|\lambda| = 1$, correspond to $B_{sH}^0$ decays.
[6] Measured using a pure $CP$-odd final state $J/\psi f_0(980)$.
[7] Uses the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays assuming $CP$-violating angle $\beta_s(B^0 \to J/\psi\phi) = 0.02$.
[8] Obtained from $\Delta\Gamma_s$ and $\Gamma_s$ fit with a correlation of 0.6.
[9] Measured using the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.

### $B_{sL}^0$ MEAN LIFE

$B_{sL}^0$ is the light mass state of two $B_s^0$ $CP$ eigenstates.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/). It is derived from the averages of $\Gamma_{B_s^0}$ and $\Delta\Gamma_{B_s^0}$ (and their correlation).

[1] Measured using results in SIRUNYAN 18BY for the heavy $B_s^0$ lifetime obtained from $B_s^0 \to J/\psi\pi^+\pi^-$ decays and the average effective $B_s^0 \to J/\psi\phi$ lifetime, and magnitude squared of the $CP$-odd amplitude $|A_\perp|^2 = 0.250 \pm 0.006$. The uncertainty includes all statistical and systematic contributions.
[2] Measured using $B_s^0 \to J/\psi\eta$ decays.
[3] Measured using $B_s^0 \to D_s^- D_s^+$. The effective lifetime is translated into a decay width of $\Gamma_L = 0.725 \pm 0.014 \pm 0.009$ ps$^{-1}$.
[4] Measured using $B_s^0 \to K^+K^-$ decays. There may still be CPV in the decay.
[5] Uses the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays and assuming $CP$-violating angle $\beta_s(B^0 \to J/\psi\phi) = 0.02$.
[6] Obtained from $\Delta\Gamma_s$ and $\Gamma_s$ fit with a correlation of 0.6.
[7] Measured using the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.
[8] Uses $\phi\phi$ correlations from $B_s^0 \to D_s^{(*)+} D_s^{(*)-}$.

### $B_s^0$ DECAY MODES

These branching fractions all scale with $B(\overline{b} \to B_s^0)$.

The branching fraction $B(B_s^0 \to D_s^-\ell^+\nu_\ell \text{anything})$ is not a pure measurement since the measured product branching fraction $B(\overline{b} \to B_s^0) \times B(B_s^0 \to D_s^-\ell^+\nu_\ell \text{anything})$ was used to determine $B(\overline{b} \to B_s^0)$, as described in the note on "$B^0$-$\overline{B}^0$ Mixing"

For inclusive branching fractions, *e.g.*, $B \to D^\pm$ anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

[a] Not a pure measurement. See note at head of $B_s^0$ Decay Modes.

[b] Here $S$ and $P$ are the hypothetical scalar and pseudoscalar particles with masses of 2.5 GeV/$c^2$ and 214.3 MeV/$c^2$, respectively.

[c] The value is for the sum of the charge states or particle/antiparticle states indicated.

### CONSTRAINED FIT INFORMATION

An overall fit to 12 branching ratios uses 20 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 26.7$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

## $B_s^0$ BRANCHING RATIOS

### $\Gamma(D_s^-\,\text{anything})/\Gamma_{\rm total}$ $\Gamma_1/\Gamma$

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.93±0.25 OUR AVERAGE** | | | | | |
| 0.91±0.18±0.41 | | [1] DRUTSKOY | 07 | BELL | $e^+e^-\to\Upsilon(4S)$ |
| 0.81±0.24±0.22 | 90 | [2] BUSKULIC | 96E | ALEP | $e^+e^-\to Z$ |
| 1.56±0.58±0.44 | 147 | [3] ACTON | 92N | OPAL | $e^+e^-\to Z$ |

[1] The extraction of this result takes into account the correlation between the measurements of $B(\Upsilon(5S)\to D_s X)$ and $B(\Upsilon(5S)\to D^0 X)$.

[2] BUSKULIC 96E separate $c\overline{c}$ and $b\overline{b}$ sources of $D_s^+$ mesons using a lifetime tag, subtract generic $\overline{b}\to W^+\to D_s^+$ events, and obtain $B(\overline{b}\to B_s^0)\times B(B_s^0\to D_s^-\,\text{anything}) = 0.088\pm0.020\pm0.020$ assuming $B(D_s\to\phi\pi) = (3.5\pm0.4)\times10^{-2}$ and PDG 1994 values for the relative partial widths to other $D_s$ channels. We evaluate using our current values $B(\overline{b}\to B_s^0) = 0.107\pm0.014$ and $B(D_s\to\phi\pi) = 0.036\pm0.009$. Our first error is their experiment's and our second error is that due to $B(\overline{b}\to B_s^0)$ and $B(D_s\to\phi\pi)$.

[3] ACTON 92N assume that excess of 147 ± 48 $D_s^0$ events over that expected from $B^0$, $B^+$, and $c\overline{c}$ is all from $B_s^0$ decay. The product branching fraction is measured to be $B(\overline{b}\to B_s^0)B(B_s^0\to D_s^-\,\text{anything})\times B(D_s^-\to\phi\pi^-) = (5.9\pm1.9\pm1.1)\times10^{-3}$. We evaluate using our current values $B(\overline{b}\to B_s^0) = 0.107\pm0.014$ and $B(D_s\to\phi\pi) = 0.036\pm0.009$. Our first error is their experiment's and our second error is that due to $B(\overline{b}\to B_s^0)$ and $B(D_s\to\phi\pi)$.

### $\Gamma(\ell\nu_\ell X)/\Gamma_{\rm total}$ $\Gamma_2/\Gamma$

| VALUE (units $10^{-2}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **9.6±0.8 OUR AVERAGE** | | | | |
| 9.6±0.4±0.7 | [1] OSWALD | 13 | BELL | $e^+e^-\to\Upsilon(5S)$ |
| $9.5^{+2.5}_{-2.0}{}^{+1.1}_{-1.9}$ | [2] LEES | 12A | BABR | $e^+e^-$ |

[1] The measurement corresponds to the average of the electron and muon branching fractions.

[2] The measurement corresponds to a branching fraction where the lepton originates from bottom decay and is the average between the electron and muon branching fractions. LEES 12A uses the correlation of the production of $\phi$ mesons in association with a lepton in $e^+e^-$ data taken at center-of-mass energies between 10.54 and 11.2 GeV.

| VALUE (units $10^{-2}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **10.2±0.6±0.8** | OSWALD | 13 | BELL | $e^+e^-\to\Upsilon(5S)$ |

### $\Gamma(D_s^-\ell^+\nu_\ell\,\text{anything})/\Gamma_{\rm total}$ $\Gamma_5/\Gamma$

The values and averages in this section serve only to show what values result if one assumes our $B(\overline{b}\to B_s^0)$. They cannot be thought of as measurements since the underlying product branching fractions were also used to determine $B(\overline{b}\to B_s^0)$ as described in the note on "Production and Decay of $b$-Flavored Hadrons."

| VALUE (units $10^{-2}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |

| 10.3±3.6±2.8 | 18 | [4] ACTON | 92N | OPAL | $e^+e^-\to Z$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 13 ±4 ±4 | 27 | [5] BUSKULIC | 92E | ALEP | $e^+e^-\to Z$ |

[1] Obtains $B_s\to D_s X e\nu$, and $D_s X\mu\nu$ separately, then combines them by assuming systematic uncertainties are fully correlated, except for the one on lepton identification. The third uncertainty adds in quadrature systematic uncertainties from external sources (number of $B_s$ events, and $D_s^{(*)}$ branching fractions). OSWALD 15 also measures the cross-section $\sigma(e^+e^-\to B_s^{(*)}\overline{B}_s^{(*)}) = 53.8\pm1.4\pm5.3$ pb at $\sqrt{s} = 10.86$ GeV.

[2] BUSKULIC 95O use $D_s\ell$ correlations. The measured product branching ratio is $B(\overline{b}\to B_s)\times B(B_s\to D_s^-\ell^+\nu_\ell\,\text{anything}) = (0.82\pm0.09^{+0.13}_{-0.14})\%$ assuming $B(D_s\to\phi\pi) = (3.5\pm0.4)\times10^{-2}$ and PDG 1994 values for the relative partial widths to the six other $D_s$ channels used in this analysis. Combined with results from $\Upsilon(4S)$ experiments this can be used to extract $B(\overline{b}\to B_s) = (11.0\pm1.2^{+2.5}_{-2.6})\%$. We evaluate using our current values $B(\overline{b}\to B_s^0) = 0.107\pm0.014$ and $B(D_s\to\phi\pi) = 0.036\pm0.009$. Our first error is their experiment's and our second error is that due to $B(\overline{b}\to B_s^0)$ and $B(D_s\to\phi\pi)$.

[3] ABREU 92M measured muons only and obtained product branching ratio $B(Z\to b\text{or }\overline{b})\times B(\overline{b}\to B_s)\times B(B_s\to D_s\mu^+\nu_\mu\,\text{anything})\times B(D_s\to\phi\pi) = (18\pm8)\times10^{-5}$. We evaluate using our current values $B(\overline{b}\to B_s^0) = 0.107\pm0.014$ and $B(D_s\to\phi\pi) = 0.036\pm0.009$. Our first error is their experiment's and our second error is that due to $B(\overline{b}\to B_s^0)$ and $B(D_s\to\phi\pi)$. We use $B(Z\to b\text{or }\overline{b}) = 2B(Z\to b\overline{b}) = 2\times(0.2212\pm0.0019)$.

