OMITTED FROM SUMMARY TABLE

This state suggested by BERTHON 70B finds support in GOPAL 80 with new $K^- p$ polarization and $K^- n$ angular distributions. The very broad state seen in KANE 72 is not required in the later (KANE 74) analysis of $\bar{K} N \rightarrow \Sigma \pi$.

$\Sigma(2250)$

$I(J^P) = 1(?)^?$ Status: ***

Results from partial-wave analyses are too weak to warrant separating them from the production and cross-section experiments. LASINSKI 71 in $\bar{K}N$ using a Pomeron + resonances model, and DEBELLEFON 76, DEBELLEFON 77, and DEBELLEFON 78 in energy-dependent partial-wave analyses of $\bar{K}N \rightarrow \Lambda\pi, \Sigma\pi$, and $N\bar{K}$, respectively, suggest two resonances around this mass.

 $\Sigma(3170)$ Bumps **$\Sigma(3170)$ Bumps** $I(J^P) = 1(?^?)$ Status: *

OMITTED FROM SUMMARY TABLE

Seen by AMIRZADEH 79 as a narrow 6.5-standard-deviation enhancement in the reaction $K^- p \rightarrow Y^{*+} \pi^-$ using data from independent high statistics bubble chamber experiments at 8.25 and 6.5 GeV/c. The dominant decay modes are multibody, multistrange final states and the production is via isospin-3/2 baryon exchange. Isospin 1 is favored.

Not seen in a $K^- p$ experiment in LASS at 11 GeV/c (ASTON 85B).

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 11 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 7.5$ for 7 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

RADIATIVE HYPERON DECAYS

Revised July 2011 by J.D. Jackson (LBNL).

The weak radiative decays of spin-1/2 hyperons, $B_i \rightarrow B_f \gamma$, yield information about matrix elements (form factors) similar to that gained from weak hadronic decays. For a polarized spin-1/2 hyperon decaying radiatively via a $\Delta Q = 0$, $\Delta S = 1$

transition, the angular distribution of the direction \hat{p} of the final spin-1/2 baryon in the hyperon rest frame is

$$\frac{dN}{d\Omega} = \frac{N}{4\pi} (1 + \alpha_\gamma \mathbf{P}_i \cdot \hat{p}). \quad (1)$$

Here \mathbf{P}_i is the polarization of the decaying hyperon, and α_γ is the asymmetry parameter. In terms of the form factors $F_1(q^2)$, $F_2(q^2)$, and $G(q^2)$ of the effective hadronic weak electromagnetic vertex,

$$F_1(q^2)\gamma_\lambda + iF_2(q^2)\sigma_{\lambda\mu}q^\mu + G(q^2)\gamma_\lambda\gamma_5,$$

α_γ is

$$\alpha_\gamma = \frac{2 \operatorname{Re}[G(0)F_M^*(0)]}{|G(0)|^2 + |F_M(0)|^2}, \quad (2)$$

where $F_M = (m_i - m_f)[F_2 - F_1/(m_i + m_f)]$. If the decaying hyperon is unpolarized, the decay baryon has a longitudinal polarization given by $P_f = -\alpha_\gamma$ [1].

The angular distribution for the weak hadronic decay, $B_i \rightarrow B_f \pi$, has the same form as Eq. (1), but of course with a different asymmetry parameter, α_π . Now, however, if the decaying hyperon is unpolarized, the decay baryon has a longitudinal polarization given by $P_f = +\alpha_\pi$ [2,3]. The difference of sign is because the spins of the pion and photon are different.

Ξ⁰ → Λγ decay—The radiative decay Ξ⁰ → Λγ of an unpolarized Ξ⁰ uses the hadronic decay Λ → pπ⁻ as the analyzer. As noted above, the longitudinal polarization of the Λ will be $P_\Lambda = -\alpha_{\Xi\Lambda\gamma}$. Let α₋ be the Λ → pπ⁻ asymmetry parameter and θ_{Λp} be the angle, as seen in the Λ rest frame, between the Λ line of flight and the proton momentum. Then the hadronic version of Eq. (1) applied to the Λ → pπ⁻ decay gives

$$\frac{dN}{d \cos \theta_{\Lambda p}} = \frac{N}{2} (1 - \alpha_{\Xi\Lambda\gamma} \alpha_- \cos \theta_{\Lambda p}) \quad (3)$$

for the angular distribution of the proton in the Λ frame. Our current value, from the CERN NA48/1 experiment [4], is α_{ΞΛγ} = -0.704 ± 0.019 ± 0.064.

Ξ⁰ → Σ⁰γ decay—The asymmetry parameter here, α_{ΞΣγ}, is measured by following the decay chain Ξ⁰ → Σ⁰γ, Σ⁰ → Λγ, Λ → pπ⁻. Again, for an unpolarized Ξ⁰, the longitudinal polarization of the Σ⁰ will be $P_\Sigma = -\alpha_{\Xi\Sigma\gamma}$. In the Σ⁰ → Λγ decay, a parity-conserving magnetic-dipole transition, the polarization of the Σ⁰ is transferred to the Λ, as may be seen as follows. Let θ_{ΣΛ} be the angle seen in the Σ⁰ rest frame between the Σ⁰ line of flight and the Λ momentum. For Σ⁰ helicity +1/2, the probability amplitudes for positive and negative spin states of the Σ⁰ along the Λ momentum are cos(θ_{ΣΛ}/2) and sin(θ_{ΣΛ}/2). Then the amplitude for a negative helicity photon and a negative helicity Λ is cos(θ_{ΣΛ}/2), while the amplitude for positive helicities for the photon and Λ is sin(θ_{ΣΛ}/2). For Σ⁰ helicity -1/2, the amplitudes are interchanged. If the Σ⁰ has longitudinal polarization P_Σ , the probabilities for Λ helicities ±1/2 are therefore

$$p(\pm 1/2) = \frac{1}{2}(1 \mp P_\Sigma) \cos^2(\theta_{\Sigma\Lambda}/2) + \frac{1}{2}(1 \pm P_\Sigma) \sin^2(\theta_{\Sigma\Lambda}/2), \quad (4)$$

and the longitudinal polarization of the Λ is

$$P_\Lambda = -P_\Sigma \cos \theta_{\Sigma\Lambda} + \alpha_{\Xi\Sigma\gamma} \cos \theta_{\Sigma\Lambda}. \quad (5)$$

Using Eq. (1) for the $\Lambda \rightarrow p\pi^-$ decay again, we get for the joint angular distribution of the $\Sigma^0 \rightarrow \Lambda\gamma, \Lambda \rightarrow p\pi^-$ chain,

$$\frac{d^2N}{d\cos\theta_{\Sigma\Lambda} d\cos\theta_{\Lambda p}} = \frac{N}{4} (1 + \alpha_{\Xi\Sigma\gamma} \cos\theta_{\Sigma\Lambda} \alpha_- \cos\theta_{\Lambda p}). \quad (6)$$

Our current average for $\alpha_{\Xi\Sigma\gamma}$ is -0.69 ± 0.06 [4,5].

References

1. R.E. Behrends, Phys. Rev. **111**, 1691 (1958); see Eq. (7) or (8).
2. In ancient times, the signs of the asymmetry term in the angular distributions of radiative and hadronic decays of polarized hyperons were sometimes opposite. For roughly 50 years, however, the overwhelming convention has been to make them the same. The aim, not always achieved, is to remove ambiguities.

$I(J^P) = \frac{1}{2}(1^+)$ Status: * * * *

The parity has not actually been measured, but + is of course expected.

We have omitted some results that have been superseded by later experiments. See our earlier editions.

Ξ^- MASS

The fit uses the Ξ^- , Ξ^+ , and Ξ^0 masses and the $\Xi^- - \Xi^+$ mass difference. It assumes that the Ξ^- and Ξ^+ masses are the same.

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 5 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 1.0$ for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

⁸ This LUK 00 value is for $\alpha(\Xi^+)\alpha_+(\bar{\Lambda})$. We assume CP conservation here by including it in the average for $\alpha(\Xi^-)\alpha_-(\Lambda)$. But see the second data block below for the CP test.

α FOR $\Xi^- \rightarrow \Lambda\pi^-$
 The above average, $\alpha(\Xi^-)\alpha_-(\Lambda) = -0.294 \pm 0.005$, divided by our current average $\alpha_-(\Lambda) = 0.732 \pm 0.014$, gives the following value for $\alpha(\Xi^-)$:

VALUE	DOCUMENT ID
-0.401 ± 0.010	OUR EVALUATION

$\frac{[\alpha(\Xi^-)\alpha_-(\Lambda) - \alpha(\Xi^+)\alpha_+(\bar{\Lambda})]}{[\alpha(\Xi^-)\alpha_-(\Lambda) + \alpha(\Xi^+)\alpha_+(\bar{\Lambda})]}$
 This is zero if CP is conserved. The α 's are the decay-asymmetry parameters for $\Xi^- \rightarrow \Lambda\pi^-$ and $\Lambda \rightarrow p\pi^-$ and for $\Xi^+ \rightarrow \bar{\Lambda}\pi^+$ and $\bar{\Lambda} \rightarrow \bar{p}\pi^+$.

VALUE (units 10^{-4})	EVTS	DOCUMENT ID	TECN	COMMENT

Ξ RESONANCES

Revised 2004 by C.G. Wohl, (LBNL).

The accompanying table gives our evaluation of the present status of the Ξ resonances. Not much is known about Ξ resonances. This is because (1) they can only be produced as a part of a final state, and so the analysis is more complicated than if direct formation were possible, (2) the production cross sections are small (typically a few μb), and (3) the final states are topologically complicated and difficult to study with electronic techniques. Thus early information about Ξ resonances came entirely from bubble chamber experiments, where the numbers of events are small, and only in the 1980's did electronic experiments make any significant contributions. However, nothing of significance on Ξ resonances has been added since our 1988 edition.

For a detailed earlier review, see Meadows [1].

Table 1. The status of the Ξ resonances. Only those with an overall status of *** or **** are included in the Baryon Summary Table.

Particle	J^P	Overall status	Status as seen in —				
			$\Xi\pi$	ΛK	ΣK	$\Xi(1530)\pi$	Other channels
$\Xi(1318)$	$1/2^+$	****					Decays weakly
$\Xi(1530)$	$3/2^+$	****					
$\Xi(1620)$	*	*					
$\Xi(1690)$	***			***	**		
$\Xi(1820)$	$3/2^-$	***	**	***	**	**	
$\Xi(1950)$	***	**	**			*	
$\Xi(2030)$	***			**	***		
$\Xi(2120)$	*			*			
$\Xi(2250)$	**						3-body decays
$\Xi(2370)$	**						3-body decays
$\Xi(2500)$	*			*	*		3-body decays

**** Existence is certain, and properties are at least fairly well explored.
 *** Existence ranges from very likely to certain, but further confirmation is desirable and/or quantum numbers, branching fractions, etc. are not well determined.
 ** Evidence of existence is only fair.
 * Evidence of existence is poor.

Reference

$\Xi(1530) 3/2^+$

$$I(J^P) = \frac{1}{2}(\frac{3}{2}^+) \text{ Status: } ***$$

This is the only Ξ resonance whose properties are all reasonably well known. Assuming that the Λ_c^+ has $J^P = 1/2^+$, AUBERT 08AK, in a study of $\Lambda_c^+ \rightarrow \Xi^- \pi^+ K^+$, finds conclusively that the spin of the $\Xi(1530)^0$ is 3/2. In conjunction with SCHLEIN 63B and BUTTON-SHAFFER 66, this proves also that the parity is +.

We use only those determinations of the mass and width that are accompanied by some discussion of systematics and resolution.

$\Xi(1690)$

$I(J^P) = \frac{1}{2}(?)^?$ Status: ** *

AUBERT 08AK, in a study of $\Lambda_c^+ \rightarrow \Xi^- \pi^+ K^+$, finds some evidence that the $\Xi(1690)$ has $J^P = 1/2^-$.

DIONISI 78 sees a threshold enhancement in both the neutral and negatively charged $\Sigma \bar{K}$ mass spectra in $K^- p \rightarrow (\Sigma \bar{K}) K \pi$ at 4.2 GeV/c. The data from the $\Sigma \bar{K}$ channels alone cannot distinguish between a resonance and a large scattering length. Weaker evidence at the same mass is seen in the corresponding $\Lambda \bar{K}$ channels, and a coupled-channel analysis yields results consistent with a new Ξ .

BIAGI 81 sees an enhancement at 1700 MeV in the diffractively produced ΛK^- system. A peak is also observed in the $\Lambda \bar{K}^0$ mass spectrum at 1660 MeV that is consistent with a 1720 MeV resonance decaying to $\Sigma^0 \bar{K}^0$, with the γ from the Σ^0 decay not detected.

Baryon Particle Listings

$\Xi(1690), \Xi(1820)$

BIAGI 87 provides further confirmation of this state in diffractive dissociation of Ξ^- into ΛK^- . The significance claimed is 6.7 standard deviations.

ADAMOVICH 98 sees a peak of 1400 ± 300 events in the $\Xi^- \pi^+$ spectrum produced by 345 GeV/c Σ^- -nucleus interactions.

$\Xi(1820) 3/2^-$

$$I(J^P) = \frac{1}{2}(\frac{3}{2}^-) \text{ Status: } ***$$

The clearest evidence is an 8-standard-deviation peak in ΛK^- seen by GAY 76C. TEODORO 78 favors $J = 3/2$, but cannot make a parity discrimination. BIAGI 87C is consistent with $J = 3/2$ and favors negative parity for this J value.

$\Xi(1820)$ MASS

We only average the measurements that appear to us to be most significant and best determined.

$\Xi(1820)$ FOOTNOTES

- BIAGI 87 also sees weak signals in the in the $\Xi^- \pi^+ \pi^-$ channel at 1782.6 ± 1.4 MeV ($\Gamma = 6.0 \pm 1.5$ MeV) and 1831.9 ± 2.8 MeV ($\Gamma = 9.6 \pm 9.9$ MeV).
- BADIER 72 adds all channels and divides the peak into lower and higher mass regions. The data can also be fitted with a single Breit-Wigner of mass 1800 MeV and width 150 MeV.
- From a fit to inclusive $\Xi \pi$, $\Xi \pi \pi$, and ΛK^- spectra.
- From a fit to inclusive $\Xi \pi$ and $\Xi \pi \pi$ spectra only.
- Including $\Xi \pi \pi$.
- DAUBER 69 uses in part the same data as SMITH 65c.
- For the decay mode $\Xi^- \pi^+ \pi^0$ only. This limit includes $\Xi(1530)\pi$.
- Or less. Upper limit for the 3-body decay.

$\Xi(1950)$

$I(J^P) = \frac{1}{2}(?)^?$ Status: ***

We list here everything reported between 1875 and 2000 MeV. The accumulated evidence for a Ξ near 1950 MeV seems strong enough to include a $\Xi(1950)$ in the main Baryon Table, but not much can be said about its properties. In fact, there may be more than one Ξ near this mass.

$\Xi(2030)$

$$I(J^P) = \frac{1}{2} (\geq \frac{5}{2}) \text{ status: } ***$$

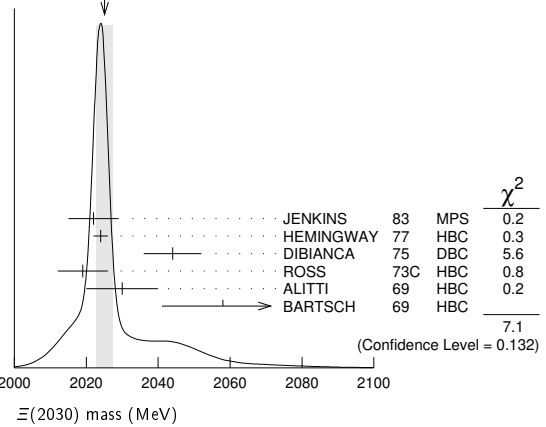

The evidence for this state has been much improved by HEMINGWAY 77, who see an eight standard deviation enhancement in $\Sigma \bar{K}$ and a weaker coupling to $\Lambda \bar{K}$. ALITTI 68 and HEMINGWAY 77 observe no signals in the $\Xi\pi\pi$ (or $\Xi(1530)\pi$) channel, in contrast to DIBIANCA 75. The decay $(\Lambda/\Sigma)\bar{K}\pi$ reported by BARTSCH 69 is also not confirmed by HEMINGWAY 77.

A moments analysis of the HEMINGWAY 77 data indicates at a level of three standard deviations that $J \geq 5/2$.

$\Xi(2120)$ FOOTNOTES

- CHLIAPNIKOV 79 does not uniquely identify the K^+ in the $(\bar{K} K^+) X$ final state. It also reports bumps with fewer events at 2240, 2540, and 2830 MeV.
- GAY 76c sees a 4-standard deviation signal. However, HEMINGWAY 77, with more events from the same experiment points out that the signal is greatly reduced if a cut is made on the 4-momentum u . This suggests an anomalous production mechanism if the $\Xi(2120)$ is real.

The evidence for this state is mixed. BARTSCH 69 sees a bump of not much statistical significance in $\Lambda\bar{K}\pi$, $\Sigma\bar{K}\pi$, and $\Xi\pi\pi$ mass spectra. GOLDWASSER 70 sees a narrower bump in $\Xi\pi\pi$ at a higher mass. Not seen by HASSALL 81 with 45 events/ μb at 6.5 GeV/c. Seen by JENKINS 83. Perhaps seen by BIAGI 87.

Ω^- BARYONS

$(S = -3, I = 0)$

$\Omega^- = sss$

$I(J^P) = 0(\frac{3}{2}^+)$ Status: ***

The unambiguous discovery in both production and decay was by BARNES 64. The quantum numbers follow from the assignment of the particle to the baryon decuplet. DEUTSCHMANN 78 and BAUBILLIER 78 rule out $J = 1/2$ and find consistency with $J = 3/2$. AUBERT, BE 06 finds from the decay angular distributions of $\Xi_c^0 \rightarrow \Omega^- K^+$ and $\Omega_c^0 \rightarrow \Omega^- K^+$ that $J = 3/2$; this depends on the spins of the Ξ_c^0 and Ω_c^0 being $J = 1/2$, their supposed values.

We have omitted some results that have been superseded by later experiments. See our earlier editions.

Ω^- MASS

The fit assumes the Ω^- and $\bar{\Omega}^+$ masses are the same, and averages them together.

1615	1	⁴ EISENBERG 54	EMUL	

¹DIBIANCA 75 gives a mass for each event. We quote the average.
²The FRY 55 and FRY 55B events were identified as Ω^- by ALVAREZ 73. The masses assume decay to ΛK^- at rest. For FRY 55B, decay from an atomic orbit could Doppler shift the K^- energy and the resulting Ω^- mass by several MeV. This shift is negligible for FRY 55 because the Ω^- decay is approximately perpendicular to its orbital velocity, as is known because the Λ strikes the nucleus (L.Alvarez, private communication 1973). We have calculated the error assuming that the orbital n is 4 or larger.
³Excluded from the average; the Ω^- lifetimes measured by the experiments differ significantly from other measurements.
⁴The EISENBERG 54 mass was calculated for decay in flight. ALVAREZ 73 has shown that the Ω^- interacted with an Ag nucleus to give $K^- \Xi Ag$.

4.3 ^{+3.4} _{-1.3}	4	BOURQUIN 84	SPEC	SPS hyperon beam

⁵This KAMAEV 10 value uses 76 $\Omega^- \rightarrow \Xi^- \pi^+ \pi^-$ and 24 $\bar{\Omega}^+ \rightarrow \Xi^+ \pi^- \pi^+$ decays. The Ω^- and $\bar{\Omega}^+$ branching fractions measurements are statistically equal. The errors given combine statistical and systematic contributions. The CP branching-fraction asymmetry, $(\Omega^- - \bar{\Omega}^+)/\text{sum}$, is $+0.12 \pm 0.20$.

OMITTED FROM SUMMARY TABLE

A peak in the $\Omega^- \pi^+ \pi^-$ mass spectrum with a signal significance claimed to be at least 5.5 standard deviations. There is no reason to seriously doubt the existence of this state, but unless the evidence is overwhelming we usually wait for confirmation from a second experiment before elevating peaks to the Summary Table.

Baryon Particle Listings

Charmed Baryons, Λ_c^+

CHARMED BARYONS ($C = +1$)

$$\Lambda_c^+ = udc, \Sigma_c^{++} = uuc, \Sigma_c^+ = udc, \Sigma_c^0 = ddc, \\ \Xi_c^+ = usc, \Xi_c^0 = dsc, \Omega_c^0 = ssc$$

See the related review(s):
Charmed Baryons

$$I(J^P) = 0(\frac{1}{2}^+) \text{ Status: } ****$$

The parity of the Λ_c^+ is defined to be positive (as are the parities of the proton, neutron, and Λ). The quark content is udc . Results of an analysis of $pK^-\pi^+$ decays (JEZABEK 92) are consistent with $J = 1/2$. Nobody doubts that the spin is indeed $1/2$.

We have omitted some results that have been superseded by later experiments. The omitted results may be found in earlier editions.

Λ_c^+ MASS

Our value in 2004, 2284.9 ± 0.6 MeV, was the average of the measurements now filed below as "not used." The BABAR measurement is so much better that we use it alone. Note that it is about 2.6 (old) standard deviations above the 2004 value.

The fit also includes $\Sigma_c^-\Lambda_c^+$ and $\Lambda_c^{*+}\Lambda_c^+$ mass-difference measurements, but this doesn't affect the Λ_c^+ mass. The new (in 2006) Λ_c^+ mass simply pushes all those other masses higher.

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
2286.46 ± 0.14	OUR FIT			
2286.46 ± 0.14	4891	¹ AUBERT,B	05s BABR	$\Lambda_c^0 K^+$ and $\Sigma^0 K_S^0 K^+$

¹AUBERT,B 05s uses low-Q $\Lambda_c^0 K^+$ and $\Sigma^0 K_S^0 K^+$ decays to minimize systematic errors. The error above includes systematic as well as statistical errors. Many cross checks and adjustments to properties of the BABAR detector, as well as the large number of clean events, make this by far the best measurement of the Λ_c^+ mass.

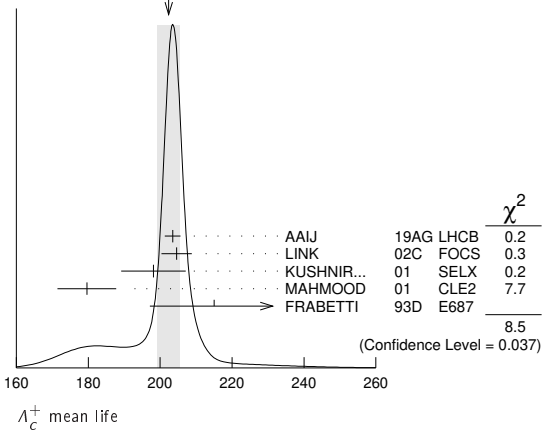

Λ_c^+ MEAN LIFE

Measurements with an error $\geq 100 \times 10^{-15}$ s or with fewer than 20 events have been omitted from the Listings.

