[1] From a fit of the $\phi\phi$ invariant mass with the width of $\chi_{c2}(1P)$ fixed to the PDG 16 value.

[2] AAIJ 17BI reports also $m(\chi_{c2}) - m(\chi_{c1}) = 45.39 \pm 0.07 \pm 0.03$ MeV.

[3] Recalculated by ANDREOTTI 05A, using the value of $\psi(2S)$ mass from AULCHENKO 03.

[4] Using mass of $\psi(2S) = 3686.0$ MeV.

[5] $J/\psi(1S)$ mass constrained to 3097 MeV.

[6] Assuming $\psi(2S)$ mass = 3686 MeV and $J/\psi(1S)$ mass = 3097 MeV.

[7] Mass value shifted by us by amount appropriate for $\psi(2S)$ mass = 3686 MeV and $J/\psi(1S)$ mass = 3097 MeV.

[8] From a simultaneous fit to radiative and hadronic decay channels.

### CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a $\chi^2 = 378.1$ for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle\delta p_i\delta p_j\rangle/(\delta p_i\cdot\delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$.

[1] AAIJ 17AD report $m_{\psi(2S)} - m_{\eta_c(2S)} = 52.5 \pm 1.7 \pm 0.6$ MeV. We use the current value $m_{\psi(2S)} = 3686.097 \pm 0.025$ MeV to obtain the quoted mass.

[2] From a fit of the $\phi\phi$ invariant mass with the width of $\eta_c(2S)$ fixed to the PDG 16 value.

[3] Ignoring possible interference with continuum.

[4] With a width fixed to 11.3 MeV.

[5] With a width fixed to 11.3 MeV. Using both $\eta \to \gamma\gamma$ and $\eta \to \pi^+\pi^-\pi^0$ decays.

[6] From a simultaneous fit to $K^0_S K^\pm\pi^\mp$ and $K^+K^-\pi^0$ decay modes.

[7] Accounts for interference with non-resonant continuum.

[8] From a fit of the $J/\psi$ recoil mass spectrum. Supersedes ABE,K 02 and ABE 04G.

[9] From the fit of the kaon momentum spectrum. Systematic errors not evaluated.

[10] Superseded by DEL-AMO-SANCHEZ 11M.

[11] Superseded by VINOKUROVA 11.

[12] Assuming mass of $\psi(2S) = 3686$ MeV.

## $\eta_c(2S)$ PARTIAL WIDTHS

### $\Gamma(\gamma\gamma)$ $\Gamma_{16}$

| VALUE (keV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 0.44±0.14 | 106 | [20] XU | 18 | BELL | $e^+ e^- \to e^+ e^- \eta' \pi^+ \pi^-$ |
| 1.3 ±0.6 | | [21] ASNER | 04 | CLEO | $\gamma\gamma \to \eta_c \to K^0_S K^\pm \pi^\mp$ |

[20] Assuming that the branching fraction into $\eta'\pi^+\pi^-$ is the same as for $\eta_c(1S)$.
[21] They measure $\Gamma(\eta_c(2S)\gamma\gamma)$ B($\eta_c(2S) \to K\overline{K}\pi$) = (0.18 ± 0.05 ± 0.02) $\Gamma(\eta_c(1S)\gamma\gamma)$ B($\eta_c(1S) \to K\overline{K}\pi$). The value for $\Gamma(\eta_c(2S) \to \gamma\gamma)$ is derived assuming that the branching fractions for $\eta_c(2S)$ and $\eta_c(1S)$ decays to $K_S K\pi$ are equal and using $\Gamma(\eta_c(1S) \to \gamma\gamma)$ = 7.4 ± 0.4 ± 2.3 keV.

# $\psi(2S)$

$I^G(J^{PC}) = 0^-(1^{--})$

See the Review on "$\psi(2S)$ and $\chi_c$ branching ratios" before the $\chi_{c0}(1P)$ Listings.

## $\psi(2S)$ MASS

OUR FIT includes measurements of $m_{\psi(2S)}$, $m_{\psi(3770)}$, and $m_{\psi(3770)} - m_{\psi(2S)}$.

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **3686.10 ±0.06 OUR FIT** Error includes scale factor of 5.9. | | | | | |
| **3686.097±0.010 OUR AVERAGE** | | | | | |
| 3686.099±0.004±0.009 | | [1] ANASHIN | 15 | KEDR | $e^+e^- \to$ hadrons |
| 3686.12 ±0.06 ±0.10 | 4k | AAIJ | 12H | LHCB | $pp \to J/\psi\pi^+\pi^- X$ |
| 3685.95 ±0.10 | 413 | [2] ARTAMONOV | 00 | OLYA | $e^+e^- \to$ hadrons |
| 3685.98 ±0.09 ±0.04 | | [3] ARMSTRONG | 93B | E760 | $\overline{p}p \to e^+e^-$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| $3686.114 \pm 0.007 ^{+0.011}_{-0.016}$ | | [4] ANASHIN | 12 | KEDR | $e^+e^- \to$ hadrons |
| 3686.111±0.025±0.009 | | AULCHENKO | 03 | KEDR | $e^+e^- \to$ hadrons |
| 3686.00 ±0.10 | 413 | [5] ZHOLENTZ | 80 | OLYA | $e^+e^-$ |

[1] Supersedes AULCHENKO 03 and ANASHIN 12.
[2] Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).
[3] Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the $J/\psi(1S)$ mass from AULCHENKO 03.
[4] From the scans in 2004 and 2006. ANASHIN 12 reports the value 3686.114 ± 0.007 ± $0.011 ^{+0.002}_{-0.012}$ MeV, where the third uncertainty is due to assumptions on the interference between the resonance and hadronic continuum. We combined the two systematic uncertainties.
[5] Superseded by ARTAMONOV 00.

## $m_{\psi(2S)} - m_{J/\psi(1S)}$

| VALUE (MeV) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **589.188±0.028 OUR AVERAGE** | | | | |
| 589.194±0.027±0.011 | [1] AULCHENKO | 03 | KEDR | $e^+e^- \to$ hadrons |
| 589.7 ±1.2 | LEMOIGNE | 82 | GOLI | 185 $\pi^-$ Be $\to \gamma\mu^+\mu^-$ A |
| 589.07 ±0.13 | [1] ZHOLENTZ | 80 | OLYA | $e^+e^-$ |
| 588.7 ±0.8 | LUTH | 75 | MRK1 | |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| 588 ±1 | [2] BAI | 98E | BES | $e^+e^-$ |

[1] Redundant with data in mass above.
[2] Systematic errors not evaluated.

## $\psi(2S)$ WIDTH

| VALUE (keV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **294± 8 OUR FIT** | | | | | |
| **286±16 OUR AVERAGE** | | | | | |
| 358±88± 4 | | ABLIKIM | 08B | BES2 | $e^+e^- \to$ hadrons |
| 290±25± 4 | 2.7k | ANDREOTTI | 07 | E835 | $p\overline{p} \to e^+e^-$, $J/\psi X$ |
| 331±58± 2 | | ABLIKIM | 06L | BES2 | $e^+e^- \to$ hadrons |
| 264±27 | | [1] BAI | 02B | BES2 | $e^+e^-$ |
| 287±37±16 | | [2] ARMSTRONG | 93B | E760 | $\overline{p}p \to e^+e^-$ |

[1] From a simultaneous fit to the hadronic and $\mu^+\mu^-$ cross section, assuming $\Gamma = \Gamma_h + \Gamma_e + \Gamma_\mu + \Gamma_\tau$ and lepton universality. Does not include vacuum polarization correction.
[2] The initial-state radiation correction reevaluated by ANDREOTTI 07 in its Ref. [4].

## $\psi(2S)$ DECAY MODES

| | Mode | Fraction ($\Gamma_i/\Gamma$) | Scale factor/ Confidence level |
|---|---|---|---|
| $\Gamma_1$ | hadrons | (97.85 ±0.13 ) % | |
| $\Gamma_2$ | virtual $\gamma \to$ hadrons | ( 1.73 ±0.14 ) % | S=1.5 |
| $\Gamma_3$ | $ggg$ | (10.6 ±1.6 ) % | |
| $\Gamma_4$ | $\gamma gg$ | ( 1.03 ±0.29 ) % | |
| $\Gamma_5$ | light hadrons | (15.4 ±1.5 ) % | |
| $\Gamma_6$ | $e^+e^-$ | ( 7.93 ±0.17 ) $\times 10^{-3}$ | |
| $\Gamma_7$ | $\mu^+\mu^-$ | ( 8.0 ±0.6 ) $\times 10^{-3}$ | |
| $\Gamma_8$ | $\tau^+\tau^-$ | ( 3.1 ±0.4 ) $\times 10^{-3}$ | |

### Decays into $J/\psi(1S)$ and anything

| | | |
|---|---|---|
| $\Gamma_9$ | $J/\psi(1S)$ anything | (61.4 ±0.6 ) % |
| $\Gamma_{10}$ | $J/\psi(1S)$ neutrals | (25.38 ±0.32 ) % |
| $\Gamma_{11}$ | $J/\psi(1S)\pi^+\pi^-$ | (34.68 ±0.30 ) % |
| $\Gamma_{12}$ | $J/\psi(1S)\pi^0\pi^0$ | (18.24 ±0.31 ) % |
| $\Gamma_{13}$ | $J/\psi(1S)\eta$ | ( 3.37 ±0.05 ) % |
| $\Gamma_{14}$ | $J/\psi(1S)\pi^0$ | ( 1.268±0.032) $\times 10^{-3}$ |

### Hadronic decays

### CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a $\chi^2 = 378.1$ for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle\delta p_i\delta p_j\rangle/(\delta p_i\cdot\delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$.

## $\psi(2S)$ $\Gamma$(i)$\Gamma(e^+e^-)/\Gamma$(total)

This combination of a partial width with the partial width into $e^+e^-$ and with the total width is obtained from the integrated cross section into channel(i) in the $e^+e^-$ annihilation. We list only data that have not been used to determine the partial width $\Gamma$(i) or the branching ratio $\Gamma$(i)/total.

[1] LEES 12E reports $[\Gamma(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \to e^+e^-)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to \mu^+\mu^-)] = (49.9 \pm 1.3 \pm 1.0) \times 10^{-3}$ keV which we divide by our best value $B(J/\psi(1S) \to \mu^+\mu^-) = (5.961 \pm 0.033) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] The value of $\Gamma(e^+e^-)$ quoted in BAI 98E is derived using $B(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) = (32.4 \pm 2.6) \times 10^{-2}$ and $B(J/\psi(1S) \to \ell^+\ell^-) = 0.1203 \pm 0.0038$. Recalculated by us using $B(J/\psi(1S) \to \ell^+\ell^-) = 0.1181 \pm 0.0020$.

[3] AUBERT 07AU reports $[\Gamma(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \to e^+e^-)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to \pi^+\pi^-\pi^0)] = 0.0186 \pm 0.0012 \pm 0.0011$ keV which we divide by our best value $B(J/\psi(1S) \to \pi^+\pi^-\pi^0) = (2.10 \pm 0.08) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] AUBERT 05D reports $[\Gamma(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \to e^+e^-)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \to \mu^+\mu^-)] = 0.0450 \pm 0.0018 \pm 0.0022$ keV which we divide by our best value $B(J/\psi(1S) \to \mu^+\mu^-) = (5.961 \pm 0.033) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Superseded by LEES 12E.

[1] AUBERT 07AU reports $[\Gamma(\psi(2S) \to K^+K^-\pi^+\pi^-\pi^0)/\Gamma_{total}] \times [\Gamma(\psi(2S) \to e^+e^-)] = (44 \pm 13 \pm 3) \times 10^{-4}$ keV which we divide by our best value $\Gamma(\psi(2S) \to e^+e^-) = 2.33 \pm 0.04$ keV. Our first error is their experiment's error and our second error is the systematic error from using our best value.

## $\psi(2S)$ CROSS-PARTICLE BRANCHING RATIOS

For measurements involving $B(\psi(2S) \to \gamma\chi_{cJ}(1P)) \times B(\chi_{cJ}(1P) \to X)$ see the corresponding entries in the $\chi_{cJ}(1P)$ sections.

## MULTIPOLE AMPLITUDE RATIOS IN RADIATIVE DECAYS $\psi(2S) \to \gamma\chi_{cJ}(1P)$ and $\chi_{cJ} \to \gamma J/\psi(1S)$

### $a_2(\chi_{c1})/a_2(\chi_{c2})$ Magnetic quadrupole transition amplitude ratio

| VALUE (units $10^{-2}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **63 ± 7 OUR AVERAGE** | | | | | |
| 61.7± 8.3 | 253k | [1] ABLIKIM | 17N | BES3 | $\psi(2S) \to \gamma\gamma\ell^+\ell^-$ |
| $67\ ^{+19}_{-13}$ | 59k | [2] ARTUSO | 09 | CLEO | $\psi(2S) \to \gamma\gamma\ell^+\ell^-$ |

[1] Statistical and systematic errors combined.

[2] Statistical and systematic errors combined. Using values from fits with floating *M2* amplitudes $a_2(\chi_{c1})$, $a_2(\chi_{c2})$, $b_2(\chi_{c1})$, $b_2(\chi_{c2})$ and fixed *E3* amplitudes of $a_3(\chi_{c2}) = b_3(\chi_{c2}) = 0$. Not independent of values for $a_2(\chi_{c1}(1P))$ and $a_2(\chi_{c2}(1P))$ from ARTUSO 09.

### $b_2(\chi_{c2})/b_2(\chi_{c1})$ Magnetic quadrupole transition amplitude ratio

| VALUE (units $10^{-2}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **60±31 OUR AVERAGE** | | | | | |
| 74±40 | 253k | [1] ABLIKIM | 17N | BES3 | $\psi(2S) \to \gamma\gamma\ell^+\ell^-$ |
| $37^{+53}_{-47}$ | 59k | [2] ARTUSO | 09 | CLEO | $\psi(2S) \to \gamma\gamma\ell^+\ell^-$ |

[1] Statistical and systematic errors combined. Derived from the reported measurement of $b_2(\chi_{c1})/b_2(\chi_{c2}) = 1.35 \pm 0.72$.

[2] Statistical and systematic errors combined. Using values from fits with floating *M2* amplitudes $a_2(\chi_{c1})$, $a_2(\chi_{c2})$, $b_2(\chi_{c1})$, $b_2(\chi_{c2})$ and fixed *E3* amplitudes of $a_3(\chi_{c2}) = b_3(\chi_{c2}) = 0$. Not independent of values for $b_2(\chi_{c1}(1P))$ and $b_2(\chi_{c2}(1P))$ from ARTUSO 09.

# $\psi(3770)$

$I^G(J^{PC}) = 0^-(1^{--})$

## $\psi(3770)$ MASS (MeV)

OUR FIT includes measurements of $m_{\psi(2S)}$, $m_{\psi(3770)}$, and $m_{\psi(3770)} - m_{\psi(2S)}$.

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |

[1] Measured in prompt hadroproduction.
[2] Taking into account interference between the resonant and non-resonant $D\overline{D}$ production.
[3] From the joint analysis of the data on the $D\overline{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR.
[4] Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = 0^\circ$.
[5] Interference between the resonant and non-resonant $D\overline{D}$ production not taken into account.

## $m_{\psi(3770)} - m_{\psi(2S)}$

OUR FIT includes measurements of $m_{\psi(2S)}$, $m_{\psi(3770)}$, and $m_{\psi(3770)} - m_{\psi(2S)}$.

## $\psi(3770)$

25.8± 1.3 [4] SHAMOV 17 RVUE $e^+e^- \to D\overline{D}$, hadrons

[1] Taking into account interference between the resonant and non-resonant $D\overline{D}$ production.
[2] Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = 0^\circ$.
[3] Interference between the resonant and non-resonant $D\overline{D}$ production not taken into account.
[4] From the joint analysis of the data on the $D\overline{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR.

### $\psi(3770)$ DECAY MODES

In addition to the dominant decay mode to $D\overline{D}$, $\psi(3770)$ was found to decay into the final states containing the $J/\psi$ (BAI 05, ADAM 06). ADAMS 06 and HUANG 06A searched for various decay modes with light hadrons and found a statistically significant signal for the decay to $\phi\eta$ only (ADAMS 06).

### CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 3 branching ratios uses 23 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 20.1$ for 19 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle\delta p_i\delta p_j\rangle/(\delta p_i\cdot\delta p_j)$, in percent, from the fit to parameters $p_i$, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

## $\psi_2(3823)$

$I^G(J^{PC}) = 0^-(2^{--})$
*I*, *J*, *P* need confirmation.

was $\psi(3823)$, $X(3823)$

Seen by BHARDWAJ 13 in $B\to\chi_{c1}\gamma K$ and ABLIKIM 15S in $e^+e^-\to\pi^+\pi^-\gamma\chi_{c1}$ decays as a narrow peak in the invariant mass distribution of the $\chi_{c1}\gamma$ system. Properties consistent with the $\psi_2(1^3D_2)$ $c\overline{c}$ state.

### $\psi_2(3823)$ MASS

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **3822.2±1.2 OUR AVERAGE** | | | | | |
| 3821.7±1.3±0.7 | 19 ± 5 | [1] ABLIKIM | 15S | BES3 | $e^+e^-\to\pi^+\pi^-\chi_{c1}\gamma$ |
| 3823.1±1.8±0.7 | 33 ± 10 | [2] BHARDWAJ | 13 | BELL | $B\to\chi_{c1}\gamma K$ |

[1] From a simultaneous unbinned maximum likelihood fit of $e^+e^-\to\pi^+\pi^-\chi_{c1}\gamma$ data (the $\pi^+\pi^-$ recoil mass) taken at $\sqrt{s}$ values of 4.23, 4.26, 4.36, 4.42, and 4.60 GeV to simulated events including both $\psi(2S)\to\chi_{c1}\gamma$ and $\psi_2(3823)\to\chi_{c1}\gamma$ together, with floating mass scale offset for $\psi(2S)$, floating $\psi_2(3823)$ mass, and zero $\psi_2(3823)$ width, resulting in a significance of $5.9\sigma$ when including systematic uncertainties.

[2] From a simultaneous fit to $B^\pm\to(\chi_{c1}\gamma)K^\pm$ and $B^0\to(\chi_{c1}\gamma)K^0_S$ with significance $4.0\sigma$ including systematics. Corrected for the measured $\psi(2S)$ mass using $B\to\psi(2S)K\to(\gamma\chi_{c1})K$ decays.

## $\chi_{c0}(3860)$

$I^G(J^{PC}) = 0^+(0^{++})$

OMITTED FROM SUMMARY TABLE

The assignment $J^P = 0^+$ is preferred over $2^+$ by 2.5 sigma.

Observed by CHILIKIN 17 using full amplitude analysis of the process $e^+e^- \to J/\psi D\overline{D}$, where $D = D^0, D^+$.

## $\chi_{c1}(3872)$

$I^G(J^{PC}) = 0^+(1^{++})$

also known as $X(3872)$

This state shows properties different from a conventional $q\overline{q}$ state. A candidate for an exotic structure. See the review on non-$q\overline{q}$ states.

First observed by CHOI 03 in $B \to K\pi^+\pi^- J/\psi(1S)$ decays as a narrow peak in the invariant mass distribution of the $\pi^+\pi^- J/\psi(1S)$ final state. Isovector hypothesis excluded by AUBERT 05B and CHOI 11.

AAIJ 13Q perform a full five-dimensional amplitude analysis of the angular correlations between the decay products in $B^+ \to \chi_{c1}(3872)K^+$ decays, where $\chi_{c1}(3872) \to J/\psi\pi^+\pi^-$ and $J/\psi \to \mu^+\mu^-$, which unambiguously gives the $J^{PC} = 1^{++}$ assignment under the assumption that the $\pi^+\pi^-$ and $J/\psi$ are in an $S$-wave. AAIJ 15AO extend this analysis with more data to limit $D$-wave contributions to $< 4\%$ at 95% CL.

See the review on "Spectroscopy of Mesons Containing Two Heavy Quarks."