[4] ACTON 92N is measured using $D_s\to\phi\pi^+$ and $K^*(892)^0K^+$ events. The product branching fraction measured is measured to be $B(\overline{b}\to B_s^0)B(B_s^0\to D_s^-\ell^+\nu_\ell\,\text{anything})\times B(D_s^-\to\phi\pi^-) = (3.9\pm1.1\pm0.8)\times10^{-4}$. We evaluate using our current values $B(\overline{b}\to B_s^0) = 0.107\pm0.014$ and $B(D_s\to\phi\pi) = 0.036\pm0.009$. Our first error is their experiment's and our second error is that due to $B(\overline{b}\to B_s^0)$ and $B(D_s\to\phi\pi)$.

[5] BUSKULIC 92E is measured using $D_s\to\phi\pi^+$ and $K^*(892)^0K^+$ events. They use 2.7 ± 0.7% for the $\phi\pi^+$ branching fraction. The average product branching fraction is measured to be $B(\overline{b}\to B_s^0)B(B_s^0\to D_s^-\ell^+\nu_\ell\,\text{anything}) = 0.020\pm0.0055^{+0.005}_{-0.006}$. We evaluate using our current values $B(\overline{b}\to B_s^0) = 0.107\pm0.014$ and $B(D_s\to\phi\pi) = 0.036\pm0.009$. Our first error is their experiment's and our second error is that due to $B(\overline{b}\to B_s^0)$ and $B(D_s\to\phi\pi)$. Superseded by BUSKULIC 95O.

| **5.4±0.4±1.0** | [1] OSWALD | 15 | BELL | $e^+e^-\to\Upsilon(5S)$ |

[1] Obtains $B_s\to D_s^* X e\nu$, and $D_s^* X\mu\nu$ separately, then combines them by assuming systematic uncertainties are fully correlated, except for the one on lepton identification. The third uncertainty adds in quadrature systematic uncertainties from external sources (number of $B_s$ events, and $D_s^{(*)}$ branching fractions). OSWALD 15 also measures the cross-section $\sigma(e^+e^-\to B_s^{(*)}\overline{B}_s^{(*)}) = 53.8\pm1.4\pm5.3$ pb at $\sqrt{s} = 10.86$ GeV.

Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Use $\Upsilon(5S)\to B_s^*\overline{B}_s^*$ decays assuming $\mathrm{B}(\Upsilon(5S)\to B_s^*\overline{B}_s^*)$ = (17.1 ± 3.0)% and $\Gamma(\Upsilon(5S)\to B_s^*\overline{B}_s^*)$ / $\Gamma(\Upsilon(5S)\to B_s^{(*)}\overline{B}_s^{(*)})$ = (87.0 ± 1.7)%.

[3] AALTONEN 12C reports $(f_s/f_d)$ $(\mathrm{B}(B_s^0\to D_s^{*+}D_s^{*-})$ / $\mathrm{B}(B^0\to D^-D_s^+))$ = 0.654 ± 0.072 ± 0.065. We multiply this result by our best value of $\mathrm{B}(B^0\to D^-D_s^+)$ = $(7.2\pm0.8)\times10^{-3}$ and divide by our best value of $f_s/f_d$, where $1/2\ f_s/f_d = 0.1230\pm0.0115$. Our first quoted uncertainty is the combined experiment's uncertainty and our second is the systematic uncertainty from using out best values.

[4] Uses $\Upsilon(10860)\to B_s^*\overline{B}_s^*$ assuming $\mathrm{B}(\Upsilon(10860)\to B_s^{(*)}\overline{B}_s^{(*)})$ = (19.3 ± 2.9)% and $\Gamma(\Upsilon(10860)\to B_s^*\overline{B}_s^*)$ / $\Gamma(\Upsilon(10860)\to B_s^{(*)}\overline{B}_s^{(*)})$ = $(90.1^{+3.8}_{-4.0})$%.

### $\Gamma(D_s^{(*)+}D_s^{(*)-})/\Gamma_{\text{total}}$ $\Gamma_{25}/\Gamma$

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements.

[1] AAIJ 13A reports $[\Gamma(B_s^0 \to J/\psi(1S)\eta)/\Gamma_{total}]$ / $[B(B^0 \to J/\psi(1S)\rho^0)] = 14.0 \pm 1.2^{+1.1}_{-1.5} {}^{+1.1}_{-1.0}$ which we multiply by our best value $B(B^0 \to J/\psi(1S)\rho^0) = (2.55^{+0.18}_{-0.16}) \times 10^{-5}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Observed for the first time with significances over 10 $\sigma$. The second error are total systematic uncertainties including the error on $N(B_s^{(*)} \overline{B}_s^{(*)})$.

[3] ACCIARRI 97C assumes $B^0$ production fraction (39.5 ± 4.0%) and $B_s$ (12.0 ± 3.0%).

[1] Assuming no contribution from $B^0\to\mu^\pm\tau^\mp$.

## POLARIZATION IN $B_s^0$ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ($L$), or both are transverse and parallel ($\parallel$), or perpendicular ($\perp$) to each other with the parameters $\Gamma_L/\Gamma$, $\Gamma_\perp/\Gamma$, and the relative phases $\phi_\parallel$ and $\phi_\perp$. In decays involving two tensor mesons, the transverse polarization states are described by parameters $\Gamma_{\parallel1}$, $\Gamma_{\parallel2}$, $\Gamma_{\perp1}$, $\Gamma_{\perp2}$ and their relative phases $\phi_{\parallel1}$, $\phi_{\parallel2}$, $\phi_{\perp1}$, $\phi_{\perp2}$. See also the review on "Polarization in $B$ Decays."

## $B_s^0$-$\overline{B}_s^0$ MIXING

For a discussion of $B_s^0$-$\overline{B}_s^0$ mixing see the note on "$B^0$-$\overline{B}^0$ Mixing" in the $B^0$ Particle Listings above.

$\chi_s$ is a measure of the time-integrated $B_s^0$-$\overline{B}_s^0$ mixing probability that produced $B_s^0(\overline{B}_s^0)$ decays as a $\overline{B}_s^0(B_s^0)$. Mixing violates $\Delta B \neq 2$ rule.

$$\chi_s = \frac{x_s^2}{2(1+x_s^2)}$$

$$x_s = \frac{\Delta m_{B_s^0}}{\Gamma_{B_s^0}} = (m_{B_{sH}^0} - m_{B_{sL}^0})\,\tau_{B_s^0},$$

where $H$, $L$ stand for heavy and light states of two $B_s^0$ $CP$ eigenstates and $\tau_{B_s^0} = \frac{1}{0.5(\Gamma_{B_{sH}^0} + \Gamma_{B_{sL}^0})}$.

### $\Delta m_{B_s^0} = m_{B_{sH}^0} - m_{B_{sL}^0}$

$\Delta m_{B_s^0}$ is a measure of $2\pi$ times the $B_s^0$-$\overline{B}_s^0$ oscillation frequency in time-dependent mixing experiments.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/) by taking into account correlations between measurements.

[1] Measured using time-dependent angular analysis of $B_s^0 \to J/\psi K^+K^-$ decays.

[2] Measured using $B_s^0 \to D_s^-\pi^+$ decays.

[3] Measured using $B_s^0 \to D_s^-\mu^+\nu_\mu X$ decays.

[4] Measured using $B_s^0 \to D_s^-\pi^+$ and $D_s^-\pi^+\pi^-\pi^+$ decays.

[5] Significance of oscillation signal is 5.4 $\sigma$. Also reports $|V_{td}\ /\ V_{ts}| = 0.2060 \pm 0.0007^{+0.0081}_{-0.0060}$.

[6] A likelihood scan over the oscillation frequency, $\Delta m_s$, gives a most probable value of 19 $ps^{-1}$ and a range of $17 < \Delta m_s < 21$ ($ps^{-1}$) at 90% C.L. assuming Gaussian uncertainties. Also excludes $\Delta m_s < 14.8\ ps^{-1}$ at 95% C.L.

[7] Significance of oscillation signal is 0.2%. Also reported the value $|V_{td}\ /\ V_{ts}| = 0.208^{+0.001+0.008}_{-0.002-0.006}$.

[8] Uses leptons emitted with large momentum transverse to a jet and improved techniques for vertexing and flavor-tagging.

[9] Updates of $D_s$-lepton analysis.

[10] Combined results from all Delphi analyses.

[11] Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.

[12] ABE 03 uses the novel "charge dipole" technique to reconstruct separate secondary and tertiary vertices originating from the $B \to D$ decay chain. The analysis excludes $\Delta m_s < 4.9\ ps^{-1}$ and $7.9 < \Delta m_s < 10.3\ ps^{-1}$.

[13] Three analyses based on complementary event selections: (1) fully-reconstructed hadronic decays; (2) semileptonic decays with $D_s$ exclusively reconstructed; (3) inclusive semileptonic decays.

[14] ABE 02V uses exclusively reconstructed $D_s^-$ mesons and excludes $\Delta m_s < 1.4\ ps^{-1}$ and $2.4 < \Delta m_s < 5.3\ ps^{-1}$ at 95%CL.

[15] Uses fully or partially reconstructed $D_s\ell$ vertices and a mixing tag as a flavor tagging.

[16] Replaced by ABDALLAH 04A. Uses $D_s^-\ell^+$, and $\phi\ell^+$ vertices, and a multi-variable discriminant as a flavor tagging.

[17] Uses inclusive $D_s$ vertices and fully reconstructed $B_s$ decays and a multi-variable discriminant as a flavor tagging.

[18] Uses $\ell$-$Q_{hem}$ and $\ell$-$\ell$.

[19] ABE 99D assumes $\tau_{B_s^0} = 1.55 \pm 0.05$ ps and $\Delta\Gamma/\Delta m = (5.6 \pm 2.6) \times 10^{-3}$.

[20] ABE 99J uses $\phi$ $\ell$-$\ell$ correlation.

[21] BARATE 99J uses combination of an inclusive lepton and $D_s^-$-based analyses.

[22] BARATE 98C combines results from $D_s h$-$\ell/Q_{hem}$, $D_s h$-$K$ in the same side, $D_s\ell$-$\ell/Q_{hem}$ and $D_s\ell$-$K$ in the same side.