[a] This branching fraction includes all the decay modes of the final-state resonance.

CONSTRAINED FIT INFORMATION

An overall fit to 41 branching ratios uses 62 measurements and one constraint to determine 21 parameters. The overall fit has a $\chi^2 = 47.4$ for 42 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$\Lambda_c(2595)^+$

$$J(J^P) = 0(\frac{1}{2}^-) \text{ Status: } ***$$

The $\Lambda_c^+ \pi^+ \pi^-$ mode is largely, and perhaps entirely, $\Sigma_c \pi$, which is just at threshold; since the Σ_c has $J^P = 1/2^+$, the J^P here is almost certainly $1/2^-$. This result is in accord with the theoretical expectation that this is the charm counterpart of the strange $\Lambda(1405)$.

$\Lambda_c(2595)^+$ MASS

The mass is obtained from the $\Lambda_c(2595)^+ - \Lambda_c^+$ mass-difference measurements below.

VALUE (MeV)	DOCUMENT ID

$305.79 \pm 0.14 \pm 0.20$	3.5k	AALTONEN	11H CDF	$p\bar{p}$ at 1.96 TeV

- • • We do not use the following data for averages, fits, limits, etc. • • •

305.6 \pm 0.3		1 BLECHMAN	03	Threshold shift
309.7 \pm 0.9 \pm 0.4	19	ALBRECHT	97 ARG	$e^+e^- \approx 10$ GeV
309.2 \pm 0.7 \pm 0.3	14 \pm 4.5	FRABETTI	96 E687	$\gamma Be, E_\gamma \approx 220$ GeV
307.5 \pm 0.4 \pm 1.0	112 \pm 17	EDWARDS	95 CLE2	$e^+e^- \approx 10.5$ GeV

- 1 BLECHMAN 03 finds that a more sophisticated treatment than a simple Breit-Wigner for the proximity of the threshold of the dominant decay, $\Sigma_c(2455) \pi$, lowers the $\Lambda_c(2595)^+ - \Lambda_c^+$ mass difference by 2 or 3 MeV. The analysis of AALTONEN 11H bears this out.

- 2 AALTONEN 11H treats the three charged modes $\Lambda_c(2595)^+ \rightarrow \Sigma_c(2455)^{++} \pi^-$, $\Sigma_c(2455)^+ \pi^0$, $\Sigma_c(2455)^0 \pi^+$ separately in terms of a common coupling constant h_2 and obtains $h_2^2 = 0.36 \pm 0.08$. From this the width is determined.

$\Lambda_c(2595)^+$ DECAY MODES

$\Lambda_c^+ \pi \pi$ and its submode $\Sigma_c(2455) \pi$ — the latter just barely — are the only strong decays allowed to an excited Λ_c^+ having this mass; and the submode seems to dominate.

Mode	Fraction (Γ_i/Γ)
Γ_1 $\Lambda_c^+ \pi^+ \pi^-$	[a] —
Γ_2 $\Sigma_c(2455)^{++} \pi^-$	24 ± 7 %
Γ_3 $\Sigma_c(2455)^0 \pi^+$	24 ± 7 %
Γ_4 $\Lambda_c^+ \pi^+ \pi^-$ 3-body	18 ± 10 %
Γ_5 $\Lambda_c^+ \pi^0$	[b] not seen
Γ_6 $\Lambda_c^+ \gamma$	not seen

[a] See AALTONEN 11H, Fig. 8, for the calculated ratio of $\Lambda_c^+ \pi^0 \pi^0$ and $\Lambda_c^+ \pi^+ \pi^-$ partial widths as a function of the $\Lambda_c(2595)^+ - \Lambda_c^+$ mass difference. At our value of the mass difference, the ratio is about 4.

[b] A test that the isospin is indeed 0, so that the particle is indeed a Λ_c^+ .

$\Sigma_c(2520)$

$$I(J^P) = 1(\frac{3}{2}^+) \text{ Status: } ***$$

Seen in the $\Lambda_c^+\pi^\pm$ mass spectrum. The natural assignment is that this is the $J^P = 3/2^+$ excitation of the $\Sigma_c(2455)$, the charm counterpart of the $\Sigma(1385)$, but neither J nor P has been measured.

$\Sigma_c(2520)$ MASSES

The masses are obtained from the mass-difference measurements that follow.

$\Sigma_c(2800)$ $I(J^P) = 1(?^?)$ Status: ***
 Seen in the $\Lambda_c^+ \pi^+$, $\Lambda_c^+ \pi^0$, and $\Lambda_c^+ \pi^-$ mass spectra.

$\Sigma_c(2800)$ MASSES

The charged ++ and + masses are obtained from the mass-difference measurements that follow. The neutral mass is dominated by the mass-difference measurement, but is pulled up somewhat by the less well-determined but considerably higher direct-mass measurement. It is possible, in fact, that AUBERT 08BN is seeing a different Σ_c .

¹ AAIJ 14Z systematic error includes in quadrature the 0.14 MeV uncertainty from the $m(\Lambda_c^+)$ mass value.
² The systematic error was (wrongly) given the other way round in LESIAK 05; see the erratum.
³ Although COTEUS 87 claims to agree well with BIAGI 83 on the mass and width, there appears to be a discrepancy between the two experiments. BIAGI 83 sees a single peak (stated significance about 6 standard deviations) in the $\Lambda K^- \pi^+ \pi^+$ mass spectrum. COTEUS 87 sees two peaks in the same spectrum, one at the Ξ_c^+ mass, the other 75 MeV lower. The latter is attributed to $\Xi_c^+ \rightarrow \Sigma^0 K^- \pi^+ \pi^+ \rightarrow (\Lambda \gamma) K^- \pi^+ \pi^+$, with the γ unseen. The combined significance of the double peak is stated to be 5.5

Baryon Particle Listings

standard deviations. But the absence of any trace of a lower peak in BIAGI 83 seems to us to throw into question the interpretation of the lower peak of COTEUS 87.

¹ AAIJ 19AG reports $[\Xi_c^+ \text{ MEAN LIFE}] / [D^\pm \text{ MEAN LIFE}] = 0.4392 \pm 0.0034 \pm 0.0028$ which we multiply by our best value $D^\pm \text{ MEAN LIFE} = (1.040 \pm 0.007) \times 10^{-12}$ s. Our first error is their experiment's error and our second error is the systematic error from using our best value.

Ξ_c^+ DECAY MODES

Branching fractions marked with a footnote, e.g. [a], have been corrected for decay modes not observed in the experiments. For example, the sub-mode fraction $\Xi_c^+ \rightarrow \Sigma^+ \bar{K}^*(892)^0$ seen in $\Xi_c^+ \rightarrow \Sigma^+ K^- \pi^+$ has been multiplied up to include $\bar{K}^*(892)^0 \rightarrow \bar{K}^0 \pi^0$ decays.

Mode	Fraction (Γ_i/Γ)	Confidence level
------	--------------------------------	------------------

No absolute branching fractions have been measured.
The following are branching ratios relative to $\Xi^- 2\pi^+$.

Cabibbo-favored ($S = -2$) decays — relative to $\Xi^- 2\pi^+$

Γ_1	$p2K_S^0$	0.087 ± 0.021	
Γ_2	$\Lambda \bar{K}^0 \pi^+$	—	
Γ_3	$\Sigma(1385)^+ \bar{K}^0$	[a] 1.0 ± 0.5	
Γ_4	$\Lambda K^- \pi^+$	0.323 ± 0.033	
Γ_5	$\Lambda \bar{K}^*(892)^0 \pi^+$	[a] < 0.16	90%

$$\Xi_c^0, \Xi_c^{\prime 0}$$

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 6 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 1.4$ for 3 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$$\Xi_c^{\prime 0}$$

$$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$$
 Status: ***

The $\Xi_c^{\prime 0}$ and Ξ_c^0 presumably complete the SU(3) sextet whose other members are the $\Sigma_c^{\prime +}$, Σ_c^+ , Σ_c^0 , and Ω_c^0 ; see Fig. 3 in the note on Charmed Baryons. The quantum numbers given above come from this presumption but have not been measured.

$\Xi_c^{\prime 0}$ MASS

The mass is obtained from the mass-difference measurement that follows.

Baryon Particle Listings

$\Xi_c^{\prime 0}, \Xi_c(2645), \Xi_c(2790)$

$\Xi_c^{\prime 0}$

$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$ Status: ***

The $\Xi_c^{\prime 0}$ and $\Xi_c^{\prime +}$ presumably complete the SU(3) sextet whose other members are the $\Sigma_c^{\prime ++}, \Sigma_c^{\prime +}, \Sigma_c^{\prime 0}$, and $\Omega_c^{\prime 0}$; see Fig. 3 in the note on Charmed Baryons. The quantum numbers given above come from this presumption but have not been measured.

$\Xi_c^{\prime 0}$ MASS

The mass is obtained from the mass-difference measurement that follows.

$\Omega_c(2770)^0$ $I(J^P) = 0(\frac{3}{2}^+)$ Status: ***

The natural assignment is that this goes with the $\Sigma_c(2520)$ and $\Xi_c(2645)$ to complete the lowest mass $J^P = \frac{3}{2}^+$ SU(3) sextet, part of the SU(4) 20-plet that includes the $\Delta(1232)$. But J and P have not been measured.

$\Omega_c(2770)^0$ MASS

The mass is obtained from the mass-difference measurement that follows.

VALUE (MeV)	DOCUMENT ID
2765.9 ± 2.0 OUR FIT	Error includes scale factor of 1.2.

Λ_b^0 MEAN LIFE

See b -baryon Admixture section for data on b -baryon mean life average over species of b -baryon particles.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

Λ_b^0

- ¹ Measured using $\Lambda_b^0 \rightarrow J/\psi\Lambda$ and $B^0 \rightarrow J/\psi K^*(892)^0$ decays.
- ² Used $\Lambda_b^0 \rightarrow J/\psi p K^-$ and $B^0 \rightarrow J/\psi K^*(892)^0$ decays.
- ³ Measured with $\Lambda_b^0 \rightarrow J/\psi(\mu^+\mu^-) \Lambda^0(p\pi^-)$ decays.
- ⁴ Uses fully reconstructed $\Lambda_b \rightarrow J/\psi\Lambda$ decays.
- ⁵ Uses $B^0 \rightarrow J/\psi K_S^0$ decays for denominator.
- ⁶ Measures $1/\tau_{\Lambda_b^0} - 1/\tau_{B^0}$ and uses $\tau_{B^0} = 1.519 \pm 0.007$ ps to extract lifetime ratio.
- ⁷ Measured mean life ratio using fully reconstructed decays.

Λ_b^0 DECAY MODES

The branching fractions $B(b\text{-baryon} \rightarrow \Lambda \ell^- \bar{\nu}_\ell \text{anything})$ and $B(\Lambda_b^0 \rightarrow \Lambda_c^+ \ell^- \bar{\nu}_\ell \text{anything})$ are not pure measurements because the underlying measured products of these with $B(b \rightarrow b\text{-baryon})$ were used to determine $B(b \rightarrow b\text{-baryon})$, as described in the note "Production and Decay of b -Flavored Hadrons."

For inclusive branching fractions, e.g., $\Lambda_b \rightarrow \bar{\Lambda}_c \text{anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level

[a] P_c^+ is a pentaquark-charmonium state.

[b] Not a pure measurement. See note at head of Λ_b^0 Decay Modes.

[c] Here h^- means π^- or K^- .

CONSTRAINED FIT INFORMATION

An overall fit to 10 branching ratios uses 12 measurements and one constraint to determine 7 parameters. The overall fit has a $\chi^2 = 10.7$ for 6 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

The values and averages in this section serve only to show what values result if one assumes our $B(b \rightarrow b\text{-baryon})$. They cannot be thought of as measurements since the underlying product branching fractions were also used to determine $B(b \rightarrow b\text{-baryon})$ as described in the note on "Production and Decay of b -Flavored Hadrons."

4.1 ± 1.0		¹ AAIJ	15BG LHCb	pp at 8 TeV

¹ The ratio of $B(\Lambda_b^0 \rightarrow p\mu^- \bar{\nu}_\mu)$ to $B(\Lambda_b^0 \rightarrow \Lambda_c^+ \mu^- \bar{\nu}_\mu)$ is measured within a restricted q^2 region. Combined with theoretical calculations of the form factors and the previously measured value of $|V_{cb}|$, the first $|V_{ub}| = (3.27 \pm 0.15 \pm 0.16 \pm 0.06) \times 10^{-3}$ measurement from the Λ_b decay is obtained, consistent with the exclusively measured world averages.

¹ AAIJ 18Q reports $[\Gamma(\Lambda_b^0 \rightarrow pK^- K^+ K^-)/\Gamma(\Lambda_b^0 \rightarrow \Lambda_c^+ \pi^-)] / [B(\Lambda_c^+ \rightarrow pK^- \pi^+)] = (4.11 \pm 0.12 \pm 0.06 \pm 0.19) \times 10^{-2}$ which we multiply by our best value $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (6.28 \pm 0.32) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

CP AND T VIOLATION PARAMETERS

Measured values of the triple-product asymmetry parameters, odd under time-reversal, are defined as $A_{c(s)}(\Lambda/\phi) = (N_{c(s)}^+ - N_{c(s)}^-) / (\text{sum})$

where $N_{c(s)}^+$, $N_{c(s)}^-$ are the number of Λ or ϕ candidates for which the $\cos(\Phi)$ and $\sin(\Phi)$ observables are positive and negative, respectively. Angles $\cos(\Phi)$ and $\sin(\Phi)$ are defined as in LEITNER 07.

See the note on "Baryon Decay Parameters" in the neutron Listings.

α decay parameter for $\Lambda_b \rightarrow J/\psi \Lambda$

VALUE	DOCUMENT ID	TECN	COMMENT
0.07 ± 0.13 OUR AVERAGE	Error includes scale factor of 1.3. See the ideogram below.		
$-0.14 \pm 0.14 \pm 0.10$	¹ SIRUNYAN	18R	CMS pp at 7, 8 TeV
$0.30 \pm 0.16 \pm 0.06$	² AAD	14L	ATLS pp at 7 TeV
$0.05 \pm 0.17 \pm 0.07$	³ AAIJ	13AG	LHCb pp at 7 TeV

- An angular analysis of $\Lambda_b \rightarrow J/\psi \Lambda$ decay is performed. Note that the sign of α in CMS definition is the opposite to that used by AAIJ 13AG and AAD 14L. Λ_b transverse production polarization of $0.00 \pm 0.06 \pm 0.06$ is also reported, as well as squares of the helicity amplitudes.
- An angular analysis of $\Lambda_b \rightarrow J/\psi \Lambda$ decay is performed and magnitudes of all helicity amplitudes are also reported.
- An angular analysis of $\Lambda_b \rightarrow J/\psi \Lambda$ decay is performed and a Λ_b transverse production polarization of $0.06 \pm 0.07 \pm 0.02$ is also reported.

$f_L(\mu\mu)$ longitudinal polarization fraction in $\Lambda_b \rightarrow \Lambda \mu^+ \mu^-$

VALUE	DOCUMENT ID	TECN	COMMENT
0.61 ± 0.11	¹ AAIJ	15AE	LHCb pp at 7, 8 TeV

- AAIJ 15AE measurement covers $15.0 < q^2 < 20.0 \text{ GeV}^2/c^4$.

FORWARD-BACKWARD ASYMMETRIES

The forward-backward asymmetry is defined as $A_{FB}^0(\Lambda_b^0) = [N(F) - N(B)] / [N(F) + N(B)]$, where the forward (F) direction corresponds to a particle (Λ_b^0 or Λ_b^-) sharing valence quark flavors with a beam particle with the same sign of rapidity.

$A_{FB}(\Lambda_b^0 \rightarrow J/\psi \Lambda)$

VALUE	DOCUMENT ID	TECN	COMMENT
$0.04 \pm 0.07 \pm 0.02$	¹ ABAZOV	15I	D0 pp at 1.96 TeV

- The measured asymmetry integrated over rapidity y in the range of $0.1 < |y| < 2.0$.

$A_{FB}^e(\mu\mu)$ in $\Lambda_b \rightarrow \Lambda \mu^+ \mu^-$

VALUE	DOCUMENT ID	TECN	COMMENT
$-0.39 \pm 0.04 \pm 0.01$	¹ AAIJ	18AP	LHCb pp at 7, 8, 13 TeV

Baryon Particle Listings

Σ_b, Σ_b^*

Σ_b

$I(J^P) = 1(\frac{1}{2}^+)$ Status: ***
I, J, P need confirmation.

In the quark model $\Sigma_b^+, \Sigma_b^0, \Sigma_b^-$ are an isotriplet (uub, udb, ddb) state. The lowest Σ_b ought to have $J^P = 1/2^+$. None of I, J, or P have actually been measured.

Ξ_b^0, Ξ_b^-

$I(J^P) = \frac{1}{2}(1^+)$ Status: ***
I, J, P need confirmation.

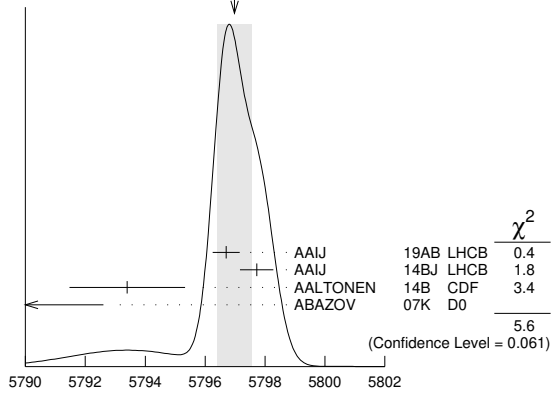

In the quark model, Ξ_b^0 and Ξ_b^- are an isodoublet (*usb, dsb*) state; the lowest Ξ_b^0 and Ξ_b^- ought to have $J^P = 1/2^+$. None of I, J, or P have actually been measured.

 Ξ_b MEAN LIFE

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

b-baryon ADMIXTURE (Lambda_b, Xi_b, Omega_b)

b-baryon ADMIXTURE MEAN LIFE

Each measurement of the b-baryon mean life is an average over an admixture of various b baryons which decay weakly. Different techniques emphasize different admixtures of produced particles, which could result in a different b-baryon mean life. More b-baryon flavor specific channels are not included in the measurement.

1 Measured mean life using fully reconstructed $\Lambda_b^0 \rightarrow J/\psi\Lambda$ decays.
 2 Measured using $\Lambda\ell^-$ decay length.
 3 Measured using $p\ell^-$ decay length.
 4 This ABREU 99W result is the combined result of the $\Lambda\ell^-$, $p\ell^-$, and excess $\Lambda\mu^-$ impact parameter measurements.
 5 Measured using $\Lambda_C\ell^-$ and $\Lambda\ell^+\ell^-$.
 6 Measured using the excess of $\Lambda\ell^-$, lepton impact parameter.
 7 Measured using $\Lambda_C\ell^-$.
 8 ABREU 93F superseded by ABREU 96D.
 9 AKERS 93 superseded by AKERS 96.
 10 BUSKULIC 92I superseded by BUSKULIC 95L.

b -baryon ADMIXTURE DECAY MODES ($\Lambda_b, \Xi_b, \Omega_b$)

These branching fractions are actually an average over weakly decaying b -baryons weighted by their production rates at the LHC, LEP, and Tevatron, branching ratios, and detection efficiencies. They scale with the b -baryon production fraction $B(b \rightarrow b\text{-baryon})$.

The branching fractions $B(b\text{-baryon} \rightarrow \Lambda\ell^-\bar{\nu}_\ell\text{anything})$ and $B(\Lambda_b^0 \rightarrow \Lambda_C^+\ell^-\bar{\nu}_\ell\text{anything})$ are not pure measurements because the underlying measured products of these with $B(b \rightarrow b\text{-baryon})$ were used to determine $B(b \rightarrow b\text{-baryon})$, as described in the note "Production and Decay of b -Flavored Hadrons."

For inclusive branching fractions, e.g., $B \rightarrow D^\pm\text{anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction (Γ_j/Γ)
Γ_1 $p\mu^-\bar{\nu}$ anything	$(5.8^{+2.3}_{-2.0})\%$
Γ_2 $p\ell\bar{\nu}_\ell$ anything	$(5.6 \pm 1.2)\%$
Γ_3 p anything	$(70 \pm 22)\%$
Γ_4 $\Lambda\ell^-\bar{\nu}_\ell$ anything	$(3.8 \pm 0.6)\%$
Γ_5 $\Lambda\ell^+\nu_\ell$ anything	$(3.2 \pm 0.8)\%$
Γ_6 Λ anything	$(39 \pm 7)\%$
Γ_7 $\Xi^-\ell^-\bar{\nu}_\ell$ anything	$(6.6 \pm 1.6) \times 10^{-3}$

 $P_c(4312)^+$ REFERENCESAAIJ 19W PRL 122 222001 R. Aaij *et al.* (LHCb Collab.) **$P_c(4380)^+$** Status: *

A resonance seen in $\Lambda_b^0 \rightarrow P_c^+ K^-$, then $P_c \rightarrow J/\psi p$, with a significance of 9 standard deviations. The $J/\psi p$ quark content is $uudc\bar{c}$, a pentaquark. See also the $P_c(4450)^+$. In the best amplitude fit, the two states have opposite parity, one having $J = 3/2$, the other $J = 5/2$.

Extraction of the pentaquark signals requires some understanding of the dominant $K^- p$ background. AAIJ 15P used a model-dependent approach. AAIJ 16AG reanalyzed the data making minimal assumptions about the $K^- p$ background, and thus confirmed the strong significance of the pentaquark signals.