[1] The mass difference for the $\chi_{c1}(3872)$ produced in $B^+$ and $B^0$ decays is $(-0.71 \pm 0.96 \pm 0.19)$ MeV.
[2] Width consistent with detector resolution.
[3] A possible equal mixture of two states with a mass difference greater than 3.6 MeV/$c^2$ is excluded at 95% CL.
[4] Calculated from the corresponding $m_{\chi_{c1}(3872)} - m_{J/\psi}$ using $m_{J/\psi}$=3096.916 MeV.
[5] Fit with fixed width and including two resonances, $X(3915)$ and $X(3960)$.
[6] Could be a different state.
[7] Calculated from the corresponding $m_{\chi_{c1}(3872)} - m_{\psi(2S)}$ using $m_{\psi(2S)}$ = 3686.093 MeV. Superseded by AUBERT 08Y.
[8] Calculated from the corresponding $m_{\chi_{c1}(3872)} - m_{\psi(2S)}$ using $m_{\psi(2S)}$ = 3685.96MeV. Superseded by AUBERT 06.
[9] Superseded by AALTONEN 09AU.
[10] Superseded by CHOI 11.
[11] A lower mass value can be due to an incorrect momentum scale for soft pions.

### $\chi_{c1}(3872)$ MASS FROM $\overline{D}^{*0}D^0$ MODE

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| $3872.9\ ^{+0.6}_{-0.4}\ ^{+0.4}_{-0.5}$ | 50 | [1,2] AUSHEV | 10 | BELL | $B \to \overline{D}^{*0} D^0 K$ |
| $3875.1\ ^{+0.7}_{-0.5}$ ± 0.5 | 33 ± 6 | [2] AUBERT | 08B | BABR | $B \to \overline{D}^{*0} D^0 K$ |
| $3875.2 \pm 0.7\ ^{+0.9}_{-1.8}$ | 24 ± 6 | [2,3] GOKHROO | 06 | BELL | $B \to D^0\overline{D}^0\pi^0 K$ |

[1] Calculated from the measured $m_{\chi_{c1}(3872)} - m_{D^{*0}} - m_{\overline{D}^0} = 1.1\ ^{+0.6}_{-0.4}\ ^{+0.1}_{-0.3}$ MeV.
[2] Experiments report $D^{*0}\overline{D}^0$ invariant mass above $D^{*0}\overline{D}^0$ threshold because $D^{*0}$ decay products are kinematically constrained to the $D^{*0}$ mass, even though the $D^{*0}$ may decay off-shell.
[3] Superseded by AUSHEV 10.

## $Z_c(3900)$

$I^G(J^{PC}) = 1^+(1^{+-})$

was $X(3900)$

Properties incompatible with a $q\overline{q}$ structure (exotic state). See the review on non-$q\overline{q}$ states.

Charged $Z_c(3900)$ seen as a peak in the invariant mass distribution of the $J/\psi\pi^\pm$ system by BES III (ABLIKIM 13T) in $e^+e^- \to \pi^+\pi^- J/\psi$ at c.m. energy of 4.26 GeV and by radiative return from $e^+e^-$ collisions at $\sqrt{s}$ from 9.46 to 10.86 GeV at Belle (LIU 13B). Partial wave analysis of ABLIKIM 17J determines $J^P = 1^+$ with more than $7\sigma$ significance. Neutral $Z_c(3900)$ seen in the $J/\psi\pi^0$ invariant mass distribution in $e^+e^- \to \pi^0\pi^0 J/\psi$ at c.m. energies of 4.23, 4.26, and 4.36 GeV by BES III (ABLIKIM 15U) and at 4.17 GeV by XIAO 13A. Peaks in $(D\overline{D}^*)^{0,\pm}$ reported by BES III (ABLIKIM 14A, ABLIKIM 15AB) are assumed to be related.

| 3881.2±4.2±52.7 | 6k | [5] ABLIKIM | 17J | BES3 | ± | $e^+e^-\to\pi^+\pi^- J/\psi$ |

[1] Measured in weak decays of $b$-flavored hadrons (nonprompt).
[2] The signal of the $Z_c(3900)$ is correlated with a parent $J/\psi\pi^+\pi^-$ system in the invariant mass range 4.2–4.7 GeV.
[3] Neglecting interference between the $Z_c(3900)$ and non-resonant continuum.
[4] For $M^2(\pi^+\pi^-)<0.65$ GeV$^2$. Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration.
[5] Pole mass obtained from a fit to a Flatte-like formula.

## $X(3915)$

$I^G(J^{PC}) = 0^+(0 \text{ or } 2^{++})$

was $\chi_{c0}(3915)$

The experimental analysis prefers $J^{PC} = 0^{++}$. However, a re-analysis presented in ZHOU 15C shows that if helicity-2 dominance assumption is abandoned and a sizable helicity-0 component is allowed, a $J^{PC} = 2^{++}$ assignment is possible.

## $X(4020)^{\pm}$

$I^G(J^{PC}) = 1^+(?^{?-})$

Properties incompatible with a $q\overline{q}$ structure (exotic state). See the review on non-$q\overline{q}$ states.

Charged $X(4020)$ seen by ABLIKIM 13X from $e^+e^- \to \pi^+\pi^- h_c(1P)$ at c.m. energy from 3.90 to 4.42 GeV as a peak in the invariant mass distribution of the $\pi^{\pm}h_c(1P)$ system, and by ABLIKIM 14B from $e^+e^- \to (D^*\overline{D}^*)^{\pm}\pi^{\mp}$ events in $(D^*\overline{D}^*)^{\pm}$ mass. A neutral $X(4020)$ seen by ABLIKIM 14P at three c.m. energies in the same range in $e^+e^- \to \pi^0\pi^0 h_c(1P)$ as a peak in the larger of the two masses recoiling against a $\pi^0$. ABLIKIM 15AA observes a 5.9 $\sigma$ signal in $(D^*\overline{D}^*)^0$ in $e^+e^- \to (D^*\overline{D}^*)^0\pi^0$ events using collisions at two c.m. energies. Production rates and mass values support grouping neutral and charged $X(4020)$ together as manifestations of a single $I = 1$ particle.

## $\psi(4040)$ DECAY MODES

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective $\sqrt{s}$ near this particle's central mass value, more (less) than $2\sigma$ above zero, without regard to any peaking behavior in $\sqrt{s}$ or absence thereof. See mode listing(s) for details and references.

| | Mode | Fraction ($\Gamma_i/\Gamma$) | Confidence level |
|---|---|---|---|
| $\Gamma_1$ | $e^+e^-$ | $(1.07\pm0.16)\times10^{-5}$ | |

[9] Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta=(130\pm46)^\circ$.

[10] Reanalysis of data presented in BAI 00 and BAI 02C. From a global fit over the center-of-mass energy 3.8-4.8 GeV covering the $\psi(4040)$, $\psi(4160)$ and $\psi(4415)$ resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different $e^+e^-$ partial widths. We quote only the range of values.

[11] From a fit to Crystal Ball (OSTERHELD 86) data.

[12] From a fit to BES (BAI 02C) data.

## $X(4050)^{\pm}$

$I^G(J^{PC}) = 1^-(?^{?+})$
*I*, *G*, *C* need confirmation.

OMITTED FROM SUMMARY TABLE

Properties incompatible with a $q\overline{q}$ structure (exotic state). See the review on non-$q\overline{q}$ states.

Observed by MIZUK 08 in the $\pi^+\chi_{c1}(1P)$ invariant mass distribution in $\overline{B}{}^0 \to K^-\pi^+\chi_{c1}(1P)$ decays. Not seen by LEES 12B in this same mode after accounting for $K\pi$ resonant mass and angular structure.

## $\chi_{c1}(4140)$

$I^G(J^{PC}) = 0^+(1^{++})$

was $X(4140)$

This state shows properties different from a conventional $q\overline{q}$ state. A candidate for an exotic structure. See the review on non-$q\overline{q}$ states.

Seen by AALTONEN 09AH, ABAZOV 14A, CHATRCHYAN 14M, AAIJ 17C in $B^+ \to \chi_{c1} K^+$, $\chi_{c1} \to J/\psi\phi$, and by ABAZOV 15M separately in both prompt (4.7 $\sigma$) and non-prompt (5.6 $\sigma$) production in $p\overline{p} \to J/\psi\phi +$ anything. Not seen by SHEN 10 in $\gamma\gamma \to J/\psi\phi$ and ABLIKIM 15 in $e^+e^- \to \gamma J/\psi\phi$ at $\sqrt{s}$ = 4.23, 4.26, 4.36 GeV.

### $\psi(4160)$ DECAY MODES

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective $\sqrt{s}$ near this particle's central mass value, more (less) than $2\sigma$ above zero, without regard to any peaking behavior in $\sqrt{s}$ or absence thereof. See mode listing(s) for details and references.

| | Mode | Fraction ($\Gamma_i/\Gamma$) | | Confidence level |

[1] Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = (293 \pm 57)^\circ$.

[2] Reanalysis of data presented in BAI 00 and BAI 02C. From a global fit over the center-of-mass energy 3.8–4.8 GeV covering the $\psi(4040)$, $\psi(4160)$ and $\psi(4415)$ resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different $e^+e^-$ partial widths. We quote only the range of values.

[3] From a fit to Crystal Ball (OSTERHELD 86) data.

[4] From a fit to BES (BAI 02C) data.

### $\psi(4160)$ $\Gamma$(i) × $\Gamma(e^+e^-)/\Gamma$(total)

## $Z_c(4200)$

$I^G(J^{PC}) = 1^+(1^{+-})$

*I*, *G*, *C* need confirmation.

OMITTED FROM SUMMARY TABLE

was $X(4200)^{\pm}$

This state shows properties different from a conventional $q\overline{q}$ state. A candidate for an exotic structure. See the review on non-$q\overline{q}$ states.

Reported by CHILIKIN 14 in $J/\psi\pi^+$ at a significance of $6.2\sigma$. Assignments of $0^-$, $1^-$, $2^-$, and $2^+$ excluded at $6.1\sigma$, $7.4\sigma$, $4.4\sigma$, and $7.0\sigma$ level, respectively. Needs confirmation.

## $\psi(4230)$

$I^G(J^{PC}) = 0^-(1^{--})$

also known as $Y(4230)$; was $X(4230)$

The recent measurement of $e^+e^- \to J/\psi\pi\pi$ (ABLIKIM 17B) led to a downward shift in the mass of the $\psi(4260)$, also known as Y(4260), such that a distinction between the $\psi(4260)$ and $\psi(4230)$ no longer appears justified. Therefore, starting from this edition, we include the data of ABLIKIM 17B in this node and have listed the $\psi(4230)$ in the summary tables instead of the $\psi(4260)$.

## $\psi(4260)$

$I^G(J^{PC}) = 0^-(1^{--})$

OMITTED FROM SUMMARY TABLE
also known as $Y(4260)$; was $X(4260)$

The state $\psi(4260)$ received its mass label from a Breit-Wigner (BW) fit to the $J/\psi\pi\pi$ data listed below. The symmetric BW placed the mass unavoidably into the center of the distribution. The most recent measurement in the 4260 MeV mass range in the same channel (ABLIKIM 17B), however, revealed that the distribution is asymmetric and that the state has a much lower mass consistent with the entry for particle $\psi(4230)$. Thus, in this edition we merged the measurement of ABLIKIM 17B with the $\psi(4230)$ node and labeled the older measurements of this node as not used. For details see the review on "Spectroscopy of mesons containing two heavy quarks."

## $\psi(4360)$

$I^G(J^{PC}) = 0^-(1^{--})$

also known as $Y(4360)$; was $X(4360)$

This state shows properties different from a conventional $q\overline{q}$ state. A candidate for an exotic structure. See the review on non-$q\overline{q}$ states.

Seen in radiative return from $e^+e^-$ collisions at $\sqrt{s} = 9.54$–$10.58$ GeV by AUBERT 07S, WANG 07D, and LEES 14F. See also the review on "Spectroscopy of mesons containing two heavy quarks."

## $\psi(4415)$ DECAY MODES

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective $\sqrt{s}$ near this particle's central mass value, more (less) than $2\sigma$ above zero, without regard to any peaking behavior in $\sqrt{s}$ or absence thereof. See mode listing(s) for details and references.

| | Mode | Fraction ($\Gamma_i/\Gamma$) | Confidence level |
|---|---|---|---|
| $\Gamma_1$ | $D\overline{D}$ | seen | |
| $\Gamma_2$ | $D^0\overline{D}^0$ | seen | |

[11] Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = (234 \pm 88)^\circ$.

[12] Reanalysis of data presented in BAI 00 and BAI 02C. From a global fit over the center-of-mass energy 3.8–4.8 GeV covering the $\psi(4040)$, $\psi(4160)$ and $\psi(4415)$ resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different $e^+e^-$ partial widths. We quote only the range of values.

[13] From a fit to Crystal Ball (OSTERHELD 86) data.

[14] From a fit to BES (BAI 02c) data.

# $Z_c(4430)$

$I^G(J^{PC}) = 1^+(1^{+-})$
*G*, *C* need confirmation.

was $X(4430)^\pm$

Properties incompatible with a $q\overline{q}$ structure (exotic state). See the review on non-$q\overline{q}$ states.

First seen by CHOI 08 in $B \to K\pi^+\psi(2S)$ decays, confirmed by AAIJ 14AG, and confirmed in a model-independent way by AAIJ 15BH. Also seen by CHILIKIN 14 in $B \to K^+\pi J/\psi$ decays. $J^P$ was determined by CHILIKIN 13 and AAIJ 14AG.

[1] From a four-dimensional amplitude analysis. No product of branching fractions quoted.
[2] From a four-dimensional amplitude analysis. Measured a product of branching fractions $B(B^0 \to Z_c(4430)^- K^+) \times B(Z_c(4430)^- \to \psi(2S)\pi^-) = (6.0^{+1.7}_{-2.0}{}^{+2.5}_{-1.4}) \times 10^{-5}$.
[3] AUBERT 09AA quotes $B(B^+ \to \overline{K}^0 Z_c(4430)^+) \times B(Z_c(4430)^+ \to \pi^+\psi(2S)) < 4.7 \times 10^{-5}$ and $B(\overline{B}^0 \to K^- Z_c(4430)^+) \times B(Z_c(4430)^+ \to \pi^+\psi(2S)) < 3.1 \times 10^{-5}$ at 95% CL.
[4] Measured a product of branching fractions $B(\overline{B}^0 \to K^- Z_c(4430)^+) \times B(Z_c(4430)^+ \to \pi^+\psi(2S)) = (3.2^{+1.8}_{-0.9}{}^{+5.3}_{-1.6}) \times 10^{-5}$. Superseded by CHILIKIN 13.

### $\Gamma(\pi^+ J/\psi)/\Gamma_{\text{total}}$ $\Gamma_2/\Gamma$

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| seen | [1,2] CHILIKIN | 14 | BELL | $\overline{B}^0 \to K^-\pi^+ J/\psi$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| not seen | [3] AUBERT | 09AA | BABR | $B \to K\pi^+ J/\psi$ |

[1] CHILIKIN 14 reports $B(\overline{B}^0 \to Z_c(4430)^+ K^-) \times B(Z_c(4430)^+ \to J/\psi\pi^+) = (5.4^{+4.0}_{-1.0}{}^{+1.1}_{-0.9}) \times 10^{-6}$.
[2] A broad enhancement seen by AAIJ 19R in the decays $B^0 \to J/\psi\pi^+ K^-$ at 4600 MeV can be due to an interplay of $Z_c(4430)$, $Z_c(4200)$ and the fitting polynomials.
[3] AUBERT 09AA quotes $B(B^+ \to \overline{K}^0 Z_c(4430)^+) \times B(Z_c(4430)^+ \to \pi^+ J/\psi) < 1.5 \times 10^{-5}$ and $B(\overline{B}^0 \to K^- Z_c(4430)^+) \times B(Z_c(4430)^+ \to \pi^+ J/\psi) < 0.4 \times 10^{-5}$ at 95% CL.

# $\chi_{c0}(4500)$

$I^G(J^{PC}) = 0^+(0^{++})$

OMITTED FROM SUMMARY TABLE

was $X(4500)$

This state shows properties different from a conventional $q\overline{q}$ state. A candidate for an exotic structure. See the review on non-$q\overline{q}$ states.

Seen by AAIJ 17C in $B^+ \to \chi_{c0} K^+$, $\chi_{c0} \to J/\psi\phi$ using an amplitude analysis of $B^+ \to J/\psi\phi K^+$ with a significance (accounting for systematic uncertainties) of 6.1 $\sigma$.

## $\psi(4660)$

$I^G(J^{PC}) = 0^-(1^{--})$

also known as $Y(4660)$; was $X(4660)$

This state shows properties different from a conventional $q\overline{q}$ state. A candidate for an exotic structure. See the review on non-$q\overline{q}$ states.

Seen in radiative return from $e^+e^-$ collisions at $\sqrt{s} = 9.54$–$10.58$ GeV by WANG 07D. Also obtained in a combined fit of WANG 07D, AUBERT 07S, and LEES 14F. See also the review on "Spectroscopy of mesons containing two heavy quarks."

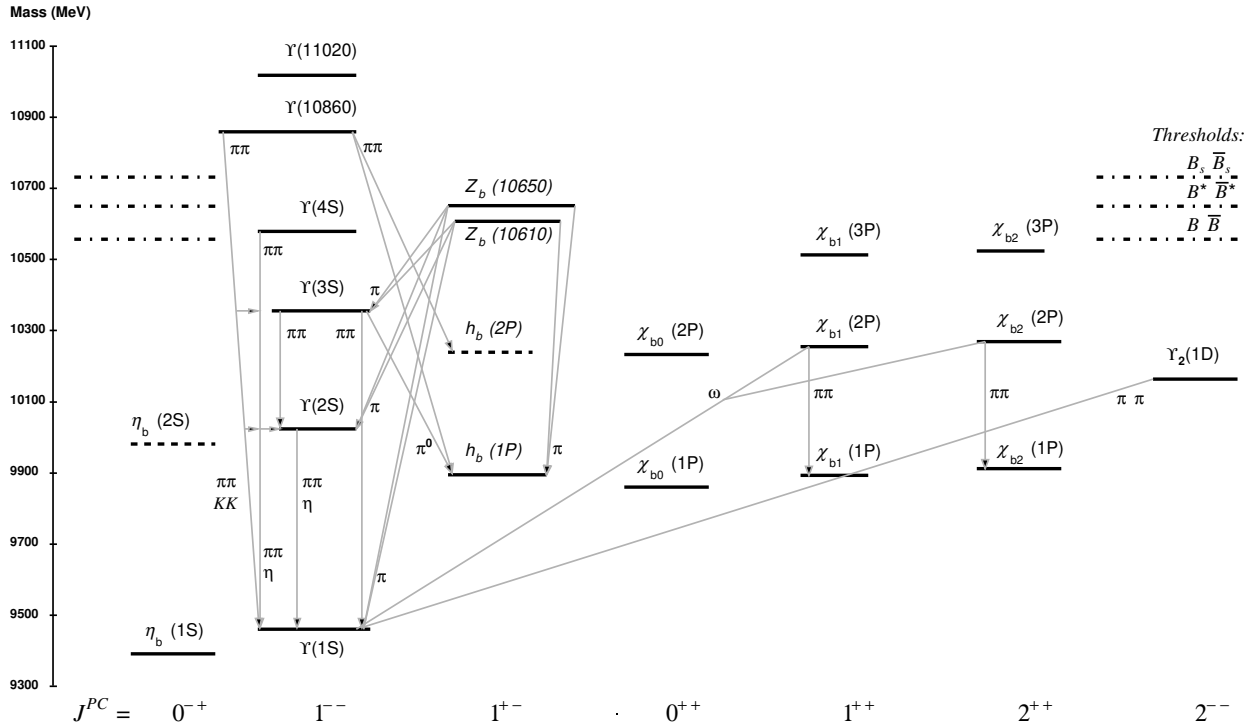
# $b\bar{b}$ MESONS (including possibly non-$q\bar{q}$ states)



The level scheme of meson states containing a minimal quark content of $b\bar{b}$. The name of a state is determined by its quantum numbers $I^G J^{PC}$ (see the review "Naming Scheme for Hadrons"). States included in the Summary Tables are shown with solid lines; those requiring confirmation are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including $\Upsilon(nS) \to \gamma\eta_b(mS)$, $\Upsilon(nS) \to \gamma\chi_{bJ}(mP)$, and $\chi_{bJ}(nP) \to \gamma\Upsilon(mS)$, are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open bottom mesons is indicated in the figure.