[23] Uses $\ell$-$Q_{hem}$.

[24] Uses $\ell$-$\ell$.

[25] ADAM 97 combines results from $D_s\ell$-$Q_{hem}$, $\ell$-$Q_{hem}$, and $\ell$-$\ell$.

[26] BUSKULIC 96M uses $D_s$ lepton correlations and lepton, kaon, and jet charge tags.

[27] BUSKULIC 95J uses $\ell$-$Q_{hem}$. They find $\Delta m_s > 5.6$ [> 6.1] for $f_s$=10% [12%]. We interpolate to our central value $f_s$=10.5%.

### $x_s = \Delta m_{B_s^0}/\Gamma_{B_s^0}$

This is derived by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/) from the results on $\Delta m_{B_s^0}$ and "OUR EVALUATION" of the $B_s^0$ mean lifetime.

| VALUE | DOCUMENT ID |

## *CP* VIOLATION PARAMETERS in $B_s^0$

### $\mathrm{Re}(\epsilon_{B_s^0})\ /\ (1 + |\epsilon_{B_s^0}|^2)$

*CP* impurity in $B_s^0$ system.

"OUR EVALUATION" is an average obtained by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/) and described at https://hflav.web.cern.ch/. It is the result of a fit to $B_d$ and $B_s$ *CP* asymmetries, which includes the $B_s$ measurements listed below and the $B_d$ measurements listed in the $B_d$ section, and takes into account correlations between those measurements.

[1] AAIJ 16G reports a measurement of time-integrated flavor-specific asymmetry in $B_s^0 \to \mu^+ D_s^- X$ decays, $A_{SL}^s = (0.39 \pm 0.26 \pm 0.20)\%$, which is approximately equal to $4 \times \mathrm{Re}(\epsilon_{B_s^0})\ /\ (1 + |\epsilon_{B_s^0}|^2)$.

[2] ABAZOV 14 uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^s = (-0.86 \pm 0.74) \times 10^{-2}$.

[3] ABAZOV 13 reports a measurement of time-integrated flavor-specific asymmetry in mixed semileptonic $B_s^0 \to \mu^+ D_s^- X$ decays $A_{SL}^s = (-1.12 \pm 0.74 \pm 0.17)\%$ which is approximately equal to $4 \times \mathrm{Re}(\epsilon_{B_s^0})\ /\ (1 + |\epsilon_{B_s^0}|^2)$.

[4] AAIJ 14D reports a measurement of time-integrated flavor-specific asymmetry in $B_s^0 \to \mu^+ D_s^- X$ decays, $A_{SL}^s = (-0.06 \pm 0.50 \pm 0.36)\%$, which is approximately equal to$4 \times \mathrm{Re}(\epsilon_{B_s^0})\ /\ (1 + |\epsilon_{B_s^0}|^2)$.

[5] ABAZOV 11U uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^s = (-18.1 \pm 10.6) \times 10^{-3}$.

[6] ABAZOV 10E reports a measurement of flavor-specific asymmetry in $B_{(s)}^0 \to \mu^+ D_{(s)}^{*-} X$ decays with a decay-time analysis including initial-state flavor tagging, $A_{SL}^s = (-1.7 \pm 9.1^{+1.4}_{-1.5}) \times 10^{-3}$ which is approximately equal to $4 \times \mathrm{Re}(\epsilon_{B_s^0})\ /\ (1 + |\epsilon_{B_s^0}|^2)$.

[7] ABAZOV 10H reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^s = (-9.57 \pm 2.51 \pm 1.46) \times 10^{-3}$ in semileptonic $b$-hadron decays. Using the measured production ratio of $B_d^0$ and $B_s^0$, and the asymmetry of $B_d^0$ $A_{SL}^s = (-4.7 \pm 4.6) \times 10^{-3}$ measured from $B$-factories, they obtain the asymmetry for $B_s^0$.

[8] The first direct measurement of the time integrated flavor untagged charge asymmetry in semileptonic $B_s^0$ decays is reported as $2 \times A_{SL}^s(\mathrm{untagged}) = A_{SL}^s = (2.45 \pm 1.93 \pm 0.35) \times 10^{-2}$.

### $r_B(B_s^0 \to D_s^\mp K^\pm)$

$r_B$ and $\delta_B$ are the amplitude ratio and relative strong phase between the amplitudes of $A(B_s^0 \to D_s^+K^-)$ and $A(B_s^0 \to D_s^-K^+)$,

| VALUE | DOCUMENT ID | | TECN | COMMENT |

| $3^{+19}_{-20}$ | [2] AAIJ | 14BF | LHCB | Repl. by AAIJ 18U |

[1] Measured in $B_s^0 \to D_s^\mp K^\pm$ decays, constraining $-2\beta_s$ by the measurement of $\phi_s = 0.030 \pm 0.033$ from HFLAV. The value is modulo 180°.
[2] Measured in $B_s^0 \to D_s^\mp K^\pm$ decays, constraining $-2\beta_s$ by the measurement of $\phi_s = 0.01 \pm 0.07 \pm 0.0$ from AAIJ 13AR. The value is modulo 180° at 68% CL.

### *CP* Violation phase $\beta_s$

$-2\beta_s$ is the weak phase difference between $B_s^0$ mixing amplitude and the $B_s^0 \to J/\psi\phi$ decay amplitude driven by the $b \to c\overline{c}s$ transition (such as $B_s \to J/\psi\phi$, $J/\psi K^+K^-$, $J/\psi\pi^+\pi^-$, and $D_s^+D_s^-$). The Standard Model value of $\beta_s$ is $\arg(-\frac{V_{ts}V_{tb}^*}{V_{cs}V_{cb}^*})$ if penguin contributions are neglected.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV, https://hflav.web.cern.ch/) and are described at https://hflav.web.cern.ch/. The averaging/scaling procedure takes into account correlation between the measurements.

[1] AAIJ 19AF reports $\phi_s = -2\beta_s = 0.002 \pm 0.044 \pm 0.012$ rad. and $|\lambda| = 0.949 \pm 0.036 \pm 0.019$, when direct *CP* violation is allowed. Measured using a time-dependent fit to $B_s^0 \to J/\psi\pi^+\pi^-$ decays, which is sensitive to $\phi_s(s\overline{s}s)$, not $\phi_s(c\overline{c}s)$.
[2] AAIJ 19Q reports $\phi_s = -2\beta_s = -0.083 \pm 0.041 \pm 0.006$ rad. that was measured using a time-dependent angular analysis of $B_s^0 \to J/\psi K^+K^-$ decays.
[3] Measured using time-dependent angular analysis of $B_s^0 \to J/\psi K^+K^-$ in the region $m(KK) > 1.05$ GeV.
[4] AAD 16AP reports $\phi_s = -2\beta_s = -0.090 \pm 0.078 \pm 0.041$ rad. that was measured using a time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.
[5] AAIJ 16AK reports $\phi_s = -2\beta_s = 0.23^{+0.29}_{-0.28} \pm 0.02$ rad. that was measured using a time-dependent angular analysis of $B_s^0 \to \psi(2S)\phi$ decays.
[6] KHACHATRYAN 16S reports $\phi_s = -2\beta_s = -0.075 \pm 0.097 \pm 0.031$ rad. that was measured using a time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.
[7] AAIJ 14AY reports $\phi_s = -2\beta_s = 0.02 \pm 0.17 \pm 0.02$ rad. in a time-dependent fit to $B_s^0 \to D_s^+D_s^-$, while allowing *CP* violation in decay.
[8] AALTONEN 12AJ reports $-\pi/2 < \beta_s < -1.51$ or $-0.06 < \beta_s < 0.30$, or $1.26 < \beta_s < \pi/2$ rad. at 68% CL. Measured using the time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.
[9] ABAZOV 12D reports $\phi_s = -2\beta_s = -0.55^{+0.38}_{-0.36}$ rad. that was measured using a time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays. A single error includes both statistical and systematic uncertainties.
[10] AAIJ 19AP reports $\phi_s^{s\overline{s}s} = -0.073 \pm 0.115 \pm 0.027$ rad and $|\lambda| = 0.99 \pm 0.05 \pm 0.01$. Measured using a time-dependent fit to $B_s^0 \to \phi\phi$ decays, assuming independence of the helicity of the $\phi\phi$ decay.
[11] AAIJ 19AP reports also polarisation-dependent results assuming that the longitudinal weak phase is CP-conserving and that there is no direct CP violation, giving $\phi_{s,\parallel} = 0.014 \pm 0.055 \pm 0.011$ rad and $\phi_{s,\perp} = 0.044 \pm 0.059 \pm 0.019$ rad.
[12] AAIJ 18S reports $\phi_s = -2\beta_s = -0.10 \pm 0.13 \pm 0.14$ rad measured in $B_s^0 \to (K^+\pi^-)(K^-\pi^+)$ in the region $0.75 < m(K^\pm\pi^\mp) < 1.6$ GeV. This is a $b \to d\overline{d}s$ transition with a decay amplitude phase different from that of $b \to c\overline{c}s$ transition.
[13] AAIJ 15I reports $\phi_s = -2\beta_s = -0.058 \pm 0.049 \pm 0.006$ rad. that was measured using a time-dependent angular analysis of $B_s^0 \to J/\psi K^+K^-$ decays. It also combines this result with that of AAIJ 14S and quotes $\phi_s = -2\beta_s = -0.010 \pm 0.039$ rad.
[14] AAIJ 15K reports $-2\beta_s = -0.12^{+0.14}_{-0.16}$ rad. The value was obtained by measuring time-dependent *CP* asymmetry in $B_s^0 \to K^+K^-$ and using a U-spin relation between $B_s^0 \to K^+K^-$ and $B^0 \to \pi^+\pi^-$.
[15] Results are also presented using additional inputs on $B^0 \to \pi^0\pi^0$ and $B^+ \to \pi^+\pi^0$ decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.
[16] AAD 14U reports $\phi_s = -2\beta_s = 0.12 \pm 0.25 \pm 0.05$ rad. that was measured using a time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.
[17] AAIJ 14AE value measured in $B_s^0 \to \phi\phi$ decays.This is a $b \to s\overline{s}s$ transition with a decay amplitude phase different from that of $b \to c\overline{c}s$ transition. Also reports $\phi_s = -0.17 \pm 0.15 \pm 0.03$ rad.
[18] AAIJ 14S reports $\phi_s = -2\beta_s = 0.070 \pm 0.068 \pm 0.008$ rad. and $|\lambda| = 0.89 \pm 0.05 \pm 0.01$, when direct *CP* violation is allowed. Measured using a time-dependent fit to $B_s^0 \to J/\psi\pi^+\pi^-$ decays.
[19] AAIJ 13AR reports $\phi_s = -2\beta_s = 0.01 \pm 0.07 \pm 0.01$ rad. obtained from combined fit to $B_s^0 \to J/\psi K^+K^-$ and $B_s^0 \to J/\psi\pi^+\pi^-$ data sets. Also reports separate results of $\phi_s = 0.07 \pm 0.09 \pm 0.01$ rad. from $B_s^0 \to J/\psi K^+K^-$ decays and $\phi_s = -0.14^{+0.17}_{-0.16} \pm 0.01$ rad. from $B_s^0 \to J/\psi\pi^+\pi^-$ decays.
[20] AAIJ 13AY uses $B_s^0 \to \phi\phi$ mode, and reports the 68% CL interval of $\phi_s = -2\beta_s$ as $[-2.46, -0.76]$ rad.
[21] AAD 12CV reports $\phi_s = -2\beta_s = 0.22 \pm 0.41 \pm 0.10$ rad. that was measured using a time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.
[22] Reports $\phi_s = -2\beta_s = -0.44 \pm 0.44 \pm 0.02$ rad. that was measured using a time-dependent fit to $B_s^0 \to J/\psi f_0(980)$ decays.
[23] Reports $\phi_s = -2\beta_s = 0.15 \pm 0.18 \pm 0.06$ rad. that was measured using a time-dependent angular analysis of $B_s^0 \to J/\psi\phi$ decays.
[24] Reports $\phi_s = -2\beta_s = -0.019^{+0.173+0.004}_{-0.174-0.003}$ rad. which was measured using a time-dependent fit to $B_s^0 \to J/\psi\pi^+\pi^-$ decays, with the $\pi^+\pi^-$ mass within 775–1550 MeV. Searches for, but finds no evidence, for direct *CP* violation in $B_s^0 \to J/\psi\pi\pi$ decays.
[25] Reports $0.02 < \phi_s < 0.52$ or $1.08 < \phi_s < 1.55$ rad. at 68% C.L. confidence regions in the two-dimensional space of $\phi_s$ and $\Delta\Gamma_{B_s^0}$ from $B_s^0 \to J/\psi\phi$ decays.
[26] Reports $0.32 < 2\beta_s < 2.82$ rad. at 68% C.L. and confidence regions in the two-dimensional space of $2\beta_s$ and $\Delta\Gamma$ from the first measurement of $B_s^0 \to J/\psi\phi$ decays using flavor tagging. The probability of a deviation from SM prediction as large as the level of observed data is 15%.
[27] Reports $\phi_s = -2\beta_s$ and obtains 90% CL interval $-0.03 < \beta_s < 0.60$ rad.
[28] The first direct measurement of the *CP*-violating mixing phase is reported from the time-dependent analysis of flavor untagged $B_s^0 \to J/\psi\phi$ decays.
[29] Reports $\phi_s$ which equals to $-2\beta_s$.
[30] Combines D0 collaboration measurements of time-dependent angular distributions in $B_s^0 \to J/\psi\phi$ and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