- The search was sensitive to monopoles which had stopped in aluminium trapping volumes. Monopoles with spins 0 and 1/2 were considered; mass-dependent spin 1/2 monopole limits are quoted here.
- AAD 16AB model-independent 95% CL limits estimated using a fiducial region of approximately constant acceptance. Limits are mass-dependent.
- ACHARYA 16 limits at 95% CL estimated using a Dreil-Yan-like production mechanism for scalar monopoles.
- AAD 12CS searched for monopoles as highly ionising objects. The cross section limits are based on an assumed Dreil-Yan-like production process for spin 1/2 monopoles. The limits are mass- and scenario-dependent.
- ABBIENDI 08 assume production of spin 1/2 monopoles with effective charge $g\beta$ ($n=1$), via $e^+e^- \rightarrow \gamma^* \rightarrow M\bar{M}$, so that the cross section is proportional to $(1 + \cos^2\theta)$. There is no z information for such highly saturated tracks, so a parabolic track in the jet chamber is projected onto the xy plane. Charge per hit in the chamber produces a clean separation of signal and background.
- ABULENCIA 06k searches for high-ionizing signals in CDF central outer tracker and time-of-flight detector. For Dreil-Yan $M\bar{M}$ production, the cross section limit implies $M > 360$ GeV at 95% CL.
- AKTAS 05A model-dependent limits as a function of monopole mass shown for arbitrary mass of 60 GeV. Based on search for stopped monopoles in the H1 Al beam pipe.
- AKTAS 05A limits with assumed elastic spin 0 monopole pair production.
- AKTAS 05A limits with assumed inelastic spin 1/2 monopole pair production.
- KALBFLEISCH 04 reports searches for stopped magnetic monopoles in Be, Al, and Pb samples obtained from discarded material from the upgrading of DØ and CDF. A large-aperture warm-bore cryogenic detector was used. The approach was an extension of the methods of KALBFLEISCH 00. Cross section results moderately model dependent; interpretation as a mass lower limit depends on possibly invalid perturbation expansion.
- KALBFLEISCH 00 used an induction method to search for stopped monopoles in pieces of the DØ (FNAL) beryllium beam pipe and in extensions to the drift chamber aluminium support cylinder. Results are model dependent.
- KALBFLEISCH 00 result is for aluminium.
- KALBFLEISCH 00 result is for beryllium.
- HE 97 used a lead target and barium phosphate glass detectors. Cross-section limits are well below those predicted via the Dreil-Yan mechanism.
- This work has also been reinterpreted in the framework of monopole production via the thermal Schwinger process (GOULD 17); this gives rise to lower mass limits.
- Multiphoton events.
- Cherenkov radiation polarization.
- Re-examines CERN neutrino experiments.
- AAD 20c give limits for Dreil-Yan production with spin-0 and spin-1/2 monopoles. The above limit is for spin = 0 at mass = 3 TeV.
- ACHARYA 19b limits both β -dependent and β -independent on monopoles with spins 0, 1/2, and 1 and with magnetic charges ranging from one to five times the Dirac charge in mass ranges between 200 GeV and 5000 GeV.
- ACHARYA 18A provide limits on monopoles with spins 0, 1/2, and 1 and with magnetic charges ranging from two to five times the Dirac charge.

- ABBOTT 98k search for heavy pointlike Dirac monopoles via central production of a pair of photons with high transverse energies.
- ACCIARRI 95c finds a limit $B(Z \rightarrow \gamma\gamma\gamma) < 0.8 \times 10^{-5}$ (which is possible via a monopole loop) at 95% CL and sets the mass limit via a cross section model.

Monopole Flux — Cosmic Ray Searches

"Caty" in the charge column indicates a search for monopole-catalyzed nucleon decay.

- ¹ ALBERT 17 limits were estimated using a Cherenkov light in an array of optical modules under the Mediterranean Sea. The limits are for MM masses between 10^{10} and 10^{14} GeV. The limits are speed-dependent.
- ² AAB 16 search was made with a set of telescopes sampling the longitudinal profile of fluorescence light emitted by extensive air showers. Limits are speed dependent.
- ³ AARTSEN 16b was based on a Cherenkov signature in an array of optical modules which were sunk in the Antarctic ice cap. Limits are speed-dependent.
- ⁴ Beyond the monopole speed, the limits of AARTSEN 14 depend on the catalysis cross section (σ) which corresponds to the monopole radiating 7 times the light per track length compared to the Cherenkov light from a single electrically charged, relativistic particle. The values quoted here correspond to $\sigma = 1$ barn or $l = 30$.
- ⁵ ABBASI 13 and ABBASI 10a were based on a Cherenkov signature in an array of optical modules which were sunk in the Antarctic ice cap. Limits are speed-dependent.
- ⁶ ADRIAN-MARTINEZ 12a measurements were based on a Cherenkov signature in an underwater telescope in the Western Mediterranean Sea. Limits are speed-dependent.
- ⁷ The limits from UENO 12 depend on the monopole speed and are also sensitive to assumed values of monopole mass and the catalysis cross section.
- ⁸ HOGAN 08 and DETRIXHE 11 limits on relativistic monopoles are based on nonobservation of radio Cherenkov signals at the South Pole. Limits are speed-dependent.
- ⁹ BALESTRA 08 exposed of nuclear track detector modules totaling 400 m² for 4 years at the Chacaltaya Laboratory (5230 m) in search for intermediate-mass monopoles with $\beta > 0.05$. The analysis is mainly based on three CR39 modules. For $M > 5 \times 10^{13}$ GeV there can be upward-going monopoles as well, hence the flux limit is half that obtained for less massive monopoles. Previous experiments (e.g. MACRO and OHYA (ORITO 91)) had set limits only for $M > 1 \times 10^9$ GeV.
- ¹⁰ AMBROSIO 02b direct search final result for $m \geq 10^{17}$ GeV, based upon 4.2 to 9.5 years of running, depending upon the subsystem. Limit with CR39 track-etch detector extends the limit from $\beta=4 \times 10^{-5}$ (3.1×10^{-16} cm⁻²sr⁻¹s⁻¹) to $\beta=1 \times 10^{-4}$ (2.1×10^{-16} cm⁻²sr⁻¹s⁻¹). Limit curve in paper is piecewise continuous due to different detection techniques for different β ranges.

- ¹¹ AMBROSIO 02c limit for catalysis of nucleon decay with catalysis cross section of ≈ 1 mb. The flux limit increases by ~ 3 at the higher β limit, and increases to 1×10^{-14} cm⁻²sr⁻¹s⁻¹ if the catalysis cross section is 0.01 mb. Based upon 71193 hr of data with the streamer detector, with an acceptance of 4250 m²sr.
- ¹² AMBROSIO 02b result for "more than two years of data." Ionization search using several subsystems. Limit curve as a function of β not given. Included in AMBROSIO 02b.
- ¹³ AMBROSIO 97 global MACRO 90%CL is 0.78×10^{-15} at $\beta=1.1 \times 10^{-4}$, goes through a minimum at 0.61×10^{-15} near $\beta=(1.1-2.7) \times 10^{-3}$, then rises to 0.84×10^{-15} at $\beta=0.1$. The global limit in this region is below the Parker bound at 10^{-15} . Less stringent limits are established for $4 \times 10^{-5} < \beta < 1 \times 10^{-4}$. Limits set by various triggers and different subdetectors are given in the paper. All limits assume a catalysis cross section smaller than a few mb.
- ¹⁴ AHLEN 94 limit for dyons extends down to $\beta=0.9E-4$ and a limit of $1.3E-14$ extends to $\beta = 0.8E-4$. Also see comment by PRICE 94 and reply of BARISH 94. One loophole in the AHLEN 94 result is that in the case of monopoles catalyzing nucleon decay, relativistic particles could veto the events. See AMBROSIO 97 for additional results.
- ¹⁵ Catalysis of nucleon decay; sensitive to assumed catalysis cross section.
- ¹⁶ ORITO 91 limits are functions of velocity. Lowest limits are given here.
- ¹⁷ Used DKMPR mechanism and Penning effect.
- ¹⁸ Assumes monopole attaches fermion nucleus.
- ¹⁹ Limit from combining data of CAPLIN 86, BERMON 85, INCANDELA 84, and CABRERA 83. For a discussion of controversy about CAPLIN 86 observed event, see GUY 87. Also see SCHOUTEN 87.
- ²⁰ Based on lack of high-energy solar neutrinos from catalysis in the sun.
- ²¹ Anomalous long-range α (⁴He) tracks.
- ²² CABRERA 82 candidate event has single Dirac charge within $\pm 5\%$.
- ²³ ALVAREZ 75, FLEISCHER 75, and FRIEDLANDER 75 explain as fragmenting nucleus. EBERHARD 75 and ROSS 76 discuss conflict with other experiments. HAGSTROM 77 reinterprets as antineutrino. PRICE 78 reassesses.

Monopole Flux — Astrophysics

FLUX (cm ⁻² sr ⁻¹ s ⁻¹)	MASS (GeV)	CHG (g)	COMMENTS ($\beta = v/c$)	DOCUMENT ID	TECN

- ¹ Catalysis of nucleon decay.
- ² ADAMS 93 limit based on "survival and growth of a small galactic seed field" is 10^{-16} ($m/10^{17}$ GeV) cm⁻²sr⁻¹s⁻¹. Above 10^{17} GeV, limit 10^{-16} (10^{17} GeV/m) cm⁻²sr⁻¹s⁻¹ (from requirement that monopole density does not overclose the universe) is more stringent.
- ³ Re-evaluates PARKER 70 limit for GUT monopoles.

Review

Supersymmetric Particle Searches

The exclusion of particle masses within a mass range (m1, m2) will be denoted with the notation "none m1-m2" in the VALUE column of the following Listings. The latest unpublished results are described in the "Supersymmetry: Experiment" review.

See the related review(s):

- Supersymmetry, Part I (Theory)
Supersymmetry, Part II (Experiment)

CONTENTS:

 – R-parity violating heavy \tilde{g} (Gluino) mass limit
 Long-lived \tilde{g} (Gluino) mass limit
 Light \tilde{G} (Gravitino) mass limits from collider experiments
 Supersymmetry miscellaneous results

Most of the results shown below, unless stated otherwise, are based on the Minimal Supersymmetric Standard Model (MSSM), as described in the Note on Supersymmetry. Unless otherwise indicated, this includes the assumption of common gaugino and scalar masses at the scale of Grand Unification (GUT), and use of the resulting relations in the spectrum and decay branching ratios. Unless otherwise indicated, it is also assumed that R -parity (R) is conserved and that:

- 1) The $\tilde{\chi}_1^0$ is the highest supersymmetric particle (LSP)
- 2) $m_{\tilde{f}_L} = m_{\tilde{f}_R}$, where $\tilde{f}_{L,R}$ refer to the scalar partners of left- and right-handed fermions.

Limits involving different assumptions are identified in the Comments or in the Footnotes. We summarize here the notations used in this Chapter to characterize some of the most common deviations from the MSSM (for further details, see the Note on Supersymmetry).

Theories with R -parity violation (\mathcal{R}) are characterized by a superpotential of the form: $\lambda_{ijk} L_i L_j e_k^c + \lambda'_{ijk} L_i Q_j d_k^c + \lambda''_{ijk} u_i^c d_j^c d_k^c$, where i, j, k are generation indices. The presence of any of these couplings is often identified in the following by the symbols $L\tilde{L}\tilde{E}$, $LQ\tilde{D}$, and $U\tilde{D}\tilde{D}$. Mass limits in the presence of \mathcal{R} will often refer to “direct” and “indirect” decays. Direct refers to \mathcal{R} decays of the particle in consideration. Indirect refers to cases where \mathcal{R} appears in the decays of the LSP. The LSP need not be the $\tilde{\chi}_1^0$.

In several models, most notably in theories with so-called Gauge Mediated Supersymmetry Breaking (GMSB), the gravitino (\tilde{G}) is the LSP. It is usually much lighter than any other massive particle in the spectrum, and $m_{\tilde{G}}$ is then neglected in all decay processes involving gravitinos. In these scenarios, particles other than the neutralino are sometimes considered as the next-to-highest supersymmetric particle (NLSP), and are assumed to decay to their even- R partner plus \tilde{G} . If the lifetime is short enough for the decay to take place within the detector, \tilde{G} is assumed to be undetected and to give rise to missing energy (\cancel{E}) or missing transverse energy (\cancel{E}_T) signatures.

When needed, specific assumptions on the eigenstate content of $\tilde{\chi}^0$ and $\tilde{\chi}^\pm$ states are indicated, using the notation $\tilde{\gamma}$ (photino), \tilde{H} (higgsino), \tilde{W} (wino), and \tilde{Z} (zino) to signal that the limit of pure states was used. The terms gaugino is also used, to generically indicate wino-like charginos and zino-like neutralinos.

In the listings we have made use of the following abbreviations for simplified models employed by the experimental collaborations in supersymmetry searches published in the past year.

WARNING: Experimental lower mass limits determined within simplified models are to be treated with extreme care as they might not be directly applicable to realistic models. This is outlined in detail in the publications and we recommend consulting them before using bounds. For example, branching ratios, typically fixed to specific values in simplified models, can vary substantially in more elaborate models.

Simplified Models Table

- Tglu1A:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_1^0$.
- Tglu1B:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
- Tglu1C:** gluino pair production with a 2/3 probability of having a $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ decay and a 1/3 probability of having a $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, $\tilde{\chi}_2^0 \rightarrow Z^\pm\tilde{\chi}_1^0$ decay.
- Tglu1D:** gluino pair production with one gluino decaying to $q\tilde{q}'\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{G}$, and the other gluino decaying to $q\tilde{q}\tilde{\chi}_1^0$ with $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tglu1E:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_2^0$ and $\tilde{\chi}_2^0 \rightarrow Z^\pm\tilde{\chi}_1^0$ where $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$, $m_{\tilde{\chi}_2^0} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tglu1F:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$ or $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$ with equal branching ratios, where $\tilde{\chi}_1^\pm$ decays through an intermediate scalar tau lepton or sneutrino to $\tau\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate scalar tau lepton or sneutrino to $\tau^+\tau^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$; the mass hierarchy is such that $m_{\tilde{\chi}_1^\pm} \sim m_{\tilde{\chi}_2^0} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$ and $m_{\tilde{\tau},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tglu1G:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, and $\tilde{\chi}_2^0$ decaying through an intermediate slepton or sneutrino to $l^{+l-}\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$ where $m_{\tilde{\chi}_2^0} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$ and $m_{\tilde{l},\tilde{\nu}} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$.
- Tglu1H:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, and $\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 Z^{0(*)}$.
- Tglu1I:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, and $\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 H$.
- Tglu1J:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_2^0$, and $\text{BR}(\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 Z^{0(*)}) = \text{BR}(\tilde{\chi}_2^0 \rightarrow \tilde{\chi}_1^0 H) = 0.5$.
- Tglu1LL:** gluino pair production where $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_1^0$ happens with 1/3 probability and $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}_1^\pm$ happens with 2/3 probability. The $\tilde{\chi}_1^\pm$ is assumed to be few hundreds of MeV heavier than the $\tilde{\chi}_1^0$, and decays to $\tilde{\chi}_1^0$ via a pion.
- Tglu2A:** gluino pair production with $\tilde{g} \rightarrow b\tilde{b}\tilde{\chi}_1^0$.
- Tglu3A:** gluino pair production with $\tilde{g} \rightarrow t\tilde{t}\tilde{\chi}_1^0$.
- Tglu3B:** gluino pair production with $\tilde{g} \rightarrow t\tilde{t}$ where \tilde{t} decays exclusively to $t\tilde{\chi}_1^0$.
- Tglu3C:** gluino pair production with $\tilde{g} \rightarrow t\tilde{t}$ where \tilde{t} decays exclusively to $c\tilde{\chi}_1^0$.
- Tglu3D:** gluino pair production with $\tilde{g} \rightarrow t\tilde{b}\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
- Tglu3E:** gluino pair production where the gluino decays 25% of the time through $\tilde{g} \rightarrow t\tilde{t}\tilde{\chi}_1^0$, 25% of the time through $\tilde{g} \rightarrow b\tilde{b}\tilde{\chi}_1^0$ and 50% of the time through $\tilde{g} \rightarrow t\tilde{b}\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
- Tglu4A:** gluino pair production with one gluino decaying to $q\tilde{q}'\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{G}$, and the other gluino decaying to $q\tilde{q}\tilde{\chi}_1^0$ with $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tglu4B:** gluino pair production with gluinos decaying to $q\tilde{q}\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tglu4C:** gluino pair production with gluinos decaying to $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$.
- Tglu4D:** gluino pair production with $\tilde{g} \rightarrow q\tilde{q}\tilde{\chi}_1^0$ where the $\tilde{\chi}_1^0$ decays with equal probability to $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ or to $\tilde{\chi}_1^0 \rightarrow H + \tilde{G}$.
- Tglu4E:** gluino pair production with $\tilde{g} \rightarrow b\tilde{b}\tilde{\chi}_1^0$ where the $\tilde{\chi}_1^0$ decays with equal probability to $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ or to $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$.
- Tglu4F:** gluino pair production with $\tilde{g} \rightarrow t\tilde{t}\tilde{\chi}_1^0$ where the $\tilde{\chi}_1^0$ decays with equal probability to $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ or to $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$.
- Tsqk1:** squark pair production with $\tilde{q} \rightarrow q\tilde{\chi}_1^0$.
- Tsqk1LL:** squark pair production where $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ and $\tilde{q} \rightarrow q'\tilde{\chi}_1^\pm$ each happen with 50% probability. The $\tilde{\chi}_1^\pm$ is assumed to be few hundreds of MeV heavier than the $\tilde{\chi}_1^0$, and decays to $\tilde{\chi}_1^0$ via a pion.
- Tsqk2:** squark pair production with $\tilde{q} \rightarrow q\tilde{\chi}_2^0$ and $\tilde{\chi}_2^0 \rightarrow Z + \tilde{\chi}_1^0$.
- Tsqk3:** squark pair production with $\tilde{q} \rightarrow q'\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ (like Tglu1B but for squarks)

- Tsqk4:** squark pair production with squarks decaying to $q\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tsqk4A:** squark pair production with one squark decaying to $q\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{G}$, and the other squark decaying to $q\tilde{\chi}_1^0$ with $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tsqk4B:** squark pair production with squarks decaying to $q\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tstop1:** stop pair production with $\tilde{t} \rightarrow t\tilde{\chi}_1^0$.
- Tstop1LL:** stop pair production where $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ each happen with 50% probability. The $\tilde{\chi}_1^\pm$ is assumed to be few hundreds of MeV heavier than the $\tilde{\chi}_1^0$, and decays to $\tilde{\chi}_1^0$ via a pion.
- Tstop2:** stop pair production with $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
- Tstop3:** stop pair production with the subsequent four-body decay $\tilde{t} \rightarrow bff'\tilde{\chi}_1^0$ where f represents a lepton or a quark.
- Tstop4:** stop pair production with $\tilde{t} \rightarrow c\tilde{\chi}_1^0$.
- Tstop5:** stop pair production with $\tilde{t} \rightarrow b\tilde{\nu}$ with $\tilde{\nu} \rightarrow \tau\tilde{G}$.
- Tstop6:** stop pair production with $\tilde{t} \rightarrow t + \tilde{\chi}_2^0$, where $\tilde{\chi}_2^0 \rightarrow Z + \tilde{\chi}_1^0$ or $H + \tilde{\chi}_1^0$ each with Br=50%.
- Tstop7:** stop pair production with $\tilde{t}_2 \rightarrow \tilde{t}_1 + H/Z$, where $\tilde{t}_1 \rightarrow t + \tilde{\chi}_1^0$.
- Tstop8:** stop pair production with equal probability of the stop decaying via $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ or via $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$.
- Tstop9:** stop pair production with equal probability of the stop decaying via $\tilde{t} \rightarrow c\tilde{\chi}_1^0$ or via the four-body decay $\tilde{t} \rightarrow bff'\tilde{\chi}_1^0$ where f represents a lepton or a quark.
- Tstop10:** stop pair production with $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0 \rightarrow (f\tilde{f}') + \tilde{\chi}_1^0$ with a virtual W -boson.
- Tstop11:** stop pair production with $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm$ decaying through an intermediate slepton to $l\nu\tilde{\chi}_1^0$.
- Tstop12:** stop pair production with $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$.
- Tstop13:** stop pair production with $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ where the $\tilde{\chi}_1^0$ can decay with equal probability to $\tilde{\chi}_1^0 \rightarrow \gamma + \tilde{G}$ or to $\tilde{\chi}_1^0 \rightarrow Z + \tilde{G}$.
- Tstop1RPV:** stop pair production with $\tilde{t} \rightarrow b\tilde{s}$ via RPV coupling λ_{323} .
- Tstop2RPV:** stop pair production with $\tilde{t} \rightarrow b\tilde{t}$, via RPV coupling λ_{t33} .
- Tsbot1:** sbottom pair production with $\tilde{b} \rightarrow b\tilde{\chi}_1^0$.
- Tsbot2:** sbottom pair production with $\tilde{b} \rightarrow t\chi_1^-, \chi_1^- \rightarrow W^-\tilde{\chi}_1^0$.
- Tsbot3:** sbottom pair production with $\tilde{b} \rightarrow b\tilde{\chi}_2^0$, where one of the $\tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0 \rightarrow f\tilde{f}\tilde{\chi}_1^0$ and the other $\tilde{\chi}_2^0 \rightarrow \tilde{\ell}\ell^+ \rightarrow \ell^+\ell^-\tilde{\chi}_1^0$.
- Tsbot4:** sbottom pair production with $\tilde{b} \rightarrow b\tilde{\chi}_2^0$, with $\tilde{\chi}_2^0 \rightarrow H\tilde{\chi}_1^0$.
- Tchi1chi1A:** electroweak pair and associated production of nearly mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$, where $\tilde{\chi}_1^\pm$ decays to $\tilde{\chi}_1^0$ plus soft radiation, and where one of the $\tilde{\chi}_1^0$ decays to $\gamma + \tilde{G}$ while the other one decays to $Z/H + \tilde{G}$ (with equal probability).
- Tchi1chi1B:** electroweak pair production of charginos $\tilde{\chi}_1^\pm$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $l\nu\tilde{\chi}_1^0$ and where the slepton or sneutrino mass is 5%, 25%, 50%, 75% and 95% of the $\tilde{\chi}_1^\pm$ mass.
- Tchi1chi1C:** electroweak pair production of charginos $\tilde{\chi}_1^\pm$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $l\nu\tilde{\chi}_1^0$ and where $m_{\tilde{\ell},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tchi1chi1D:** electroweak associated pair production of charginos $\tilde{\chi}_1^\pm$, where $\tilde{\chi}_1^\pm$ decays through an intermediate scalar tau lepton or sneutrino to $\tau\nu\tilde{\chi}_1^0$ and where $m_{\tilde{\tau},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tchi1chi1F:** electroweak pair and associated production of nearly mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$ (i.e. $\tilde{\chi}_1^\pm\tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^\pm\tilde{\chi}_1^0$ production) where the $\tilde{\chi}_1^\pm$ decays exclusively to $\tilde{\chi}_1^0$ plus soft radiation and the $\tilde{\chi}_1^0$ decays to $\gamma/Z + \tilde{G}$.
- Tchi1chi1G:** electroweak pair production of charginos $\tilde{\chi}_1^\pm$, which are nearly mass-degenerate with neutralinos $\tilde{\chi}_1^0$. The $\tilde{\chi}_1^\pm$ decays either to $W^\pm + \tilde{G}$, or to $\tilde{\chi}_1^0$ plus soft radiation. The $\tilde{\chi}_1^0$ decays exclusively to $\gamma + \tilde{G}$.
- Tchi1n1A:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$, where $\tilde{\chi}_1^\pm$ decays exclusively to $W^\pm + \tilde{G}$ and $\tilde{\chi}_1^0$ decays exclusively to $\gamma + \tilde{G}$.
- Tchi1n2A:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $l\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate slepton or sneutrino to $l^+l^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$.
- Tchi1n2B:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $l\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate slepton or sneutrino to $l^+l^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$ and where the slepton or sneutrino mass is 5%, 25%, 50%, 75% and 95% of the $\tilde{\chi}_1^\pm$ mass.
- Tchi1n2C:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $l\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate slepton or sneutrino to $l^+l^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$ and where $m_{\tilde{\ell},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tchi1n2D:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate scalar tau lepton or sneutrino to $\tau\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate scalar tau lepton or sneutrino to $\tau^+\tau^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$ and where $m_{\tilde{\tau},\tilde{\nu}} = (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})/2$.
- Tchi1n2E:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm \rightarrow W^\pm + \tilde{\chi}_1^0$ and $\tilde{\chi}_2^0 \rightarrow H + \tilde{\chi}_1^0$.
- Tchi1n2F:** electroweak associated production of mass-degenerate wino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate W^{**} to $l\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate Z^* to $l^+l^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$.
- Tchi1n2G:** electroweak associated production of Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, and electroweak associated production of $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^0$, where $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$ and where $\tilde{\chi}_1^\pm$ decays through an intermediate W^{**} to $l\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate Z^* to $l^+l^-\tilde{\chi}_1^0$.
- Tchi1n2H:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays through an intermediate slepton or sneutrino to $l\nu\tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays through an intermediate scalar tau lepton or sneutrino to $\tau^+\tau^-\tilde{\chi}_1^0$ or $\nu\bar{\nu}\tilde{\chi}_1^0$.
- Tchi1n2I:** electroweak associated production of mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ decays to $W^\pm + \tilde{\chi}_1^0$ and where $\tilde{\chi}_2^0$ decays 50% of the time to $Z + \tilde{\chi}_1^0$ and 50% of the time to $H + \tilde{\chi}_1^0$.
- Tchi1n12-GGM:** in the framework of General Gauge Mediation (GGM): electroweak pair and associated production of nearly mass-degenerate charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0, \tilde{\chi}_2^0$ (i.e. $\tilde{\chi}_1^\pm\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm\tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm\tilde{\chi}_2^0$ production) where the $\tilde{\chi}_1^\pm$ decays exclusively to $W^\pm + \tilde{G}$, the $\tilde{\chi}_2^0$ decays to $Z/H + \tilde{G}$ and the $\tilde{\chi}_1^0$ decays to $\gamma/Z + \tilde{G}$. The branching ratios depend on the composition of the gauge eigenstates of the neutralinos in the GGM scenario.
- Tn1n1A:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$ and $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ decay to $\tilde{\chi}_1^0$ plus soft radiation and where both of the $\tilde{\chi}_1^0$ decay to $H + \tilde{G}$.
- Tn1n1B:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$ and $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ decay to $\tilde{\chi}_1^0$ plus soft radiation and where the $\tilde{\chi}_1^0$ decays 50% of the time to $H + \tilde{G}$ and 50% of the time to $Z + \tilde{G}$.
- Tn1n1C:** electroweak pair and associated production of nearly mass-degenerate Higgsino-like charginos $\tilde{\chi}_1^\pm$ and neutralinos $\tilde{\chi}_1^0$ and $\tilde{\chi}_2^0$, where $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ decay to $\tilde{\chi}_1^0$ plus soft radiation and where both of the $\tilde{\chi}_1^0$ decay to $Z + \tilde{G}$.
- Tn2n3A:** electroweak associated production of mass-degenerate neutralinos $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$, where $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$ decay through intermediate sleptons to $l^+l^-\tilde{\chi}_1^0$ and where the slepton mass is 5%, 25%, 50%, 75% and 95% of the $\tilde{\chi}_2^0$ mass.
- Tn2n3B:** electroweak associated production of mass-degenerate neutralinos $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$, where $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$ decay through intermediate sleptons to $l^+l^-\tilde{\chi}_1^0$ and where $m_{\tilde{\ell}} = (m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0})/2$.