## WIDTH DETERMINATIONS OF THE Υ STATES

As is the case for the $J/\psi(1S)$ and $\psi(2S)$, the full widths of the $b\bar{b}$ states $\Upsilon(1S)$, $\Upsilon(2S)$, and $\Upsilon(3S)$ are not directly measurable, since they are much narrower than the energy resolution of the $e^+e^-$ storage rings where these states are produced. The common indirect method to determine $\Gamma$ starts from

$$\Gamma = \Gamma_{\ell\ell}/B_{\ell\ell} \ , \tag{1}$$

where $\Gamma_{\ell\ell}$ is one leptonic partial width and $B_{\ell\ell}$ is the corresponding branching fraction ($\ell = e$, $\mu$, or $\tau$). One then assumes $e$-$\mu$-$\tau$ universality and uses

$$\Gamma_{\ell\ell} = \Gamma_{ee}$$

$$B_{\ell\ell} = \text{average of } B_{ee},\ B_{\mu\mu},\ \text{and } B_{\tau\tau} \ . \tag{2}$$

The electronic partial width $\Gamma_{ee}$ is also not directly measurable at $e^+e^-$ storage rings, only in the combination $\Gamma_{ee}\Gamma_{\rm had}/\Gamma$, where $\Gamma_{\rm had}$ is the hadronic partial width and

$$\Gamma_{\rm had} + 3\Gamma_{ee} = \Gamma \ . \tag{3}$$

This combination is obtained experimentally from the energy-integrated hadronic cross section

$$\int_{\text{resonance}} \sigma(e^+e^- \to \Upsilon \to \text{hadrons})dE$$

$$= \frac{6\pi^2}{M^2}\frac{\Gamma_{ee}\Gamma_{\rm had}}{\Gamma}C_r = \frac{6\pi^2}{M^2}\frac{\Gamma_{ee}^{(0)}\Gamma_{\rm had}}{\Gamma}C_r^{(0)} \ , \tag{4}$$

where $M$ is the $\Upsilon$ mass, and $C_r$ and $C_r^{(0)}$ are radiative correction factors. $C_r$ is used for obtaining $\Gamma_{ee}$ as defined in Eq. (1), and contains corrections from all orders of QED for describing $(b\bar{b}) \to e^+e^-$. The lowest order QED value $\Gamma_{ee}^{(0)}$, relevant for comparison with potential-model calculations, is defined by the lowest order QED graph (Born term) alone, and is about 7% lower than $\Gamma_{ee}$.

The Listings give experimental results on $B_{ee}$, $B_{\mu\mu}$, $B_{\tau\tau}$, and $\Gamma_{ee}\Gamma_{\rm had}/\Gamma$. The entries of the last quantity have been re-evaluated consistently using the correction procedure of KURAEV 85 [1]. The partial width $\Gamma_{ee}$ is obtained from the average values for $\Gamma_{ee}\Gamma_{\rm had}/\Gamma$ and $B_{\ell\ell}$ using

$$\Gamma_{ee} = \frac{\Gamma_{ee}\Gamma_{\rm had}}{\Gamma(1-3B_{\ell\ell})} \ . \tag{5}$$

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Université user on 06 January 2021

The total width $\Gamma$ is then obtained from Eq. (1). We do not list $\Gamma_{ee}$ and $\Gamma$ values of individual experiments. The $\Gamma_{ee}$ values in the Meson Summary Table are also those defined in Eq. (1).

[1] Using $B(f_2'(1525)\to K\overline{K})=0.887\pm0.022$ and $B(K^0\overline{K}^0)=1/2\ B(K\overline{K})$.
[2] BESSON 11 reports $(4.0\pm1.3\pm0.6)\times10^{-5}$ from a measurement of $[\Gamma(\Upsilon(1S)\to\gamma f_2'(1525))/\Gamma_{total}]\times[B(f_2'(1525)\to K\overline{K})]$ assuming $B(f_2'(1525)\to K\overline{K})=(88.8\pm3.1)\times10^{-2}$, which we rescale to our best value $B(f_2'(1525)\to K\overline{K})=(87.6\pm2.2)\times10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. The result also assumes $B(K^0_S\to\pi^+\pi^-)=(69.20\pm0.05)\%$ and $B(f_2'(1525)\to K\overline{K})=4\ B(f_2'(1525)\to K^0_SK^0_S)$.
[3] Assuming $B(f_2'(1525)\to K\overline{K})=0.71$.

# $\chi_{b0}(1P)$

$I^G(J^{PC}) = 0^+(0^{++})$
$J$ needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

• • • We do not use the following data for averages, fits, limits, etc. • • •

| | | | | | | |
|---|---|---|---|---|---|---|
| < 4.6 | 90 | [5] LEES | 11J | BABR | $\Upsilon(2S) \to X\gamma$ | |
| < 6 | 90 | WALK | 86 | CBAL | $\Upsilon(2S) \to \gamma\gamma\ell^+\ell^-$ | |
| <11 | 90 | PAUSS | 83 | CUSB | $\Upsilon(2S) \to \gamma\gamma\ell^+\ell^-$ | |

[1] LEES 14M quotes $\Gamma(\chi_{b0}(1P) \to \gamma\Upsilon(1S))/\Gamma_{\rm total} \times \Gamma(\Upsilon(2S) \to \gamma\chi_{b0}(1P))/\Gamma_{\rm total} = (7.75 \pm 0.91) \times 10^{-4}$ combining the results from samples of $\Upsilon(2S) \to \gamma\gamma\mu^+\mu^-$ with and without converted photons. Assumes $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.05)\%$.

[2] LEES 14M reports $[\Gamma(\chi_{b0}(1P) \to \gamma\Upsilon(1S))/\Gamma_{\rm total}] \times [B(\Upsilon(2S) \to \gamma\chi_{b0}(1P))] = (7.75 \pm 0.91) \times 10^{-4}$ which we divide by our best value $B(\Upsilon(2S) \to \gamma\chi_{b0}(1P)) = (3.8 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[3] Assuming $B(\Upsilon(1S) \to \ell^+\ell^-) = (2.48 \pm 0.05)\%$.

[4] KORNICER 11 reports $[\Gamma(\chi_{b0}(1P) \to \gamma\Upsilon(1S))/\Gamma_{\rm total}] \times [B(\Upsilon(2S) \to \gamma\chi_{b0}(1P))] = (6.59 \pm 0.96 \pm 0.60) \times 10^{-4}$ which we divide by our best value $B(\Upsilon(2S) \to \gamma\chi_{b0}(1P)) = (3.8 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[5] LEES 11J quotes a central value of $\Gamma(\chi_{b0}(1P) \to \gamma\Upsilon(1S))/\Gamma_{\rm total} \times \Gamma(\Upsilon(2S) \to \gamma\chi_{b0}(1P))/\Gamma_{\rm total} = (8.3 \pm 5.6^{+3.7}_{-2.6}) \times 10^{-4}$.

## $\chi_{b1}(1P)$

$I^G(J^{PC}) = 0^+(1^{++})$
$J$ needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$. $J = 1$ from SKWARNICKI 87.

## $\chi_{b2}(1P)$

$I^G(J^{PC}) = 0^+(2^{++})$
$J$ needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$. $J = 2$ from SKWARNICKI 87.

[1] FULSOM 18 reports $[\Gamma(\chi_{b2}(1P)\to\gamma\Upsilon(1S))/\Gamma_{\text{total}}]\times[\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P))] = (1.17\pm0.01^{+0.06}_{-0.07})\times10^{-2}$ which we divide by our best value $\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P)) = (7.15\pm0.35)\times10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] LEES 14M quotes $\Gamma(\chi_{b2}(1P)\to\gamma\Upsilon(1S))/\Gamma_{\text{total}}\times\Gamma(\Upsilon(2S)\to\gamma\chi_{b2}(1P))/\Gamma_{\text{total}} = (1.32\pm0.06)\%$ combining the results from samples of $\Upsilon(2S)\to\gamma\gamma\mu^+\mu^-$ with and without converted photons.

[3] LEES 14M reports $[\Gamma(\chi_{b2}(1P)\to\gamma\Upsilon(1S))/\Gamma_{\text{total}}]\times[\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P))] = (1.32\pm0.06)\times10^{-2}$ which we divide by our best value $\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P)) = (7.15\pm0.35)\times10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] Assuming $\text{B}(\Upsilon(1S)\to\mu^+\mu^-) = (2.48\pm0.05)\%$.

[5] KORNICER 11 reports $[\Gamma(\chi_{b2}(1P)\to\gamma\Upsilon(1S))/\Gamma_{\text{total}}]\times[\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P))] = (1.33\pm0.04\pm0.07)\times10^{-2}$ which we divide by our best value $\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P)) = (7.15\pm0.35)\times10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[6] LEES 11J reports $[\Gamma(\chi_{b2}(1P)\to\gamma\Upsilon(1S))/\Gamma_{\text{total}}]\times[\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P))] = (13.9\pm0.5^{+0.9}_{-1.1})\times10^{-3}$ which we divide by our best value $\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P)) = (7.15\pm0.35)\times10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[7] WALK 86 quotes $\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P))\times\text{B}(\chi_{b2}(1P)\to\gamma\Upsilon(1S))\times\text{B}(\Upsilon(1S)\to\ell^+\ell^-) = (4.4\pm0.9\pm0.5)\%$.

[8] WALK 86 reports $[\Gamma(\chi_{b2}(1P)\to\gamma\Upsilon(1S))/\Gamma_{\text{total}}]\times[\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P))] = (17.7\pm3.6\pm2.0)\times10^{-3}$ which we divide by our best value $\text{B}(\Upsilon(2S)\to\gamma\chi_{b2}(1P)) = (7.15\pm0.35)\times10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

## $\eta_b(2S)$

$I^G(J^{PC}) = 0^+(0^{-+})$

OMITTED FROM SUMMARY TABLE

Quantum numbers shown are quark-model predictions.

### $\eta_b(2S)$ MASS

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **9999.0±3.5$^{+2.8}_{-1.9}$** | 26k | [1] MIZUK | 12 | BELL | $e^+e^- \to \gamma\pi^+\pi^-$ + hadrons |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 9974.6±2.3±2.1 | 11 ± 4 | [2,3,4] DOBBS | 12 | | $\Upsilon(2S) \to \gamma$ hadrons |

[1] Assuming $\Gamma_{\eta_b(2S)} = 4.9$ MeV. Not independent of the corresponding mass difference measurement.

[2] SANDILYA 13 (Belle Collab.) search for such a state reconstructed in the same 26 exclusive hadronic final states as DOBBS 12 using a sample of $(157.8\pm3.6)\times10^6$ $\Upsilon(2S)$ decays or about 17 times larger and find no evidence for a signal. Their 90% C.L. upper limit on the branching fraction $B(\Upsilon(2S) \to \eta_b(2S)\gamma) \times \sum_i B(\eta_b(2S) \to X_i) < 4.9\times10^{-6}$, summed over the exclusive hadronic final states $X_i$, is an order of magnitude smaller than that reported by DOBBS 12.

[3] Obtained by analyzing CLEO III data but not authored by the CLEO Collaboration.

[4] Assuming $\Gamma_{\eta_b(2S)} = 5$ MeV. Not independent of the corresponding mass difference measurement.

### $m_{\Upsilon(2S)} - m_{\eta_b(2S)}$

| 48.7±2.3±2.1 | 11 ± 4 | [6,7,8] DOBBS | 12 | | $\Upsilon(2S) \to \gamma$ hadrons |

[5] Assuming $\Gamma_{\eta_b(2S)} = 4.9$ MeV. Not independent of the corresponding mass measurement.

[6] SANDILYA 13 (Belle Collab.) search for such a state reconstructed in the same 26 exclusive hadronic final states as DOBBS 12 using a sample of $(157.8\pm3.6)\times10^6$ $\Upsilon(2S)$ decays or about 17 times larger and find no evidence for a signal. Their 90% C.L. upper limit on the branching fraction $B(\Upsilon(2S) \to \eta_b(2S)\gamma) \times \sum_i B(\eta_b(2S) \to X_i) < 4.9\times10^{-6}$, summed over the exclusive hadronic final states $X_i$, is an order of magnitude smaller than that reported by DOBBS 12.

[7] Obtained by analyzing CLEO III data but not authored by the CLEO Collaboration.

[8] Assuming $\Gamma_{\eta_b(2S)} = 5$ MeV. Not independent of the corresponding mass measurement.

### CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 13 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 11.8$ for 11 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

[1] LEES 11C reports $[\Gamma(\Upsilon(2S) \to \Upsilon(1S)\pi^+\pi^-)/\Gamma_{total}] \times [B(\Upsilon(3S) \to \Upsilon(2S)\text{anything})] = (1.78 \pm 0.02 \pm 0.11) \times 10^{-2}$ which we divide by our best value $B(\Upsilon(3S) \to \Upsilon(2S)\text{anything}) = (10.6 \pm 0.8) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Using $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.05)\%$.

[3] A weighted average of the inclusive and exclusive results.

[4] Using $B(\Upsilon(2S) \to e^+e^-) = (1.91 \pm 0.16)\%$, $B(\Upsilon(2S) \to \mu^+\mu^-) = (1.93 \pm 0.17)\%$ and, $\Gamma_{ee}(\Upsilon(2S)) = 0.612 \pm 0.011$ keV.

[5] Using $B(\Upsilon(1S) \to e^+e^-) = (2.52 \pm 0.17)\%$ and $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.07)\%$.

### $\Gamma(\Upsilon(1S)\pi^0\pi^0)/\Gamma_{total}$ $\Gamma_2/\Gamma$

$I^G(J^{PC}) = 0^-(2^{--})$

was $\Upsilon(1D)$

First observed by BONVICINI 04 in the decay to $\gamma\gamma\Upsilon(1S)$ and confirmed by DEL-AMO-SANCHEZ 10R in the decay to $\pi^+\pi^-\Upsilon(1S)$. Data consistent with $J^P=2^-$. The states with $J=1$ and 3 also possibly seen, but need confirmation.

## $\chi_{b0}(2P)$

$I^G(J^{PC}) = 0^+(0^{++})$
$J$ needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

## $\chi_{b1}(2P)$

$I^G(J^{PC}) = 0^+(1^{++})$

$J$ needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

## $\chi_{b2}(2P)$

$I^G(J^{PC}) = 0^+(2^{++})$

$J$ needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

### $\chi_{b2}(2P)$ MASS

| VALUE (MeV) | DOCUMENT ID |

## $\chi_{b1}(3P)$

$I^G(J^{PC}) = 0^+(1^{++})$

Needs confirmation.

Observed in the radiative decay to $\Upsilon(1S, 2S, 3S)$, therefore $C = +$. $J$ needs confirmation.

### $\chi_{b1}(3P)$ MASS

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |

## $\Upsilon(4S)$ BRANCHING RATIOS

### $B\overline{B}$ DECAYS

The ratio of branching fraction to charged and neutral B mesons is often derived assuming isospin invariance in the decays, and relies on the knowledge of the $B^+/B^0$ lifetime ratio. "OUR EVALUATION" is obtained based on averages of rescaled data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/. The averaging/rescaling procedure takes into account the common dependence of the measurement on the value of the lifetime ratio.

### $\Gamma(B^+B^-)/\Gamma_{\text{total}}$ $\Gamma_2/\Gamma$

| VALUE | DOCUMENT ID |
|---|---|
| **0.514±0.006 OUR EVALUATION** | Assuming B( $\Upsilon(4S) \rightarrow B\overline{B}$) = 1 |

### $\Gamma(D_s^+ \text{ anything + c.c.})/\Gamma_{\text{total}}$ $\Gamma_3/\Gamma$

| VALUE | | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.178±0.021±0.016** | [1] | ARTUSO | 05B | CLE3 | $e^+e^- \rightarrow D_X X$ |

[1] ARTUSO 05B reports $[\Gamma(\Upsilon(4S) \rightarrow D_s^+ \text{ anything + c.c.})/\Gamma_{\text{total}}] \times [\mathrm{B}(D_s^+ \rightarrow \phi\pi^+)] = (8.0 \pm 0.2 \pm 0.9) \times 10^{-3}$ which we divide by our best value $\mathrm{B}(D_s^+ \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[1] SOKOLOV 09 reports $[\Gamma(\Upsilon(4S) \to \Upsilon(1S)\pi^+\pi^-)/\Gamma_{total}] \times [B(\Upsilon(1S) \to \mu^+\mu^-)] = (0.211 \pm 0.030 \pm 0.014) \times 10^{-5}$ which we divide by our best value $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.05) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[2] Using $B(\Upsilon(1S) \to e^+e^-) = (2.38 \pm 0.11)\%$ and $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.05)\%$.

[3] SOKOLOV 07 reports $[\Gamma(\Upsilon(4S) \to \Upsilon(1S)\pi^+\pi^-)/\Gamma_{total}] \times [B(\Upsilon(1S) \to \mu^+\mu^-)] = (4.42 \pm 0.81 \pm 0.56) \times 10^{-6}$ which we divide by our best value $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.05) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

[4] According to the authors, systematic errors were underestimated.

[5] Superseded by AUBERT 08BP. AUBERT 06R reports $[\Gamma(\Upsilon(4S) \to \Upsilon(1S)\pi^+\pi^-)/\Gamma_{total}] \times [B(\Upsilon(1S) \to \mu^+\mu^-)] = (2.23 \pm 0.25 \pm 0.27) \times 10^{-6}$ which we divide by our best value $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.05) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

## $Z_b(10610)$

$I^G(J^{PC}) = 1^+(1^{+-})$

was $X(10610)$

Properties incompatible with a $q\overline{q}$ structure (exotic state). See the review on non-$q\overline{q}$ states.

Observed by BONDAR 12 in $\Upsilon(5S)$ decays to $\Upsilon(nS)\pi^+\pi^-$ (n = 1, 2, 3) and $h_b(mP)\pi^+\pi^-$ (m = 1, 2). $J^P = 1^+$ is favored from angular analyses.

## $Z_b(10650)$

**$Z_b(10650)$** $I^G(J^{PC}) = 1^+(1^{+-})$

*I, G, C need confirmation.*

was $X(10650)^\pm$

Properties incompatible with a $q\overline{q}$ structure (exotic state). See the review on non-$q\overline{q}$ states.

Observed by BONDAR 12 in $\Upsilon(5S)$ decays to $\Upsilon(nS)\pi^+\pi^-$ (n = 1, 2, 3) and $h_b(mP)\pi^+\pi^-$ (m = 1, 2). $J^P = 1^+$ is favored from angular analyses.

[1] From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n$ = 1, 2, 3, cross sections at 28 energy points within $\sqrt{s}$ = 10.6–11.05 GeV, including the initial-state radiation at $\Upsilon(10860)$.

[2] From a simultaneous fit to the $h_b(nP)\pi^+\pi^-$, $n$ = 1, 2 cross sections at 22 energy points within $\sqrt{s}$ = 10.77–11.02 GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single relative phase, a single relative amplitude, and two overall normalization factors, one for each $n$). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

[3] From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s}$ = 10.82–11.05 GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).

[4] Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.

[5] From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n$ = 1, 2, 3, cross sections at 25energy points within $\sqrt{s}$ = 10.6–11.05 GeV to a pair of interfering Breit-Wigner amplitudesmodified by phase space factors, with fourteen resonance parameters (a mass, width, and threeamplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relativephase, and three decoherence coefficients, one for each $n$). Continuum contributions weremeasured (and therefore fixed) to be zero.

[6] Superseded by MIZUK 19.

[7] In a model where a flat non-resonant $b\overline{b}$-continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

[8] The parameters of the $\Upsilon(11020)$ are fixed to those in AUBERT 09E.

[9] In a model where a flat nonresonant $\Upsilon(1S,2S,3S)\pi^+\pi^-$ continuum interferes with a single Breit-Wigner resonance.

[10] In a model where a non-resonant $b\overline{b}$-continuum represented by a threshold function at $\sqrt{s}$=$2m_B$ is incoherently added to a flat component interfering with two Breit-Wigner resonances. Not independent of other AUBERT 09E results. Systematic uncertainties not estimated.