### $S(B_s^0 \to \phi\gamma)$

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.43±0.30±0.11** | [1] AAIJ | 19AE | LHCB | $pp$ at 7, 8 TeV |

[1] Measured in flavor tagged time dependent analysis.

### $C(B_s^0 \to \phi\gamma)$

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.11±0.29±0.11** | [1] AAIJ | 19AE | LHCB | $pp$ at 7, 8 TeV |

[1] Measured in flavor tagged time dependent analysis.

### $A^{\Delta}(B_s \to \phi\gamma)$

$A^{\Delta}(B_s \to \phi\gamma)$ is the multiplicative coefficient of the $\sinh(\Delta\Gamma t/2)$ term in the $B_s \to \phi\gamma$ decay rate time dependence.

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| $\mathbf{-0.67^{+0.37}_{-0.41} \pm 0.17}$ | [1] AAIJ | 19AE | LHCB | $pp$ at 7, 8 TeV |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| $-0.98^{+0.46}_{-0.52} \pm 0.23 \pm 0.20$ | [2] AAIJ | 17B | LHCB | Repl. by AAIJ 19AE |

[1] Measured in flavor tagged time dependent analysis, using tagged and un-tagged events. This result updates AAIJ 17B with better selection efficiency and other analysis improvements.
[2] Measured in time dependent analysis without initial flavor tagging.

## *CPT* VIOLATION PARAMETERS

In the $B_s^0$ mixing, propagating mass eigenstates can be written as

$$|B_{sL}\rangle \propto p\sqrt{1-\xi}\,|B_s^0\rangle + q\sqrt{1+\xi}\,|\overline{B}_s^0\rangle$$
$$|B_{sH}\rangle \propto p\sqrt{1+\xi}\,|B_s^0\rangle - q\sqrt{1-\xi}\,|\overline{B}_s^0\rangle$$

where parameter $\xi$ controls *CPT* violation. If $\xi$ is zero, then *CPT* is conserved. The parameter $\xi$ can be written as

$$\xi = \frac{2(M_{11}-M_{22}) - i(\Gamma_{11}-\Gamma_{22})}{-2\Delta m_s + i\Delta\Gamma_s} \approx \frac{-2\beta^\mu \Delta a_\mu}{2\Delta m_s - i\Delta\Gamma_s},$$

where $M_{ii}$, $\Gamma_{ii}$, $\Delta m_s$, and $\Delta\Gamma_s$ are parameters of Hamiltonian governing $B_s$ oscillations, $\beta^\mu$ is the $B_s^0$ meson velocity and $\Delta a_\mu$ characterizes Lorentz-invariance violation.

### $\Delta a_\perp$

| VALUE ($10^{-12}$ GeV) | CL% | DOCUMENT ID | | TECN | COMMENT |

## $B_s^*$

$I(J^P) = 0(1^-)$

*I*, *J*, *P* need confirmation. Quantum numbers shown are quark-model predictions.

## $B_s^*$ MASS

From mass difference below and the $B_s^0$ mass.

| *VALUE* (MeV) | *DOCUMENT ID* | | *TECN* | *COMMENT* |
|---|---|---|---|---|
| **$5415.4^{+1.8}_{-1.5}$ OUR FIT** Error includes scale factor of 2.9. | | | | |
| **5415.8±1.5 OUR AVERAGE** Error includes scale factor of 2.6. | | | | |
| 5416.4±0.4±0.5 | LOUVOT | 09 | BELL | $e^+e^- \to \Upsilon(5S)$ |
| 5411.7±1.6±0.6 | [1] AQUINES | 06 | CLEO | $e^+e^- \to \Upsilon(5S)$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| 5418 ±1 ±3 | DRUTSKOY | 07A | BELL | Repl. by LOUVOT 09 |
| 5414 ±1 ±3 | [2] BONVICINI | 06 | CLEO | $e^+e^- \to \Upsilon(5S)$ |

[1] Utilized the beam constrained invariant mass peak positions for $B^*$ and $B_s^*$ to extract the measurement.

[2] Uses 14 candidates consistent with $B_s$ decays into final states with a $J/\psi$ and a $D_s^{(*)-}$.

## $m_{B_s^*} - m_{B_s}$

| 48 ±1 ±3 | [5] BONVICINI | 06 | CLEO | Repl. by AQUINES 06 |

[3] Utilized the beam constrained invariant mass peak positions for $B^*$ and $B_s^*$ to extract the measurement.

[4] LEE-FRANZINI 90 measure 46.7 ± 0.4 ± 0.2 MeV for an admixture of $B^0$, $B^+$, and $B_S$. They use the shape of the photon line to separate the above value for $B_S$.

[5] Uses 14 candidates consistent with $B_S$ decays into final states with a $J/\psi$ and a $D_s^{(*)-}$.

# Meson Particle Listings

## $B_s^*$, $X(5568)^\pm$, $B_{s1}(5830)^0$

## $X(5568)^\pm$

$I(J^P) = ?(?^?)$

OMITTED FROM SUMMARY TABLE

Seen as a peak in the $B_s\pi^\pm$ mass spectrum with a significance of more than $3\sigma$ by ABAZOV 16E and ABAZOV 18A in inclusive $p\overline{p}$ collisions at 1.96 TeV. Not seen by AAIJ 16AI, AABOUD 18L, AALTONEN 18A, and SIRUNYAN 18J. Needs confirmation.

### $X(5568)^\pm$ MASS

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **$5566.9^{+3.2}_{-3.1}{}^{+0.6}_{-1.2}$** | 278 | [1] ABAZOV | 18A | D0 | $p\overline{p} \to B_s^0\pi^\pm X$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| $5567.8\pm2.9^{+0.9}_{-1.9}$ | 133 | [2] ABAZOV | 16E | D0 | $p\overline{p} \to B_s^0\pi^\pm X$ |

[1] From the combined analysis of $B_s^0 \to J/\psi\phi$ and $B_s^0 \to D_s^\pm\mu^\mp X$ decays.