Searches Particle Listings

Supersymmetric Particle Searches

$\tilde{\chi}_1^0$ (Lightest Neutralino) mass limit

$\tilde{\chi}_1^0$ is often assumed to be the lightest supersymmetric particle (LSP). See also the $\tilde{\chi}_2^0, \tilde{\chi}_3^0, \tilde{\chi}_4^0$ section below.

We have divided the $\tilde{\chi}_1^0$ listings below into five sections:

- 1) Accelerator limits for stable $\tilde{\chi}_1^0$,
- 2) Bounds on $\tilde{\chi}_1^0$ from dark matter searches,
- 3) $\tilde{\chi}_1^0 - p$ elastic cross section (spin-dependent, spin-independent interactions),
- 4) Other bounds on $\tilde{\chi}_1^0$ from astrophysics and cosmology, and
- 5) Unstable $\tilde{\chi}_1^0$ (Lightest Neutralino) mass limit.

Accelerator limits for stable $\tilde{\chi}_1^0$

Unless otherwise stated, results in this section assume spectra, production rates, decay modes, and branching ratios as evaluated in the MSSM, with gaugino and sfermion mass unification at the GUT scale. These papers generally study production of $\tilde{\chi}_i^0 \tilde{\chi}_j^0$ ($i \geq 1, j \geq 2$), $\tilde{\chi}_1^+ \tilde{\chi}_1^-$, and (in the case of hadronic collisions) $\tilde{\chi}_1^+ \tilde{\chi}_2^0$ pairs. The mass limits on $\tilde{\chi}_1^0$ are either direct, or follow indirectly from the constraints set by the non-observation of $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ states on the gaugino and higgsino MSSM parameters M_2 and μ . In some cases, information is used from the nonobservation of slepton decays.

Obsolete limits obtained from e^+e^- collisions up to $\sqrt{s}=184$ GeV have been removed from this compilation and can be found in the 2000 Edition (The European Physical Journal **C15** 1 (2000)) of this Review. $\Delta m = m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$.

• • • We do not use the following data for averages, fits, limits, etc. • • •

- 1 DREINER 09 show that in the general MSSM with non-universal gaugino masses there exists no model-independent laboratory bound on the mass of the lightest neutralino. An essentially massless $\tilde{\chi}_1^0$ is allowed by the experimental and observational data, imposing some constraints on other MSSM parameters, including M_2 , μ and the slepton and squark masses.
- 2 ABBIENDI 04H search for charginos and neutralinos in events with acoplanar leptons + jets and multi-jet final states in the 192–209 GeV data, combined with the results on leptonic final states from ABBIENDI 04. The results hold for a scan over the parameter space covering the region $0 < M_2 < 5000$ GeV, $-1000 < \mu < 1000$ GeV and $\tan\beta$ from 1 to 40. This limit supersedes ABBIENDI 00H.
- 3 HEISTER 04 data collected up to 209 GeV. Updates earlier analysis of selectrons from HEISTER 02E, includes a new analysis of charginos and neutralinos decaying into stau and uses results on charginos with initial state radiation from HEISTER 02J. The limit is based on the direct search for charginos and neutralinos, the constraints from the slepton search and the Higgs mass limits from HEISTER 02 using a top mass of 175 GeV, interpreted in a framework with universal gaugino and sfermion masses. Assuming the mixing in the stau sector to be negligible, the limit improves to 43.1 GeV. Under the assumption of MSUGRA with unification of the Higgs and sfermion masses, the limit improves to 50 GeV, and reaches 53 GeV for $A_0 = 0$. These limits include and update the results of BARATE 01.
- 4 ABDALLAH 03M uses data from $\sqrt{s} = 192$ –208 GeV. A limit on the mass of $\tilde{\chi}_1^0$ is derived from direct searches for neutralinos combined with the chargino search. Neutralinos are searched in the production of $\tilde{\chi}_1^0 \tilde{\chi}_2^0, \tilde{\chi}_1^0 \tilde{\chi}_3^0$, as well as $\tilde{\chi}_2^0 \tilde{\chi}_3^0$ and $\tilde{\chi}_2^0 \tilde{\chi}_4^0$ giving rise to cascade decays, and $\tilde{\chi}_1^0 \tilde{\chi}_2^0$ and $\tilde{\chi}_1^0 \tilde{\chi}_3^0$, followed by the decay $\tilde{\chi}_2^0 \rightarrow \tilde{\tau} \tau$. The results hold for the parameter space defined by values of $M_2 < 1$ TeV, $|\mu| \leq 2$ TeV with the $\tilde{\chi}_1^0$ as LSP. The limit is obtained for $\tan\beta = 1$ and large m_0 , where $\tilde{\chi}_2^0 \tilde{\chi}_3^0$ and chargino pair production are important. If the constraint from Higgs searches is also imposed, the limit improves to 49.0 GeV in the m_h^{max} scenario with $m_t = 174.3$ GeV. These limits update the results of ABREU 00J.
- 5 ABDALLAH 03M uses data from $\sqrt{s} = 192$ –208 GeV. An indirect limit on the mass of $\tilde{\chi}_1^0$ is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays and $\tilde{\tau} \tau$ final states), for charginos (for all Δm_{\pm}) and for sleptons, stop and sbottom. The results hold for the full parameter space defined by values of $M_2 < 1$ TeV, $|\mu| \leq 2$ TeV with the $\tilde{\chi}_1^0$ as LSP. Constraints from the Higgs search in the m_h^{max} scenario assuming $m_t = 174.3$ GeV are included. The limit is obtained for $\tan\beta \geq 5$ when stau mixing leads to mass degeneracy between $\tilde{\tau}_1$ and $\tilde{\chi}_1^0$ and the limit is based on $\tilde{\chi}_2^0$ production followed by its decay to $\tilde{\tau}_1 \tau$. In the pathological scenario where m_0 and $|\mu|$ are large, so that the $\tilde{\chi}_2^0$ production cross section is negligible, and where there is mixing in the stau sector but not in stop nor sbottom, the limit is based on charginos with soft decay products and an ISR photon. The limit then degrades to 39 GeV. See Figs. 40–42 for the dependence of the limit on $\tan\beta$ and $m_{\tilde{\nu}}$. These limits update the results of ABREU 00W.
- 6 ACCIARRI 00D data collected at $\sqrt{s} = 189$ GeV. The results hold over the full parameter space defined by $0.7 \leq \tan\beta \leq 60$, $0 \leq M_2 \leq 2$ TeV, $m_0 \leq 500$ GeV, $|\mu| \leq 2$ TeV. The minimum mass limit is reached for $\tan\beta = 1$ and large m_0 . The results of slepton

searches from ACCIARRI 99W are used to help set constraints in the region of small m_0 . The limit improves to 48 GeV for $m_0 \gtrsim 200$ GeV and $\tan\beta \gtrsim 10$. See their Figs. 6–8 for the $\tan\beta$ and m_0 dependence of the limits. Updates ACCIARRI 98F.

7 AAD 14K sets limits on the χ -nucleon spin-dependent and spin-independent cross sections out to $m_\chi = 10$ TeV.

Bounds on $\tilde{\chi}_1^0$ from dark matter searches

These papers generally exclude regions in the $M_2 - \mu$ parameter plane assuming that $\tilde{\chi}_1^0$ is the dominant form of dark matter in the galactic halo. These limits are based on the lack of detection in laboratory experiments, telescopes, or by the absence of a signal in underground neutrino detectors. The latter signal is expected if $\tilde{\chi}_1^0$ accumulates in the Sun or the Earth and annihilates into high-energy ν 's.

- 1 DI-MAURO 19 sets limits on the dark matter annihilation from gamma-ray searches in M31 and M33 galaxies using Fermi LAT data.
- 2 JOHNSON 19 sets limits on p-wave dark matter annihilations in the galactic center using Fermi data.
- 3 LI 19D sets limits on dark matter annihilation cross sections searching for line-like signals in the all-sky Fermi data.
- 4 ABDALLAH 18 places constraints on the dark matter annihilation cross section for annihilations into gamma-rays in the Galactic center for masses between 300 GeV to 70 TeV. This updates ABDALLAH 16.
- 5 AHNEN 18 uses observations of the dwarf satellite galaxy Ursa Major II to obtain upper limits on annihilation cross sections for dark matter in various channels for masses between 0.1–100 TeV.
- 6 ALBERT 18B sets limits on the annihilation cross section of dark matter with mass between 1 and 100 TeV from gamma-ray observations of the Andromeda galaxy.
- 7 ALBERT 18C sets limits on the spin-dependent coupling of dark matter to protons from dark matter annihilation in the Sun.
- 8 AARTSEN 17 is based on data collected during 327 days of detector livetime with IceCube. They looked for interactions of ν 's resulting from neutralino annihilations in the Earth over a background of atmospheric neutrinos and set 90% CL limits on the spin independent neutralino-proton cross section for neutralino masses in the range 10–10000 GeV.
- 9 AARTSEN 17A is based on data collected during 532 days of livetime with the IceCube 86-string detector including the DeepCore sub-array. They looked for interactions of ν 's

- from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the spin dependent neutralino-proton cross section for neutralino masses in the range 10–10000 GeV. This updates AARTSEN 16c.
- 10 AARTSEN 17c is based on 1005 days of running with the IceCube detector. They set a limit on the annihilation cross section for dark matter with masses between 10–1000 GeV annihilating in the Galactic center assuming an NFW profile. The limit is of $1.2 \times 10^{23} \text{ cm}^3 \text{ s}^{-1}$ in the $\tau^+ \tau^-$ channel. Supercedes AARTSEN 15e.
- 11 ALBERT 17A is based on data from the ANTARES neutrino telescope. They looked for interactions of ν 's from neutralino annihilations in the Milky Way galaxy over a background of atmospheric neutrinos and set 90% CL limits on the muon neutrino flux. They also obtain limits on the thermally averaged cross section for neutralino masses in the range 50 to 100,000 GeV. This updates ADRIAN-MARTINEZ 15.
- 12 ARCHAMBAULT 17 performs a joint statistical analysis of four dwarf galaxies with VERITAS looking for gamma-ray emission from neutralino annihilation. They set limits on the neutralino annihilation cross section.
- 13 AARTSEN 16D is based on 329 live days of running with the DeepCore subdetector of the IceCube detector. They set a limit of $10^{-23} \text{ cm}^3 \text{ s}^{-1}$ on the annihilation cross section to $\nu\bar{\nu}$. This updates AARTSEN 15c.
- 14 ABDALLAH 16A place upper limits on the annihilation cross section with final states in the energy range of 0.1 to 2 TeV. This complements ABRAMOWSKI 13.
- 15 ADRIAN-MARTINEZ 16 is based on data from the ANTARES neutrino telescope. They looked for interactions of ν 's from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon neutrino flux. They also obtain limits on the spin dependent and spin independent neutralino-proton cross section for neutralino masses in the range 50 to 5,000 GeV. This updates ADRIAN-MARTINEZ 13.
- 16 AHNEN 16 combines 158 hours of Segue 1 observations with MAGIC with 6 year observations of 15 dwarf satellite galaxies by Fermi-LAT to set limits on annihilation cross sections for dark matter masses between 10 GeV and 100 TeV.
- 17 AVRORIN 16 is based on 2.76 years with Lake Baikal neutrino telescope. They derive 90% upper limits on the annihilation cross section from dark matter annihilations in the Galactic center.
- 18 CIRELLI 16 and LEITE 16 derive bounds on the annihilation cross section from radio observations.
- 19 ABRAMOWSKI 15 places constraints on the dark matter annihilation cross section for annihilations in the Galactic center for masses between 300 GeV to 10 TeV.
- 20 ACKERMANN 15 is based on 5.8 years of data with Fermi-LAT and search for monochromatic gamma-rays in the energy range of 0.2–500 GeV from dark matter annihilations. This updates ACKERMANN 13A.
- 21 ACKERMANN 15A is based on 50 months of data with Fermi-LAT and search for dark matter annihilation signals in the isotropic gamma-ray background as well as galactic subhalos in the energy range of a few GeV to a few tens of TeV.
- 22 ACKERMANN 15B is based on 6 years of data with Fermi-LAT observations of Milky Way dwarf spheroidal galaxies. Set limits on the annihilation cross section from $m_\chi = 2 \text{ GeV}$ to 10 TeV. This updates ACKERMANN 14.
- 23 BUCKLEY 15 is based on 5 years of Fermi-LAT data searching for dark matter annihilation signals from Large Magellanic Cloud.
- 24 CHOI 15 is based on 3903 days of SuperKamiokande data searching for neutrinos produced from dark matter annihilations in the sun. They place constraints on the dark matter-nucleon scattering cross section for dark matter masses between 4–200 GeV.
- 25 ALEKSIC 14 is based on almost 160 hours of observations of Segue 1 satellite dwarf galaxy using the MAGIC telescopes between 2011 and 2013. Sets limits on the annihilation cross section out to $m_\chi = 10 \text{ TeV}$.
- 26 AVRORIN 14 is based on almost 2.76 years with Lake Baikal neutrino telescope. They derive 90% upper limits on the fluxes of muons and muon neutrinos from dark matter annihilations in the Sun.
- 27 AARTSEN 13c is based on data collected during 339.8 effective days with the IceCube 59-string detector. They looked for interactions of ν_μ 's from neutralino annihilations in nearby galaxies and galaxy clusters. They obtain limits on the neutralino annihilation cross section for neutralino masses in the range 30–100,000 GeV.
- 28 ABRAMOWSKI 13 place upper limits on the annihilation cross section with $\gamma\gamma$ final states in the energy range of 0.5–25 TeV.
- 29 BERGSTROM 13, JIN 13, and KOPP 13 derive limits on the mass and annihilation cross section using AMS-02 data. JIN 13 also sets a limit on the lifetime of the dark matter particle.
- 30 BOLIEV 13 is based on data collected during 24.12 years of live time with the Bakon Underground Scintillator Telescope. They looked for interactions of ν_μ 's from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. They also obtain limits on the spin dependent and spin independent neutralino-proton cross section for neutralino masses in the range 10–1000 GeV.
- 31 ABBASI 12 is based on data collected during 812 effective days with AMANDA II and 149 days of the IceCube 40-string detector combined with the data of ABBASI 09B. They looked for interactions of ν_μ 's from neutralino annihilations in the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. No excess is observed. They also obtain limits on the spin dependent neutralino-proton cross section for neutralino masses in the range 50–5000 GeV.
- 32 ABRAMOWSKI 11 place upper limits on the annihilation cross section with $\gamma\gamma$ final states.
- 33 ABDO 10 place upper limits on the annihilation cross section with $\gamma\gamma$ or $\mu^+ \mu^-$ final states.
- 34 ACKERMANN 10 place upper limits on the annihilation cross section with $b\bar{b}$ or $\mu^+ \mu^-$ final states.
- 35 ACHTERBERG 06 is based on data collected during 421.9 effective days with the AMANDA detector. They looked for interactions of ν_μ 's from the centre of the Earth over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. Their limit is compared with the muon flux expected from neutralino annihilations into $W^+ W^-$ and $b\bar{b}$ at the centre of the Earth for MSSM parameters compatible with the relic dark matter density, see their Fig. 7.
- 36 ACKERMANN 06 is based on data collected during 143.7 days with the AMANDA-II detector. They looked for interactions of ν_μ 's from the Sun over a background of atmospheric neutrinos and set 90% CL limits on the muon flux. Their limit is compared with the muon flux expected from neutralino annihilations into $W^+ W^-$ in the Sun for SUSY model parameters compatible with the relic dark matter density, see their Fig. 3.
- 37 DEBOER 06 interpret an excess of diffuse Galactic gamma rays observed with the EGRET satellite as originating from π^0 decays from the annihilation of neutralinos into quark jets. They analyze the corresponding parameter space in a supergravity inspired MSSM

model with radiative electroweak symmetry breaking, see their Fig. 3 for the preferred region in the $(m_0, m_{1/2})$ plane of a scenario with large $\tan\beta$.

- 38 AMBROSIO 99 and DESAI 04 set new neutrino flux limits which can be used to limit the parameter space in supersymmetric models based on neutralino annihilation in the Sun and the Earth.
- 39 LOSECO 95 reanalyzed the IMB data and places lower limit on $m_{\tilde{\chi}_1^0}$ of 18 GeV if the LSP is a photino and 10 GeV if the LSP is a higgsino based on LSP annihilation in the sun producing high-energy neutrinos and the limits on neutrino fluxes from the IMB detector.
- 40 MORI 93 excludes some region in $M_2-\mu$ parameter space depending on $\tan\beta$ and lightest scalar Higgs mass for neutralino dark matter $m_{\tilde{\chi}_1^0} > m_W$, using limits on upgoing muons produced by energetic neutrinos from neutralino annihilation in the Sun and the Earth.
- 41 BOTTINO 92 excludes some region $M_2-\mu$ parameter space assuming that the lightest neutralino is the dark matter, using upgoing muons at Kamiokande, direct searches by Ge detectors, and by LEP experiments. The analysis includes top radiative corrections on Higgs parameters and employs two different hypotheses for nucleon-Higgs coupling. Effects of rescaling in the local neutralino density according to the neutralino relic abundance are taken into account.
- 42 BOTTINO 91 excluded a region in $M_2-\mu$ plane using upgoing muon data from Kamioka experiment, assuming that the dark matter surrounding us is composed of neutralinos and that the Higgs boson is not too heavy.
- 43 GELMINI 91 exclude a region in $M_2-\mu$ plane using dark matter searches.
- 44 KAMIONKOWSKI 91 excludes a region in the $M_2-\mu$ plane using IMB limit on upgoing muons originated by energetic neutrinos from neutralino annihilation in the sun, assuming that the dark matter is composed of neutralinos and that $m_{H_1^0} \lesssim 50 \text{ GeV}$. See Fig. 8 in the paper.
- 45 MORI 91B exclude a part of the region in the $M_2-\mu$ plane with $m_{\tilde{\chi}_1^0} \gtrsim 80 \text{ GeV}$ using a limit on upgoing muons originated by energetic neutrinos from neutralino annihilation in the earth, assuming that the dark matter surrounding us is composed of neutralinos and that $m_{H_1^0} \lesssim 80 \text{ GeV}$.
- 46 OLIVE 88 result assumes that photinos make up the dark matter in the galactic halo. Limit is based on annihilations in the sun and is due to an absence of high energy neutrinos detected in underground experiments. The limit is model dependent.

$\tilde{\chi}_1^0-p$ elastic cross section

Experimental results on the $\tilde{\chi}_1^0-p$ elastic cross section are evaluated at $m_{\tilde{\chi}_1^0}=100 \text{ GeV}$. The experimental results on the cross section are often mass dependent. Therefore, the mass and cross section results are also given where the limit is strongest, when appropriate. Results are quoted separately for spin-dependent interactions (based on an effective 4-Fermi Lagrangian of the form $\bar{\nu}\gamma^\mu\mu\gamma^5\chi\bar{q}\gamma^\mu\gamma^5q$) and spin-independent interactions ($\bar{\nu}\chi\bar{q}q$). For calculational details see GRIEST 88b, ELLIS 88b, BARBIERI 89c, DREES 93b, ARNOWITT 96, BERGSTROM 96, and BAER 97 in addition to the theory papers listed in the Tables. For a description of the theoretical assumptions and experimental techniques underlying most of the listed papers, see the review on "Dark matter" in this "Review of Particle Physics," and references therein. Most of the following papers use galactic halo and nuclear interaction assumptions from (LEWIN 96).