[11] Assuming four Gaussians with radiative tails and a single step in $R$.

[12] In a coupled-channel model with three resonances and a smooth step in $R$.

[1] From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 28 energy points within $\sqrt{s} = 10.6$–11.05 GeV, including the initial-state radiation at $\Upsilon(10860)$.

[2] From a simultaneous fit to the $h_b(nP)\pi^+\pi^-$, $n = 1, 2$ cross sections at 22 energy points within $\sqrt{s} = 10.77$–11.02 GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single relative phase, a single relative amplitude, and two overall normalization factors, one for each $n$). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

[3] From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s} = 10.82$–11.05 GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).

[4] Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.

[5] From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 25energy points within $\sqrt{s} = 10.6$–11.05 GeV to a pair of interfering Breit-Wigner amplitudesmodified by phase space factors, with fourteen resonance parameters (a mass, width, and threeamplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relativephase, and three decoherence coefficients, one for each $n$). Continuum contributions weremeasured (and therefore fixed) to be zero.

[6] Superseded by MIZUK 19.

[7] In a model where a flat non-resonant $b\overline{b}$-continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

[3] From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s} = 10.82$–11.05 GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).

[4] Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.

[5] From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n$=1, 2, 3, cross sections at 25energy points within $\sqrt{s} = 10.6$–11.05 GeV to a pair of interfering Breit-Wigner amplitudesmodified by phase space factors, with fourteen resonance parameters (a mass, width, and threeamplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relativephase, and three decoherence coefficients, one for each $n$). Continuum contributions weremeasured (and therefore fixed) to be zero.

[6] Superseded by MIZUK 19.

[7] In a model where a flat non-resonant $b\overline{b}$-continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

## $\Upsilon(11020)$ DECAY MODES

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $e^+e^-$ | $(5.4^{+1.9}_{-2.1}) \times 10^{-6}$ |
| $\Gamma_2$ | $\Upsilon(1S)\pi^+\pi^-$ | |
| $\Gamma_3$ | $\Upsilon(2S)\pi^+\pi^-$ | |
| $\Gamma_4$ | $\Upsilon(3S)\pi^+\pi^-$ | |
| $\Gamma_5$ | $\chi_{bJ}(1P)\pi^+\pi^-\pi^0$ | $(9\ ^{+9}_{-8}) \times 10^{-3}$ |
| $\Gamma_6$ | $\chi_{b1}(1P)\pi^+\pi^-\pi^0$ | seen |
| $\Gamma_7$ | $\chi_{b2}(1P)\pi^+\pi^-\pi^0$ | seen |

| 1.007276470 | ±0.000000012 | COHEN | 87 | RVUE | 1986 CODATA value |

[1] The statistical and systematic errors are 15 and 29 in the last two places of the value. The value disagrees with the MOHR 16 value by over 3 standard deviations.

### p MASS (MeV)

The mass is known much more precisely in u (atomic mass units) than in MeV. The conversion from u to MeV, 1 u = 931.494 0054(57) MeV/$c^2$ (MOHR 16, the 2014 CODATA value), involves the relatively poorly known electronic charge.

| VALUE (MeV) | | DOCUMENT ID | | TECN | COMMENT |

| <6 × 10⁻⁸ | 90 | [1] HORI | 01 | SPEC | $\overline{p}e^-$He atom |
| <5 × 10⁻⁷ | | [2] TORII | 99 | SPEC | $\overline{p}e^-$He atom |

[1] HORI 01, HORI 03, HORI 06, and HORI 11 use the more-precisely-known constraint on the $\overline{p}$ charge-to-mass ratio of GABRIELSE 99 (see below) to get their results. Their results are not independent of the HORI 01, HORI 03, HORI 06, and HORI 11 values for $|q_p+q_{\overline{p}}|/e$, below.

[2] TORII 99 uses the more-precisely-known constraint on the $\overline{p}$ charge-to-mass ratio of GABRIELSE 95 (see below) to get this result. This is not independent of the TORII 99 value for $|q_p+q_{\overline{p}}|/e$, below.

### $\overline{p}/p$ CHARGE-TO-MASS RATIO, $|\frac{q_{\overline{p}}}{m_{\overline{p}}}|/(\frac{q_p}{m_p})$

A test of *CPT* invariance. Listed here are measurements involving the *inertial* masses. For a discussion of what may be inferred about the ratio of $\overline{p}$ and $p$ *gravitational* masses, see ERICSON 90; they obtain an upper bound of $10^{-6}$–$10^{-7}$ for violation of the equivalence principle for $\overline{p}$'s.

[1] HORI 01, HORI 03, HORI 06, and HORI 11 use the more-precisely-known constraint on the $\overline{p}$ charge-to-mass ratio of GABRIELSE 99 (see above) to get their results. Their results are not independent of the HORI 01, HORI 03, HORI 06, and HORI 11 values for $|m_p-m_{\overline{p}}|/m_p$, above.

[2] TORII 99 uses the more-precisely-known constraint on the $\overline{p}$ charge-to-mass ratio of GABRIELSE 95 (see above) to get this result. This is not independent of the TORII 99 value for $|m_p-m_{\overline{p}}|/m_p$, above.

[3] HUGHES 92 uses recent measurements of Rydberg-energy and cyclotron-frequency ratios.

### $|q_p + q_e|/e$

See BRESSI 11 for a summary of experiments on the neutrality of matter.
See also "*n* CHARGE" in the neutron Listings.

| VALUE | DOCUMENT ID | | COMMENT |
|---|---|---|---|
| **<1 × 10⁻²¹** | [1] BRESSI | 11 | Neutrality of $SF_6$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | |
| <3.2 × 10⁻²⁰ | [2] SENGUPTA | 00 | binary pulsar |
| <0.8 × 10⁻²¹ | MARINELLI | 84 | Magnetic levitation |
| <1.0 × 10⁻²¹ | [1] DYLLA | 73 | Neutrality of $SF_6$ |

[1] BRESSI 11 uses the method of DYLLA 73 but finds serious errors in that experiment that greatly reduce its accuracy. The BRESSI 11 limit assumes that $n \to p e^- \nu_e$ conserves charge. Thus the limit applies equally to the charge of the neutron.

[2] SENGUPTA 00 uses the difference between the observed rate of of rotational energy loss by the binary pulsar PSR B1913+16 and the rate predicted by general relativity to set this limit. See the paper for assumptions.

## $p$

### $(\mu_p + \mu_{\overline{p}}) / \mu_p$

A test of $CPT$ invariance.

| VALUE (units $10^{-6}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.002±0.004** | SMORRA | 17 | TRAP | Hot/cold $\overline{p}$ frequencies, Penning traps |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| 0.3 ±0.8 | NAGAHAMA | 17 | TRAP | Single $\overline{p}$, Penning trap |
| 0 ±5 | DISCIACCA | 13 | TRAP | Single $\overline{p}$, Penning trap |

### $p$ ELECTRIC DIPOLE MOMENT

A nonzero value is forbidden by both $T$ invariance and $P$ invariance.

| VALUE ($10^{-23}$ e cm) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **< 0.021** | [1] SAHOO | 17 | | Theory plus $^{199}$Hg atom EDM |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| < 0.54 | [1] DMITRIEV | 03 | | Theory plus $^{199}$Hg atom EDM |
| − 3.7 ± 6.3 | CHO | 89 | NMR | Tl F molecules |
| < 400 | DZUBA | 85 | THEO | Uses $^{129}$Xe moment |
| 130 ± 200 | [2] WILKENING | 84 | | |
| 900 ±1400 | [3] WILKENING | 84 | | |
| 700 ± 900 | HARRISON | 69 | MBR | Molecular beam |

[1] SAHOO 17 and DMITRIEV 03 are not direct measurements of the proton electric dipole moment. They use theory to calculate this limit from the limit on the electric dipole moment of the $^{199}$Hg atom.
[2] This WILKENING 84 value includes a finite-size effect and a magnetic effect.
[3] This WILKENING 84 value is more cautious than the other and excludes the finite-size effect, which relies on uncertain nuclear integrals.

### $p$ ELECTRIC POLARIZABILITY $\alpha_p$

For a very complete review of the "polarizability of the nucleon and Compton scattering," see SCHUMACHER 05. His recommended values for the proton are $\alpha_p = (12.0 \pm 0.6) \times 10^{-4}$ fm$^3$ and $\beta_p = (1.9 \mp 0.6) \times 10^{-4}$ fm$^3$, almost exactly our averages.

| VALUE ($10^{-4}$ fm$^3$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **11.2 ±0.4 OUR AVERAGE** | | | | |
| 10.65±0.35±0.36 | MCGOVERN | 13 | RVUE | $\chi$EFT + Compton scattering |
| 12.1 ±1.1 ±0.5 | [1] BEANE | 03 | | EFT + $\gamma p$ |
| 11.82±0.98$^{+0.52}_{-0.98}$ | [2] BLANPIED | 01 | LEGS | $p(\vec{\gamma},\gamma)$, $p(\vec{\gamma},\pi^0)$, $p(\vec{\gamma},\pi^+)$ |
| 11.9 ±0.5 ±1.3 | [3] OLMOSDEL... | 01 | CNTR | $\gamma p$ Compton scattering |
| 12.1 ±0.8 ±0.5 | [4] MACGIBBON | 95 | RVUE | global average |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| 11.7 ±0.8 ±0.7 | [5] BARANOV | 01 | RVUE | Global average |
| 12.5 ±0.6 ±0.9 | MACGIBBON | 95 | CNTR | $\gamma p$ Compton scattering |
| 9.8 ±0.4 ±1.1 | HALLIN | 93 | CNTR | $\gamma p$ Compton scattering |
| 10.62$^{+1.25}_{-1.19}$ $^{+1.07}_{-1.03}$ | ZIEGER | 92 | CNTR | $\gamma p$ Compton scattering |
| 10.9 ±2.2 ±1.3 | [6] FEDERSPIEL | 91 | CNTR | $\gamma p$ Compton scattering |

[1] BEANE 03 uses effective field theory and low-energy $\gamma p$ and $\gamma d$ Compton-scattering data. It also gets for the isoscalar polarizabilities (see the erratum) $\alpha_N = (13.0 \pm 1.9^{+3.9}_{-1.5}) \times 10^{-4}$ fm$^3$ and $\beta_N = (-1.8 \pm 1.9^{+2.1}_{-0.9}) \times 10^{-4}$ fm$^3$.
[2] BLANPIED 01 gives $\alpha_p + \beta_p$ and $\alpha_p - \beta_p$. The separate $\alpha_p$ and $\beta_p$ are provided to us by A. Sandorfi. The first error above is statistics plus systematics; the second is from the model.
[3] This OLMOSDELEON 01 result uses the TAPS data alone, and does not use the (re-evaluated) sum-rule constraint that $\alpha + \beta = (13.8 \pm 0.4) \times 10^{-4}$ fm$^3$. See the paper for a discussion.
[4] MACGIBBON 95 combine the results of ZIEGER 92, FEDERSPIEL 91, and their own experiment to get a "global average" in which model errors and systematic errors are treated in a consistent way. See MACGIBBON 95 for a discussion.
[5] BARANOV 01 combines the results of 10 experiments from 1958 through 1995 to get a global average that takes into account both systematic and model errors and does not use the theoretical constraint on the sum $\alpha_p + \beta_p$.
[6] FEDERSPIEL 91 obtains for the (static) electric polarizability $\alpha_p$, defined in terms of the induced electric dipole moment by $\mathbf{D} = 4\pi\epsilon_0\alpha_p\mathbf{E}$, the value (7.0±2.2±1.3)×$10^{-4}$ fm$^3$.

### $p$ MAGNETIC POLARIZABILITY $\beta_p$

The electric and magnetic polarizabilities are subject to a dispersion sum-rule constraint $\overline{\alpha} + \overline{\beta} = (14.2 \pm 0.5) \times 10^{-4}$ fm$^3$. Errors here are anticorrelated with those on $\overline{\alpha_p}$ due to this constraint.

| VALUE ($10^{-4}$ fm$^3$) | DOCUMENT ID | | TECN | COMMENT |

[1] BEANE 03 uses effective field theory and low-energy $\gamma p$ and $\gamma d$ Compton-scattering data. It also gets for the isoscalar polarizabilities (see the erratum) $\alpha_N = (13.0 \pm 1.9^{+3.9}_{-1.5}) \times 10^{-4}$ fm$^3$ and $\beta_N = (-1.8 \pm 1.9^{+2.1}_{-0.9}) \times 10^{-4}$ fm$^3$.
[2] BLANPIED 01 gives $\alpha_p + \beta_p$ and $\alpha_p - \beta_p$. The separate $\alpha_p$ and $\beta_p$ are provided to us by A. Sandorfi. The first error above is statistics plus systematics; the second is from the model.
[3] This OLMOSDELEON 01 result uses the TAPS data alone, and does not use the (re-evaluated) sum-rule constraint that $\alpha + \beta = (13.8 \pm 0.4) \times 10^{-4}$ fm$^3$. See the paper for a discussion.
[4] MACGIBBON 95 combine the results of ZIEGER 92, FEDERSPIEL 91, and their own experiment to get a "global average" in which model errors and systematic errors are treated in a consistent way. See MACGIBBON 95 for a discussion.
[5] BARANOV 01 combines the results of 10 experiments from 1958 through 1995 to get a global average that takes into account both systematic and model errors and does not use the theoretical constraint on the sum $\alpha_p + \beta_p$.

### $p$ CHARGE RADIUS

This is the rms electric charge radius, $\sqrt{\langle r_E^2 \rangle}$.

There are three kinds of measurements of the proton radius: via transitions in atomic hydrogen; via electron scattering off hydrogen; and via muonic hydrogen Lamb shift. Most measurements of the radius of the proton involve electron-proton interactions, the most recent of which is the electron scattering measurement $r_p = 0.831(14)$ fm (XIONG 19), and the atomic-hydrogen value, $r_p = 0.833(10)$ fm (BEZGINOV 19). These agree well with another recent atomic-hydrogen value $r_p = 0.8335(95)$ fm (BEYER 17), and with the best measurement using muonic hydrogen $r_p = 0.84087(39)$ fm (ANTOGNINI 13), that is far more precise.

The MOHR 16 value (2014 CODATA), obtained from the electronic results available at the time, was 0.8751(61) fm. This differs by 5.6 standard deviations from the muonic hydrogen value, leading to the so-called proton charge radius puzzle. See our 2018 edition (Physical Review **D98** 030001 (2018)) for a further discussion of interpretations of this puzzle. However, reflecting the new electronic measurements, the 2018 CODATA recommended value is 0.8414(19) fm, and the puzzle appears to be resolved.

See our 2014 edition (Chinese Physics **C38** 070001 (2014)) for values published before 2003.

[1] BEZGINOV 19 measures the $2S_{1/2}$ to $2P_{1/2}$ transition frequency in atomic hydrogen using the frequency-offset separated oscillatory field (FOSOF) technique. The result agrees well with the muonic hydrogen Lamb shift value.
[2] The XIONG 19 value from $ep \to ep$ scattering and supports the muonic hydrogen Lamb shift value.
[3] FLEURBAEY 18 measures the 1S-3S transition frequency in hydrogen and in combination with the 1S-2S transition frequency deduces the proton radius and the Rydberg constant.
[4] The BEYER 17 result is 3.3 combined standard deviations below the MOHR 16 (2014 CODATA) value. The experiment measures the 2S-4P transition in hydrogen and gets the proton radius and the Rydberg constant.
[5] Authors also provide values for combinations of all available data.

## $p$ MAGNETIC RADIUS

This is the rms magnetic radius, $\sqrt{\langle r_M^2 \rangle}$.

| VALUE (fm) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.851±0.026** | [1] LEE | 15 | | Combination of world and Mainz data |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| 0.87 ±0.02 | EPSTEIN | 14 | | Using $ep$, $en$, $\pi\pi$ data |
| 0.867±0.009±0.018 | ZHAN | 11 | SPEC | Recoil polarimetry |
| 0.777±0.013±0.010 | BERNAUER | 10 | SPEC | $ep \to ep$ form factor |
| 0.876±0.010±0.016 | BORISYUK | 10 | | Reanalyzes old $ep \to ep$ data |
| 0.854±0.005 | BELUSHKIN | 07 | | Dispersion analysis |

[1] In a consistent reanalysis LEE 2015 extract values separately for the Mainz 2010 data only (0.776+-0.034+-0.017) fm and for the world data without Mainz data (0.914+-0.035) fm. The quoted value is a simple combination of the two, which ignores possible discrepancies and unknown correlations and should be considered with caution.

## $p$ MEAN LIFE

A test of baryon conservation. See the "$p$ Partial Mean Lives" section below for limits for identified final states. The limits here are to "anything" or are for "disappearance" modes of a bound proton ($p$) or ($n$). See also the $3\nu$ modes in the "Partial Mean Lives" section. Table 1 of BACK 03 is a nice summary.

| LIMIT (years) | PARTICLE | CL% | DOCUMENT ID | | TECN | COMMENT |

[1] AHMED 04 and ANDERSON 19A look for $\gamma$ rays from the de-excitation of a residual $^{15}$O* or $^{15}$N* following the disappearance of a neutron or proton in $^{16}$O.

[2] ARAKI 06 looks for signs of de-excitation of the residual nucleus after disappearance of a neutron from the $s$ shell of $^{12}$C.

[3] BACK 03 looks for decays of unstable nuclides left after $N$ decays of parent $^{12}$C, $^{13}$C, $^{16}$O nuclei. These are "invisible channel" limits.

[4] ZDESENKO 03 gets this limit on proton disappearance in deuterium by analyzing SNO data in AHMAD 02.

[5] AHMAD 02 (see its footnote 7) looks for neutrons left behind after the disappearance of the proton in deuterons.

[6] BERNABEI 00B looks for the decay of a $^{128}_{53}$I nucleus following the disappearance of a proton in the otherwise-stable $^{129}_{54}$Xe nucleus.

[7] EVANS 77 looks for the daughter nuclide $^{129}$Xe from possible $^{130}$Te decays in ancient Te ore samples.

[8] This mean-life limit has been obtained from a half-life limit by dividing the latter by ln(2) = 0.693.

[9] FLEROV 58 looks for the spontaneous fission of a $^{232}$Th nucleus after the disappearance of one of its nucleons.

## $\overline{p}$ MEAN LIFE

Of the two astrophysical limits here, that of GEER 00D involves considerably more refinements in its modeling. The other limits come from direct observations of stored antiprotons. See also "$\overline{p}$ Partial Mean Lives" after "$p$ Partial Mean Lives," below, for exclusive-mode limits. The best (lifetime/branching fraction) limit there is $7\times10^5$ years, for $\overline{p} \to e^-\gamma$. We advance only the exclusive-mode limits to our Summary Tables.

| LIMIT (years) | CL% | EVTS | DOCUMENT ID | | TECN | COMMENT |

[1] GEER 00D uses agreement between a model of galactic $\overline{p}$ production and propagation and the observed $\overline{p}/p$ cosmic-ray spectrum to set this limit.

## $p$ DECAY MODES

See the "Note on Nucleon Decay" in our 1994 edition (Phys. Rev. **D50**, 1173) for a short review.

The "partial mean life" limits tabulated here are the limits on $\tau/B_i$, where $\tau$ is the total mean life and $B_i$ is the branching fraction for the mode in question. For $N$ decays, $p$ and $n$ indicate proton and neutron partial lifetimes.

| | Mode | Partial mean life ($10^{30}$ years) | Confidence level |

## $p$ PARTIAL MEAN LIVES

The "partial mean life" limits tabulated here are the limits on $\tau/B_i$, where $\tau$ is the total mean life for the proton and $B_i$ is the branching fraction for the mode in question.

Decaying particle: $p$ = proton, $n$ = bound neutron. The same event may appear under more than one partial decay mode. Background estimates may be accurate to a factor of two.

[1] In estimating the background, this HIRATA 89C limit (as opposed to the later limits of WALL 00B and MCGREW 99) does not take into account present understanding that the flux of $\nu_\mu$ originating in the upper atmosphere is depleted. Doing so would reduce the background and thus also would reduce the limit here.
[2] We have calculated 90% CL limit from 1 confined event.
[3] We have converted 2 possible events to 90% CL limit.
[4] We have converted half-life to 90% CL mean life.