[2] Assumes $X(5568)^\pm \to B_s\pi^\pm$ decay. If $X(5568)^\pm \to B_s^*\pi^\pm$ decay is assumed, the mass shifts upward by 49 MeV.

### $X(5568)^\pm$ WIDTH

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **$18.6^{+7.9}_{-6.1}{}^{+3.5}_{-3.8}$** | 278 | [1] ABAZOV | 18A | D0 | $p\overline{p} \to B_s\pi^\pm X$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| $21.9\pm6.4^{+5.0}_{-2.5}$ | 133 | ABAZOV | 16E | D0 | $p\overline{p} \to B_s\pi^\pm X$ |

[1] From the combined analysis of $B_s^0 \to J/\psi\phi$ and $B_s^0 \to D_s^\pm\mu^\mp X$ decays.

### $X(5568)^\pm$ DECAY MODES

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $B_s\pi^\pm$ | seen |

### $\Gamma(B_s\pi^\pm)/\Gamma_{\text{total}}$ $\Gamma_1/\Gamma$

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| seen | 145 | [1] ABAZOV | 18A | D0 | $p\overline{p} \to B_s^0\pi^\pm X$ |
| **seen** | 133 | [2] ABAZOV | 16E | D0 | $p\overline{p} \to B_s^0\pi^\pm X$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| not seen | | [3] AABOUD | 18L | ATLS | $pp \to B_s^0\pi^\pm X$ |
| not seen | | [4] AALTONEN | 18A | CDF | $p\overline{p} \to B_s^0\pi^\pm X$ |
| not seen | | [5] SIRUNYAN | 18J | CMS | $pp \to B_s^0\pi^\pm X$ |
| not seen | | [6] AAIJ | 16AI | LHCB | $pp \to B_s^0\pi^\pm X$ |

[1] With $B_s$ mesons reconstructed in decays to $D_s^\pm\mu^\mp X$.

[2] Seen in $p\overline{p}$ collisions at 1.96 TeV at a rate of $(8.6 \pm 1.9 \pm 1.4)\%$ relative to inclusive $B_s$ production in the kinematic region $10 < p_T(B_s) < 30$ GeV/c, with $B_s$ mesons reconstructed in decays to $J/\psi\phi$.An alternative possibility, $X(5568)^\pm \to B_s^*\pi^\pm$ with a missing $\gamma$, could not be ruled out.

[3] Not seen in 24.4 fb$^{-1}$ of $pp$ collision data at $\sqrt{s} = 7$ and 8 TeV with $B_s$ mesons reconstructed in decays to $J/\psi\phi$. An upper limit on the production rate times branching fraction for $X(5568)^\pm \to B_s\pi^\pm$ relative to inclusive $B_s$ production is less than 1.5% at $p_T(B_s) > 10$ GeV/c and less than 1.6% at $p_T(B_s) > 15$ GeV/c at 95% CL.

[4] Not seen in 9.6 fb$^{-1}$ of $p\overline{p}$ collision data at $\sqrt{s} = 1.96$ TeV with $B_s$ mesons reconstructed in decays to $J/\psi\phi$. An upper limit on the production rate times branching fraction for $X(5568)^\pm \to B_s\pi^\pm$ relative to inclusive $B_s$ production is less than 6.7% at 95% CL.

[5] Not seen in 19.7 fb$^{-1}$ of $pp$ collisions data at $\sqrt{s} = 8$ TeV with $B_s$ mesons reconstructed in decays to $J/\psi\phi$. An upper limit on the production rate times branching fraction for $X(5568)^\pm \to B_s\pi^\pm$ relative to inclusive $B_s$ production is less than 1.1% at $p_T(B_s) > 10$ GeV/c and less than 1.0% at $p_T(B_s) > 15$ GeV/c at 95%CL.

[6] Not seen in 3 fb$^{-1}$ of $pp$ collision data at $\sqrt{s} = 7$ and 8 TeV in a scan over the $X(5568)$ mass and width, with $B_s$ mesons reconstructed in decays to $D_s^-\pi^+$ or $J/\psi\phi$. An upper limit on the production rate times branching fraction for $X(5568)^\pm \to B_s\pi^\pm$ relative to inclusive $B_s$ production is less than 2.1% at $p_T(B_s) > 10$ GeV/c at 90% CL.

[1] Measured using $B_c^+ \to J/\psi D^0 K^+$ decays.
[2] Uses $B_c^+ \to J/\psi p\overline{p}\pi^+$ decays.
[3] AAIJ 13AS uses the $B_c^+ \to J/\psi D_s^+$.
[4] AAIJ 12AV uses the $B_c^+ \to J/\psi\pi^+$ mode and also measures the mass difference $M(B_c^+) - M(B^+) = 994.6 \pm 1.3 \pm 0.6$ MeV/$c^2$.
[5] Measured using a fully reconstructed decay mode of $B_c \to J/\psi\pi$.
[6] ABE 98M observed $20.4^{+6.2}_{-5.5}$ events in the $B_c^+ \to J/\psi(1s)\ell\nu_\ell$ with a significance of $> 4.8$ standard deviations. The mass value is estimated from $m(J/\psi(1S)\ell)$.
[7] ACKERSTAFF 98O observed 2 candidate events in the $B_c^+ \to J/\psi(1S)\pi^+$ channel with an estimated background of $0.63 \pm 0.20$ events.

## $B_c^+$ MEAN LIFE

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account correlations between the measurements.

[1] The lifetime is measured using the decays $B_c^+ \to J/\psi\pi^+$ and $B^+ \to J/\psi K^+$.
[2] Also measures the width difference $\Delta\Gamma = \Gamma_{B_c^+} - \Gamma_{B^+} = 4.46 \pm 0.14 \pm 0.07$ mm$^{-1}$ c.
[3] Uses fully reconstructed $B_c^+ \to J/\psi\pi^+$ decays.
[4] Measured using $B_c^+ \to J/\psi\mu^+\nu_\mu X$ decays.
[5] The lifetime is measured from the $J/\psi e$ decay vertices.

## $B_c^+$ DECAY MODES × B($\overline{b} \to B_c$)

$B_c^-$ modes are charge conjugates of the modes below.

| | Mode | Fraction ($\Gamma_i/\Gamma$) | Confidence level |
|---|---|---|---|
| | The following quantities are not pure branching ratios; rather the fraction $\Gamma_i/\Gamma \times$ B($\overline{b} \to B_c$). | | |
| $\Gamma_1$ | $J/\psi(1S)\ell^+\nu_\ell$ anything | $(8.1 \pm 1.2) \times 10^{-5}$ | |
| $\Gamma_2$ | $J/\psi(1S)\mu^+\nu_\mu$ | | |
| $\Gamma_3$ | $J/\psi(1S)\tau^+\nu_\tau$ | | |
| $\Gamma_4$ | $J/\psi(1S)\pi^+$ | seen | |

## $B_c^+$ BRANCHING RATIOS

### $\Gamma(J/\psi(1S)\ell^+\nu_\ell \text{anything})/\Gamma_{\text{total}} \times$ B($\overline{b} \to B_c$) $\Gamma_1/\Gamma \times$ B

| VALUE (units $10^{-5}$) | CL% | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **8.1±1.2 OUR AVERAGE** | Error includes scale factor of 1.3. | | | | |
| 8.7 ± 1.0 ± 0.3 | | [1,2] AALTONEN | 16A | CDF | $p\overline{p}$ at 1.96 TeV |
| $5.2^{+2.4}_{-2.1}$ | | [3] ABE | 98M | CDF | $p\overline{p}$ 1.8 TeV |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| <16 | 90 | [4] ACKERSTAFF | 98O | OPAL | $e^+e^- \to Z$ |
| <19 | 90 | [5] ABREU | 97E | DLPH | $e^+e^- \to Z$ |
| <12 | 90 | [6] BARATE | 97H | ALEP | $e^+e^- \to Z$ |

[1] AALTONEN 16A reports $[\Gamma(B_c^+ \to J/\psi(1S)\ell^+\nu_\ell \text{anything})/\Gamma_{\text{total}} \times \text{B}(\overline{b} \to B_c)] / [\text{B}(\overline{b} \to B^+) / [\text{B}(B^+ \to J/\psi(1S)K^+)] = 0.211 \pm 0.012^{+0.021}_{-0.020}$ which we multiply by our best values $\text{B}(\overline{b} \to B^+) = (40.8 \pm 0.7) \times 10^{-2}$, $\text{B}(B^+ \to J/\psi(1S)K^+) = (1.006 \pm 0.027) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
[2] AALTONEN 16A also measures the cross-section $\sigma(B_c) \times \text{B}(B_c \to J/\psi\mu\nu_\mu) = 0.60 \pm 0.09$ nb and estimates the total cross-section $\sigma(B_c)$ to be in the range $25 \pm 4$ to $52 \pm 8$ nb for $p_T(B_c) > 6$ GeV/c and $|y(B_c)| < 1$.
[3] ABE 98M result is derived from the measurement of $[\sigma(B_c) \times \text{B}(B_c \to J/\psi(1S)\ell\nu_\ell)] / [\sigma(B^+) \times \text{B}(B^+ \to J/\psi(1S)K^+)] = 0.132^{+0.041}_{-0.037}(\text{stat}) \pm 0.031(\text{sys})^{+0.032}_{-0.020}(\text{lifetime})$ by using PDG 98 values of $\text{B}(b \to B^+)$ and $\text{B}(B^+ \to J/\psi(1S)K^+)$.
[4] ACKERSTAFF 98O reports $\text{B}(Z \to B_c X)/\text{B}(Z \to q\overline{q}) \times \text{B}(B_c \to J/\psi(1S)\ell\nu_\ell) < 6.95 \times 10^{-5}$ at 90%CL. We rescale to our PDG 98 values of $\text{B}(Z \to b\overline{b})$.
[5] ABREU 97E value listed is for an assumed $\tau_{B_c} = 0.4$ ps and improves to $1.6 \times 10^{-4}$ for $\tau_{B_c} = 1.4$ ps.
[6] BARATE 97H reports $\text{B}(Z \to B_c X)/\text{B}(Z \to q\overline{q}) \cdot \text{B}(B_c \to J/\psi(1S)\ell\nu_\ell) < 5.2 \times 10^{-5}$ at 90%CL. We rescale to our PDG 96 values of $\text{B}(Z \to b\overline{b})$. A $B_c^+ \to J/\psi(1S)\mu^+\nu_\mu$ candidate event is found, compared to all the known background sources $2 \times 10^{-3}$, which gives $m_{B_c} = 5.96^{+0.25}_{-0.19}$ GeV and $\tau_{B_c} = 1.77 \pm 0.17$ ps.