Supersymmetric Particle Searches

- 1 The strongest limit is $< 2.5 \times 10^{-5}$ pb at $m_\chi = 25$ GeV. This updates AMOLE 17.
- 2 The strongest limit is $< 2 \times 10^{-4}$ pb at $m_\chi = 30$ GeV. For scatterings on neutrons, the strongest limit is $< 6.3 \times 10^{-6}$ at $m_\chi = 30$ GeV.
- 3 The strongest limit is $< 4.4 \times 10^{-4}$ pb at $m_\chi = 40$ GeV. This updates FU 17.
- 4 The strongest limit is 5×10^{-4} pb at $m_\chi = 35$ GeV. The limit for scattering on neutrons is 3×10^{-5} pb at 100 GeV and is 1.6×10^{-5} pb at 35 GeV. This updates AKERIB 16A.
- 5 Directional recoil detector. This updates DAW 12.
- 6 This result updates ARCHAMBAULT 12. The strongest limit is 0.013 pb at $m_\chi = 20$ GeV.
- 7 The strongest limit is 5×10^{-4} pb at $m_\chi = 80$ GeV.
- 8 The strongest limit is 5.2×10^{-3} pb at 50 GeV. The limit for scattering on neutrons is 2.8×10^{-4} pb at 100 GeV and the strongest limit is 2.0×10^{-4} pb at 50 GeV. This updates APRILE 13.
- 9 The strongest limit is 0.0043 pb and occurs at $m_\chi = 35$ GeV. FELIZARDO 14 also presents limits for the scattering on neutrons. At $m_\chi = 100$ GeV, the upper limit is 0.13 pb and the strongest limit is 0.066 pb at $m_\chi = 35$ GeV.
- 10 This result updates LEBEDENKO 09A. The strongest limit is 8×10^{-3} pb at $m_\chi = 50$ GeV. Limit applies to the neutralino neutron elastic cross section.
- 11 The strongest limit is 6×10^{-3} at $m_\chi = 60$ GeV.
- 12 The strongest limit is 5.7×10^{-3} at $m_\chi = 35$ GeV.
- 13 This result updates LEE 07A. The strongest limit is at $m_\chi = 80$ GeV.
- 14 Predictions for the spin-dependent elastic cross section based on a frequentist approach to electroweak observables in the framework of $N = 1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- 15 The strongest limit is 0.6 pb and occurs at $m_\chi = 30$ GeV. The limit for scattering on neutrons is 0.01 pb at $m_\chi = 100$ GeV, and the strongest limit is 0.0045 pb at $m_\chi = 30$ GeV.
- 16 Limit applies to neutron elastic cross section.
- 17 The strongest upper limit is 0.25 pb and occurs at $m_\chi \simeq 40$ GeV.
- 18 The strongest upper limit is 4 pb and occurs at $m_\chi \simeq 60$ GeV. The limit on the neutron spin-dependent elastic cross section is 0.07 pb. This latter limit is improved in AHMED 09, where a limit of 0.02 pb is obtained at $m_\chi = 100$ GeV. The strongest limit in AHMED 09 is 0.018 pb and occurs at $m_\chi = 60$ GeV.
- 19 The strongest upper limit is 1.2 pb and occurs at $m_\chi \simeq 40$ GeV. The limit on the neutron spin-dependent cross section is 35 pb.
- 20 The strongest upper limit is 0.35 pb and occurs at $m_\chi \simeq 60$ GeV.
- 21 The strongest upper limit is 1.2 pb and occurs $m_\chi \simeq 30$ GeV.
- 22 ELLIS 04 calculates the χp elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry, but without universal scalar masses. In the case of universal squark and slepton masses, but non-universal Higgs masses, the limit becomes 2×10^{-4} , see ELLIS 03E.
- 23 The strongest upper limit is 0.75 pb and occurs at $m_\chi \approx 70$ GeV.
- 24 The strongest upper limit is 30 pb and occurs at $m_\chi \approx 20$ GeV.
- 25 The strongest upper limit is 8 pb and occurs at $m_\chi \approx 30$ GeV.
- 26 ELLIS 01C calculates the χp elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry. In models with nonuniversal Higgs masses, the upper limit to the cross section is 6×10^{-4} .
- 27 The strongest upper limit is 3 pb and occurs at $m_\chi \simeq 60$ GeV. The limits are for inelastic scattering $\chi^0 + {}^{129}\text{Xe} \rightarrow \chi^0 + {}^{129}\text{Xe}^* (39.58 \text{ keV})$.
- 28 The strongest upper limit is 4.4 pb and occurs at $m_\chi \simeq 60$ GeV.
- 29 The strongest upper limit is about 35 pb and occurs at $m_\chi \simeq 15$ GeV.

- 1 The strongest upper limit is 2.2×10^{-8} pb at 60 GeV.
- 2 This updates AMAUDRUZ 18.
- 3 This updates AMOLE 16.
- 4 The strongest limit is 2.05×10^{-6} at $m = 60$ GeV.
- 5 The strongest limit is 1.09×10^{-8} pb at $m_\chi = 126$ GeV. This updates AGNES 15.
- 6 The strongest limit is 1.0×10^{-8} pb at $m_\chi = 46$ GeV. This updates AGNESE 15B.
- 7 Based on 278.8 days of data collection. The strongest limit is 4.1×10^{-11} pb at $m_\chi = 30$ GeV. This updates APRILE 17G.
- 8 AKERIB 17. The strongest limit is 1.1×10^{-10} pb at 50 GeV. This updates AKERIB 16.
- 9 The strongest limit is 8.6×10^{-11} pb at 40 GeV. This updates TAN 16b.
- 10 The strongest limit is 1.1×10^{-9} pb at 50 GeV. This updates APRILE 12.
- 11 The strongest upper limit is 7.6×10^{-10} at $m_\chi = 33$ GeV.
- 12 Predictions for the spin-independent elastic cross section based on a frequentist approach to electroweak observables in the framework of $N = 1$ supergravity models with radiative breaking of the electroweak gauge symmetry using the 20 fb⁻¹ 8 TeV and the 5 fb⁻¹ 7 TeV LHC data and the LUX data.
- 13 The strongest limit is 3.6×10^{-6} pb and occurs at $m_\chi = 35$ GeV. Felizardo 2014 updates Felizardo 2012.
- 14 Predictions for the spin-independent elastic cross section based on a Bayesian approach to electroweak observables in the framework of $N = 1$ supergravity models with radiative breaking of the electroweak gauge symmetry using the 20 fb⁻¹ LHC data and LUX.
- 15 AGNESE 13 presents 90% CL limits on the elastic cross section for masses in the range 7–100 GeV using the Si based detector. The strongest upper limit is 1.8×10^{-6} pb at $m_\chi = 50$ GeV. This limit is improved to 7×10^{-7} pb in AGNESE 13A.
- 16 This result updates LEBEDENKO 09. The strongest limit is 3.9×10^{-8} pb at $m_\chi = 52$ GeV.
- 17 ANGLÖHER 12 presents results of 730 kg days from the CRESST-II dark matter detector. They find two maxima in the likelihood function corresponding to best fit WIMP masses of 25.3 and 11.6 GeV with elastic cross sections of 1.6×10^{-6} and 3.7×10^{-5} pb respectively, see their Table 4. The statistical significance is more than 4σ . ANGLÖHER 12 updates ANGLÖHER 09.
- 18 Predictions for the spin-independent elastic cross section based on a frequentist approach to electroweak observables in the framework of $N = 1$ supergravity models with radiative breaking of the electroweak gauge symmetry using the 5 fb⁻¹ LHC data and XENON100.
- 19 The strongest limit is 1.4×10^{-7} at $m_\chi = 60$ GeV.
- 20 This result updates LEE 07A. The strongest limit is 2.1×10^{-7} at $m_\chi = 70$ GeV.
- 21 AHMED 11A gives combined results from CDMS and EDELWEISS. The strongest limit is at $m_\chi = 90$ GeV.
- 22 ARMENGAUD 11 updates result of ARMENGAUD 10. Strongest limit at $m_\chi = 85$ GeV.
- 23 The strongest upper limit is 5.1×10^{-8} pb and occurs at $m_\chi \simeq 30$ GeV. The values quoted here are based on the analysis performed in ANGLE 08 with the update from SORESENSEN 09.
- 24 The strongest upper limit is 6.6×10^{-7} pb and occurs at $m_\chi \simeq 65$ GeV.
- 25 AKERIB 06A updates the results of AKERIB 05. The strongest upper limit is 1.6×10^{-7} pb and occurs at $m_\chi \approx 60$ GeV.
- 26 The strongest upper limit is also close to 1.0×10^{-6} pb and occurs at $m_\chi \simeq 70$ GeV. BENOIT 06 claim that the discrimination power of ZEPLIN-I measurement (ALNER 05A) is not reliable enough to obtain a limit better than 1×10^{-3} pb. However, SMITH 06 do not agree with the criticisms of BENOIT 06.
- 27 AKERIB 04 is incompatible with BERNABEI 00 most likely value, under the assumption of standard WIMP-halo interactions. The strongest upper limit is 4×10^{-7} pb and occurs at $m_\chi \simeq 60$ GeV.
- 28 Predictions for the spin-independent elastic cross section in the framework of $N = 1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- 29 KIM 02 and ELLIS 04 calculate the χp elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry, but without universal scalar masses.

See key on page 999

Searches Particle Listings Supersymmetric Particle Searches

- ³⁰ In the case of universal squark and slepton masses, but non-universal Higgs masses, the limit becomes 2×10^{-6} (2×10^{-11} when constraint from the BNL $g-2$ experiment are included), see ELLIS 03E. ELLIS 05 display the sensitivity of the elastic scattering cross section to the π -Nucleon Σ term.
- ³¹ PIERCE 04A calculates the χp elastic scattering cross section in the framework of models with very heavy scalar masses. See Fig. 2 of the paper.
- ³² The strongest upper limit is 1.8×10^{-5} pb and occurs at $m_\chi \approx 80$ GeV.
- ³³ Under the assumption of standard WIMP-halo interactions, Akerib 03 is incompatible with BERNABEI 00 most likely value at the 99.98% CL. See Fig. 4.
- ³⁴ BAER 03A calculates the χp elastic scattering cross section in several models including the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- ³⁵ The strongest upper limit is 7×10^{-6} pb and occurs at $m_\chi \approx 30$ GeV.
- ³⁶ ABRAMS 02 is incompatible with the DAMA most likely value at the 99.9% CL. The strongest upper limit is 3×10^{-6} pb and occurs at $m_\chi \approx 30$ GeV.
- ³⁷ The strongest upper limit is 2×10^{-5} pb and occurs at $m_\chi \approx 40$ GeV.
- ³⁸ The strongest upper limit is 7×10^{-6} pb and occurs at $m_\chi \approx 46$ GeV.
- ³⁹ The strongest upper limit is 1.8×10^{-5} pb and occurs at $m_\chi \approx 32$ GeV.
- ⁴⁰ BOTTINO 01 calculates the χ - p elastic scattering cross section in the framework of the following supersymmetric models: $N=1$ supergravity with the radiative breaking of the electroweak gauge symmetry, $N=1$ supergravity with nonuniversal scalar masses and an effective MSSM model at the electroweak scale.
- ⁴¹ Calculates the χ - p elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- ⁴² ELLIS 01c calculates the χ - p elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry. ELLIS 02B find a range 2×10^{-8} - 1.5×10^{-7} at $\tan\beta=50$. In models with nonuniversal Higgs masses, the upper limit to the cross section is 4×10^{-7} .
- ⁴³ ACCOMANDO 00 calculate the χ - p elastic scattering cross section in the framework of minimal $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry. The limit is relaxed by at least an order of magnitude when models with nonuniversal scalar masses are considered. A subset of the authors in ARNOWITT 02 updated the limit to $< 9 \times 10^{-8}$ ($\tan\beta < 55$).
- ⁴⁴ BERNABEI 00 search for annual modulation of the WIMP signal. The data favor the hypothesis of annual modulation at 4σ and are consistent, for a particular model framework quoted there, with $m_{\chi_0^0} = 44 \pm \frac{12}{9}$ GeV and a spin-independent X^0 -proton cross section of $(5.4 \pm 1.0) \times 10^{-6}$ pb. See also BERNABEI 01 and BERNABEI 00c.
- ⁴⁵ FENG 00 calculate the χ - p elastic scattering cross section in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with a particular emphasis on focus point models. At $\tan\beta=50$, the range is 8×10^{-8} - 4×10^{-7} .

Other bounds on $\tilde{\chi}_1^0$ from astrophysics and cosmology

Most of these papers generally exclude regions in the M_2 - μ parameter plane by requiring that the $\tilde{\chi}_1^0$ contribution to the overall cosmological density is less than some maximal value to avoid overclosure of the Universe. Those not based on the cosmological density are indicated. Many of these papers also include LEP and/or other bounds.

- ¹ ELLIS 00 updates ELLIS 98. Uses LEP e^+e^- data at $\sqrt{s}=202$ and 204 GeV to improve bound on neutralino mass to 51 GeV when scalar mass universality is assumed and 46 GeV when Higgs mass universality is relaxed. Limits on $\tan\beta$ improve to > 2.7 ($\mu > 0$), > 2.2 ($\mu < 0$) when scalar mass universality is assumed and > 1.9 (both signs of μ) when Higgs mass universality is relaxed.
- ² Implications of the LHC result on the Higgs mass and on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry.
- ³ BUCHMUELLER 14A places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches using the 20 fb^{-1} 8 TeV and the 5 fb^{-1} 7 TeV LHC and the LUX data.
- ⁴ ROSZKOWSKI 14 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using Bayesian statistics and indirect experimental searches using the 20 fb^{-1} LHC and the LUX data.
- ⁵ CABRERA 13 and STREGE 13 place constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with and without non-universal Higgs masses using the 5.8 fb^{-1} , $\sqrt{s} = 7$ TeV ATLAS supersymmetry searches and XENON100 results.
- ⁶ ELLIS 13B place constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with and without Higgs mass universality. Models with universality below the GUT scale are also considered.
- ⁷ BALAZS 12 and STREGE 12 place constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using the 1 fb^{-1} LHC supersymmetry searches, the 5 fb^{-1} Higgs mass constraints, both with $\sqrt{s} = 7$ TeV, and XENON100 results.
- ⁸ BECHTLE 12 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches, using the 5 fb^{-1} LHC and XENON100 data.
- ⁹ BESKIDT 12 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches, the 5 fb^{-1} LHC and the XENON100 data.
- ¹⁰ BELANGER 04 and BOTTINO 12 (see also BOTTINO 03, BOTTINO 03A and BOTTINO 04) do not assume gaugino or scalar mass unification.
- ¹¹ FENG 12B places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry and large sfermion masses using the 1 fb^{-1} LHC supersymmetry searches, the 5 fb^{-1} LHC Higgs mass constraints both with $\sqrt{s} = 7$ TeV, and XENON100 results.
- ¹² BUCHMUELLER 11 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches and including supersymmetry breaking relations between A and B parameters.
- ¹³ Places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry but non-Universal Higgs masses.
- ¹⁴ ELLIS 10 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry with universality above the GUT scale.
- ¹⁵ BUCHMUELLER 09 places constraints on the SUSY parameter space in the framework of $N=1$ supergravity models with radiative breaking of the electroweak gauge symmetry using indirect experimental searches.
- ¹⁶ DREINER 09 show that in the general MSSM with non-universal gaugino masses there exists no model-independent laboratory bound on the mass of the lightest neutralino. An essentially massless $\tilde{\chi}_1^0$ is allowed by the experimental and observational data, imposing some constraints on other MSSM parameters, including M_2 , μ and the slepton and squark masses.

1 SIRUNYAN 19Ca	searched in 77.4 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing delayed photons in both single and diphoton plus \cancel{E}_T final states. No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. exclusion limits in the context of GMSB, using the SPS8 benchmark model. For neutralino proper decay lengths of 0.1, 1, 10, and 100 m, masses up to about 320, 525, 360, and 215 GeV are excluded, respectively. See their Fig. 5. The searches involve the simplified models Tglu1D, Tglu4A,B,C, Tsqk4A,4B,4C.			
2 SIRUNYAN 19ci	searched in 77.5 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsbot4 simplified model, see Figure 3, and on the wino mass in the Tchi1n2E simplified model, see their Figure 4. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 5.			
3 SIRUNYAN 19k	searched in 35.9 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with a photon, an electron or muon, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchi1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.			
4 AABOUD 18ck	searched for events with at least 3 b-jets and large missing transverse energy in two datasets of pp collisions at $\sqrt{s} = 13$ TeV of 36.1 fb ⁻¹ and 24.3 fb ⁻¹ depending on the trigger requirements. The analyses aimed to reconstruct two Higgs bosons decaying to pairs of b-quarks. No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 15(a). Constraints are also presented as a function of the BR of Higgsino decaying into an higgs boson and a gravitino, see their Figure 15(b).			
5 AABOUD 18z	searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{j33} to charged leptons, see their Figures 7, 8.			
6 SIRUNYAN 18Ao	searched in 35.9 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos and neutralinos in events with either two or more leptons (electrons or muons) of the same electric charge, or with three or more leptons, which can include up to two hadronically decaying tau leptons. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2A, Tchi1n2H, Tchi1n2D, Tchi1n2E and Tchi1n2F simplified models, see their Figures 14, 15, 16, 17 and 18. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 19.			