[1] The SUZUKI 93B limit applies to any of $\nu_e\nu_e\overline{\nu}_e$, $\nu_\mu\nu_\mu\overline{\nu}_\mu$, or $\nu_\tau\nu_\tau\overline{\nu}_\tau$.

[2] GLICENSTEIN 97 uses Kamioka data and the idea that the disappearance of the neutron's magnetic moment should produce radiation.

[3] The first BERGER 91B limit is for $n \to \nu_e\nu_e\overline{\nu}_e$, the second is for $n \to \nu_\mu\nu_\mu\overline{\nu}_\mu$.

### $\tau(n \to 5\nu)$ $\tau_{60}$

| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | | | |
| > 1 | 90 | | | [1] BRYMAN | 14 | CHER | |

[1] BRYMAN 14 uses a MCGREW 99 limit on the $p \to e^+\nu\nu$ lifetime to extract this value.

### $\tau(nn \to \nu_e\overline{\nu}_e)$ $\tau_{77}$

We include "invisible" modes here.

| LIMIT ($10^{30}$ years) | CL% | EVTS | BKGD EST | DOCUMENT ID | | TECN | COMMENT |

| >0.000012 | 90 | 5 | 9.7 | BERGER | 91B | FREJ | $\tau$ per iron nucleus |

[1] ARAKI 06 looks for signs of de-excitation of the residual nucleus after disappearance of two neutrons from the $s$ shell of $^{12}$C.
[2] ANDERSON 19A looks for $\gamma$ rays from the de-excitation of a residual $^{14}$O* following the disappearance of $nn$ in $^{16}$O.
[3] TRETYAK 04 uses data from an old Homestake-mine radiochemical experiment on limits for invisible decays of $^{39}$K to $^{37}$Ar.
[4] BACK 03 looks for decays of unstable nuclides left after $NN$ decays of parent $^{12}$C, $^{13}$C, $^{16}$O nuclei. These are "invisible channel" limits.
[5] BERNABEI 00B looks for the decay of a $^{127}_{54}$Xe nucleus following the disappearance of an $nn$ pair in the otherwise-stable $^{129}_{54}$Xe nucleus. The limit here applies as well to $nn \to \nu_\mu\overline{\nu}_\mu$, $nn \to \nu_\tau\overline{\nu}_\tau$, or any "disappearance" mode.

### $\tau(nn \to \nu_\mu\overline{\nu}_\mu)$ $\tau_{78}$

See the proceeding data block. "Invisible modes" would include any multi-neutrino mode.

[3] BERNABEI 00B looks for the decay of a $^{127}_{52}$Te nucleus following the disappearance of a $pp$ pair in the otherwise-stable $^{129}_{54}$Xe nucleus.

## $\overline{p}$ PARTIAL MEAN LIVES

The "partial mean life" limits tabulated here are the limits on $\overline{\tau}/B_i$, where $\overline{\tau}$ is the total mean life for the antiproton and $B_i$ is the branching fraction for the mode in question.

## $n$

$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$ Status: ****

We have omitted some results that have been superseded by later experiments. See our earlier editions.

Anyone interested in the neutron should look at these two review articles: D. Dubbers and M.G. Schmidt, "The neutron and its role in cosmology and particle physics," Reviews of Modern Physics **83** 1111 (2011); and F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," Reviews of Modern Physics **83** 1173 (2011).

### $n$ MASS (atomic mass units u)

The mass is known much more precisely in u (atomic mass units) than in MeV. See the next data block.

| VALUE (u) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **1.00866491588±0.00000000049** | MOHR | 16 | RVUE | 2014 CODATA value |

### $n$ MASS (MeV)

The mass is known much more precisely in u (atomic mass units) than in MeV. The conversion from u to MeV, 1 u = 931.494 0054(57) MeV/$c^2$ (MOHR 16, the 2014 CODATA value), involves the relatively poorly known electronic charge.

See key on page 999

[1] We use the 1998 CODATA u-to-MeV conversion factor (see the heading above) to get this mass in MeV from the much more precisely measured KESSLER 99 value of 1.00866491637 ± 0.00000000082 u.
[2] The mass is known much more precisely in u: $m = 1.0086649235 \pm 0.0000000023$ u. We use the 1986 CODATA conversion factor to get the mass in MeV.
[3] These determinations are not independent of the $m_n - m_p$ measurements below.
[4] The mass is known much more precisely in u: $m = 1.008664919 \pm 0.000000014$ u.

[1] The 2014 CODATA mass difference in $u$ is $m_n - m_p = 1.001\,388\,449\,00(51) \times 10^{-3}\,u$.
[2] The 2010 CODATA mass difference in $u$ is $m_n - m_p = 1.388\,449\,19(45) \times 10^{-3}\,u$.
[3] Calculated by us from the MOHR 08 ratio $m_n/m_p = 1.00137841918(46)$. In u, $m_n - m_p = 1.38844920(46) \times 10^{-3}$ u.
[4] Calculated by us from the MOHR 05 ratio $m_n/m_p = 1.00137841870 \pm 0.00000000058$. In u, $m_n - m_p = (1.3884487 \pm 0.0000006) \times 10^{-3}$ u.
[5] Calculated by us from the MOHR 99 ratio $m_n/m_p = 1.00137841887 \pm 0.00000000058$. In u, $m_n - m_p = (1.3884489 \pm 0.0000006) \times 10^{-3}$ u.
[6] Calculated by us from the COHEN 87 ratio $m_n/m_p = 1.001378404 \pm 0.000000009$. In u, $m_n - m_p = 0.001388434 \pm 0.000000009$ u.

## n MEAN LIFE

Limits on lifetimes for *bound* neutrons are given in the section "p PARTIAL MEAN LIVES."

We average seven of the best eight measurements, those made with ultra-cold neutrons (UCN's). If we include the one in-beam measurement with a comparable error (YUE 13), we get 879.6 ± 0.8 s, where the scale factor is now 2.0.

For a recent discussion of the long-standing disagreement between in-beam and UCN results, see CZARNECKI 18 (Physical Review Letters **120** 202002 (2018)). For a full review of all matters concerning the neutron lifetime until about 2010, see WIETFELDT 11, F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," Reviews of Modern Physics **83** 1173 (2011).

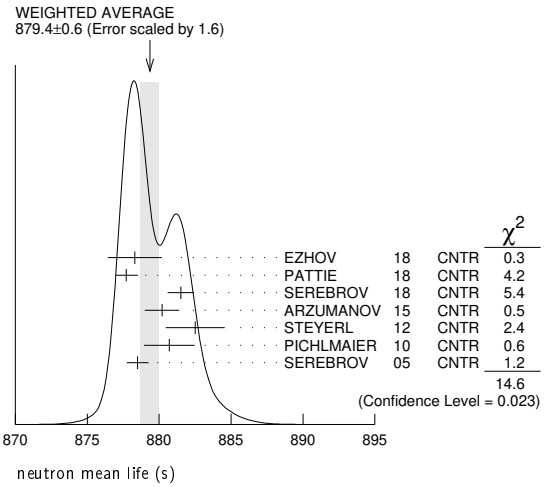
[1] PATTIE 18 uses a new technique, with a semi-toroidal magneto-gravitational asymmetric trap and a novel in situ $n$-detector.
[2] ARZUMANOV 15 is a reanalysis of their 2008–2010 dataset, with improved systematic corrections of of ARZUMANOV 00 and ARZUMANOV 12.
[3] STEYERL 12 is a detailed reanalysis of neutron storage loss corrections to the raw data of MAMPE 89, and it replaces that value.
[4] YUE 13 differs from NICO 05 in that a different and better method was used to measure the neutron density in the fiducial volume. This shifted the lifetime by +1.4 seconds and reduced the previously largest source of systematic uncertainty by a factor of five.
[5] ARZUMANOV 12 reanalyzes its systematic corrections in ARZUMANOV 00 and obtains this corrected value.
[6] IGNATOVICH 95 calls into question some of the corrections and averaging procedures used by MAMPE 93. The response, BONDARENKO 96, denies the validity of the criticisms.
[7] The NESVIZHEVSKII 92 measurement has been withdrawn by A. Serebrov.
[8] The BYRNE 80 measurement has been withdrawn (J. Byrne, private communication, 1990).



## n MAGNETIC MOMENT

See the "Note on Baryon Magnetic Moments" in the Λ Listings.

| VALUE ($\mu_N$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **−1.91304273 ± 0.00000045** | MOHR | 16 | RVUE | 2014 CODATA value |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| −1.91304272 ± 0.00000045 | MOHR | 12 | RVUE | 2010 CODATA value |

[1] ABEL 20 reports $d = (0.0 \pm 1.1 \pm 0.2) \times 10^{-26}$ *e* cm value corresponding to the listed limit.
[2] SAHOO 17 develops theory to calculate this limit from the measured limit by GRANER 16 of the $^{199}$Hg atom EDM.
[3] PENDLEBURY 15 reports $d = (-0.21 \pm 1.82) \times 10^{-26}$ *e* cm value corresponding to the listed limit.
[4] SEREBROV 14 includes the data of ALTAREV 96.
[5] LAMOREAUX 07 faults BAKER 06 for not including in the estimate of systematic error an effect due to the Earth's rotation. BAKER 07 replies (1) that the effect was included implicitly in the analysis and (2) that further analysis confirms that the BAKER 06 limit is correct as is. See also SILENKO 07.
[6] This HARRIS 99 result includes the result of SMITH 90. However, the averaging of the results of these two experiments has been criticized by LAMOREAUX 00.

## *n* MEAN-SQUARE CHARGE RADIUS

The mean-square charge radius of the neutron, $\langle r_n^2 \rangle$, is related to the neutron-electron scattering length $b_{ne}$ by $\langle r_n^2 \rangle = 3(m_e a_0/m_n) b_{ne}$, where $m_e$ and $m_n$ are the masses of the electron and neutron, and $a_0$ is the Bohr radius. Numerically, $\langle r_n^2 \rangle = 86.34\, b_{ne}$, if we use $a_0$ for a nucleus with infinite mass.

[1] KOSSERT 03 gets $\alpha_n - \beta_n = (9.8 \pm 3.6^{+2.1}_{-1.1} \pm 2.2) \times 10^{-4}$ fm$^3$, and uses $\alpha_n + \beta_n = (15.2 \pm 0.5) \times 10^{-4}$ fm$^3$ from LEVCHUK 00. Thus the errors on $\alpha_n$ and $\beta_n$ are anti-correlated.
[2] LUNDIN 03 measures $\alpha_N - \beta_N = (6.4 \pm 2.4) \times 10^{-4}$ fm$^3$ and uses accurate values for $\alpha_p$ and $\alpha_p$ and a precise sum-rule result for $\alpha_n + \beta_n$. The second error is a model uncertainty, and errors on $\alpha_n$ and $\beta_n$ are anticorrelated. The data from this paper aer included in the analysis of MYERS 14.
[3] KOLB 00 obtains this value with a lower limit of $7.6 \times 10^{-4}$ fm$^3$ but no upper limit from this experiment alone. Combined with results of ROSE 90, the 1-$\sigma$ range is (7.6–14.0) × $10^{-4}$ fm$^3$.
[4] KOESTER 95 uses natural Pb and the isotopes 208, 207, and 206. See this paper for a discussion of methods used by various groups to extract $\alpha_n$ from data.

[2] The BAUMANN 88 error ±1.1 gives the 68% CL limits about the the value −0.4.
[3] The GAEHLER 82 error ±22 gives the 90% CL limits about the the value −15.

## LIMIT ON $n\overline{n}$ OSCILLATIONS

### Mean Time for $n\overline{n}$ Transition in Vacuum

A test of ΔB=2 baryon number nonconservation. MOHAPATRA 80 and MOHAPATRA 89 discuss the theoretical motivations for looking for $n\overline{n}$ oscillations. DOVER 83 and DOVER 85 give phenomenological analyses. The best limits come from looking for the decay of neutrons bound in nuclei. However, these analyses require model-dependent corrections for nuclear effects. See KABIR 83, DOVER 89, ALBERICO 91, and GAL 00 for discussions. Direct searches for $n \to \overline{n}$ transitions using reactor neutrons are cleaner but give somewhat poorer limits. We include limits for both free and bound neutrons in the Summary Table. See MOHAPATRA 09 and PHILLIPS 16 for recent reviews.

## LIMIT ON $nn'$ OSCILLATIONS

Lee and Yang (LEE 56) proposed the existence of mirror world in an attempt to restore global parity symmetry. A possible candidate for dark matter. Limits depend on assumptions about fields $B$ and $B'$. See the papers for details. See BEREZHIANI 18 for a recent discussion.

| VALUE (s) | CL% | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **>448** | 90 | SEREBROV | 09A | CNTR | Assumes $B' < 100$ nT |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| $>17$ | 95 | [1] BEREZHIANI | 18 | CNTR | UCN, scan of $B$ field |
| $>12$ | 95 | [2] ALTAREV | 09A | CNTR | UCN, scan $0\le B\le12.5$ $\mu$T |
| >414 | 90 | SEREBROV | 08 | CNTR | UCN, $B$ field on & off |
| >103 | 95 | BAN | 07 | CNTR | UCN, $B$ field on & off |

[1] The $B$ field was set to (0.09, 0.12, 0.21) G. Limits on oscillation time are valid for any mirror field $B'$ in (0.08–0.17) G, and for aligned fields $B$ and $B'$. For larger values of $B'$, the limits are significantly reduced.

[2] Losses of neutrons due to oscillations to mirror neutrons would be maximal when the magnetic fields $B$ and $B'$ in the two worlds were equal. Hence the scan over $B$ by ALTAREV 09A: the limit applies for any $B'$ over the given range. At $B'=0$, the limit is 141 s (95% CL).

## *n* DECAY MODES

| | Mode | | Fraction ($\Gamma_i/\Gamma$) | | | Confidence level |
|---|---|---|---|---|---|---|
| $\Gamma_1$ | $pe^-\overline{\nu}_e$ | | 100 | % | | |

| $<3\times10^{-19}$ | | NORMAN | 79 | CNTR | $^{87}$Rb → $^{87m}$Sr neut. |

[1] NORMAN 96 gets this limit by attributing SAGE and GALLEX counting rates to the charge-nonconserving transition $^{71}$Ga → $^{71}$Ge+neutrals rather than to solar-neutrino reactions.

### $\Gamma(e^+e^-\text{invisible})/\Gamma_{\text{total}}$ $\Gamma_5/\Gamma$

Baryon number violating decay

| VALUE | CL% | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| <0.01 | 90 | [1] KLOPF | 19 | CNTR | re-interpretation of MUND 13 |
| $<1\times10^{-4}$ | 90 | [2] SUN | 18 | SPEC | Ultracold *n*, polarized |

[1] KLOPF 19 value is for baryon number violating decay of neutron to electrons plus an invisible state, $\chi$. The limit is valid for KE($e^+e^-$) range between 32 keV and 664 keV, strengthening to few $\times\ 10^{-4}$ above approximately 100 keV.

[2] SUN 18 value is for baryon number violating decay of neutron to electrons plus an invisible state, $\chi$. The limit is valid for 644 keV > KE($e^+e^-$) > 100 keV. Assuming this decay $\chi ee$ is the only allowed $\chi$ decay channel, a 0.01 BR is ruled out for 644 keV > E($e^+e^-$) > 100 keV at over $5\sigma$.

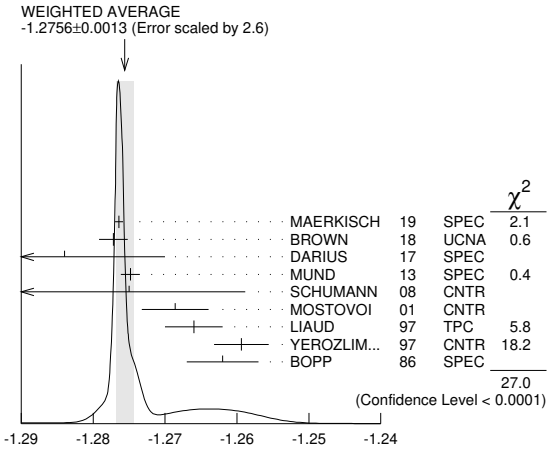
[7] MENDENHALL 13 gets $A = -0.11954 \pm 0.00055 \pm 0.00098$ and $\lambda = -1.2756 \pm 0.0030$. We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.
[8] This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.
[9] This is the combined result of ABELE 02 and ABELE 97D.
[10] These experiments measure the absolute value of $g_A/g_V$ only.
[11] KROHN 75 includes events of CHRISTENSEN 70.
[12] KROPF 74 reviews all data through 1972.



$\lambda \equiv g_A / g_V$

## $e^-$ ASYMMETRY PARAMETER $A$

This is the neutron-spin electron-momentum correlation coefficient. Unless otherwise noted, the values are corrected for radiative effects and weak magnetism. In the Standard Model, $A$ is related to $\lambda \equiv g_A/g_V$ by $A = -2\lambda(\lambda+1)/(1+3\lambda^2)$; this assumes that $g_A$ and $g_V$ are real.

## $e$-$\bar{\nu}_e$ ANGULAR CORRELATION COEFFICIENT $a$

For a review of past experiments and plans for future measurements of the $a$ parameter, see WIETFELDT 05. In the Standard Model, $a$ is related to $\lambda \equiv g_A/g_V$ by $a = (1-\lambda^2)/(1+3\lambda^2)$; this assumes that $g_A$ and $g_V$ are real.

| VALUE | | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **−0.1059±0.0028 OUR AVERAGE** | | | | | |
| −0.1090±0.0030±0.0028 | [1] | DARIUS | 17 | SPEC | Cold *n*, unpolarized |
| −0.1054±0.0055 | | BYRNE | 02 | SPEC | Proton recoil spectrum |
| −0.1017±0.0051 | | STRATOWA | 78 | CNTR | Proton recoil spectrum |
| −0.091 ±0.039 | | GRIGOREV | 68 | SPEC | Proton recoil spectrum |

| −0.1045±0.0014 | [2] | MOSTOVOI | 01 | CNTR | Inferred |

[1] DARIUS 17 exploits a "wishbone" correlation, where the $p$ time of flight is correlated with the momentum of the electron in delayed coincidence.
[2] MOSTOVOI 01 calculates this from its measurement of $\lambda = g_A/g_V$ above.

## $\phi_{AV}$, PHASE OF $g_A$ RELATIVE TO $g_V$

Time reversal invariance requires this to be 0 or 180°. This is related to $D$ given in the next data block and $\lambda \equiv g_A/g_V$ by $\sin(\phi_{AV}) \equiv D(1+3\lambda^2)/2|\lambda|$; this assumes that $g_A$ and $g_V$ are real.

| 180.14 ±0.22 | | STEINBERG | 74 | CNTR | Cold *n*, polarized |

[1] KROPF 74 reviews all data through 1972.

## TRIPLE CORRELATION COEFFICIENT $D$

These are measurements of the component of $n$ spin perpendicular to the decay plane in $\beta$ decay. Should be zero if $T$ invariance is not violated.

| VALUE (units $10^{-4}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **− 1.2 ± 2.0 OUR AVERAGE** | | | | |
| − 0.94± 1.89±0.97 | CHUPP | 12 | CNTR | Cold *n*, polarized > 91% |
| − 2.8 ± 6.4 ±3.0 | SOLDNER | 04 | CNTR | Cold *n*, polarized |
| − 6 ±12 ±5 | LISING | 00 | CNTR | Polarized > 93% |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |

| −27 ±50 [1] | EROZOLIM... | 74 | CNTR | Cold *n*, polarized |
| −11 ±17 | STEINBERG | 74 | CNTR | Cold *n*, polarized |

[1] EROZOLIMSKII 78 says asymmetric proton losses and nonuniform beam polarization may give a systematic error up to $30 \times 10^{-4}$, thus increasing the EROZOLIMSKII 74 error to $50 \times 10^{-4}$. STEINBERG 74 and STEINBERG 76 estimate these systematic errors to be insignificant in their experiment.

## TRIPLE CORRELATION COEFFICIENT $R$

Another test of time-reversal invariance. $R$ measures the polarization of the electron in the direction perpendicular to the plane defined by the neutron spin and the electron momentum. $R = 0$ for T invariance.