| **$3.8^{+1.2}_{-1.0}\pm0.1$** | [1] AAIJ | 17AG | LHCB | $pp$ at 7, 8 TeV |

[1] AAIJ 17AG reports $[\Gamma(B_c^+\to D^0K^+)/\Gamma_{\text{total}}\times B(\overline{b}\to B_c)]$ / $[B(\overline{b}\to B^+)] = (9.3^{+2.8}_{-2.5}\pm0.6)\times10^{-7}$ which we multiply by our best value $B(\overline{b}\to B^+) = (40.8\pm0.7)\times10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

### $\Gamma(D^0\pi^+)/\Gamma_{\text{total}} \times B(\overline{b}\to B_c)$ $\Gamma_{21}/\Gamma\times B$

### POLARIZATION IN $B_c^+$ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal ($L$) or both are transverse and parallel ($\|$) or perpendicular ($\perp$) to each other with the parameters $\Gamma_L/\Gamma$, $\Gamma_\perp/\Gamma$, and the relative phases $\phi_\|$ and $\phi_\perp$. See the definitions in the note on "Polarization in $B$ Decays" review in the $B^0$ Particle Listings.

## $B_c(2S)^\pm$ $I(J^P) = 0(0^-)$

OMITTED FROM SUMMARY TABLE
Quantum numbers neither measured nor confirmed.

### $B_c(2S)^\pm$ MASS

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **6871.6±1.1 OUR AVERAGE** | | | | | |
| 6872.1±1.3±0.8 | 24 | [1,2] AAIJ | 19Y | LHCB | $pp$ at 7, 8, 13 TeV |
| 6871.0±1.4±0.8 | 51 | [3,4] SIRUNYAN | 19M | CMS | $pp$ at 13 TeV |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| not seen | | [5] AAIJ | 18AL | LHCB | $pp$ at 8 TeV |
| 6842 ±4 ±5 | 57 | [6,7] AAD | 14AQ | ATLS | $pp$ at 7, 8 TeV |

[1] AAIJ 19Y observed $B_c(2S)^+$ in the decay mode $B_c(2S)^+ \to B_c^+\pi^+\pi^-$ ($B_c^+ \to J/\psi\pi^+$) with 2.2 (3.2) global (local) standard deviations significance.
[2] AAIJ 19Y reports mass difference measurement of $M(B_c(2S)^+) - M(B_c^+) = 597.2 \pm 1.3 \pm 0.1$ MeV. We have adjusted this measurement with our best value of $M(B_c^+) = 6274.9 \pm 0.8$ MeV. The first uncertainty of the $M(B_c(2S)^+)$ value is a total of uncertainties reported by the experiment and the second one comes from our best value of $M(B_c^+)$.
[3] SIRUNYAN 19M observed $B_c(2S)^+$ in the decay mode $B_c(2S)^+ \to B_c^+\pi^+\pi^-$ ($B_c^+ \to J/\psi\pi^+$) with 6.5 standard deviations significance.
[4] SIRUNYAN 19M reports mass difference measurement of $M(B_c(2S)^+) - M(B_c^+) = 596.1 \pm 1.2 \pm 0.8$ MeV. We have adjusted this measurement with our best value of $M(B_c^+) = 6274.9 \pm 0.8$ MeV. The first uncertainty of the $M(B_c(2S)^+)$ value is a total of uncertainties reported by the experiment and the second one comes from our best value of $M(B_c^+)$.
[5] AAIJ 18AL reports an upper limit on the ratio of production cross sections for $[\sigma(B_c(2S)^+)/\sigma(B_c^+)]\cdot B(B_c(2S)^+ \to B_c^+\pi^+\pi^-) < 0.04$–$0.09$ at 95% CL for the mass value reported by AAD 14AQ.
[6] Observed in the decay mode $B_c(2S)^+ \to B_c^+\pi^+\pi^-$ ($B_c^+ \to J/\psi\pi^+$) with 5.2 standard deviations significance.
[7] Might be the $B_c^*(2S)$.

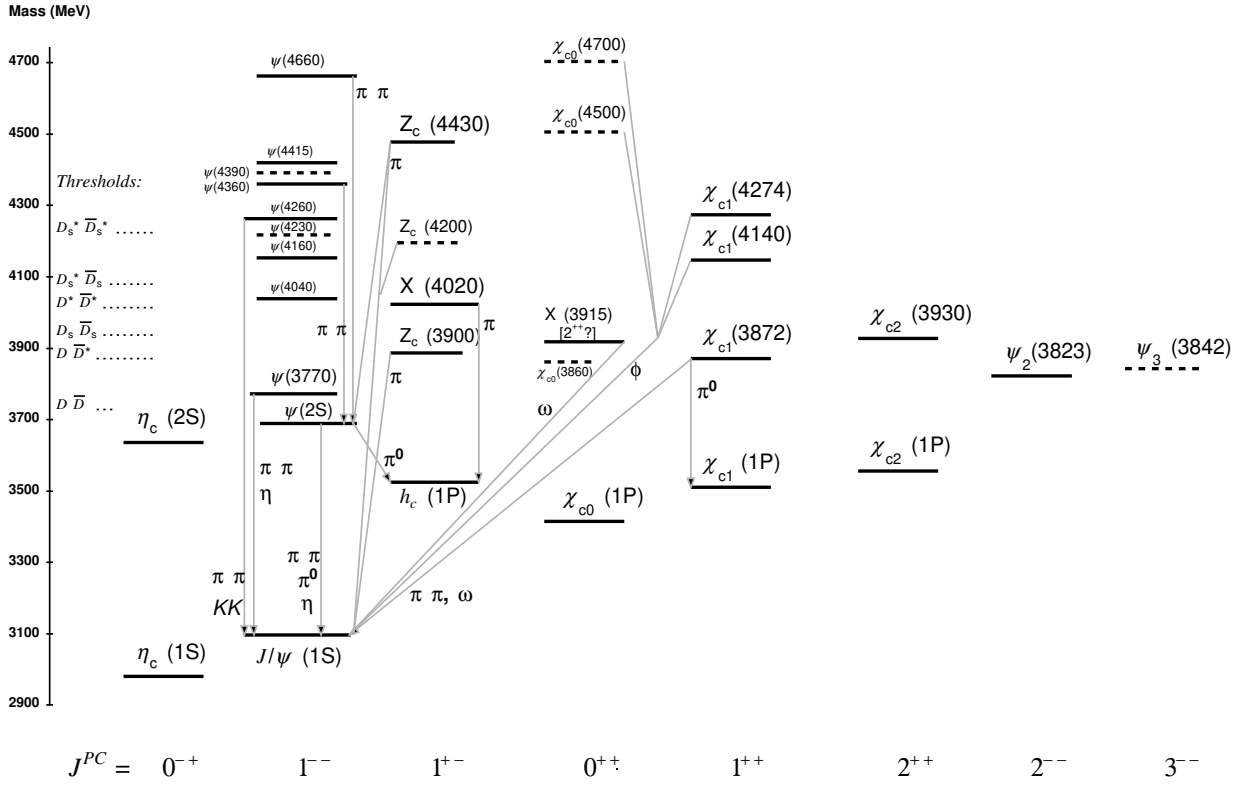
Spectroscopy of Mesons Containing Two Heavy Quarks

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

# $c\overline{c}$ MESONS (including possibly non-$q\overline{q}$ states)



$J^{PC}$ = $0^{-+}$ $1^{--}$ $1^{+-}$ $0^{++}$ $1^{++}$ $2^{++}$ $2^{--}$ $3^{--}$

The level scheme of meson states containing a minimal quark content of $c\overline{c}$. The name of a state is determined by its quantum numbers $I^G J^{PC}$ (see the review "Naming Scheme for Hadrons"). States with unestablished quantum numbers are called $X$ and are drawn according to our best estimate of their likely $J^{PC}$. States included in the Summary Tables are shown with solid lines; selected states not in the Summary Tables, but with assigned quantum numbers, are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including $\psi(nS) \to \gamma\eta_c(mS)$, $\psi(nS) \to \gamma\chi_{cJ}(1P)$, and $\chi_{cJ}(1P) \to \gamma J/\psi$, are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open charm mesons is indicated in the figure.