Unstable $\tilde{\chi}_1^0$ (Lightest Neutralino) mass limit

Unless otherwise stated, results in this section assume spectra and production rates as evaluated in the MSSM. Unless otherwise stated, the goldstino or gravitino mass $m_{\tilde{G}}$ is assumed to be negligible relative to all other masses. In the following, \tilde{G} is assumed to be undetected and to give rise to a missing energy (\cancel{E}) signature.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 7 SIRUNYAN 18AP searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos by combining a number of previous and new searches. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2E, Tchi1n2F and Tchi1n2I simplified models, see their Figures 7, 8, 9 and 10. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 11, 12, 13 and 14.
- 8 SIRUNYAN 18AR searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tchi1n2F simplified models, see their Figure 8, and on the higgsino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsb0t3 simplified model, see their Figure 10.
- 9 SIRUNYAN 18o searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two Higgs bosons, decaying to pairs of b -quarks, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the T1n1n1A simplified model, see their Figure 9.
- 10 SIRUNYAN 18x searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and \cancel{E}_T . The razor variables (M_R and R^2) are used to categorise the events. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model and on the wino mass in the Tchi1n2E simplified model, see their Figure 5. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 6.
- 11 KHACHATRYAN 14L searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of direct pair production of neutralinos with Higgs or Z -bosons in the decay chain, leading to HH , HZ and ZZ final states with missing transverse energy. The decays of 16–20. a Higgs boson to a b -quark pair, to a photon pair, and to final states with leptons are considered in conjunction with hadronic and leptonic decay modes of the Z and W bosons. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of GMSB simplified models where the decays $\tilde{\chi}_1^0 \rightarrow H\bar{G}$ or $\tilde{\chi}_1^0 \rightarrow Z\bar{G}$ take place either 100% or 50% of the time, see Figs. 16–20.
- 12 AABOUD 19g searched in 32.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for evidence of neutralinos decaying into a Z -boson and a gravitino, in events characterized by the presence of dimuon vertices with displacements from the pp interaction point in the range of 1400 cm. Neutralinos are assumed to be produced in the decay chain of gluinos as in Tglu1A models. No significant excess is observed in the number of vertices relative to the predicted background. In GGM with a gluino mass of 1100 GeV, neutralino masses in the range 300–1000 GeV are excluded for certain values of $c\tau$, see their Figure 7.
- 13 AAIJ 17z searched in 1 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 2 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing a displaced vertex with one associated high transverse momentum μ . No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. upper limits on the cross section times branching fractions of pair-produced neutralinos decaying non-promptly into a muon and two quarks. Long-lived particles in a mass range 23–198 GeV are considered, see their Fig. 5 and Fig. 6.
- 14 KHACHATRYAN 16BX searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 3 or more leptons coming from the electroweak production of wino- or higgsino-like neutralinos, assuming non-zero R-parity-violating leptonic couplings λ_{122} , λ_{123} , and λ_{233} or semileptonic couplings λ_{131} , λ_{233} , λ_{331} , and λ_{333} . No excess over the expected background is observed and limits are derived on the neutralino mass, see Figs. 24 and 25.
- 15 AAD 14BH searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing non-pointing photons in a diphoton plus missing transverse energy final state. No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. exclusion limits in the context of gauge-mediated supersymmetric breaking models, with the lightest neutralino being the next-to-lightest supersymmetric particle and decaying with a lifetime in the range from 0.25 ns to about 100 ns into a photon and a gravitino. For limits on the NLSP lifetime versus Λ plane, for the SPS8 model, see their Fig. 7.
- 16 AAD 13AP searched in 4.8 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing non-pointing photons in a diphoton plus missing transverse energy final state. No excess is observed above the background expected from Standard Model processes. The results are used to set 95% C.L. exclusion limits in the context of gauge-mediated supersymmetric breaking models, with the lightest neutralino being the next-to-lightest supersymmetric particle and decaying with a lifetime in excess of 0.25 ns into a photon and a gravitino. For limits in the NLSP lifetime versus Λ plane, for the SPS8 model, see their Fig. 8.
- 17 AAD 13Q searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing a high- p_T isolated photon, at least one jet identified as originating from a bottom quark, and high missing transverse momentum. Such signatures may originate from supersymmetric models with gauge-mediated supersymmetry breaking in events in which one of a pair of higgsino-like neutralinos decays into a photon and a gravitino while the other decays into a Higgs boson and a gravitino. No significant excess above the expected background was found and limits were set on the neutralino mass in a generalized GMSB model (GGM) with a higgsino-like neutralino NLSP, see their Fig. 4. Intermediate neutralino masses between 220 and 380 GeV are excluded at 95% C.L., regardless of the squark and gluino masses, purely on the basis of the expected weak production.
- 18 AAD 13R looked in 4.4 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing new, heavy particles that decay at a significant distance from their production point into a final state containing a high-momentum muon and charged hadrons. No excess over the expected background is observed and limits are placed on the production cross-section of neutralinos via squarks for various $m_{\tilde{q}}$, $m_{\tilde{\chi}_1^0}$ in an R-parity violating scenario with $\lambda'_{211} \neq 0$, as a function of the neutralino lifetime, see their Fig. 6.
- 19 AALTONEN 13i searched in 6.3 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events containing \cancel{E}_T and a delayed photon that arrives late in the detector relative to the time expected from prompt production. No evidence of delayed photon production is observed.
- 20 CHATRCHYAN 13AH searched in 4.9 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing \cancel{E}_T and a delayed photon that arrives late in the detector relative to the time expected from prompt production. No significant excess above the expected background was found and limits were set on the pair production of $\tilde{\chi}_1^0$ depending on the neutralino proper decay length, see Fig. 8. Supersedes CHATRCHYAN 12BK.
- 21 AAD 12CP searched in 4.8 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two photons and large \cancel{E}_T due to $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$ decays in a GMSB framework. No significant excess above the expected background was found and limits were set on the neutralino mass in a generalized GMSB model (GGM) with a bino-like neutralino NLSP, see Figs. 6 and 7. The other sparticle masses were decoupled, $\tan\beta = 2$ and $c\tau_{NLSP} < 0.1 \text{ mm}$. Also, in the framework of the SPS8 model, limits are presented in Fig. 8.
- 22 AAD 12CT searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing four or more leptons (electrons or muons) and either moderate values of missing transverse momentum or large effective mass. No significant excess is found in the data. Limits are presented in a simplified model of R-parity violating supersymmetry in which charginos are pair-produced and then decay into a W -boson and a $\tilde{\chi}_1^0$, which in turn decays through an RPV coupling into two charged leptons ($e^\pm e^\mp$ or $\mu^\pm \mu^\mp$) and a neutrino. In this model, limits are set on the neutralino mass as a function of the chargino mass, see Fig. 3a. Limits are also set in an R-parity violating mSUGRA model, see Fig. 3b.
- 23 AAD 12R looked in 33 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing new, heavy particles that decay at a significant distance from their production point into a final state containing a high-momentum muon and charged hadrons. No excess over the expected background is observed and limits are placed on the production cross-section of neutralinos via squarks for various $(m_{\tilde{q}}, m_{\tilde{\chi}_1^0})$ in an R-parity violating scenario with $\lambda'_{211} \neq 0$, as a function of the neutralino lifetime, see their Fig. 8. Superseded by AAD 13R.
- 24 ABAZOV 12AD looked in 6.2 fb^{-1} of pp collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with a photon, a Z -boson, and large \cancel{E}_T in the final state. This topology corresponds to a GMSB model where pairs of neutralino NLSPs are either pair produced promptly or from decays of other supersymmetric particles and then decay to either $Z\bar{G}$ or $\gamma\bar{G}$. No significant excess over the SM expectation is observed and a limit at 95% C.L. on the cross section is derived as a function of the effective SUSY breaking scale Λ , see Fig. 3. Assuming $N_{mes} = 2$, $M_{mes} = 3 \Lambda$, $\tan\beta = 3$, $\mu = 0.75 M_1$, and $C_{grav} = 1$, the model is excluded at 95% C.L. for values of $\Lambda < 87 \text{ TeV}$.
- 25 CHATRCHYAN 12BK searched in 2.23 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two photons and large \cancel{E}_T due to $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$ decays in a GMSB framework. No significant excess above the expected background was found and limits were set on the pair production of $\tilde{\chi}_1^0$ depending on the neutralino lifetime, see Fig. 6.
- 26 CHATRCHYAN 11B looked in 35 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with an isolated lepton (e or μ), a photon and \cancel{E}_T which may arise in a generalized gauge mediated model from the decay of Wino-like NLSPs. No evidence for an excess over the expected background is observed. Limits are derived in the plane of squark/gluino mass versus Wino mass (see Fig. 4). Mass degeneracy of the produced squarks and gluinos is assumed.
- 27 AALTONEN 10 searched in 2.6 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for diphoton events with large \cancel{E}_T . They may originate from the production of $\tilde{\chi}^\pm$ in pairs or associated to a $\tilde{\chi}_1^0$, decaying into $\tilde{\chi}_1^0$ which itself decays in GMSB to $\gamma\bar{G}$. There is no excess of events beyond expectation. An upper limit on the cross section is calculated in the GMSB model as a function of the $\tilde{\chi}_1^0$ mass and lifetime, see their Fig. 2. A limit is derived on the $\tilde{\chi}_1^0$ mass of 149 GeV for $\tau_{\tilde{\chi}_1^0} \ll 1 \text{ ns}$, which improves the results of previous searches.
- 28 ABAZOV 10P looked in 6.3 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with at least two isolated γ s and large \cancel{E}_T . These could be the signature of $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm$ production, decaying to $\tilde{\chi}_1^0$ and finally $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$ in a GMSB framework. No significant excess over the SM expectation is observed, and a limit at 95% C.L. on the cross section is derived for $N_{mes} = 1$, $\tan\beta = 15$ and $\mu > 0$, see their Fig. 2. This allows them to set a limit on the effective SUSY breaking scale $\Lambda > 124 \text{ TeV}$, from which the excluded $\tilde{\chi}_1^0$ mass range is obtained.
- 29 ABAZOV 08F looked in 1.1 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for diphoton events with large \cancel{E}_T . They may originate from the production of $\tilde{\chi}^\pm$ in pairs or associated to a $\tilde{\chi}_1^0$, decaying to a $\tilde{\chi}_1^0$ which itself decays promptly in GMSB to $\tilde{\chi}_1^0 \rightarrow \gamma\bar{G}$. No significant excess was found compared to the background expectation. A limit is derived on the masses of SUSY particles in the GMSB framework for $M = 2\Lambda$, $N = 1$, $\tan\beta = 15$ and $\mu > 0$, see Figure 2. It also excludes $\Lambda < 91.5 \text{ TeV}$. Supersedes the results of ABAZOV 05A. Superseded by ABAZOV 10P.
- 30 ABULENCIA 07H searched in 346 pb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with at least three leptons (e or μ) from the decay of $\tilde{\chi}_1^0$ via $L\bar{L}\bar{E}$ couplings. The results are consistent with the hypothesis of no signal. Upper limits on the cross-section are extracted and a limit is derived in the framework of mSUGRA on the masses of $\tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm$, see e.g. their Fig. 3 and Tab. II.
- 31 ABBIENDI 06b use 600 pb^{-1} of data from $\sqrt{s} = 189\text{--}209 \text{ GeV}$. They look for events with diphotons + \cancel{E} final states originating from prompt decays of pair-produced neutralinos in a GMSB scenario with $\tilde{\chi}_1^0$ NLSP. Limits on the cross-section are computed as a function of $m(\tilde{\chi}_1^0)$, see their Fig. 14. The limit on the $\tilde{\chi}_1^0$ mass is for a pure Bino state assuming a prompt decay, with lifetimes up to 10^{-9} s. Supersedes the results of ABBIENDI 04n.
- 32 ABDALLAH 05B use data from $\sqrt{s} = 180\text{--}209 \text{ GeV}$. They look for events with single photons + \cancel{E} final states. Limits are computed in the plane $(m(\tilde{G}), m(\tilde{\chi}_1^0))$, shown in their Fig. 9b for a pure Bino state in the GMSB framework and in Fig. 9c for a no-scale supergravity model. Supersedes the results of ABREU 00z.
- 33 ABDALLAH 05b use data from $\sqrt{s} = 130\text{--}209 \text{ GeV}$. They look for events with diphotons + \cancel{E} final states and single photons not pointing to the vertex, expected in GMSB when the $\tilde{\chi}_1^0$ is the NLSP. Limits are computed in the plane $(m(\tilde{G}), m(\tilde{\chi}_1^0))$, see their Fig. 10. The lower limit is derived on the $\tilde{\chi}_1^0$ mass for a pure Bino state assuming a prompt decay and $m_{\tilde{e}_R} = m_{\tilde{e}_L} = 2 m_{\tilde{\nu}_0}$. It improves to 100 GeV for $m_{\tilde{e}_R} = m_{\tilde{e}_L} = 1.1 m_{\tilde{\nu}_0}$, and the limit in the plane $(m(\tilde{\chi}_1^0), m(\tilde{e}_R))$ is shown in Fig. 10b. For long-lived neutralinos, cross-section limits are displayed in their Fig. 11. Supersedes the results of ABREU 00z.

Supersymmetric Particle Searches

$\tilde{\chi}_2^0, \tilde{\chi}_3^0, \tilde{\chi}_4^0$ (Neutralinos) mass limits

Neutralinos are unknown mixtures of photinos, z-inos, and neutral higgsinos (the supersymmetric partners of photons and of Z and Higgs bosons). The limits here apply only to $\tilde{\chi}_2^0, \tilde{\chi}_3^0$, and $\tilde{\chi}_4^0$. $\tilde{\chi}_1^0$ is the lightest supersymmetric particle (LSP); see $\tilde{\chi}_1^0$ Mass Limits. It is not possible to quote rigorous mass limits because they are extremely model dependent; i.e. they depend on branching ratios of various $\tilde{\chi}^0$ decay modes, on the masses of decay products ($\bar{e}, \bar{\nu}, \bar{q}, \bar{g}$), and on the \bar{e} mass exchanged in $e^+e^- \rightarrow \tilde{\chi}_i^0 \tilde{\chi}_j^0$. Limits arise either from direct searches, or from the MSSM constraints set on the gaugino and higgsino mass parameters M_2 and μ through searches for lighter charginos and neutralinos. Often limits are given as contour plots in the $m_{\tilde{\chi}^0} - m_{\tilde{e}}$ plane vs other parameters. When specific assumptions are made, e.g. the neutralino is a pure photino ($\tilde{\gamma}$), pure z-ino (\tilde{Z}), or pure neutral higgsino (\tilde{H}^0), the neutralinos will be labelled as such.

Limits obtained from e^+e^- collisions at energies up to 136 GeV, as well as other limits from different techniques, are now superseded and have not been included in this compilation. They can be found in the 1998 Edition (The European Physical Journal **C3** 1 (1998)) of this Review. Some later papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- AABOUD 19AU searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos and next-to-lightest neutralinos decaying into lightest neutralinos and a W and a Higgs boson, respectively. Fully hadronic, semileptonic, diphoton, and multilepton (electrons, muons) final states with missing transverse momentum are considered in this search. Observations are consistent with the Standard Model expectations, and 95% confidence-level limits of up to 680 GeV on the chargino/next-to-lightest neutralino masses are set (Tchi1n2E model). See their Figure 14 for an overlay of exclusion contours from all searches.
- SIRUNYAN 19BU searched for pair production of gauginos via vector boson fusion assuming the gaugino spectrum is compressed, in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV. The final states explored included zero leptons plus two jets, one lepton plus two jets, and one hadronic tau plus two jets. A similar bound is obtained in the light slepton limit.
- AABOUD 18AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos and neutralinos as in Tchi1n2D models, in events characterised by the presence of at least two hadronically decaying tau leptons and large missing transverse energy. No significant deviation from the expected SM background is observed. Assuming decays via intermediate $\tilde{\tau}_1$ and $m_{\tilde{\chi}_1^+} = m_{\tilde{\chi}_2^0}$, the observed limits rule out $\tilde{\chi}_2^0$ masses up to 760 GeV for a massless $\tilde{\chi}_1^0$. See their Fig.7 (right). Interpretations are also provided in Fig 8 (bottom) for different assumptions on the ratio between $m_{\tilde{\tau}}$ and $m_{\tilde{\chi}_2^0} + m_{\tilde{\chi}_1^0}$.
- AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of chargino, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the next-to-lightest neutralino mass up to 1100 GeV for massless $\tilde{\chi}_1^0$ in the Tchi1n2C simplified model exploiting the 3ℓ signature, see their Figure 8(c).
- AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the next-to-lightest neutralino mass up to 580 GeV for massless $\tilde{\chi}_1^0$ in the Tchi1n2F simplified model exploiting the $2\ell + 2$ jets and 3ℓ signatures, see their Figure 8(d).
- AABOUD 18CK searched for events with at least 3 b -jets and large missing transverse energy in two datasets of pp collisions at $\sqrt{s} = 13$ TeV of 36.1 fb^{-1} and 24.3 fb^{-1} depending on the trigger requirements. The analyses aimed to reconstruct two Higgs bosons decaying to pairs of b -quarks. No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 15(a). Constraints are also presented as a function of the BR of Higgsino decaying into a higgs boson and a gravitino, see their Figure 15(b).
- AABOUD 18CO searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of mass-degenerate charginos and next-to-lightest neutralinos in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. The search channels are based on recursive jigsaw reconstruction. Limits are set on the next-to-lightest neutralinos mass up to 600 GeV for massless neutralinos in the Tchi1n2F simplified model exploiting the statistical combination of $2\ell + 2$ jets and 3ℓ channels. Next-to-lightest neutralinos masses below 220 GeV are not excluded due to an excess of events above the SM prediction in the dedicated regions. See their Figure 13(d).
- AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2G higgsino models, and $\tilde{\chi}_2^0$ masses are excluded up to 145 GeV for $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = 5$ GeV. The exclusion limits extend down to mass splittings of 2.5 GeV, see their Fig. 10 (top). Results are also interpreted in terms of exclusion bounds on the production cross-sections for the NUHM2 scenario as a function of the universal gaugino mass $m_{1/2}$ and $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$, see their Fig. 12.
- AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2F wino models, and $\tilde{\chi}_2^0$ masses are excluded up to 175 GeV for $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = 10$ GeV. The exclusion limits extend down to mass splittings of 2 GeV, see their Fig. 10 (bottom). Results are also interpreted in terms of exclusion bounds on the production cross-sections for the NUHM2 scenario as a function of the universal gaugino mass $m_{1/2}$ and $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$, see their Fig. 12.
- AABOUD 18U searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results of the diphoton channel are interpreted in terms of lower limits on the masses of gauginos Tchi1chi1A models, which reach as high as 1.3 TeV. Gaugino masses below 1060 GeV are excluded for any NLSP mass, see their Fig. 10.
- SIRUNYAN 18AJ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing two low-momentum, oppositely charged leptons (electrons or muons) and \cancel{E}_T . No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2F simplified model, see their Figure 5. Limits are also set on the stop mass in the Tstop10 simplified model, see their Figure 6. Finally, limits are set on the Higgsino mass in the Tchi1n2G simplified model, see Figure 8 and in the pMSSM, see Figure 7.

- 12 SIRUNYAN 18DP searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos and neutralinos or of chargino pairs in events with a tau lepton pair and significant missing transverse momentum. Both hadronic and leptonic decay modes are considered for the tau lepton. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tchi1ch1D and Tchi1n2 simplified models, see their Figures 14 and 15. Also, excluded stau pair production cross sections are shown in Figures 11, 12, and 13.
- 13 SIRUNYAN 17AW searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with a charged lepton (electron or muon), two jets identified as originating from a b-quark, and large E_T . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the chargino and the next-to-lightest neutralino in the Tchi1n2E simplified model, see their Figure 6.
- 14 AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons, E_T , with or without hadronic jets, in 20 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on mass-degenerate $\tilde{\chi}_2^0$ and $\tilde{\chi}_3^0$ masses in the Tn2n3A and Tn2n3B simplified models. See their Fig. 15.
- 15 AAD 15BA searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of charginos and neutralinos decaying to a final state containing a W boson and a 125 GeV Higgs boson, plus missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with the decays $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$ and $\tilde{\chi}_2^0 \rightarrow H \tilde{\chi}_1^0$ having 100% branching fraction, see Fig. 8. A combination of the multiple final states for the Higgs decay yields the best limits (Fig. 8d).
- 16 AAD 14H searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of charginos and neutralinos decaying to a final state with three leptons and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via either all three generations of leptons, staus only, gauge bosons, or Higgs bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 8.
- 17 AAD 14X searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the neutralino mass in an R-parity conserving simplified model where the decay $\tilde{\chi}_{2,3}^0 \rightarrow \ell^\pm \ell^\mp \tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 10.
- 18 AAD 13 searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for charginos and neutralinos decaying to a final state with three leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 and 3, and in simplified models, see Fig. 4. For the simplified models with intermediate slepton decays, degenerate $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ masses up to 500 GeV are excluded at 95% C.L. for very large mass differences with the $\tilde{\chi}_1^0$. Supersedes AAD 12As.
- 19 CHATRCHYAN 12BJ searched in 4.98 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for direct electroweak production of charginos and neutralinos in events with at least two leptons, jets and missing transverse momentum. No significant excesses over the expected SM backgrounds are observed and 95% C.L. limits on the production cross section of $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production were set in a number of simplified models, see Figs. 7 to 12. Most limits are for exactly 3 jets.
- 20 ABREU 00w combines data collected at $\sqrt{s}=189$ GeV with results from lower energies. The mass limit is obtained by constraining the MSSM parameter space with gaugino and sfermion mass universality at the GUT scale, using the results of negative direct searches for neutralinos (including cascade decays and $\tilde{\tau}\tau$ final states) from ABREU 01, for charginos from ABREU 00j and ABREU 00t (for all Δm_+), and for charged sleptons from ABREU 01b. The results hold for the full parameter space defined by all values of M_2 and $|\mu| \leq 2$ TeV with the $\tilde{\chi}_1^0$ as LSP.
- 21 AAD 14G searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of chargino-neutralino pairs, decaying to a final state with two leptons (e and μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via gauge bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 10.
- 22 KHACHATRYAN 14t searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of charginos and neutralinos decaying to a final state with three leptons (e or μ) and missing transverse momentum, or with a Z-boson, dijets and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Figs. 12–16.
- 23 AAD 12As searched in 2.06 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for charginos and neutralinos decaying to a final state with three leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 (top), and in simplified models, see Fig. 2 (bottom).
- 24 AAD 12T looked in 1 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for the production of supersymmetric particles decaying into final states with missing transverse momentum and exactly two isolated leptons (e or μ). Same-sign dilepton events were separately studied. Additionally, in opposite-sign events, a search was made for an excess of same-flavor over different-flavor lepton pairs. No excess over the expected background is observed and limits are placed on the effective production cross section of opposite-sign dilepton events with $E_T > 250$ GeV and on same-sign dilepton events with $E_T > 100$ GeV. The latter limit is interpreted in a simplified electroweak gaugino production model.

Unless otherwise stated, results in this section assume spectra, production rates, decay modes and branching ratios as evaluated in the MSSM, with gaugino and sfermion mass unification at the GUT scale. These papers generally study production of $\tilde{\chi}_1^0 \tilde{\chi}_2^0$, $\tilde{\chi}_1^\pm \tilde{\chi}_1^\mp$ and (in the case of hadronic collisions) $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pairs, including the effects of cascade decays. The mass limits on $\tilde{\chi}_1^\pm$ are either direct, or follow indirectly from the constraints set by the non-observation of $\tilde{\chi}_2^0$ states on the gaugino and higgsino MSSM parameters M_2 and μ . For generic values of the MSSM parameters, limits from high-energy e^+e^- collisions coincide with the highest value of the mass allowed by phase-space, namely $m_{\tilde{\chi}_1^\pm} \lesssim \sqrt{s}/2$. The still unpublished combination of the results of the four LEP collaborations from the 2000 run of LEP2 at \sqrt{s} up to ≈ 209 GeV yields a lower mass limit of 103.5 GeV valid for general MSSM models. The limits become however weaker in certain regions of the MSSM parameter space where the detection efficiencies or production cross sections are suppressed. For example, this may happen when: (i) the mass differences $\Delta m_+ = m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}$ or $\Delta m_\nu = m_{\tilde{\chi}_1^\pm} - m_{\tilde{\nu}}$ are very small, and the detection efficiency is reduced; (ii) the electron sneutrino mass is small, and the $\tilde{\chi}_1^\pm$ production rate is suppressed due to a destructive interference between s and t channel exchange diagrams. The regions of MSSM parameter space where the following limits are valid are indicated in the comment lines or in the footnotes.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

$\tilde{\chi}_1^\pm, \tilde{\chi}_2^0$ (Charginos) mass limits

Charginos are unknown mixtures of w-inos and charged higgsinos (the supersymmetric partners of W and Higgs bosons). A lower mass limit for the lightest chargino ($\tilde{\chi}_1^\pm$) of approximately 45 GeV, independent of the field composition and of the decay mode, has been obtained by the LEP experiments from the analysis of the Z width and decays. These results, as well as other now superseded limits from e^+e^- collisions at energies below 136 GeV, and from hadronic collisions, can be found in the 1998 Edition (The European Physical Journal **C3** 1 (1998)) of this Review.

No significant excess above the Standard Model expectations is observed. Limits are set on chargino masses in a general gauge-mediated SUSY breaking (GGM) scenario Tchi1n12-GGM, see Figure 4. Limits are also set on the NLSP mass in the Tchi1chi1F and Tchi1chi1G simplified models, see their Figure 5. Finally, limits are set on the gluino mass in the Tglu4A simplified model, see Figure 6.				
none 124-361	95	31 AAD	15CA ATLS	$\geq 1\gamma + e\mu + \cancel{E}_T$, GGM, wino-like NLSP		2 AABOUD 19AU searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct production of charginos and next-to-lightest neutralinos decaying into lightest neutralinos and a W, and a Higgs boson, respectively. Fully hadronic, semileptonic, diphoton, and multilepton (electrons, muons) final states with missing transverse momentum are considered in this search. Observations are consistent with the Standard Model expectations, and 95% confidence-level limits of up to 680 GeV on the chargino/next-to-lightest neutralino masses are set (Tchi1n2E model). See their Figure 14 for an overlay of exclusion contours from all searches.				
> 700	95	32 AAD	14H ATLS	$\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow \ell^\pm \nu \tilde{\chi}_1^0 \ell^\mp \tilde{\chi}_1^0$, simplified model, $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}$, $m_{\tilde{\chi}_1^0} = 0$ GeV		3 SIRUNYAN 19BU searched for pair production of gauginos via vector boson fusion assuming the gaugino spectrum is compressed, in 35.9 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV. The final states explored included zero leptons plus two jets, one lepton plus two jets, and one hadronic tau plus two jets. A similar bound is obtained in the light slepton limit.				
> 345	95	32 AAD	14H ATLS	$\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow W \tilde{\chi}_1^0 Z \tilde{\chi}_1^0$, simplified model, $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}, m_{\tilde{\chi}_1^0} = 0$ GeV		4 SIRUNYAN 19CI searched in 77.5 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb04 simplified model, see Figure 3, and on the wino mass in the Tchi1n2E simplified model, see their Figure 4. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 5.				
> 148	95	32 AAD	14H ATLS	$\tilde{\chi}_1^\pm \tilde{\chi}_2^0 \rightarrow W \tilde{\chi}_1^0 H \tilde{\chi}_1^0$, simplified model, $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}, m_{\tilde{\chi}_1^0} = 0$ GeV		5 SIRUNYAN 19K searched in 35.9 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with a photon, an electron or muon, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchi1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsq4A simplified model, see their Figure 7.				