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **+0.004±0.012±0.005** | [1] KOZELA | 12 | CNTR | Mott polarimeter |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| +0.008±0.015±0.005 | KOZELA | 09 | CNTR | See KOZELA 12 |

[1] KOZELA 12 also measures the polarization of the electron along the direction of the neutron spin. This is nonzero in the Standard Model; the correlation coefficient is $N = +0.067 \pm 0.011 \pm 0.004$.

## $n$ REFERENCES

We have omitted some papers that have been superseded by later experiments. See our earlier editions.

## $N(1440)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 55–75 % |
| $\Gamma_2$ | $N\eta$ | <1 % |
| $\Gamma_3$ | $N\pi\pi$ | 17–50 % |
| $\Gamma_4$ | $\Delta(1232)\pi$, $P$-wave | 6–27 % |
| $\Gamma_5$ | $N\sigma$ | 11–23 % |
| $\Gamma_6$ | $p\gamma$, helicity=1/2 | 0.035–0.048 % |
| $\Gamma_7$ | $n\gamma$, helicity=1/2 | 0.02–0.04 % |

### $N(1520)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 55–65 % |
| $\Gamma_2$ | $N\eta$ | 0.07–0.09 % |
| $\Gamma_3$ | $N\pi\pi$ | 25–35 % |
| $\Gamma_4$ | $\Delta(1232)\pi$ | 22–34 % |
| $\Gamma_5$ | $\Delta(1232)\pi$, $S$-wave | 15–23 % |
| $\Gamma_6$ | $\Delta(1232)\pi$, $D$-wave | 7–11 % |
| $\Gamma_7$ | $N\sigma$ | < 2 % |
| $\Gamma_8$ | $p\gamma$ | 0.31–0.52 % |
| $\Gamma_9$ | $p\gamma$, helicity=1/2 | 0.01–0.02 % |
| $\Gamma_{10}$ | $p\gamma$, helicity=3/2 | 0.30–0.50 % |
| $\Gamma_{11}$ | $n\gamma$ | 0.30–0.53 % |
| $\Gamma_{12}$ | $n\gamma$, helicity=1/2 | 0.04–0.10 % |
| $\Gamma_{13}$ | $n\gamma$, helicity=3/2 | 0.25–0.45 % |

## $N(1535)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 32–52 % |
| $\Gamma_2$ | $N\eta$ | 30–55 % |
| $\Gamma_3$ | $N\pi\pi$ | 3–14 % |
| $\Gamma_4$ | $\Delta(1232)\pi$ | |
| $\Gamma_5$ | $\Delta(1232)\pi$, $D$-wave | 1–4 % |
| $\Gamma_6$ | $N\rho$ | |
| $\Gamma_7$ | $N\rho$, $S$=1/2 | |
| $\Gamma_8$ | $N\rho$, $S$=3/2 , $D$-wave | |
| $\Gamma_9$ | $N\sigma$ | 2–10 % |
| $\Gamma_{10}$ | $N(1440)\pi$ | 5–12 % |
| $\Gamma_{11}$ | $p\gamma$, helicity=1/2 | 0.15–0.30 % |
| $\Gamma_{12}$ | $n\gamma$, helicity=1/2 | 0.01–0.25 % |

# $N(1650)$ $1/2^-$

$I(J^P) = \frac{1}{2}(\frac{1}{2}^-)$ Status: ****

Older and obsolete values are listed and referenced in the 2014 edition, Chinese Physics **C38** 070001 (2014).

### $N(1650)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 50–70 % |
| $\Gamma_2$ | $N\eta$ | 15–35 % |
| $\Gamma_3$ | $\Lambda K$ | 5–15 % |
| $\Gamma_4$ | $N\pi\pi$ | 8–36 % |
| $\Gamma_5$ | $\Delta(1232)\pi$ | |
| $\Gamma_6$ | $\Delta(1232)\pi$, $D$-wave | 6–18 % |
| $\Gamma_7$ | $N\rho$ | |
| $\Gamma_8$ | $N\rho$, $S$=1/2 | |
| $\Gamma_9$ | $N\rho$, $S$=3/2 , $D$-wave | |
| $\Gamma_{10}$ | $N\sigma$ | 2–18 % |
| $\Gamma_{11}$ | $N(1440)\pi$ | 6–26 % |
| $\Gamma_{12}$ | $p\gamma$, helicity=1/2 | 0.04–0.20 % |
| $\Gamma_{13}$ | $n\gamma$, helicity=1/2 | 0.003–0.17 % |

## $N(1675)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 38–42 % |
| $\Gamma_2$ | $N\eta$ | < 1 % |
| $\Gamma_3$ | $\Lambda K$ | |
| $\Gamma_4$ | $N\pi\pi$ | 25–45 % |
| $\Gamma_5$ | $\Delta(1232)\pi$ | |
| $\Gamma_6$ | $\Delta(1232)\pi$, $D$-wave | 23–37 % |
| $\Gamma_7$ | $N\rho$ | |
| $\Gamma_8$ | $N\rho$, $S$=1/2 | |
| $\Gamma_9$ | $N\rho$, $S$=3/2 , $D$-wave | |
| $\Gamma_{10}$ | $N\sigma$ | 3–7 % |
| $\Gamma_{11}$ | $p\gamma$ | 0–0.02 % |
| $\Gamma_{12}$ | $p\gamma$, helicity=1/2 | 0–0.01 % |
| $\Gamma_{13}$ | $p\gamma$, helicity=3/2 | 0–0.01 % |
| $\Gamma_{14}$ | $n\gamma$ | 0–0.15 % |
| $\Gamma_{15}$ | $n\gamma$, helicity=1/2 | 0–0.05 % |
| $\Gamma_{16}$ | $n\gamma$, helicity=3/2 | 0–0.10 % |

### $N(1680)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 60–70 % |
| $\Gamma_2$ | $N\eta$ | <1 % |
| $\Gamma_3$ | $\Lambda K$ | |
| $\Gamma_4$ | $N\pi\pi$ | 20–40 % |
| $\Gamma_5$ | $\Delta(1232)\pi$ | 11–23 % |
| $\Gamma_6$ | $\Delta(1232)\pi$, P-wave | 4–10 % |
| $\Gamma_7$ | $\Delta(1232)\pi$, F-wave | 1–13 % |
| $\Gamma_8$ | $N\rho$ | |
| $\Gamma_9$ | $N\rho$, $S=3/2$, P-wave | |
| $\Gamma_{10}$ | $N\rho$, $S=3/2$, F-wave | |
| $\Gamma_{11}$ | $N\sigma$ | 9–19 % |
| $\Gamma_{12}$ | $p\gamma$ | 0.21–0.32 % |
| $\Gamma_{13}$ | $p\gamma$, helicity=1/2 | 0.001–0.011 % |
| $\Gamma_{14}$ | $p\gamma$, helicity=3/2 | 0.20–0.32 % |
| $\Gamma_{15}$ | $n\gamma$ | 0.021–0.046 % |
| $\Gamma_{16}$ | $n\gamma$, helicity=1/2 | 0.004–0.029 % |
| $\Gamma_{17}$ | $n\gamma$, helicity=3/2 | 0.01–0.024 % |

## $N(1700)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 7–17 % |
| $\Gamma_2$ | $N\eta$ | seen |
| $\Gamma_3$ | $N\omega$ | 10–34 % |
| $\Gamma_4$ | $\Lambda K$ | |
| $\Gamma_5$ | $N\pi\pi$ | 60–90 % |
| $\Gamma_6$ | $\Delta(1232)\pi$ | 55–85 % |
| $\Gamma_7$ | $\Delta(1232)\pi$, $S$-wave | 50–80 % |
| $\Gamma_8$ | $\Delta(1232)\pi$, $D$-wave | 4–14 % |
| $\Gamma_9$ | $N(1440)\pi$ | 3–11 % |
| $\Gamma_{10}$ | $N(1520)\pi$ | <4 % |
| $\Gamma_{11}$ | $N\rho$, $S$=3/2, $S$-wave | 32–44 % |
| $\Gamma_{12}$ | $N\sigma$ | 2–14 % |
| $\Gamma_{13}$ | $p\gamma$ | 0.01–0.05 % |
| $\Gamma_{14}$ | $p\gamma$, helicity=1/2 | 0.0–0.024 % |
| $\Gamma_{15}$ | $p\gamma$, helicity=3/2 | 0.002–0.026 % |
| $\Gamma_{16}$ | $n\gamma$ | 0.01–0.13 % |
| $\Gamma_{17}$ | $n\gamma$, helicity=1/2 | 0.0–0.09 % |
| $\Gamma_{18}$ | $n\gamma$, helicity=3/2 | 0.01–0.05 % |

## $N(1710)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 5–20 % |
| $\Gamma_2$ | $N\eta$ | 10–50 % |
| $\Gamma_3$ | $N\omega$ | 1–5 % |
| $\Gamma_4$ | $\Lambda K$ | 5–25 % |
| $\Gamma_5$ | $\Sigma K$ | seen |
| $\Gamma_6$ | $N\pi\pi$ | seen |
| $\Gamma_7$ | $\Delta(1232)\pi$ | |
| $\Gamma_8$ | $\Delta(1232)\pi$, $P$-wave | 3–9 % |
| $\Gamma_9$ | $N(1535)\pi$ | 9–21 % |
| $\Gamma_{10}$ | $N\rho$ | |
| $\Gamma_{11}$ | $N\rho$, $S$=1/2, $P$-wave | 11–23 % |
| $\Gamma_{12}$ | $N\sigma$ | |
| $\Gamma_{13}$ | $p\gamma$, helicity=1/2 | 0.002–0.08 % |
| $\Gamma_{14}$ | $n\gamma$, helicity=1/2 | 0.0–0.02% |

## $N(1720)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 8–14 % |
| $\Gamma_2$ | $N\eta$ | 1–5 % |
| $\Gamma_3$ | $N\omega$ | 12–40 % |
| $\Gamma_4$ | $\Lambda K$ | 4–5 % |
| $\Gamma_5$ | $N\pi\pi$ | 50–90 % |
| $\Gamma_6$ | $\Delta(1232)\pi$ | 47–89 % |
| $\Gamma_7$ | $\Delta(1232)\pi$, $P$-wave | 47–77 % |
| $\Gamma_8$ | $\Delta(1232)\pi$, $F$-wave | <12 % |
| $\Gamma_9$ | $N\rho$ | |
| $\Gamma_{10}$ | $N\rho$, $S$=1/2, $P$-wave | 1–2 % |
| $\Gamma_{11}$ | $N\sigma$ | 2–14 % |
| $\Gamma_{12}$ | $N(1440)\pi$ | <2 % |
| $\Gamma_{13}$ | $N(1520)\pi$, $S$-wave | 1–5 % |
| $\Gamma_{14}$ | $p\gamma$ | 0.05–0.25 % |
| $\Gamma_{15}$ | $p\gamma$, helicity=1/2 | 0.05–0.15 % |
| $\Gamma_{16}$ | $p\gamma$, helicity=3/2 | 0.002–0.16 % |
| $\Gamma_{17}$ | $n\gamma$ | 0.0–0.016 % |
| $\Gamma_{18}$ | $n\gamma$, helicity=1/2 | 0.0–0.01 % |
| $\Gamma_{19}$ | $n\gamma$, helicity=3/2 | 0.0–0.015 % |

# $N(1860)\ 5/2^+$

$I(J^P) = \frac{1}{2}(\frac{5}{2}^+)$ Status: **

OMITTED FROM SUMMARY TABLE

Before the 2012 *Review*, all the evidence for a $J^P = 5/2^+$ state with a mass above 1800 MeV was filed under a two-star $N(2000)$. There is now some evidence from ANISOVICH 12A for two $5/2^+$ states in this region, so we have split the older data (according to mass) between two two-star $5/2^+$ states, an $N(1860)$ and an $N(2000)$.

# $N(1895)\ 1/2^-$

$I(J^P) = \frac{1}{2}(\frac{1}{2}^-)$ Status: ****

Before our 2012 *Review*, this state appeared in our Listings as the $N(2090)$. Any structure in the $S_{11}$ wave above 1800 MeV is listed here. A few early results that are now obsolete have been omitted.

## $N(2000)\ 5/2^+$

$I(J^P) = \frac{1}{2}(\frac{5}{2}^+)$ Status: **

OMITTED FROM SUMMARY TABLE

Before the 2012 *Review*, all the evidence for a $J^P = 5/2^+$ state with a mass above 1800 MeV was filed under a two-star $N(2000)$. There is now some evidence from ANISOVICH 12A for two $5/2^+$ states in this region, so we have split the older data (according to mass) between two two-star $5/2^+$ states, an $N(1860)$ and an $N(2000)$.

## $N(2120)\ 3/2^-$

$I(J^P) = \frac{1}{2}(\frac{3}{2}^-)$ Status: ***

Before the 2012 *Review*, all the evidence for a $J^P = 3/2^-$ state with a mass above 1800 MeV was filed under a two-star $N(2080)$. There is now evidence from ANISOVICH 12A for two $3/2^-$ states in this region, so we have split the older data (according to mass) between a three-star $N(1875)$ and a two-star $N(2120)$.

## $N(\sim 3000$ Region) Partial-Wave Analyses

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-1/2 resonances found in partial-wave analyses.

Our 1982 edition had an $N(3245)$, an $N(3690)$, and an $N(3755)$, each a narrow peak seen in a production experiment. Since nothing has been heard from them since the 1960's, we declare them to be dead. There was also an $N(3030)$, deduced from total cross-section and 180° elastic cross-section measurements; it is the KOCH 80 $L_{1,15}$ state below.

### $N(\sim 3000)$ BREIT-WIGNER MASS

### $\Delta(1600)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 8–24 % |
| $\Gamma_2$ | $N\pi\pi$ | 75–90 % |
| $\Gamma_3$ | $\Delta(1232)\pi$ | 73–83 % |
| $\Gamma_4$ | $\Delta(1232)\pi$, $P$-wave | 72–82 % |
| $\Gamma_5$ | $\Delta(1232)\pi$, $F$-wave | <2 % |
| $\Gamma_6$ | $N(1440)\pi$ | |
| $\Gamma_7$ | $N(1440)\pi$, $P$-wave | 15–25 % |
| $\Gamma_8$ | $N\gamma$ | 0.001–0.035 % |
| $\Gamma_9$ | $N\gamma$, helicity=1/2 | 0.0–0.02 % |
| $\Gamma_{10}$ | $N\gamma$, helicity=3/2 | 0.001–0.015 % |

## Δ(1900) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 4–12 % |
| $\Gamma_2$ | $\Sigma K$ | seen |
| $\Gamma_3$ | $N\pi\pi$ | 45–85 % |
| $\Gamma_4$ | $\Delta(1232)\pi$ | |
| $\Gamma_5$ | $\Delta(1232)\pi$, D-wave | 30–70 % |
| $\Gamma_6$ | $N\rho$ | |
| $\Gamma_7$ | $N\rho$, S=1/2, S-wave | 8–16 % |
| $\Gamma_8$ | $N\rho$, S=3/2, D-wave | 18–28 % |
| $\Gamma_9$ | $N(1440)\pi$ | 8–32 % |
| $\Gamma_{10}$ | $N(1520)\pi$ | 2–10 % |
| $\Gamma_{11}$ | $\Delta(1232)\eta$ | 0–2 % |
| $\Gamma_{12}$ | $N\gamma$, helicity=1/2 | 0.06–0.43 % |

## Δ(1910) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 15–30 % |
| $\Gamma_2$ | $\Sigma K$ | 4–14 % |
| $\Gamma_3$ | $N\pi\pi$ | |
| $\Gamma_4$ | $\Delta(1232)\pi$ | 34–66 % |
| $\Gamma_5$ | $N(1440)\pi$ | 3–9 % |
| $\Gamma_6$ | $\Delta(1232)\eta$ | 5–13 % |
| $\Gamma_7$ | $N\gamma$, helicity=1/2 | 0.0–0.02 % |

## $\Delta(1950)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\pi$ | 35–45 % |
| $\Gamma_2$ | $\Sigma K$ | 0.3–0.5 % |
| $\Gamma_3$ | $N\pi\pi$ | |
| $\Gamma_4$ | $\Delta(1232)\pi$, $F$-wave | 1–9 % |
| $\Gamma_5$ | $N(1680)\pi$, $P$-wave | 3–9 % |
| $\Gamma_6$ | $\Delta(1232)\eta$ | < 0.6 % |

## Δ(∼ 3000 Region) Partial-Wave Analyses

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-3/2 resonances found in partial-wave analyses.

Our 1982 edition also had a Δ(2850) and a Δ(3230). The evidence for them was deduced from total cross-section and 180° elastic cross-section measurements. The Δ(2850) has been resolved into the Δ(2750) $I_{3,13}$ and Δ(2950) $K_{3,15}$. The Δ(3230) is perhaps related to the $K_{3,13}$ of HENDRY 78 and to the $L_{3,17}$ of KOCH 80.

[1] We assume $CPT$ invariance: this is the $\overline{\Lambda}$ mass as measured by HARTOUNI 94. See below for the fractional mass difference, testing $CPT$.
[2] The SCHMIDT 65 masses have been reevaluated using our April 1973 proton and $K^\pm$ and $\pi^\pm$ masses. P. Schmidt, private communication (1974).
[3] The mass has been raised 35 keV to take into account a 46 keV increase in the proton mass and an 11 keV decrease in the $\pi^\pm$ mass (note added Reviews of Modern Physics **39** 1 (1967)).

[a] See the Listings below for the pion momentum range used in this measurement.

### CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 20 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 10.5$ for 16 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

[1] Changed by us from $\Gamma(pe^-\overline{\nu}_e)/\Gamma(N\pi)$ assuming the authors used $\Gamma(\Lambda \to p\pi^-)/\Gamma(\text{total}) = 2/3$.

[2] Changed by us from $\Gamma(pe^-\overline{\nu}_e)/\Gamma(N\pi)$ because $\Gamma(pe^-\nu)/\Gamma(p\pi^-)$ is the directly measured quantity.

### $\overline{\alpha}_0 / \alpha_+$ in $\overline{\Lambda} \to \overline{n}\pi^0$, $\overline{\Lambda} \to \overline{p}\pi^+$

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.913±0.028±0.012** | 47k | ABLIKIM | 19BJ | BES3 | $J/\psi$ to $\Lambda\overline{\Lambda}$ |

### $(\alpha + \overline{\alpha})/(\alpha - \overline{\alpha})$ in $\Lambda \to p\pi^-$, $\overline{\Lambda} \to \overline{p}\pi^+$

Zero if $CP$ is conserved; $\alpha_-$ and $\alpha_+$ are the asymmetry parameters for $\Lambda \to p\pi^-$ and $\overline{\Lambda} \to \overline{p}\pi^+$ decay. See also the $\Xi^-$ for a similar test involving the decay chain $\Xi^- \to \Lambda\pi^-, \Lambda \to p\pi^-$ and the corresponding antiparticle chain.

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **−0.002±0.012 OUR AVERAGE** | | | | | |
| −0.006±0.012±0.007 | 420k | ABLIKIM | 19BJ | BES3 | $J/\psi$ to $\Lambda\overline{\Lambda}$ |

| −0.07 ±0.09 | 4063 | BARNES | 87 | CNTR | See BARNES 96 |

[1] CHAUVAT 85 actually gives $\alpha_+(\overline{\Lambda})/\alpha_-(\Lambda) = -1.04 \pm 0.29$. Assumes polarization is same in $\overline{p}p \to \overline{\Lambda}X$ and $pp \to \Lambda X$. Tests of this assumption, based on $C$-invariance and fragmentation, are satisfied by the data.

### R = $|G_E/G_M|$ in $\Lambda \to p\pi^-$, $\overline{\Lambda} \to \overline{p}\pi^+$

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.96±0.14±0.02** | [1] ABLIKIM | 19BF | BES3 | $e^+e^- \to \overline{\Lambda}\Lambda$ at $\sqrt{s}$ = 2.396 GeV |

[1] Determined using the latest BES-III value on the asymmetry parameter $\alpha = 0.750 \pm 0.010$.