## $\eta_c(1S)$

$I^G(J^{PC}) = 0^+(0^{-+})$

[1] AAIJ 17AD report $m_{J/\psi} - m_{\eta_c(1S)} = 110.2 \pm 0.5 \pm 0.9$ MeV. We use the current value $m_{J/\psi} = 3096.900 \pm 0.006$ MeV to obtain the quoted mass.
[2] From a fit of the $\phi\phi$ invariant mass with the mass and width of $\eta_c(1S)$ as free parameters.
[3] AAIJ 15BI reports $m_{J/\psi} - m_{\eta_c(1S)} = 114.7 \pm 1.5 \pm 0.1$ MeV from a sample of $\eta_c(1S)$ and $J/\psi$ produced in $b$-hadron decays. We have used current value of $m_{J/\psi} = 3096.900 \pm 0.006$ MeV to arrive at the quoted $m_{\eta_c(1S)}$ result.
[4] Taking into account an asymmetric photon lineshape.
[5] With floating width.
[6] Ignoring possible interference with the non-resonant $0^-$ amplitude.
[7] Using both, $\eta \to \gamma\gamma$ and $\eta \to \pi^+\pi^-\pi^0$ decays.
[8] From a simultaneous fit to six decay modes of the $\eta_c$.
[9] Accounts for interference with non-resonant continuum.
[10] Taking into account interference with the non-resonant $J^P = 0^-$ amplitude.
[11] From a fit of the $J/\psi$ recoil mass spectrum. Supersedes ABE,K 02 and ABE 04G.
[12] Using mass of $\psi(2S) = 3686.00$ MeV.
[13] Not independent from the measurements reported by LEES 10.
[14] MITCHELL 09 observes a significant asymmetry in the lineshapes of $\psi(2S) \to \gamma\eta_c$ and $J/\psi \to \gamma\eta_c$ transitions. If ignored, this asymmetry could lead to significant bias whenever the mass and width are measured in $\psi(2S)$ or $J/\psi$ radiative decays.
[15] From the fit of the kaon momentum spectrum. Systematic errors not evaluated.
[16] Superseded by LEES 10.
[17] From a simultaneous fit of five decay modes of the $\eta_c$.
[18] Superseded by VINOKUROVA 11.
[19] Weighted average of the $\psi(2S)$ and $J/\psi(1S)$ samples. Using an $\eta_c$ width of 13.2 MeV.
[20] Average of several decay modes. Using an $\eta_c$ width of 13.2 MeV.
[21] Superseded by ASNER 04.
[22] Average of several decay modes.
[23] $\eta_c \to \phi\phi$.
[24] Mass adjusted by us to correspond to $J/\psi(1S)$ mass = 3097 MeV.

### CONSTRAINED FIT INFORMATION

An overall fit to the total width, 8 combinations of partial widths obtained from integrated cross section, and 19 branching ratios uses 93 measurements and one constraint to determine 13 parameters. The overall fit has a $\chi^2 = 121.6$ for 81 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

| | | | | | |
|---|---|---|---|---|---|
| < 10.7 | 90% CL | [8,12] PARTRIDGE | 80B | CBAL | $J/\psi \to \eta_c\gamma$ |

[1] ABLIKIM 19AP quotes $B(\eta_c \to K^+K^-\pi^0) = (1.15 \pm 0.12 \pm 0.10) \times 10^{-2}$ which we multiply by 6 to account for isospin symmetry.

[2] ABLIKIM 19AP quotes $B(\eta_c \to K^0_S K^\pm\pi^\mp) = (2.60 \pm 0.21 \pm 0.20) \times 10^{-2}$ which we multiply by 3 to account for isospin symmetry.

[3] ABLIKIM 12N quotes $B(\psi(2S) \to \pi^0 h_c) \cdot B(h_c \to \gamma\eta_c) \cdot B(\eta_c \to K^+K^-\pi^0) = (4.54 \pm 0.76 \pm 0.48) \times 10^{-6}$ which we multiply by 6 to account for isospin symmetry.

[4] ABLIKIM 12N reports $[\Gamma(\eta_c(1S) \to K\overline{K}\pi)/\Gamma_{total}] \times [\Gamma(h_c(1P) \to \gamma\eta_c(1S))/\Gamma_{total} \times \Gamma(\psi(2S) \to \pi^0 h_c(1P))/\Gamma_{total}] = (27.24 \pm 4.56 \pm 2.88) \times 10^{-6}$ which we divide by our best value $\Gamma(h_c(1P) \to \gamma\eta_c(1S))/\Gamma_{total} \times \Gamma(\psi(2S) \to \pi^0 h_c(1P))/\Gamma_{total} = (4.3 \pm 0.4) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[5] ABLIKIM 12N quotes $B(\psi(2S) \to \pi^0 h_c) \cdot B(h_c \to \gamma\eta_c) \cdot B(\eta_c \to K^0_S K^\pm\pi^\mp) = (11.35 \pm 1.25 \pm 1.50) \times 10^{-6}$ which we multiply by 3 to account for isospin symmetry.

[6] ABLIKIM 12N reports $[\Gamma(\eta_c(1S) \to K\overline{K}\pi)/\Gamma_{total}] \times [\Gamma(h_c(1P) \to \gamma\eta_c(1S))/\Gamma_{total} \times \Gamma(\psi(2S) \to \pi^0 h_c(1P))/\Gamma_{total}] = (34.05 \pm 3.75 \pm 4.50) \times 10^{-6}$ which we divide by our best value $\Gamma(h_c(1P) \to \gamma\eta_c(1S))/\Gamma_{total} \times \Gamma(\psi(2S) \to \pi^0 h_c(1P))/\Gamma_{total} = (4.3 \pm 0.4) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[7] Determined from the ratio of $B(B^\pm \to K^\pm\eta_c)\, B(\eta_c \to K\overline{K}\pi) = (7.4 \pm 0.5 \pm 0.7) \times 10^{-5}$ reported in AUBERT,B 04B and $B(B^\pm \to K^\pm\eta_c) = (8.7 \pm 1.5) \times 10^{-3}$ reported in AUBERT 06E.

[8] The quoted branching ratios use $B(J/\psi(1S) \to \gamma\eta_c(1S)) = 0.0127 \pm 0.0036$. Where relevant, the error in this branching ratio is treated as a common systematic in computing averages.

[9] Average from $K^+K^-\pi^0$ and $K^\pm K^0_S\pi^\mp$ decay channels.

[10] $K^\pm K^0_S\pi^\mp$ corrected to $K\overline{K}\pi$ by factor 3. KS, MR.

[11] Estimated using $B(\psi(2S) \to \gamma\eta_c(1S)) = 0.0028 \pm 0.0006$.

[12] $K^+K^-\pi^0$ corrected to $K\overline{K}\pi$ by factor 6. KS, MR

# Meson Particle Listings

## $J/\psi(1S)$

## $J/\psi(1S)$

$I^G(J^{PC}) = 0^-(1^{--})$

### $J/\psi(1S)$ MASS

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **3096.900±0.006 OUR AVERAGE** | | | | | |
| 3096.900±0.002±0.006 | | [1] ANASHIN | 15 | KEDR | $e^+e^- \to$ hadrons |
| 3096.89 ±0.09 | 502 | [2] ARTAMONOV | 00 | OLYA | $e^+e^- \to$ hadrons |
| 3096.91 ±0.03 ±0.01 | | [3] ARMSTRONG | 93B | E760 | $\overline{p}p \to e^+e^-$ |
| 3096.95 ±0.1 ±0.3 | 193 | BAGLIN | 87 | SPEC | $\overline{p}p \to e^+e^-X$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 3096.66 ±0.19 ±0.02 | 6.1k | [4] AAIJ | 15BI | LHCB | $pp \to J/\psi X$ |
| 3096.917±0.010±0.007 | | AULCHENKO | 03 | KEDR | $e^+e^- \to$ hadrons |
| 3097.5 ±0.3 | | GRIBUSHIN | 96 | FMPS | 515 $\pi^-$Be $\to 2\mu X$ |
| 3098.4 ±2.0 | 38k | LEMOIGNE | 82 | GOLI | 185 $\pi^-$Be $\to \gamma\mu^+\mu^-$A |
| 3096.93 ±0.09 | 502 | [5] ZHOLENTZ | 80 | REDE | $e^+e^-$ |
| 3097.0 ±1 | | [6] BRANDELIK | 79C | DASP | $e^+e^-$ |

[1] Supersedes AULCHENKO 03.
[2] Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).
[3] Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the $\psi(2S)$ mass from AULCHENKO 03.
[4] From a sample of $\eta_c(1S)$ and $J/\psi$ produced in $b$-hadron decays. Systematic uncertainties not estimated.
[5] Superseded by ARTAMONOV 00.
[6] From a simultaneous fit to $e^+e^-$, $\mu^+\mu^-$ and hadronic channels assuming $\Gamma(e^+e^-) = \Gamma(\mu^+\mu^-)$.

### $J/\psi(1S)$ WIDTH

| VALUE (keV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **92.9 ± 2.8 OUR AVERAGE** Error includes scale factor of 1.1. | | | | | |
| 96.1 ± 3.2 | 13k | [1] ADAMS | 06A | CLEO | $e^+e^- \to \mu^+\mu^-\gamma$ |
| 84.4 ± 8.9 | | BAI | 95B | BES | $e^+e^-$ |
| 91 ±11 ±6 | | [2] ARMSTRONG | 93B | E760 | $\overline{p}p \to e^+e^-$ |
| 85.5 $^{+\ 6.1}_{-\ 5.8}$ | | [3] HSUEH | 92 | RVUE | See $\Upsilon$ mini-review |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 92.94± 1.83 | | [4] ANASHIN | 18A | KEDR | $e^+e^-$ |
| 94.1 ± 2.7 | | [5] ANASHIN | 10 | KEDR | 3.097 $e^+e^- \to e^+e^-$, $\mu^+\mu^-$ |
| 93.7 ± 3.5 | 7.8k | [1] AUBERT | 04 | BABR | $e^+e^- \to \mu^+\mu^-\gamma$ |

[1] Calculated by us from the reported values of $\Gamma(e^+e^-)\times B(\mu^+\mu^-)$ using $B(e^+e^-) = (5.94 \pm 0.06)\%$ and $B(\mu^+\mu^-) = (5.93 \pm 0.06)\%$.
[2] The initial-state radiation correction reevaluated by ANDREOTTI 07 in its Ref. [4].
[3] Using data from COFFMAN 92, BALDINI-CELIO 75, BOYARSKI 75, ESPOSITO 75B, BRANDELIK 79C.
[4] Using $\Gamma(e^+e^-)$ from ANASHIN 18A and $B(J/\psi(1S) \to e^+e^-) = (5.971 \pm 0.032)\%$ from PDG 16.
[5] Assuming $\Gamma(e^+e^-) = \Gamma(\mu^+\mu^-)$ and using $\Gamma(e^+e^-)/\Gamma_{\rm total} = (5.94 \pm 0.06)\%$.