- 6 AABOUD 18AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos as in Tchi1ch1D models in events characterised by the presence of at least two hadronically decaying tau leptons and large missing transverse energy. No significant deviation from the expected SM background is observed. In the Tchi1ch1D model, assuming decays via intermediate $\tilde{\tau}_L$, the observed limits rule out $\tilde{\chi}_1^\pm$ masses up to 630 GeV for a massless $\tilde{\chi}_1^0$. See their Fig.7 (left). Interpretations are also provided in Fig 8 (top) for different assumptions on the ratio between $m_{\tilde{\tau}}$ and $m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0}$.
- 7 AABOUD 18AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos as in Tchi1n2D models, in events characterised by the presence of at least two hadronically decaying tau leptons and large missing transverse energy. No significant deviation from the expected SM background is observed. Assuming decays via intermediate $\tilde{\tau}_L$ and $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0}$, the observed limits rule out $\tilde{\chi}_1^\pm$ masses up to 760 GeV for a massless $\tilde{\chi}_1^0$. See their Fig.7 (right). Interpretations are also provided in Fig 8 (bottom) for different assumptions on the ratio between $m_{\tilde{\tau}}$ and $m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0}$.
- 8 AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass up to 750 GeV for massless neutralinos in the Tchi1ch1C simplified model exploiting $2\ell + 0$ jets signatures, see their Figure 8(a).
- 9 AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass up to 1100 GeV for massless neutralinos in the Tchi1n2C simplified model exploiting 3ℓ signature, see their Figure 8(c).
- 10 AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass up to 580 GeV for massless neutralinos in the Tchi1n2F simplified model exploiting $2\ell + 2$ jets and 3ℓ signatures, see their Figure 8(d).
- 11 AABOUD 18CK searched for events with at least 3 b -jets and large missing transverse energy in two datasets of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ of 36.1 fb^{-1} and 24.3 fb^{-1} depending on the trigger requirements. The analyses aimed to reconstruct two Higgs bosons decaying to pairs of b -quarks. No significant excess above the Standard Model expectations is observed. Limits are set on the Higgsino mass in the Tn1n1A simplified model, see their Figure 15(a). Constraints are also presented as a function of the BR of Higgsino decaying into an higgs boson and a gravitino, see their Figure 15(b).
- 12 AABOUD 18CO searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of mass-degenerate charginos and next-to-lightest neutralinos in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. The search channels are based on recursive jigsaw reconstruction. Limits are set on the chargino mass up to 600 GeV for massless neutralinos in the Tchi1n2F simplified model exploiting the statistical combination of $2\ell + 2$ jets and 3ℓ channels. Chargino masses below 220 GeV are not excluded due to an excess of events above the SM prediction in the dedicated regions. See their Figure 13(d).
- 13 AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2G wino models and $\tilde{\chi}_1^\pm$ masses are excluded up to 175 GeV for $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$. The exclusion limits extend down to mass splittings of 2 GeV, see their Fig. 10 (bottom).
- 14 AABOUD 18R searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in Tchi1n2G higgsino models and $\tilde{\chi}_1^\pm$ masses are excluded up to 145 GeV for $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$. The exclusion limits extend down to mass splittings of 2.5 GeV, see their Fig. 10 (top).
- 15 AABOUD 18U searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results of the diphoton channel are interpreted in terms of lower limits on the masses of gauginos Tchi1ch1A models, which reach as high as 1.3 TeV. Gaugino masses below 1060 GeV are excluded for any NLSP mass, see their Fig. 10.
- 16 AABOUD 18Z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12c} or λ_{133} to charged leptons, see their Figures 7, 8.
- 17 SIRUNYAN 18AA searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon and large E_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking (GGM) scenario with bino-like $\tilde{\chi}_1^0$ and wino-like $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$, see Figure 7. Limits are also set on the NLSP mass in the Tchi1n1A and Tchi1ch1A simplified models, see their Figure 8. Finally, limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, see their Figure 9, and on the squark mass in the Tsq44A and Tsq44B simplified models, see their Figure 10.
- 18 SIRUNYAN 18AJ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two low-momentum, oppositely charged leptons (electrons or muons) and E_T . No excess over the expected background is observed. Limits are derived on the wino mass in the Tchi1n2F simplified model, see their Figure 5. Limits are also set on the stop mass in the Tstop10 simplified model, see their Figure 6. Finally, limits are set on the Higgsino mass in the Tchi1n2G simplified model, see Figure 8 and in the pMSSM, see Figure 7.
- 19 SIRUNYAN 18AO searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos in events with either two or more leptons (electrons or muons) of the same electric charge, or with three or more leptons, which can include up to two hadronically decaying tau leptons. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2A, Tchi1n2H, Tchi1n2D, Tchi1n2E and Tchi1n2F simplified models, see their Figures 14, 15, 16, 17 and 18. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 19.
- 20 SIRUNYAN 18AP searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos by combining a number of previous and new searches. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino/neutralino mass in the Tchi1n2E, Tchi1n2F and Tchi1n2I simplified models, see their Figures 7, 8, 9 and 10. Limits are also set on the higgsino mass in the Tn1n1A, Tn1n1B and Tn1n1C simplified models, see their Figure 11, 12, 13 and 14.
- 21 SIRUNYAN 18AR searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and E_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tchi1n2F simplified models, see their Figure 8, and on the higgsino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsb0t3 simplified model, see their Figure 10.
- 22 SIRUNYAN 18DN searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and for pair production of top squarks in events with two leptons (electrons or muons) of the opposite electric charge. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tchi1ch1C and Tchi1ch1E simplified models, see their Figure 8. Limits are also set on the stop mass in the Tstop1 and Tstop2 simplified models, see their Figure 9.
- 23 SIRUNYAN 18DP searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and neutralinos or of chargino pairs in events with a tau lepton pair and significant missing transverse momentum. Both hadronic and leptonic decay modes are considered for the tau lepton. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tchi1ch1D and Tchi1n2 simplified models, see their Figures 14 and 15. Also, excluded stau pair production cross sections are shown in Figures 11, 12, and 13.
- 24 SIRUNYAN 18X searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more high-momentum Higgs bosons, decaying to pairs of photons, jets and E_T . The razor variables (M_R and R^2) are used to categorise the events. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t4 simplified model and on the wino mass in the Tchi1n2E simplified model, see their Figure 5. Limits are also set on the higgsino mass in the Tn1n1A and Tn1n1B simplified models, see their Figure 6.
- 25 KHACHATRYAN 17L searched in about 19 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two τ (at least one decaying hadronically) and E_T . In the Tchi1ch1C model, assuming decays via intermediate $\tilde{\tau}$ or $\tilde{\nu}_\tau$ with equivalent mass, the observed limits rule out $\tilde{\chi}_1^\pm$ masses up to 420 GeV for a massless $\tilde{\chi}_1^0$. See their Fig.5.
- 26 SIRUNYAN 17AW searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a charged lepton (electron or muon), two jets identified as originating from a b -quark, and large E_T . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the chargino and the next-to-lightest neutralino in the Tchi1n2E simplified model, see their Figure 6.
- 27 AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons, E_T , with or without hadronic jets, in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the $\tilde{\chi}_1^\pm$ mass in the Tchi1ch1B and Tchi1ch1C simplified models. See their Fig. 13.
- 28 AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons, E_T , with or without hadronic jets, in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on mass-degenerate $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ masses in the Tchi1n2B, Tchi1n2C, and Tchi1n2D simplified models. See their Figs. 16, 17, and 18. Interpretations in phenomenological-MSSM, two-parameter Non Universal Higgs Masses (NUHM2), and gauge-mediated symmetry breaking (GMSB) models are also given in their Figs. 20, 21 and 22.
- 29 KHACHATRYAN 16R searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or more photons, one electron or muon, and E_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking model (GGM), for a wino-like neutralino NLSP scenario, see Fig. 5. Limits are also set in the Tglu1D and Tchi1n1A simplified models, see Fig. 6. The Tchi1n1A limit is reduced to 340 GeV for a branching ratio reduced by the weak mixing angle.
- 30 AAD 15BA searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for electroweak production of charginos and neutralinos decaying to a final state containing a W boson and a 125 GeV Higgs boson, plus missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with the decays $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$ and $\tilde{\chi}_2^0 \rightarrow H \tilde{\chi}_1^0$ having 100% branching fraction, see Fig. 8. A combination of the multiple final states for the Higgs decay yields the best limits (Fig. 8d).
- 31 AAD 15CA searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or more photons and E_T , with or without leptons (e, μ). No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in the general gauge-mediated SUSY breaking model (GGM), for wino-like NLSP, see Fig. 9, 12.
- 32 AAD 14H searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for electroweak production of charginos and neutralinos decaying to a final state with three leptons and missing transverse momentum. No excess beyond the Standard Model expectation is observed.

Supersymmetric Particle Searches

- Exclusion limits are derived in simplified models of direct chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via either all three generations of leptons, staus only, gauge bosons, or Higgs bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 8.
- 33 AAD 14X searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the wino-like chargino mass in the R-parity violating simplified model where the decay $\tilde{\chi}_1^\pm \rightarrow W^{(*)\pm} \tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$, takes place with a branching ratio of 100%, see Fig. 8.
- 34 KHACHATRYAN 14L searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for evidence of chargino-neutralino $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production with Higgs or W -bosons in the decay chain, leading to HW final states with missing transverse energy. The decays of a Higgs boson to a photon pair are considered in conjunction with hadronic and leptonic decay modes of the W bosons. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of simplified models where the decays $\tilde{\chi}_2^0 \rightarrow H \tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm \rightarrow W^\pm \tilde{\chi}_1^0$ take place 100% of the time, see Figs. 22–23.
- 35 AAD 13 searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for charginos and neutralinos decaying to a final state with three leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 and 3, and in simplified models, see Fig. 4. For the simplified models with intermediate slepton decays, degenerate $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$ masses up to 500 GeV are excluded at 95% C.L. for very large mass differences with the $\tilde{\chi}_1^0$. Supersedes AAD 12As.
- 36 AAD 13b searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for gauginos decaying to a final state with two leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Limits are derived in a simplified model of wino-like chargino pair production, where the chargino always decays to the lightest neutralino via an intermediate on-shell charged slepton, see Fig. 2(b). Chargino masses between 110 and 340 GeV are excluded at 95% C.L. for $m_{\tilde{\chi}_1^0} = 10$ GeV. Exclusion limits are also derived in the phenomenological MSSM, see Fig. 3.
- 37 AAD 12CT searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events containing four or more leptons (electrons or muons) and either moderate values of missing transverse momentum or large effective mass. No significant excess is found in the data. Limits are presented in a simplified model of R-parity violating supersymmetry in which charginos are pair-produced and then decay into a W -boson and a $\tilde{\chi}_1^0$, which in turn decays through an RPV coupling into two charged leptons ($e^\pm e^\mp$ or $e^\pm \mu^\mp$) and a neutrino. In this model, chargino masses up to 540 GeV are excluded at 95% C.L. for $m_{\tilde{\chi}_1^0}$ above 300 GeV, see Fig. 3a. The limit deteriorates for lighter $\tilde{\chi}_1^0$. Limits are also set in an R-parity violating mSUGRA model, see Fig. 3b.
- 38 CHATRCHYAN 12BJ searched in 4.98 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for direct electroweak production of charginos and neutralinos in events with at least two leptons, jets and missing transverse momentum. No significant excesses over the expected SM backgrounds are observed and 95% C.L. limits on the production cross section of $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production were set in a number of simplified models, see Figs. 7 to 12.
- 39 ABDALLAH 03M uses data from $\sqrt{s} = 192$ –208 GeV to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass of charginos is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays), for charginos and for sleptons. These limits are valid for values of $M_2 < 1$ TeV, $|\mu| \leq 2$ TeV with the $\tilde{\chi}_1^0$ as LSP. Constraints from the Higgs search in the m_h^{max} scenario assuming $m_t = 174.3$ GeV are included. The quoted limit applies if there is no mixing in the third family or when $m_{\tilde{\tau}_1} - m_{\tilde{\chi}_1^0} > 6$ GeV. If mixing is included the limit degrades to 90 GeV. See Fig. 43 for the mass limits as a function of $\tan\beta$. These limits update the results of ABREU 00w.
- 40 KHACHATRYAN 16AA searched in 7.4 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with one or more photons, hadronic jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in the general gauge-mediated SUSY breaking model (GGM), for a wino-like neutralino NLSP scenario and with the wino mass fixed at 10 GeV above the bino mass, see Fig. 4. Limits are also set in the Tch1ch1A and Tch1n1A simplified models, see Fig. 3.
- 41 KHACHATRYAN 16R searched in 19.7 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with one or more photons, one electron or muon, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are also set in the TgluIF simplified model, see Fig. 6.
- 42 KHACHATRYAN 16Y searched in 19.7 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with one or two soft isolated leptons, hadronic jets, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the $\tilde{\chi}_1^\pm$ mass (which is degenerate with the $\tilde{\chi}_2^0$) in the Tch1n2A simplified model, see Fig. 4.
- 43 AAD 14AV searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for the direct production of charginos, neutralinos and staus in events containing at least two hadronically decaying τ -leptons, large missing transverse momentum and low jet activity. The quoted limit was derived for direct $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ and $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$ production with $\tilde{\chi}_2^0 \rightarrow \tilde{\tau} \tau \rightarrow \tau \tau \tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm \rightarrow \tilde{\tau} \nu(\tilde{\nu} \tau) \rightarrow \tau \nu \tilde{\chi}_1^0$, $m_{\tilde{\chi}_1^0} = m_{\tilde{\chi}_1^\pm}$, $m_{\tilde{\tau}} = 0.5(m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})$, $m_{\tilde{\chi}_1^0} = 0$ GeV. No excess over the expected SM background is observed. Exclusion limits are set in simplified models of $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production, see their Figure 7. Upper limits on the cross section and signal strength for direct di-stau production are derived, see Figures 8 and 9. Also, limits are derived in a pMSSM model where the only light slepton is the $\tilde{\tau}_R$, see Figure 10.
- 44 AAD 14AV searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for the direct production of charginos, neutralinos and staus in events containing at least two hadronically decaying τ -leptons, large missing transverse momentum and low jet activity. The quoted limit was derived for direct $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$ production with $\tilde{\chi}_1^0 \rightarrow \tilde{\tau} \nu(\tilde{\nu} \tau) \rightarrow \tau \nu \tilde{\chi}_1^0$, $m_{\tilde{\tau}} = 0.5(m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^0})$, $m_{\tilde{\chi}_1^0} = 0$ GeV. No excess over the expected SM background is observed. Exclusion limits are set in simplified models of $\tilde{\chi}_1^\pm \tilde{\chi}_1^0$ and $\tilde{\chi}_1^\pm \tilde{\chi}_2^0$ pair production, see their Figure 7. Upper limits on the cross section and signal strength for direct di-stau production are derived, see Figures 8 and 9. Also, limits are derived in a pMSSM model where the only light slepton is the $\tilde{\tau}_R$, see Figure 10.

- 45 AAD 14G searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of chargino pairs, or chargino-neutralino pairs, decaying to a final state with two leptons (e and μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of chargino pair production, with chargino decays to the lightest neutralino via either sleptons or gauge bosons, see Fig 5; or in simplified models of chargino and next-to-lightest neutralino production, with decays to the lightest neutralino via gauge bosons, see Fig. 7. An interpretation in the pMSSM is also given, see Fig. 10.
- 46 AALTONEN 14 searched in 5.8 fb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for evidence of chargino and next-to-lightest neutralino associated production in final states consisting of three leptons (electrons, muons or taus) and large missing transverse momentum. The results are consistent with the Standard Model predictions within 1.85 σ . Limits on the chargino mass are derived in an mSUGRA model with $m_0 = 60$ GeV, $\tan\beta = 3$, $A_0 = 0$ and $\mu > 0$, see their Fig. 2.
- 47 KHACHATRYAN 14I searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of chargino pairs decaying to a final state with opposite-sign lepton pairs (e or μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Fig. 18.
- 48 AALTONEN 13Q searched in 6.0 fb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for evidence of chargino-neutralino associated production in like-sign dilepton final states. One lepton is identified as the hadronic decay of a tau lepton, while the other is an electron or muon. Good agreement with the Standard Model predictions is observed and limits are set on the chargino-neutralino cross section for simplified gravity- and gauge-mediated models, see their Figs. 2 and 3.
- 49 AAD 12As searched in 2.06 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for charginos and neutralinos decaying to a final state with three leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the phenomenological MSSM, see Fig. 2 (top), and in simplified models, see Fig. 2 (bottom).
- 50 AAD 12T looked in 1 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for the production of supersymmetric particles decaying into final states with missing transverse momentum and exactly two isolated leptons (e or μ). Opposite-sign and same-sign dilepton events were separately studied. Additionally, in opposite-sign events, a search was made for an excess of same-flavor over different-flavor lepton pairs. No excess over the expected background is observed and limits are placed on the effective production cross section of opposite-sign dilepton events with $\cancel{E}_T > 250$ GeV and on same-sign dilepton events with $\cancel{E}_T > 100$ GeV. The latter limit is interpreted in a simplified electroweak gaugino production model as a lower chargino mass limit.
- 51 CHATRCHYAN 11B looked in 35 pb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with an isolated lepton (e or μ), a photon and \cancel{E}_T which may arise in a generalized gauge mediated model from the decay of Wino-like NLSPs. No evidence for an excess over the expected background is observed. Limits are derived in the plane of squark/gluino mass versus Wino mass (see Fig. 4). Mass degeneracy of the produced squarks and gluinos is assumed.
- 52 CHATRCHYAN 11V looked in 35 pb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with ≥ 3 isolated leptons (e , μ or τ), with or without jets and \cancel{E}_T . No evidence for an excess over the expected background is observed. Limits are derived in the CMSSM ($m_0, m_{1/2}$) plane for $\tan\beta = 3$ (see Fig. 5).

Long-lived $\tilde{\chi}^\pm$ (Chargino) mass limit

Limits on charginos which leave the detector before decaying.

- 1 AABOUD 19AT searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for metastable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Results are interpreted in terms of direct electroweak production of long-lived charginos in the context of mAMSB scenarios. Chargino masses are excluded at 95% C.L. below 1090 GeV. See their Figure 10 (right).
- 2 AABOUD 18AS searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of long-lived charginos in the context of AMSB or phenomenological MSSM scenarios with wino-like LSP. Events with a disappearing track due to a low-momentum pion accompanied by at least one jet with high transverse momentum from initial-state radiation are considered. No significant excess above the Standard Model expectations is observed. Exclusion limits are set at 95% confidence level on the mass of charginos for different chargino lifetimes. For a pure wino with a lifetime of about 0.2 ns, corresponding to a mass-splitting between the charged and neutral wino of around 160 MeV, chargino masses up to 460 GeV are excluded, see their Fig. 8.
- 3 SIRUNYAN 18BR searched in 38.4 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of long-lived charginos in events containing isolated tracks with missing hits in the outer layer of the silicon tracker and little or no associated calorimetric energy deposits (disappearing tracks). No significant excess above the Standard Model expectations is observed. In an AMSB context, limits are set on the cross section of direct chargino production through $pp \rightarrow \tilde{\chi}^{\pm} \tilde{\chi}^{\mp}$ and $pp \rightarrow \tilde{\chi}^{\pm} \tilde{\chi}_1^0$, assuming $\text{BR}(\tilde{\chi}^{\pm} \rightarrow \tilde{\chi}_1^0 \pi^{\pm}) = 100\%$, as a function of the chargino mass and mean proper lifetime, see Figures 3, 4 and 5.
- 4 AAD 15AE searched in 19.1 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ALTAS muon system. In the absence of an excess of events above the expected backgrounds, limits are set on stable charginos, see Fig. 10.
- 5 AAD 15BM searched in 18.4 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for stable and metastable non-relativistic charged particles through their anomalous specific ionization energy loss in the ATLAS pixel detector. In absence of an excess of events above the expected backgrounds, limits are set on stable charginos (see Table 5) and on metastable charginos decaying to $\tilde{\chi}_1^0 \pi^{\pm}$, see Fig. 11.
- 6 AAD 13H searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for direct electroweak production of long-lived charginos in the context of AMSB scenarios. The search is based on the signature of a high-momentum isolated track with few associated hits in the outer part of the tracking system, arising from a chargino decay into a neutralino and a low-momentum pion. The p_T spectrum of the tracks was found to be consistent with the SM expectations. Constraints on the lifetime and the production cross section were obtained, see Fig. 6. In the minimal AMSB framework with $\tan\beta = 5$, and $\mu > 0$, a chargino having a mass below 103 (85) GeV for a chargino-neutralino mass splitting $\Delta m_{\tilde{\chi}_1^{\pm}} = 160$ (170) MeV is excluded at the 95% C.L. See Fig. 7 for more precise bounds.
- 7 AAD 12BJ looked in 1.02 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for signatures of decaying charginos resulting in isolated tracks with few associated hits in the outer region of the tracking system. The p_T spectrum of the tracks was found to be consistent with the SM expectations. Constraints on the lifetime and the production cross section were obtained. In the minimal AMSB framework with $m_{3/2} < 32$ TeV, $m_0 < 1.5$ TeV, $\tan\beta = 5$, and $\mu > 0$, a chargino having a mass below 92 GeV and a lifetime between 0.5 ns and 2 ns is excluded at the 95% C.L. See their Fig. 8 for more precise bounds.
- 8 ABAZOV 09M searched in 1.1 fb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for events with direct production of a pair of charged massive stable particles identified by their TOF. The number of the observed events is consistent with the predicted background. The data are used to constrain the production cross section as a function of the $\tilde{\chi}_1^{\pm}$ mass, see their Fig. 2. The quoted limit improves to 206 GeV for gaugino-like charginos.
- 9 ABBIENDI 03L used e^+e^- data at $\sqrt{s} = 130$ –209 GeV to select events with two high momentum tracks with anomalous dE/dx . The excluded cross section is compared to the theoretical expectation as a function of the heavy particle mass in their Fig. 3. The bounds are valid for colorless fermions with lifetime longer than 10^{-6} s. Supersedes the results from ACKERSTAFF 98P.
- 10 ABREU 00T searches for the production of heavy stable charged particles, identified by their ionization or Cherenkov radiation, using data from $\sqrt{s} = 130$ to 189 GeV. These limits include and update the results of ABREU 98P.
- 11 KHACHATRYAN 15AB searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing tracks with little or no associated calorimeter energy deposits and with missing hits in the outer layers of the tracking system (disappearing-track signature). Such disappearing tracks can result from the decay of charginos that are nearly mass degenerate with the lightest neutralino. The number of observed events is in agreement with the background expectation. Limits are set on the cross section of electroweak chargino production in terms of the chargino mass and mean proper lifetime, see Fig. 4. In the minimal AMSB model, a chargino mass below 260 GeV is excluded at 95% C.L., see their Fig. 5.
- 12 KHACHATRYAN 15O searched in 18.8 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for evidence of long-lived charginos in the context of AMSB and pMSSM scenarios. The results are based on a previously published search for heavy stable charged particles at 7 and 8 TeV. In the minimal AMSB framework with $\tan\beta = 5$ and $\mu \geq 0$, constraints on the chargino mass and lifetime were placed, see Fig. 5. Charginos with a mass below 800 (100) GeV are excluded at the 95% C.L. for lifetimes above 100 ns (3 ns). Constraints are also placed on the pMSSM parameter space, see Fig. 3.
- 13 KHACHATRYAN 15W searched in up to 20.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for evidence of long-lived neutralinos produced through $\tilde{q}\tilde{q}$ -pair production, with $\tilde{q} \rightarrow q\tilde{\chi}^0$ and $\tilde{\chi}^0 \rightarrow \ell^+ \ell^- \nu$ (RPV: $\lambda_{121}, \lambda_{122} \neq 0$). 95% C.L. exclusion limits on cross section times branching ratio are set as a function of mean proper decay length of the neutralino, see Figs. 6 and 9.
- 14 AAD 13BD searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing tracks with no associated hits in the outer region of the tracking system resulting from the decay of charginos that are nearly mass degenerate with the lightest neutralino, as is often the case in AMSB scenarios. No significant excess above the background expectation is observed for candidate tracks with large transverse momentum. Constraints on chargino properties are obtained and in the minimal AMSB model, a chargino mass below 270 GeV is excluded at 95% C.L., see their Fig. 7.
- 15 ABAZOV 13b looked in 6.3 fb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for charged massive long-lived particles in events with muon-like particles that have both speed and ionization energy loss inconsistent with muons produced in beam collisions. In the absence of an excess, limits are set at 95% C.L. on gaugino- and higgsino-like charginos, see their Table 20 and Fig. 23.