### $\Delta\Phi = \Phi_E - \Phi_M$ in $\Lambda \to p\pi^-$, $\overline{\Lambda} \to \overline{p}\pi^+$

| VALUE (degrees) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **37±12±6** | [1] ABLIKIM | 19BF | BES3 | $e^+e^- \to \overline{\Lambda}\Lambda$ at $\sqrt{s}$ = 2.396 GeV |

[1] Relative phase between GE and GM, determined using the latest BES-III value on the asymmetry parameter $\alpha = 0.750 \pm 0.010$.

### $g_A / g_V$ FOR $\Lambda \to pe^-\overline{\nu}_e$

Measurements with fewer than 500 events have been omitted. Where necessary, signs have been changed to agree with our conventions, which are given in the "Note on Baryon Decay Parameters" in the neutron Listings. The measurements all assume that the form factor $g_2 = 0$. See also the footnote on DWORKIN 90.

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **−0.718±0.015 OUR AVERAGE** | | | | | |
| −0.719±0.016±0.012 | 37k | [1] DWORKIN | 90 | SPEC | $e\nu$ angular corr. |
| −0.70 ±0.03 | 7111 | BOURQUIN | 83 | SPEC | $\Xi \to \Lambda\pi^-$ |
| −0.734±0.031 | 10k | [2] WISE | 81 | SPEC | $e\nu$ angular correl. |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| −0.63 ±0.06 | 817 | ALTHOFF | 73 | OSPK | Polarized $\Lambda$ |

[1] The tabulated result assumes the weak-magnetism coupling $w \equiv g_W(0)/g_V(0)$ to be 0.97, as given by the CVC hypothesis and as assumed by the other listed measurements. However, DWORKIN 90 *measures* $w$ to be 0.15 ± 0.30, and then $g_A/g_V = -0.731 \pm 0.016$.

[2] This experiment measures only the absolute value of $g_A/g_V$.

### $\Lambda$ REFERENCES

We have omitted some papers that have been superseded by later experiments. See our earlier editions.

# Λ(1405) 1/2⁻

$I(J^P) = 0(\frac{1}{2}^-)$ Status: ****

In the 1998 Note on the Λ(1405) in PDG 98, R.H. Dalitz discussed the S-shaped cusp behavior of the intensity at the $N$-$\overline{K}$ threshold observed in THOMAS 73 and HEMINGWAY 85. He commented that this behavior "is characteristic of $S$-wave coupling; the other below threshold hyperon, the Σ(1385), has no such threshold distortion because its $N$-$\overline{K}$ coupling is $P$-wave. For Λ(1405) this asymmetry is the sole direct evidence that $J^P = 1/2^-$."

A recent measurement by the CLAS collaboration, MORIYA 14, definitively established the long-assumed $J^P = 1/2^-$ spin-parity assignment of the Λ(1405). The experiment produced the Λ(1405) spin-polarized in the photoproduction process $\gamma p \to K^+\Lambda(1405)$ and measured the decay of the Λ(1405)(polarized) $\to \Sigma^+$(polarized)$\pi^-$. The observed isotropic decay of Λ(1405) is consistent with spin $J = 1/2$. The polarization transfer to the $\Sigma^+$(polarized) direction revealed negative parity, and thus established $J^P = 1/2^-$.

## Λ(1520) 3/2⁻

$I(J^P) = 0(\frac{3}{2}^-)$ Status: ****

Discovered by FERRO-LUZZI 62; the elaboration in WATSON 63 is the classic paper on the Breit-Wigner analysis of a multichannel resonance.

The measurements of the mass, width, and elasticity published before 1975 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

Production and formation experiments agree quite well, so they are listed together here.

### $\Gamma(\Sigma(1385)\pi)/\Gamma_{\text{total}}$ $\Gamma_6/\Gamma$

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.041±0.005** | CHAN | 72 | HBC | $K^-p \rightarrow \Lambda\pi\pi$ |

### $\Gamma(\Sigma(1385)\pi(\rightarrow \Lambda\pi\pi))/\Gamma(\Lambda\pi\pi)$ $\Gamma_7/\Gamma_3$

The $\Lambda\pi\pi$ mode is largely due to $\Sigma(1385)\pi$. Only the values of ($\Sigma(1385)\pi$) / ($\Lambda 2\pi$) given by MAST 73B and CORDEN 75 are based on real 3-body partial-wave analyses. The discrepancy between the two results is essentially due to the different hypotheses made concerning the shape of the $(\pi\pi)_{S\text{-wave}}$ state.

| VALUE | CL% | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| 0.58±0.22 | | CORDEN | 75 | DBC | $K^-d$ 1.4–1.8 GeV/$c$ |
| 0.82±0.10 | | [1] MAST | 73B | IPWA | $K^-p \rightarrow \Lambda\pi\pi$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| <0.44 | 90 | WIELAND | 11 | SPHR | $\gamma p \rightarrow K^+\Lambda(1520)$ |
| 0.39±0.10 | | [2] BURKHARDT | 71 | HBC | $K^-p \rightarrow (\Lambda\pi\pi)\pi$ |

[1] Both $\Sigma(1385)\pi$ $DS_{03}$ and $\Sigma(\pi\pi)$ $DP_{03}$ contribute.

[2] The central bin (1514–1524 MeV) gives 0.74 ± 0.10; other bins are lower by 2-to-5 standard deviations.

### $\Gamma(\Lambda(\pi\pi)_{S\text{-wave}})/\Gamma(\Lambda\pi\pi)$ $\Gamma_8/\Gamma_3$

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.20±0.08** | CORDEN | 75 | DBC | $K^-d$ 1.4–1.8 GeV/$c$ |

### $\Gamma(\Sigma\pi\pi)/\Gamma_{\text{total}}$ $\Gamma_9/\Gamma$

| VALUE | DOCUMENT ID | | TECN | COMMENT |

## Λ(1670) 1/2⁻

$I(J^P) = 0(\frac{1}{2}^-)$ Status: ****

The measurements of the mass, width, and elasticity published before 1974 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

# Λ(1690) 3/2⁻

$I(J^P) = 0(\frac{3}{2}^-)$ Status: ****

The measurements of the mass, width, and elasticity published before 1974 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

## Λ(1690) POLE POSITION

## $\Lambda(1800)$ FOOTNOTES

[1] The two MARTIN 77 values are from a T-matrix pole and from a Breit-Wigner fit.
[2] The published sign has been changed to be in accord with the baryon-first convention.

# Λ(1820) 5/2+

$I(J^P) = 0(\frac{5}{2}^+)$ Status: ****

This resonance is the cornerstone for all partial-wave analyses in this region. Most of the results published before 1973 are now obsolete and have been omitted. They may be found in our 1982 edition Physics Letters **111B** 1 (1982).

## Λ(1820) DECAY MODES

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $N\overline{K}$ | 55–65 % |
| $\Gamma_2$ | $\Sigma\pi$ | 8–14 % |
| $\Gamma_3$ | $\Sigma(1385)\pi$ | 5–10 % |
| $\Gamma_4$ | $\Sigma(1385)\pi$, *P*-wave | |
| $\Gamma_5$ | $\Sigma(1385)\pi$, *F*-wave | (2.0±1.0) % |
| $\Gamma_6$ | $\Lambda\eta$ | |
| $\Gamma_7$ | $\Xi K$ | |
| $\Gamma_8$ | $\Sigma\pi\pi$ | |
| $\Gamma_9$ | $N\overline{K}^*(892)$, $S$=1/2, *F*-wave | |
| $\Gamma_{10}$ | $N\overline{K}^*(892)$, $S$=3/2, *P*-wave | (3.0±1.0) % |
| $\Gamma_{11}$ | $N\overline{K}^*(892)$, $S$=3/2, *F*-wave | |

## Λ(1820) BRANCHING RATIOS

Errors quoted do not include uncertainties in the parametrizations used in the partial-wave analyses and are thus too small. See also "Sign conventions for resonance couplings" in the Note on Λ and Σ Resonances.

# Λ(1830) 5/2⁻

$I(J^P) = 0(\frac{5}{2}^-)$ Status: ****

For results published before 1973 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

The best evidence for this resonance is in the Σπ channel.

### Λ(2080) REFERENCES

SARANTSEV 19 EPJ A55 180 A.V. Sarantsev *et al.* (BONN, PNPI)

## Λ(2085) 7/2+

$I(J^P) = 0(\frac{7}{2}^+)$ Status: **

OMITTED FROM SUMMARY TABLE
was Λ(2020)

In LITCHFIELD 71, need for the state rests solely on a possibly inconsistent polarization measurement at 1.784 GeV/$c$. HEMINGWAY 75 does not require this state. GOPAL 77 does not need it in either $N\overline{K}$ or $\Sigma\pi$. With new $K^-n$ angular distributions included, DECLAIS 77 sees it. However, this and other new data are included in GOPAL 80 and the state is not required. BACCARI 77 weakly supports it.

# $\Lambda(2100)\ 7/2^-$

$I(J^P) = 0(\frac{7}{2}^-)$ Status: ****

Most of the results published before 1973 are now obsolete and have been omitted. They may be found in our 1982 edition Physics Letters **111B** 1 (1982).

This entry only includes results from partial-wave analyses. Parameters of peaks seen in cross sections and in invariant-mass distributions around 2100 MeV used to be listed in a separate entry immediately following. It may be found in our 1986 edition Physics Letters **170B** 1 (1986).

## Λ(2100) FOOTNOTES

[1] The NAKKASYAN 75 values are from the two best solutions found. Each has the Λ(2100) and one additional resonance ($P_3$ or $F_5$).
[2] Note that the three for BACCARI 77 entries are for three different waves.
[3] The published sign has been changed to be in accord with the baryon-first convention. The upper limit on the $G_3$ wave is 0.03.

### $\Lambda(2110)$ FOOTNOTES

[1] Found in one of two best solutions.
[2] The published error of 0.6 was a misprint.
[3] The CAMERON 78 upper limit on $F$-wave decay is 0.03. The sign here has been changed to be in accord with the baryon-first convention.
[4] The published sign has been changed to be in accord with the baryon-first convention. The CAMERON 78B upper limits on the $P_3$ and $F_3$ waves are each 0.03.

## $\Lambda(2325)\ 3/2^-$

$I(J^P) = 0(\frac{3}{2}^-)$ Status: *

OMITTED FROM SUMMARY TABLE

BACCARI 77 finds this state with either $J^P = 3/2^-$ or $3/2^+$ in a energy-dependent partial-wave analyses of $K^-p \to \Lambda\omega$ from 2070 to 2436 MeV. A subsequent semi-energy-independent analysis from threshold to 2436 MeV selects $3/2^-$. DEBELLEFON 78 (same group) also sees this state in an energy-dependent partial-wave analysis of $K^-p \to \overline{K}N$ data, and finds $J^P = 3/2^-$ or $3/2^+$. They again prefer $J^P = 3/2^-$, but only on the basis of model-dependent considerations.

# Baryon Particle Listings

## Λ(2325), Λ(2350), Λ(2585) Bumps

## Λ(2350) 9/2+

$I(J^P) = 0(\frac{9}{2}^+)$ Status: ***

DAUM 68 favors $J^P = 7/2^-$ or $9/2^+$. BRICMAN 70 favors $9/2^+$. LASINSKI 71 suggests three states in this region using a Pomeron + resonances model. There are now also three formation experiments from the College de France-Saclay group, DEBELLEFON 77, BACCARI 77, and DEBELLEFON 78, which find $9/2^+$ in energy-dependent partial-wave analyses of $\overline{K}N \to \Sigma\pi$, $\Lambda\omega$, and $N\overline{K}$.

# $\Sigma$ BARYONS
## ($S = -1$, $I = 1$)

$\Sigma^+ = uus$, $\Sigma^0 = uds$, $\Sigma^- = dds$

## $\Sigma^+$

$I(J^P) = 1(\frac{1}{2}^+)$ Status: ****

We have omitted some results that have been superseded by later experiments. See our earlier editions.

### $\Sigma^+$ MASS

The fit uses $\Sigma^+$, $\Sigma^0$, $\Sigma^-$, and $\Lambda$ mass and mass-difference measurements.

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **1189.37±0.07 OUR FIT** Error includes scale factor of 2.2. | | | | | |
| **1189.37±0.06 OUR AVERAGE** Error includes scale factor of 1.8. See the ideogram below. | | | | | |
| 1189.33±0.04 | 607 | [1] BOHM | 72 | EMUL | |
| 1189.16±0.12 | | HYMAN | 67 | HEBC | |
| 1189.61±0.08 | 4205 | SCHMIDT | 65 | HBC | See note with $\Lambda$ mass |

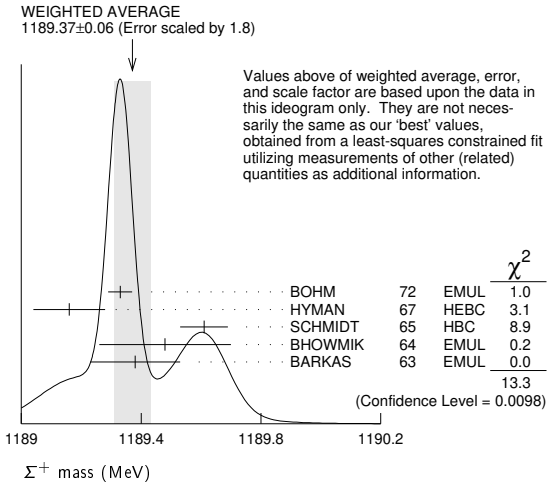
| 1189.38±0.15 | 144 | [2] BARKAS | 63 | EMUL | |

[1] BOHM 72 is updated with our 1973 $K^-$, $\pi^-$, and $\pi^0$ masses (Reviews of Modern Physics **45** S1 (1973)).

[2] These masses have been raised 30 keV to take into account a 46 keV increase in the proton mass and a 21 keV decrease in the $\pi^0$ mass (note added 1967 edition, Reviews of Modern Physics **39** 1 (1967)).



### $\Sigma^+$ MEAN LIFE

Measurements with fewer than 1000 events have been omitted.

| VALUE ($10^{-10}$ s) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.8018±0.0026 OUR AVERAGE** | | | | | |
| 0.8038±0.0040±0.0014 | | BARBOSA | 00 | E761 | hyperons, 375 GeV |
| 0.8043±0.0080±0.0014 | | [1] BARBOSA | 00 | E761 | hyperons, 375 GeV |
| 0.798 ±0.005 | 30k | MARRAFFINO | 80 | HBC | $K^-p$ 0.42–0.5 GeV/$c$ |
| 0.807 ±0.013 | 5719 | CONFORTO | 76 | HBC | $K^-p$ 1–1.4 GeV/$c$ |
| 0.795 ±0.010 | 20k | EISELE | 70 | HBC | $K^-p$ at rest |
| 0.803 ±0.008 | 10664 | BARLOUTAUD | 69 | HBC | $K^-p$ 0.4–1.2 GeV/$c$ |
| 0.83 ±0.032 | 1300 | [2] CHANG | 66 | HBC | |

[1] This is a measurement of the $\overline{\Sigma}^-$ lifetime. Here we assume $CPT$ invariance; see below for the fractional $\Sigma^+$-$\overline{\Sigma}^-$ lifetime difference obtained by BARBOSA 00.

[2] We have increased the CHANG 66 error of 0.018; see our 1970 edition, Reviews of Modern Physics **42** 87 (1970).

### $(\tau_{\Sigma^+} - \tau_{\overline{\Sigma}^-}) / \tau_{\Sigma^+}$

A test of $CPT$ invariance.

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **$(-6\pm12)\times10^{-4}$** | BARBOSA | 00 | E761 | hyperons, 375 GeV |

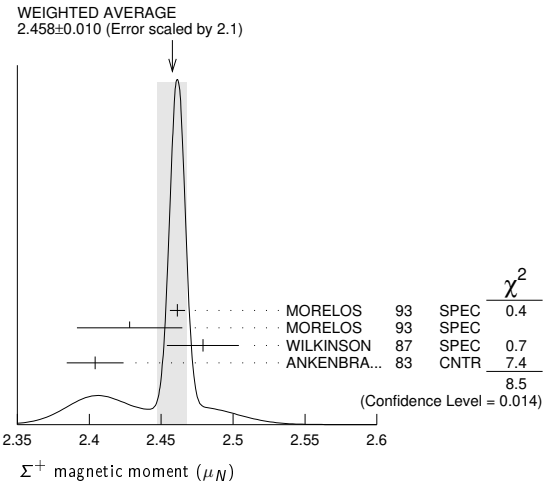
### $\Sigma^+$ MAGNETIC MOMENT

See the "Note on Baryon Magnetic Moments" in the $\Lambda$ Listings. Measurements with an error $\geq 0.1\ \mu_N$ have been omitted.

| VALUE ($\mu_N$) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **2.458 ±0.010 OUR AVERAGE** Error includes scale factor of 2.1. See the ideogram below. | | | | | |
| 2.4613±0.0034±0.0040 | 250k | MORELOS | 93 | SPEC | $p$Cu 800 GeV |
| 2.428 ±0.036 ±0.007 | 12k | [1] MORELOS | 93 | SPEC | $p$Cu 800 GeV |
| 2.479 ±0.012 ±0.022 | 137k | WILKINSON | 87 | SPEC | $p$Be 400 GeV |
| 2.4040±0.0198 | 44k | [2] ANKENBRA... | 83 | CNTR | $p$Cu 400 GeV |

[1] We assume $CPT$ invariance: this is (minus) the $\overline{\Sigma}^-$ magnetic moment as measured by MORELOS 93. See below for the moment difference testing $CPT$.

[2] ANKENBRANDT 83 gives the value 2.38 ± 0.02$\mu_N$. MORELOS 93 uses the same hyperon magnet and channel and claims to determine the field integral better, leading to the revised value given here.



### $(\mu_{\Sigma^+} + \mu_{\overline{\Sigma}^-}) / \mu_{\Sigma^+}$

A test of $CPT$ invariance.

| VALUE | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.014±0.015** | [1] MORELOS | 93 | SPEC | $p$Cu 800 GeV |

[1] This is our calculation from the MORELOS 93 measurements of the $\Sigma^+$ and $\overline{\Sigma}^-$ magnetic moments given above. The statistical error on $\mu_{\overline{\Sigma}^-}$ dominates the error here.

### $\Sigma^+$ DECAY MODES

| | Mode | | Fraction ($\Gamma_i/\Gamma$) | | Confidence level |
|---|---|---|---|---|---|
| $\Gamma_1$ | $p\pi^0$ | | (51.57±0.30) % | | |
| $\Gamma_2$ | $n\pi^+$ | | (48.31±0.30) % | | |
| $\Gamma_3$ | $p\gamma$ | | ( 1.23±0.05) | $\times10^{-3}$ | |
| $\Gamma_4$ | $n\pi^+\gamma$ | [a] | ( 4.5 ±0.5 ) | $\times10^{-4}$ | |
| $\Gamma_5$ | $\Lambda e^+\nu_e$ | | ( 2.0 ±0.5 ) | $\times10^{-5}$ | |
| | **$\Delta S = \Delta Q$ ($SQ$) violating modes or $\Delta S = 1$ weak neutral current ($S1$) modes** | | | | |
| $\Gamma_6$ | $ne^+\nu_e$ | $SQ$ | < 5 | $\times10^{-6}$ | 90% |
| $\Gamma_7$ | $n\mu^+\nu_\mu$ | $SQ$ | < 3.0 | $\times10^{-5}$ | 90% |
| $\Gamma_8$ | $pe^+e^-$ | $S1$ | < 7 | $\times10^{-6}$ | |
| $\Gamma_9$ | $p\mu^+\mu^-$ | $S1$ | ( 2.4 $^{+1.7}_{-1.3}$ ) | $\times10^{-8}$ | |

[a] See the Listings below for the pion momentum range used in this measurement.

### CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 14 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 7.7$ for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

# Baryon Particle Listings

$\Sigma^+$

## $\Sigma^+$ BRANCHING RATIOS

### $\Gamma(n\pi^+)/\Gamma(N\pi)$ $\Gamma_2/(\Gamma_1+\Gamma_2)$

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.4836±0.0030 OUR FIT** | | | | | |
| **0.4836±0.0030 OUR AVERAGE** | | | | | |
| 0.4828±0.0036 | 10k | [1] MARRAFFINO | 80 | HBC | $K^-p$ 0.42–0.5 GeV/$c$ |
| 0.488 ±0.008 | 1861 | NOWAK | 78 | HBC | |
| 0.484 ±0.015 | 537 | TOVEE | 71 | EMUL | |
| 0.488 ±0.010 | 1331 | BARLOUTAUD | 69 | HBC | $K^-p$ 0.4–1.2 GeV/$c$ |
| 0.46 ±0.02 | 534 | CHANG | 66 | HBC | |
| 0.490 ±0.024 | 308 | HUMPHREY | 62 | HBC | |

[1] MARRAFFINO 80 actually gives $\Gamma(p\pi^0)/\Gamma(\text{total}) = 0.5172 \pm 0.0036$.

### $\Gamma(p\gamma)/\Gamma(p\pi^0)$ $\Gamma_3/\Gamma_1$

| VALUE (units $10^{-3}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **2.38±0.10 OUR FIT** | | | | | |
| **2.38±0.10 OUR AVERAGE** | | | | | |
| 2.32±0.11±0.10 | 32k | TIMM | 95 | E761 | $\Sigma^+$ 375 GeV |
| $2.81\pm0.39^{+0.21}_{-0.43}$ | 408 | HESSEY | 89 | CNTR | $K^-p \to \Sigma^+\pi^-$ at rest |
| 2.52±0.28 | 190 | [1] KOBAYASHI | 87 | CNTR | $\pi^+p \to \Sigma^+K^+$ |
| $2.46^{+0.30}_{-0.35}$ | 155 | BIAGI | 85 | CNTR | CERN hyperon beam |
| 2.11±0.38 | 46 | MANZ | 80 | HBC | $K^-p \to \Sigma^+\pi^-$ |
| 2.1 ±0.3 | 45 | ANG | 69B | HBC | $K^-p$ at rest |
| 2.76±0.51 | 31 | GERSHWIN | 69B | HBC | $K^-p \to \Sigma^+\pi^-$ |
| 3.7 ±0.8 | 24 | BAZIN | 65 | HBC | $K^-p$ at rest |

[1] KOBAYASHI 87 actually gives $\Gamma(p\gamma)/\Gamma(\text{total}) = (1.30 \pm 0.15) \times 10^{-3}$.

### $\Gamma(n\pi^+\gamma)/\Gamma(n\pi^+)$ $\Gamma_4/\Gamma_2$

The $\pi^+$ momentum cuts differ, so we do not average the results but simply use the latest value in the Summary Table.

| VALUE (units $10^{-3}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.93±0.10** | 180 | EBENHOH | 73 | HBC | $\pi^+ < 150$ MeV/$c$ |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |

### $\Gamma(ne^+\nu_e)/\Gamma(n\pi^+)$ $\Gamma_6/\Gamma_2$

Test of $\Delta S = \Delta Q$ rule. Experiments with an effective denominator less than 100,000 have been omitted.

| EFFECTIVE DENOM. | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **$< 1.1 \times 10^{-5}$ OUR LIMIT** Our 90% CL limit = (2.3 events)/(effective denominator sum). [Number of events increased to 2.3 for a 90% confidence level.] | | | | | |
| 111000 | 0 | [1] EBENHOH | 74 | HBC | $K^-p$ at rest |
| 105000 | 0 | [1] SECHI-ZORN | 73 | HBC | $K^-p$ at rest |

[1] Effective denominator calculated by us.

### $\Gamma(n\mu^+\nu_\mu)/\Gamma(n\pi^+)$ $\Gamma_7/\Gamma_2$

Test of $\Delta S = \Delta Q$ rule.

| EFFECTIVE DENOM. | EVTS | DOCUMENT ID | | TECN |
|---|---|---|---|---|
| **$< 6.2 \times 10^{-5}$ OUR LIMIT** Our 90% CL limit = (6.7 events)/(effective denominator sum). [Number of events increased to 6.7 for a 90% confidence level.] | | | | |
| 33800 | 0 | BAGGETT | 69B | HBC |
| 62000 | 2 | [1] EISELE | 69B | HBC |
| 10150 | 0 | [2] COURANT | 64 | HBC |
| 1710 | 0 | [2] NAUENBERG | 64 | HBC |
| 120 | 1 | GALTIERI | 62 | EMUL |

[1] Effective denominator calculated by us.
[2] Effective denominator taken from EISELE 67.

### $\Gamma(pe^+e^-)/\Gamma_{\text{total}}$ $\Gamma_8/\Gamma$

| VALUE (units $10^{-6}$) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **<7** | [1] ANG | 69B | HBC | $K^-p$ at rest |

[1] ANG 69B found three $pe^+e^-$ events in agreement with $\gamma \to e^+e^-$ conversion from $\Sigma^+ \to p\gamma$. The limit given here is for neutral currents.

### $\Gamma(p\mu^+\mu^-)/\Gamma_{\text{total}}$ $\Gamma_9/\Gamma$

A test for a $\Delta S = 1$ weak neutral current, but also allowed by higher-order electroweak interactions.

| VALUE (units $10^{-8}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **$2.4^{+1.7}_{-1.3}$ OUR AVERAGE** | | | | | |
| $2.2^{+0.9}_{-0.8}{}^{+1.5}_{-1.1}$ | 10.2 | [1] AAIJ | 18E | LHCB | $pp$ at 7, 8 TeV |
| $8.6^{+6.6}_{-5.4}\pm5.5$ | 3 | [2] PARK | 05 | HYCP | $p$ Cu, 800 GeV |

[1] AAIJ 18E sees no structure in the dimuon mass distribution, contrary to PARK 05.
[2] The masses of the three dimuons of PARK 05 are within 1 MeV of one another, perhaps indicating the existence of a new state $P^0$ with mass 214.3 ± 0.5 MeV. In that case, the decay is $\Sigma^+ \to pP^0$, $P^0 \to \mu^+\mu^-$, with a branching fraction of $(3.1^{+2.4}_{-1.9} \pm 1.5) \times 10^{-8}$.

### $\Gamma(\Sigma^+ \to ne^+\nu_e)/\Gamma(\Sigma^- \to ne^-\overline{\nu}_e)$ $\Gamma_6/\Gamma_3^{\Sigma^-}$

## $\Sigma^0$

$I(J^P) = 1(\frac{1}{2}^+)$ Status: ****

COURANT 63 and ALFF 65, using $\Sigma^0 \to \Lambda e^+ e^-$ decays (Dalitz decays), determined the $\Sigma^0$ parity to be positive, given that $J = 1/2$ and that certain very reasonable assumptions about form factors are true. The results of experiments involving the Primakoff effect, from which the $\Sigma^0$ mean life and $\Sigma^0 \to \Lambda$ transition magnetic moment come (see below), strongly support $J = 1/2$.

### $\Sigma^0$ MASS

The fit uses $\Sigma^+$, $\Sigma^0$, $\Sigma^-$, and $\Lambda$ mass and mass-difference measurements.

| VALUE (MeV) | EVTS | DOCUMENT ID | | TECN | COMMENT |

### $\Sigma^0$ MEAN LIFE

These lifetimes are deduced from measurements of the cross sections for the Primakoff process $\Lambda \to \Sigma^0$ in nuclear Coulomb fields. An alternative expression of the same information is the $\Sigma^0$-$\Lambda$ transition magnetic moment given in the following section. The relation is $(\mu_{\Sigma\Lambda}/\mu_N)^2\,\tau = 1.92951 \times 10^{-19}$ s (see DEVLIN 86).

| VALUE ($10^{-20}$ s) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **7.4±0.7 OUR EVALUATION** Using $\mu_{\Sigma\Lambda}$ (see the above note). | | | | |
| $6.5\ ^{+1.7}_{-1.1}$ | [2] DEVLIN | 86 | SPEC | Primakoff effect |

### $\Sigma^-$ CHARGE RADIUS

| VALUE (fm) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **0.780±0.080±0.060** | [3] ESCHRICH | 01 | SELX | $\Sigma^-e \rightarrow \Sigma^-e$ |

[3] ESCHRICH 01 actually gives $\langle r^2 \rangle = (0.61 \pm 0.12 \pm 0.09)$ fm$^2$.

### $\Sigma^-$ DECAY MODES

| | Mode | Fraction ($\Gamma_i/\Gamma$) |
|---|---|---|
| $\Gamma_1$ | $n\pi^-$ | (99.848±0.005) % |
| $\Gamma_2$ | $n\pi^-\gamma$ | [a] ( 4.6 ±0.6 ) × $10^{-4}$ |
| $\Gamma_3$ | $ne^-\overline{\nu}_e$ | ( 1.017±0.034) × $10^{-3}$ |
| $\Gamma_4$ | $n\mu^-\overline{\nu}_\mu$ | ( 4.5 ±0.4 ) × $10^{-4}$ |
| $\Gamma_5$ | $\Lambda e^-\overline{\nu}_e$ | ( 5.73 ±0.27 ) × $10^{-5}$ |

[a] See the Listings below for the pion momentum range used in this measurement.

### CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 16 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2$ = 8.7 for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the $x_i$ whose labels appear in this array to sum to one.

| | | | |
|---|---|---|---|
| $x_3$ | −64 | | |
| $x_4$ | −77 | 0 | |
| $x_5$ | −5 | 0 | 0 |
| | $x_1$ | $x_3$ | $x_4$ |

### $\Sigma^-$ BRANCHING RATIOS

$\Gamma(n\pi^-\gamma)/\Gamma(n\pi^-)$ $\Gamma_2/\Gamma_1$

The $\pi^+$ momentum cuts differ, so we do not average the results but simply use the latest value for the Summary Table.

| VALUE (units $10^{-3}$) | EVTS | DOCUMENT ID | | TECN | COMMENT |

| 0.75 ±0.28 | 11 | COURANT | 64 | HBC | $K^-p$ at rest |

[5] The value is from BOURQUIN 83B, and includes radiation corrections and new acceptance.

## $\Sigma^-$ DECAY PARAMETERS

See the "Note on Baryon Decay Parameters" in the neutron Listings. Older, outdated results have been omitted.

### $\alpha_-$ FOR $\Sigma^-\to n\pi^-$

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **−0.068±0.008 OUR AVERAGE** | | | | | |
| −0.062±0.024 | 28k | HANSL | 78 | HBC | $K^-p\to\Sigma^-\pi^+$ |
| −0.067±0.011 | 60k | BOGERT | 70 | HBC | $K^-p$ 0.4 GeV/$c$ |
| −0.071±0.012 | 51k | BANGERTER | 69 | HBC | $K^-p$ 0.4 GeV/$c$ |

### $\phi$ ANGLE FOR $\Sigma^-\to n\pi^-$ $(\tan\phi=\beta/\gamma)$

| VALUE (°) | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **10±15 OUR AVERAGE** | | | | | |
| + 5±23 | 1092 | [6] BERLEY | 70B | HBC | $n$ rescattering |
| 14±19 | 1385 | BANGERTER | 69B | HBC | $K^-p$ 0.4 GeV/$c$ |

[6] BERLEY 70B changed from −5 to +5° to agree with our sign convention.

### $g_A/g_V$ FOR $\Sigma^-\to ne^-\overline{\nu}_e$

Measurements with fewer than 500 events have been omitted. Where necessary, signs have been changed to agree with our conventions, which are given in the "Note on Baryon Decay Parameters" in the neutron Listings. What is actually listed is $|g_1/f_1 - 0.237g_2/f_1|$. This reduces to $g_A/g_V \equiv g_1(0)/f_1(0)$ on making the usual assumption that $g_2 = 0$. See also the note on HSUEH 88.

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.340±0.017 OUR AVERAGE** | | | | | |
| +0.327±0.007±0.019 | 50k | [7] HSUEH | 88 | SPEC | $\Sigma^-$ 250 GeV |
| +0.34 ±0.05 | 4456 | [8] BOURQUIN | 83C | SPEC | SPS hyperon beam |
| 0.385±0.037 | 3507 | [9] TANENBAUM | 74 | ASPK | |
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | | |
| 0.29 ±0.07 | 25k | HSUEH | 85 | SPEC | See HSUEH 88 |
| 0.17 $^{+0.07}_{-0.09}$ | 519 | DECAMP | 77 | ELEC | Hyperon beam |

[7] The sign is, *with our conventions*, unambiguously positive. The value assumes, as usual, that $g_2 = 0$. If $g_2$ is included in the fit, than (with our sign convention) $g_2 = -0.56 \pm 0.37$, with a corresponding reduction of $g_A/g_V$ to $+0.20 \pm 0.08$.

[8] BOURQUIN 83C favors the positive sign by at least 2.6 standard deviations.

[9] TANENBAUM 74 gives $0.435 \pm 0.035$, assuming no $q^2$ dependence in $g_A$ and $g_V$. The listed result allows $q^2$ dependence, and is taken from HSUEH 88.

### $f_2(0)/f_1(0)$ FOR $\Sigma^-\to ne^-\overline{\nu}_e$

The signs have been changed to be in accord with our conventions, given in the "Note on Baryon Decay Parameters" in the neutron Listings.

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.97±0.14 OUR AVERAGE** | | | | | |
| +0.96±0.07±0.13 | 50k | HSUEH | 88 | SPEC | $\Sigma^-$ 250 GeV |
| +1.02±0.34 | 4456 | BOURQUIN | 83C | SPEC | SPS hyperon beam |

### TRIPLE CORRELATION COEFFICIENT $D$ for $\Sigma^-\to ne^-\overline{\nu}_e$

The coefficient $D$ of the term $D\,\mathbf{P}\cdot(\hat{\mathbf{p}}_e\times\hat{\mathbf{p}}_\nu)$ in the $\Sigma^-\to ne^-\overline{\nu}$ decay angular distribution. A nonzero value would indicate a violation of time-reversal invariance.

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.11±0.10** | 50k | HSUEH | 88 | SPEC | $\Sigma^-$ 250 GeV |

### $g_V/g_A$ FOR $\Sigma^-\to\Lambda e^-\overline{\nu}_e$

For the sign convention, see the "Note on Baryon Decay Parameters" in the neutron Listings. The value is predicted to be zero by conserved vector current theory. The values averaged assume CVC-SU(3) weak magnetism term.

| VALUE | EVTS | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|---|
| **0.01 ±0.10 OUR AVERAGE** Error includes scale factor of 1.5. See the ideogram below. | | | | | |
| −0.034±0.080 | 1620 | [10] BOURQUIN | 82 | SPEC | SPS hyperon beam |

## $\Sigma(1385)\ 3/2^+$

$I(J^P) = 1(\frac{3}{2}^+)$ Status: ****

Discovered by ALSTON 60. Early measurements of the mass and width for combined charge states have been omitted. They may be found in our 1984 edition Reviews of Modern Physics **56** S1 (1984).

We average only the most significant determinations. We do not average results from inclusive experiments with large backgrounds or results which are not accompanied by some discussion of experimental resolution. Nevertheless systematic differences between experiments remain. (See the ideograms in the Listings below.) These differences could arise from interference effects that change with production mechanism and/or beam momentum. They can also be accounted for in part by differences in the parametrizations employed. (See BORENSTEIN 74 for a discussion on this point.) Thus BORENSTEIN 74 uses a Breit-Wigner with energy-independent width, since a $P$-wave was found to give unsatisfactory fits. CAMERON 78 uses the same form. On the other hand HOLMGREN 77 obtains a good fit to their $\Lambda\pi$ spectrum with a $P$-wave Breit-Wigner, but includes the partial width for the $\Sigma\pi$ decay mode in the parametrization. AGUILAR-BENITEZ 81D gives masses and widths for five different Breit-Wigner shapes. The results vary considerably. Only the best-fit $S$-wave results are given here.

### $\Sigma(1385)$ FOOTNOTES

[1] From fit to inclusive $\Lambda\pi$ spectrum.
[2] Includes data of HOLMGREN 77.
[3] The errors are statistical only. The resolution is not unfolded.
[4] The error is enlarged to $\Gamma/\sqrt{N}$. See the note on the $K^*(892)$ mass in the 1984 edition.
[5] From a fit to $\Lambda\pi^0$ with the width fixed at 34 MeV.
[6] From fit to inclusive $\Lambda\pi^0$ spectrum with the width fixed at 40 MeV.
[7] Redundant with data in the mass Listings.
[8] Results from $\Lambda\pi^+\pi^-$ and $\Lambda\pi^+\pi^-\pi^0$ combined by us.
[9] The error is enlarged to $4\Gamma/\sqrt{N}$. See the note on the $K^*(892)$ mass in the 1984 edition.
[10] Consistent with +, 0, and − widths equal.
[11] KELLER 12 gives $\Gamma(\Sigma^+\gamma)/\Gamma(\Sigma^+\pi^0) = (11.95 \pm 2.21^{+0.53}_{-1.21})\%$, using 1/2 our total $\Sigma(1385) \to \Sigma\pi$ fraction for $\Sigma^+\pi^0$. We divide the KELLER 12 value by two.
[12] We calculate this from the MOLCHANOV 04 upper limit of 9.5 keV on the $\Sigma^-\gamma$ width.
[13] We calculate this from the ARIK 77 upper limit of 24 keV on the $\Sigma^-\gamma$ width.
[14] An extrapolation of the parametrized amplitude below threshold.

## $\Sigma(1580)\ 3/2^-$

$I(J^P) = 1(\frac{3}{2}^-)$ Status: *

OMITTED FROM SUMMARY TABLE

Seen in the isospin-1 $\overline{K}N$ cross section at BNL (LI 73, CARROLL 76) and in a partial-wave analysis of $K^-p \to \Lambda\pi^0$ for c.m. energies 1560–1600 MeV by LITCHFIELD 74. LITCHFIELD 74 finds $J^P = 3/2^-$. Not seen by ENGLER 78, CAMERON 78C, OLMSTED 04, nor by PRAKHOV 04.

Neither ZHANG 13A nor SARANTSEV 19 see any evidence for this state.

### $\Sigma(1580)$ POLE POSITION

#### REAL PART

| VALUE (MeV) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| $1607^{+13}_{-11}$ | [1] KAMANO | 15 | DPWA | Multichannel |

[1] From the preferred solution A in KAMANO 15. Solution B reports M = $1492^{+4}_{-7}$ MeV.

#### −2×IMAGINARY PART

| VALUE (MeV) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| • • • We do not use the following data for averages, fits, limits, etc. • • • | | | | |
| $253^{+30}_{-18}$ | [2] KAMANO | 15 | DPWA | Multichannel |

[2] From the preferred solution A in KAMANO 15. Solution B reports M = $138^{+8}_{-14}$ MeV.

### $\Sigma(1580)$ POLE RESIDUES

The "normalized residue" is the residue divided by $\Gamma_{pole}/2$.

#### Normalized residue in $N\overline{K} \to \Sigma(1580) \to N\overline{K}$

## $\Sigma(1580)$ MASS

| VALUE (MeV) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| **≈ 1580 OUR ESTIMATE** | | | | |
| 1583±4 | [8] CARROLL | 76 | DPWA | Isospin-1 total $\sigma$ |
| 1582±4 | [9] LITCHFIELD | 74 | DPWA | $K^- p \to \Lambda\pi^0$ |

[8] CARROLL 76 sees a total-cross-section bump with $(J{+}1/2)\ \Gamma_{el}\ /\ \Gamma_{total} = 0.06$.

[9] The main effect observed by LITCHFIELD 74 is in the $\Lambda\pi$ final state; the $\overline{K}N$ and $\Sigma\pi$ couplings are estimated from a multichannel fit including total-cross-section data of LI 73.

## $\Sigma(1580)$ WIDTH

| VALUE (MeV) | DOCUMENT ID | | TECN | COMMENT |
|---|---|---|---|---|
| 15 | [10] CARROLL | 76 | DPWA | Isospin-1 total $\sigma$ |
| 11±4 | [11] LITCHFIELD | 74 | DPWA | $K^- p \to \Lambda\pi^0$ |

[10] CARROLL 76 sees a total-cross-section bump with $(J{+}1/2)\ \Gamma_{el}\ /\ \Gamma_{total} = 0.06$.

[11] The main effect observed by LITCHFIELD 74 is in the $\Lambda\pi$ final state; the $\overline{K}N$ and $\Sigma\pi$ couplings are estimated from a multichannel fit including total-cross-section data of LI 73.

## $\Sigma(1580)$ DECAY MODES

| | Mode |
|---|---|