### $J/\psi(1S)$ DECAY MODES

| | Mode | Fraction ($\Gamma_i/\Gamma$) | Scale factor/ Confidence level |
|---|---|---|---|
| $\Gamma_1$ | hadrons | (87.7 ± 0.5 ) % | |
| $\Gamma_2$ | virtual$\gamma \to$ hadrons | (13.50 ± 0.30 ) % | |
| $\Gamma_3$ | $ggg$ | (64.1 ± 1.0 ) % | |
| $\Gamma_4$ | $\gamma gg$ | ( 8.8 ± 1.1 ) % | |
| $\Gamma_5$ | $e^+e^-$ | ( 5.971± 0.032) % | |
| $\Gamma_6$ | $e^+e^-\gamma$ [a] | ( 8.8 ± 1.4 ) $\times 10^{-3}$ | |
| $\Gamma_7$ | $\mu^+\mu^-$ | ( 5.961± 0.033) % | |
| | **Decays involving hadronic resonances** | | |
| $\Gamma_8$ | $\rho\pi$ | ( 1.69 ± 0.15 ) % | S=2.4 |
| $\Gamma_9$ | $\rho^0\pi^0$ | ( 5.6 ± 0.7 ) $\times 10^{-3}$ | |
| $\Gamma_{10}$ | $\rho(770)^\mp K^\pm K^0_S$ | ( 1.9 ± 0.4 ) $\times 10^{-3}$ | |
| $\Gamma_{11}$ | $\rho(1450)\pi$ | | |
| $\Gamma_{12}$ | $\rho(1450)\pi \to \pi^+\pi^-\pi^0$ | ( 2.3 ± 0.7 ) $\times 10^{-3}$ | |

[a] For $E_\gamma > 100$ MeV.
[b] The value is for the sum of the charge states or particle/antiparticle states indicated.
[c] Includes $p\overline{p}\pi^+\pi^-\gamma$ and excludes $p\overline{p}\eta$, $p\overline{p}\omega$, $p\overline{p}\eta'$.
[d] See the "Note on the $\eta(1405)$" in the $\eta(1405)$ Particle Listings.
[e] For a narrow state $A$ with mass less than 960 MeV.
[f] For a narrow scalar or pseudoscalar $A^0$ with mass 0.21–3.0 GeV.

[1] MITCHELL 09 reports (1.98 ± 0.09 ± 0.30) × $10^{-2}$ from a measurement of $[\Gamma(J/\psi(1S) \to \gamma\eta_c(1S))/\Gamma_{\text{total}}]$ × [B($\psi(2S) \to J/\psi(1S)\pi^+\pi^-$)] assuming B($\psi(2S) \to J/\psi(1S)\pi^+\pi^-$) = (35.04 ± 0.07 ± 0.77) × $10^{-2}$, which we rescale to our best value B($\psi(2S) \to J/\psi(1S)\pi^+\pi^-$) = (34.68 ± 0.30) × $10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
[2] Calculated by the authors using an average of B($J/\psi \to \gamma\eta_c$) × B($\eta_c \to K\overline{K}\pi$) from BALTRUSAITIS 86, BISELLO 91, BAI 04 and B($\eta_c \to K\overline{K}\pi$) = (8.5 ± 1.8)% from AUBERT 06E.

| 2.2 ±0.4 ±0.4 | 264 | ABLIKIM | 05R | BES2 | $J/\psi \to \gamma\pi^+\pi^-\eta'$ |

[1] From a fit of the measured $\pi^+\pi^-\eta'$ lineshape that accounts for the abrupt distortion observed at the $p\overline{p}$ threshold with a Flatte formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16J is that a second resonance near 1870 MeV interferes with the $X(1835)$; fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.
[2] From a fit of the $\pi^+\pi^-\eta'$ mass distribution to a combination of $\gamma f_1(1510)$, $\gamma X(1835)$, and two unconfirmed states $\gamma X(2120)$, and $\gamma X(2370)$, for $M(p\overline{p}) < 2.8$ GeV, and accounting for backgrounds from non-$\eta'$ events and $J/\psi \to \pi^0\pi^+\pi^-\eta'$.

## BRANCHING RATIOS OF $\psi(2S)$ AND $\chi_{c0,1,2}$

Updated March 2020 by J.J. Hernández-Rey (IFIC, Valencia), S. Navas (U. of Granada), and C. Patrignani (Bologna Univ., INFN)

Since 2002, the treatment of the branching ratios of the $\psi(2S)$ and $\chi_{c0,1,2}$ has undergone an important restructuring.

When measuring a branching ratio experimentally, it is not always possible to normalize the number of events observed in the corresponding decay mode to the total number of particles produced. Therefore, the experimenters sometimes report the number of observed decays with respect to another decay mode of the same or another particle in the relevant decay chain. This is actually equivalent to measuring combinations of branching fractions of several decay modes.

To extract the branching ratio of a given decay mode, the collaborations use some previously reported measurements of

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

the required branching ratios. However, the values are frequently taken from the *Review of Particle Physics* (RPP), which in turn uses the branching ratio reported by the experiment in the following edition, giving rise either to correlations or to plain vicious circles, as discussed in more detail in earlier editions of this review [1,2].

The way to avoid these dependencies and correlations is to extract the branching ratios through a fit that uses the truly measured combinations of branching fractions and partial widths. This fit, in fact, should involve decays from the four concerned particles, $\psi(2S)$, $\chi_{c0}$, $\chi_{c1}$, and $\chi_{c2}$, and occasionally some combinations of branching ratios of more than one of them. This is what is done since the 2002 edition [3].

The PDG policy is to quote the results of the collaborations in a manner as close as possible to what appears in their original publications. However, in order to avoid the problems mentioned above, we had in some cases to work out the values originally measured, using the number of events and detection efficiencies given by the collaborations, or rescaling back the published results. The information was sometimes spread over several articles, and some articles referred to papers still unpublished, which in turn contained the relevant numbers in footnotes.

Even though the experimental collaborations are entitled to extract whatever branching ratios they consider appropriate by using other published results, we would like to encourage them to also quote explicitly in their articles the actual quantities measured, so that they can be used directly in averages and fits of different experimental determinations.

To inform the reader how we computed some of the values used in this edition of RPP, we use footnotes to indicate the branching ratios actually given by the experiments and the quantities they use to derive them from the true combination of branching ratios actually measured.

None of the branching ratios of the $\chi_{c0,1,2}$ are measured independently of the $\psi(2S)$ radiative decays. We tried to identify those branching ratios which can be correlated in a non-trivial way, and although we cannot preclude the existence of other cases, we are confident that the most relevant correlations have already been removed. Nevertheless, correlations in the errors of different quantities measured by the same experiment have not been taken into account.

### Fit information

This is an overall fit to 4 total widths, 1 partial width, 26 combinations of partial widths, 24 branching ratios, and 108 combinations of branching ratios. Of the latter 62 involve decays of more than one particle.

The overall fit uses 248 measurements to determine 49 parameters and has a $\chi^2$ of 378.1 for 199 degrees of freedom.

The relatively high $\chi^2$ of the fit, 1.9 per d.o.f., can be traced back to a few specific discrepancies in the data. No scaling factors to fit uncertainties have been applied.

In the listing we provide the inter-particle correlation coefficients $< \delta x_i \delta x_j > / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the corresponding parameter $x_i$.

### CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a $\chi^2 = 378.1$ for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle\delta p_i\delta p_j\rangle/(\delta p_i\cdot\delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$.

| 3500 ±10 | 40 | TANENBAUM | 75 | MRK1 | Hadrons $\gamma$ |

[1] From a fit of the $\phi\phi$ invariant mass with the width of $\chi_{c1}(1P)$ fixed to the PDG 16 value.

[2] AAIJ 17BI reports also $m(\chi_{c2}) - m(\chi_{c1}) = 45.39 \pm 0.07 \pm 0.03$ MeV.

[3] Recalculated by ANDREOTTI 05A, using the value of $\psi(2S)$ mass from AULCHENKO 03.

[4] Using mass of $\psi(2S) = 3686.0$ MeV.

[5] $J/\psi(1S)$ mass constrained to 3097 MeV.

[6] Mass value shifted by us by amount appropriate for $\psi(2S)$ mass = 3686 MeV and $J/\psi(1S)$ mass = 3097 MeV.

[7] From a simultaneous fit to radiative and hadronic decay channels.

### CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a $\chi^2 = 378.1$ for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$.

[1] HE 08B reports 1.56 ± 0.13 ± 0.22 ± 0.10 % from a measurement of $[\Gamma(\chi_{c1}(1P) \to \rho^+\pi^-\pi^0 + c.c.)/\Gamma_{total}] \times [B(\psi(2S) \to \gamma\chi_{c1}(1P))]$ assuming $B(\psi(2S) \to \gamma\chi_{c1}(1P)) = (9.07 \pm 0.11 \pm 0.54) \times 10^{-2}$, which we rescale to our best value $B(\psi(2S) \to \gamma\chi_{c1}(1P)) = (9.75 \pm 0.24) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Calculated by us. We have added the values from HE 08B for $\rho^+\pi^-\pi^0$ and $\rho^-\pi^+\pi^0$ decays assuming uncorrelated statistical and fully correlated systematic uncertainties.

### $\Gamma(\rho^0\pi^+\pi^-)/\Gamma_{total}$ $\Gamma_5/\Gamma$