$\tilde{\nu}$ (Sneutrino) mass limit

The limits may depend on the number, $N(\tilde{\nu})$, of sneutrinos assumed to be degenerate in mass. Only $\tilde{\nu}_L$ (not $\tilde{\nu}_R$) is assumed to exist. It is possible that $\tilde{\nu}$ could be the lightest supersymmetric particle (LSP).

We report here, but do not include in the Listings, the limits obtained from the fit of the final results obtained by the LEP Collaborations on the invisible width of the Z boson ($\Delta\Gamma_{\text{inv.}} < 2.0$ MeV, LEP-SLC 06): $m_{\tilde{\nu}} > 43.7$ GeV ($N(\tilde{\nu})=1$) and $m_{\tilde{\nu}} > 44.7$ GeV ($N(\tilde{\nu})=3$).

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 1 AABOUD 18CM searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for heavy particles decaying into an $e\mu$, $e\tau$, $\mu\tau$ final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings. For $\tilde{\nu}_\tau \rightarrow e\mu$, masses below 3.4 TeV are excluded at 95% CL, see their Figure 4(b). Upper limits on the RPV couplings $|\lambda_{312}|$ versus $|\lambda'_{311}|$ are also performed, see their Figure 8(a-b).
- 2 AABOUD 18CM searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for heavy particles decaying into an $e\mu$, $e\tau$, $\mu\tau$ final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings. For $\tilde{\nu}_\tau \rightarrow e\tau$, masses below 2.9 TeV are excluded at 95% CL, see their Figure 5(b). Upper limits on the RPV couplings $|\lambda_{313}|$ versus $|\lambda'_{311}|$ are also performed, see their Figure 8(c).
- 3 AABOUD 18CM searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for heavy particles decaying into an $e\mu$, $e\tau$, $\mu\tau$ final state. No significant deviation from the expected SM background is observed. Limits are set on the mass of a stau neutrino with R-parity-violating couplings. For $\tilde{\nu}_\tau \rightarrow \mu\tau$, masses below 2.6 TeV are excluded at 95% CL, see their Figure 6(b). Upper limits on the RPV couplings $|\lambda_{323}|$ versus $|\lambda'_{311}|$ are also performed, see their Figure 8(d).

Searches Particle Listings

Supersymmetric Particle Searches

- 4 AABOUD 18z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{133} to charged leptons, see their Figures 7, 8.
- 5 SIRUNYAN 18AT searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for heavy resonances decaying into $e\mu$ final states. No significant excess above the Standard Model expectation is observed and 95% C.L. exclusions are placed on the cross section times branching ratio for the R-parity-violating production and decay of a supersymmetric tau sneutrino, see their Fig. 3.
- 6 AABOUD 16P searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with different flavour dilepton pairs ($e\mu, e\tau, \mu\tau$) from the production of $\tilde{\nu}_\tau$ via an RPV λ'_{311} coupling and followed by a decay via $\lambda_{312} = \lambda_{321} = 0.07$ for $e + \mu$, via $\lambda_{313} = \lambda_{331} = 0.07$ for $e + \tau$ and via $\lambda_{323} = \lambda_{332} = 0.07$ for $\mu + \tau$. No evidence for a dilepton resonance over the SM expectation is observed, and limits are derived on $m_{\tilde{\nu}_\tau}$ at 95% CL, see their Figs. 2(b), 3(b), 4(b), and Table 3.
- 7 AAD 14x searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the sneutrino mass in an R-parity violating simplified model where the decay $\tilde{\nu}_\tau \rightarrow \nu \tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$, takes place with a branching ratio of 100%, see Fig. 9.
- 8 AAD 11z looked in 1.07 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with one electron and one muon of opposite charge from the production of $\tilde{\nu}_\tau$ via an RPV λ'_{311} coupling and followed by a decay via λ_{312} into $e + \mu$. No evidence for an (e, μ) resonance over the SM expectation is observed, and a limit is derived in the plane of λ'_{311} versus $m_{\tilde{\nu}_\tau}$ for three values of λ_{312} , see their Fig. 2. Masses $m_{\tilde{\nu}_\tau} < 1.32 (1.45) \text{ TeV}$ are excluded for $\lambda'_{311} = 0.10$ and $\lambda_{312} = 0.05 (\lambda'_{311} = 0.11$ and $\lambda_{312} = 0.07)$.
- 9 ABDALLAH 03M uses data from $\sqrt{s} = 192\text{--}208 \text{ GeV}$ to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays) and for sleptons. These limits are valid for values of $M_2 < 1 \text{ TeV}$, $|\mu| \leq 1 \text{ TeV}$ with the $\tilde{\chi}_1^0$ as LSP. The quoted limit is obtained when there is no mixing in the third family. See Fig. 43 for the mass limits as a function of $\tan\beta$. These limits update the results of ABREU 00w.
- 10 HEISTER 02N derives a bound on $m_{\tilde{\nu}_e}$ by exploiting the mass relation between the $\tilde{\nu}_e$ and \tilde{e} , based on the assumption of universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 and the search described in the \tilde{e} section. In the MSUGRA framework with radiative electroweak symmetry breaking, the limit improves to $m_{\tilde{\nu}_e} > 130 \text{ GeV}$, assuming a trilinear coupling $A_0=0$ at the GUT scale. See Figs. 5 and 7 for the dependence of the limits on $\tan\beta$.
- 11 DECAMP 2J limit is from $\Gamma(\text{invisible})/\Gamma(\ell\ell) = 5.91 \pm 0.15$ ($N_p = 2.97 \pm 0.07$).
- 12 SIRUNYAN 19A0 searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two same-sign muons and at last two jets, originating from resonant production of second-generation sleptons ($\tilde{\mu}_L, \tilde{\nu}_\mu$) via the R-parity violating coupling λ_{211} to quarks. No significant excess above the Standard Model expectations is observed. Upper limits on cross sections are derived in the context of two simplified models, see their Figure 4. The cross section limits are translated into limits on λ'_{211} for a modified CMSSM, see their Figure 5.
- 13 KHACHATRYAN 16BE searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of narrow resonances decaying into $e\mu$ final states. No significant excess above the Standard Model expectation is observed and 95% C.L. exclusions are placed on the cross section times branching ratio for the production of an R-parity-violating supersymmetric tau sneutrino, see their Fig. 3.
- 14 AAD 15o searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of heavy particles decaying into $e\mu, e\tau$ or $\mu\tau$ final states. No significant excess above the Standard Model expectation is observed, and 95% C.L. exclusions are placed on the cross section times branching ratio for the production of an R-parity-violating supersymmetric tau sneutrino, applicable to any sneutrino flavour, see their Fig. 2.
- 15 AAD 13AI searched in 4.6 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for evidence of heavy particles decaying into $e\mu, e\tau$ or $\mu\tau$ final states. No significant excess above the Standard Model expectation is observed, and 95% C.L. exclusions are placed on the cross section times branching ratio for the production of an R-parity-violating supersymmetric tau sneutrino, see their Fig. 2. For couplings $\lambda'_{311} = 0.10$ and $\lambda_{33k} = 0.05$, the lower limits on the $\tilde{\nu}_\tau$ mass are 1610, 1110, 1100 GeV in the $e\mu, e\tau$, and $\mu\tau$ channels, respectively.
- 16 AAD 11H looked in 35 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with one electron and one muon of opposite charge from the production of $\tilde{\nu}_\tau$ via an RPV λ'_{311} coupling and followed by a decay via λ_{312} into $e + \mu$. No evidence for an excess over the SM expectation is observed, and a limit is derived in the plane of λ'_{311} versus $m_{\tilde{\nu}_\tau}$ for several values of λ_{312} , see their Fig. 2. Superseded by AAD 11z.
- 17 AALTONEN 10Z searched in 1 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events from the production $d\bar{d} \rightarrow \tilde{\nu}_\tau$ with the subsequent decays $\tilde{\nu}_\tau \rightarrow e\mu, \mu\tau, e\tau$ in the MSSM framework with RPV. Two isolated leptons of different flavor and opposite charges are required, with τ s identified by their hadronic decay. No statistically significant excesses are observed over the SM background. Upper limits on λ'_{311} times the branching ratio are listed in their Table III for various $\tilde{\nu}_\tau$ masses. Limits on the cross section times branching ratio for $\lambda'_{311} = 0.10$ and $\lambda_{33k} = 0.05$, displayed in Fig. 2, are used to set limits on the $\tilde{\nu}_\tau$ mass of 558 GeV for the $e\mu$, 441 GeV for the $\mu\tau$ and 442 GeV for the $e\tau$ channels.
- 18 ABAZOV 10M looked in 5.3 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ for events with exactly one pair of high p_T isolated $e\mu$ and a veto against hard jets. No evidence for an excess over the SM expectation is observed, and a limit at 95% C.L. on the cross section times branching ratio is derived, see their Fig. 3. These limits are translated into limits on couplings as a function of $m_{\tilde{\nu}_\tau}$ as shown in their Fig. 4. As an example, for $m_{\tilde{\nu}_\tau} = 100 \text{ GeV}$ and $\lambda_{312} \leq 0.07$, couplings $\lambda'_{311} > 7.7 \times 10^{-4}$ are excluded.
- 19 ABDALLAH 04H use data from LEP 1 and $\sqrt{s} = 192\text{--}208 \text{ GeV}$. They re-use results or re-analyze the data from ABDALLAH 03M to put limits on the parameter space of anomaly-mediated supersymmetry breaking (AMSB), which is scanned in the region $1 < m_{3/2} < 50 \text{ TeV}$, $0 < m_0 < 1000 \text{ GeV}$, $1.5 < \tan\beta < 35$, both signs of μ . The constraints

are obtained from the searches for mass degenerate chargino and neutralino, for SM-like and invisible Higgs, for leptonically decaying charginos and from the limit on non-SM Z width of 3.2 MeV. The limit is for $m_t = 174.3 \text{ GeV}$ (see Table 2 for other m_t values). The limit improves to 114 GeV for $\mu < 0$.

20 ADRIANI 93M limit from $\Delta\Gamma(Z)(\text{invisible}) < 16.2 \text{ MeV}$.

21 ALEXANDER 91F limit is for one species of $\tilde{\nu}$ and is derived from $\Gamma(\text{invisible, new})/\Gamma(\ell\ell) < 0.38$.

Charged sleptons

This section contains limits on charged scalar leptons ($\tilde{\ell}$, with $\ell=e,\mu,\tau$). Studies of width and decays of the Z boson (use is made here of $\Delta\Gamma_{\text{inv}} < 2.0 \text{ MeV}$, LEP 00) conclusively rule out $m_{\tilde{\ell}_R} < 40 \text{ GeV}$ (41 GeV for $\tilde{\ell}_L$), independently of decay modes, for each individual slepton. The limits improve to 43 GeV (43.5 GeV for $\tilde{\ell}_L$) assuming all 3 flavors to be degenerate. Limits on higher mass sleptons depend on model assumptions and on the mass splitting $\Delta m = m_{\tilde{\ell}} - m_{\tilde{\chi}_1^0}$. The mass and composition

of $\tilde{\chi}_1^0$ may affect the selectron production rate in e^+e^- collisions through t -channel exchange diagrams. Production rates are also affected by the potentially large mixing angle of the lightest mass eigenstate $\tilde{\ell}_1 = \tilde{\ell}_R \sin\theta_{\tilde{\ell}} + \tilde{\ell}_L \cos\theta_{\tilde{\ell}}$. It is generally assumed that only $\tilde{\tau}$ may have significant mixing. The coupling to the Z vanishes for $\theta_{\tilde{\ell}}=0.82$. In the high-energy limit of e^+e^- collisions the interference between γ and Z exchange leads to a minimal cross section for $\theta_{\tilde{\ell}}=0.91$, a value which is sometimes used in the following entries relative to data taken at LEP2. When limits on $m_{\tilde{\ell}_R}$ are quoted, it is understood that limits on $m_{\tilde{\ell}_L}$ are usually at least as strong.

Possibly open decays involving gauginos other than $\tilde{\chi}_1^0$ will affect the detection efficiencies. Unless otherwise stated, the limits presented here result from the study of $\tilde{\ell}^+\tilde{\ell}^-$ production, with production rates and decay properties derived from the MSSM. Limits made obsolete by the recent analyses of e^+e^- collisions at high energies can be found in previous Editions of this Review.

For decays with final state gravitinos (\tilde{G}), $m_{\tilde{G}}$ is assumed to be negligible relative to all other masses.

R-parity conserving \tilde{e} (Selectron) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

1 SIRUNYAN 19AW searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak pair production of selectrons or smuons in events with two leptons (electrons or muons) of the opposite electric charge and same flavour, no jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the selectron mass assuming left-handed, right-handed or both left- and right-handed (mass degenerate) production, see their Figure 6. Similarly, limits are set on the smuon mass, see their Figure 7. Limits are also set on slepton masses under the assumption that the selectron and smuon are mass degenerate, see their Figure 5.

- 2 AABOUD 18BT searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass up to 500 GeV for massless $\tilde{\chi}_1^0$, assuming degeneracy of \tilde{e} , $\tilde{\mu}$, and $\tilde{\tau}$ and exploiting the 2ℓ signature, see their Figure 8(b).
- 3 AABOUD 18R searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in slepton pair production models with a fourfold degeneracy assumed in selectron and smuon masses. The \tilde{e} masses are excluded up to 190 GeV for $m_{\tilde{e}} - m_{\tilde{\chi}_1^0} = 5$ GeV. The exclusion limits extend down to mass splittings of 1 GeV, see their Fig. 11.
- 4 CHATRCHYAN 14R searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in a stau (N)NLSP simplified model (GMSB) where the decay $\tilde{e} \rightarrow e^\pm \tau^\pm \mp \tilde{G}$ takes place with a branching ratio of 100%, see Fig. 8.
- 5 AAD 13B searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for sleptons decaying to a final state with two leptons (e and μ) and missing transverse energy. No excess beyond the Standard Model expectation is observed. Limits are derived in a simplified model of direct left-handed slepton pair production, where left-handed slepton masses between 85 and 195 GeV are excluded at 95% C.L. for $m_{\tilde{\chi}_1^0} = 20$ GeV. See also Fig. 2(a). Exclusion limits are also derived in the phenomenological MSSM, see Fig. 3.
- 6 ABBIENDI 04 search for $\tilde{e}_R \tilde{e}_R$ production in acoplanar di-electron final states in the 183–208 GeV data. See Fig. 13 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ and for the limit at $\tan\beta=35$. This limit supersedes ABBIENDI 00g.
- 7 ACHARD 04 search for $\tilde{e}_R \tilde{e}_L$ and $\tilde{e}_R \tilde{e}_R$ production in single- and acoplanar di-electron final states in the 192–209 GeV data. Absolute limits on $m_{\tilde{e}_R}$ are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 , $1 \leq \tan\beta \leq 60$ and $-2 \leq \mu \leq 2$ TeV. See Fig. 4 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$. This limit supersedes ACCIARRI 99w.
- 8 ABDALLAH 03M looked for acoplanar dielectron + \cancel{E}_T final states at $\sqrt{s} = 189$ –208 GeV. The limit assumes $\mu = -200$ GeV and $\tan\beta = 1.5$ in the calculation of the production cross section and $B(\tilde{e} \rightarrow e \tilde{\chi}_1^0)$. See Fig. 15 for limits in the $(m_{\tilde{e}_R}, m_{\tilde{\chi}_1^0})$ plane. These limits include and update the results of ABREU 01.
- 9 ABDALLAH 03M uses data from $\sqrt{s} = 192$ –208 GeV to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays) and for sleptons. These limits are valid for values of $M_2 < 1$ TeV, $|\mu| \leq 1$ TeV with the $\tilde{\chi}_1^0$ as LSP. The quoted limit is obtained when there is no mixing in the third family. See Fig. 43 for the mass limits as a function of $\tan\beta$. These limits update the results of ABREU 00w.
- 10 HEISTER 02E looked for acoplanar dielectron + \cancel{E}_T final states from e^+e^- interactions between 183 and 209 GeV. The mass limit assumes $\mu < -200$ GeV and $\tan\beta = 2$ for the production cross section and $B(\tilde{e} \rightarrow e \tilde{\chi}_1^0) = 1$. See their Fig. 4 for the dependence of the limit on Δm . These limits include and update the results of BARATE 01.
- 11 HEISTER 02N search for $\tilde{e}_R \tilde{e}_L$ and $\tilde{e}_R \tilde{e}_R$ production in single- and acoplanar di-electron final states in the 183–208 GeV data. Absolute limits on $m_{\tilde{e}_R}$ are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 , $1 \leq \tan\beta \leq 50$ and $-10 \leq \mu \leq 10$ TeV. The region of small $|\mu|$, where cascade decays are important, is covered by a search for $\tilde{\chi}_1^0 \tilde{\chi}_3^0$ in final states with leptons and possibly photons. Limits on $m_{\tilde{e}_L}$ are derived by exploiting the mass relation between the \tilde{e}_L and \tilde{e}_R , based on universal m_0 and $m_{1/2}$. When the constraint from the mass limit of the lightest Higgs from HEISTER 02 is included, the bounds improve to $m_{\tilde{e}_R} > 77(75)$ GeV and $m_{\tilde{e}_L} > 115(115)$ GeV for a top mass of 175(180) GeV. In the MSUGRA framework with radiative electroweak symmetry breaking, the limits improve further to $m_{\tilde{e}_R} > 95$ GeV and $m_{\tilde{e}_L} > 152$ GeV, assuming a trilinear coupling $A_0 = 0$ at the GUT scale. See Figs. 4, 5, 7 for the dependence of the limits on $\tan\beta$.
- 12 AAD 14G searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of slepton pairs, decaying to a final state with two leptons (e and μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of slepton pair production, see Fig. 8. An interpretation in the pMSSM is also given, see Fig. 10.
- 13 KHACHATRYAN 14I searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of slepton pairs decaying to a final state with opposite-sign lepton pairs (e or μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Fig. 18.

R-parity violating \tilde{e} (Selectron) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- 1 AABOUD 18z searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1nA/Tn1nB/Tn1nC, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{133} to charged leptons, see their Figures 7, 8.
- 2 AAD 14x searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in an R-parity violating simplified model where the decay $\tilde{e} \rightarrow \ell \tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$, takes place with a branching ratio of 100%, see Fig. 9.
- 3 ABBIENDI 04F use data from $\sqrt{s} = 189$ –209 GeV. They derive limits on sparticle masses under the assumption of RPV with $LL\tilde{E}$ or $LQ\tilde{D}$ couplings. The results are valid for $\tan\beta = 1.5$, $\mu = -200$ GeV, with, in addition, $\Delta m > 5$ GeV for indirect decays via $LQ\tilde{D}$. The limit quoted applies to direct decays via $LL\tilde{E}$ or $LQ\tilde{D}$ couplings. For indirect decays, the limits on the \tilde{e}_R mass are respectively 99 and 92 GeV for $LL\tilde{E}$ and $LQ\tilde{D}$ couplings and $m_{\tilde{\chi}_1^0} = 10$ GeV and degrade slightly for larger $\tilde{\chi}_1^0$ mass. Supersedes the results of ABBIENDI 00.
- 4 ABDALLAH 04M use data from $\sqrt{s} = 192$ –208 GeV to derive limits on sparticle masses under the assumption of RPV with $LL\tilde{E}$ or $UD\tilde{D}$ couplings. The results are valid for $\mu = -200$ GeV, $\tan\beta = 1.5$, $\Delta m > 5$ GeV and assuming a BR of 1 for the given decay. The limit quoted is for indirect $UD\tilde{D}$ decays using the neutralino constraint of 39.5 GeV for $LL\tilde{E}$ and of 38.0 GeV for $UD\tilde{D}$ couplings, also derived in ABDALLAH 04M. For indirect decays via $LL\tilde{E}$ the limit improves to 95 GeV if the constraint from the neutralino is used and to 94 GeV if it is not used. For indirect decays via $UD\tilde{D}$ couplings it remains unchanged when the neutralino constraint is not used. Supersedes the result of ABREU 00u.

- 1 SIRUNYAN 19AW searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak pair production of selectrons or smuons in events with two leptons (electrons or muons) of the opposite electric charge and same flavour, no jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the selectron mass assuming left-handed, right-handed or both left- and right-handed (mass degenerate) production, see their Figure 6. Similarly, limits are set on the smuon mass, see their Figure 7. Limits are also set on slepton masses under the assumption that the selectron and smuon are mass degenerate, see their Figure 5.
- 2 AABOUD 18R searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for electroweak production in scenarios with compressed mass spectra in final states with two low-momentum leptons and missing transverse momentum. The data are found to be consistent with the SM prediction. Results are interpreted in slepton pair production models with a fourfold degeneracy assumed in selectron and smuon masses. The $\tilde{\mu}$ masses are excluded up to 190 GeV for $m_{\tilde{\mu}} - m_{\tilde{\chi}_1^0} = 5$ GeV. The exclusion limits extend down to mass splittings of 1 GeV, see their Fig. 11.
- 3 CHATRCHYAN 14R searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in a stau (N)NLSP simplified model (GMSB) where the decay $\tilde{e} \rightarrow \ell^\pm \tau^\pm \mp \tilde{G}$ takes place with a branching ratio of 100%, see Fig. 8.
- 4 AAD 13B searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for sleptons decaying to a final state with two leptons (e and μ) and missing transverse energy. No excess beyond

Supersymmetric Particle Searches

the Standard Model expectation is observed. Limits are derived in a simplified model of direct left-handed slepton pair production, where left-handed slepton masses between 85 and 195 GeV are excluded at 95% C.L. for $m_{\tilde{\chi}_1^0} = 20$ GeV. See also Fig. 2(a). Exclusion limits are also derived in the phenomenological MSSM, see Fig. 3.

⁵ ABBIENDI 04 search for $\tilde{\mu}_R \tilde{\mu}_R$ production in acoplanar di-muon final states in the 183–208 GeV data. See Fig. 14 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ and for the

limit at $\tan\beta=35$. Under the assumption of 100% branching ratio for $\tilde{\mu}_R \rightarrow \mu \tilde{\chi}_1^0$, the limit improves to 94.0 GeV for $\Delta m > 4$ GeV. See Fig. 11 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ at several values of the branching ratio. This limit supersedes ABBIENDI 00G.

⁶ ACHARD 04 search for $\tilde{\mu}_R \tilde{\mu}_R$ production in acoplanar di-muon final states in the 192–209 GeV data. Limits on $m_{\tilde{\mu}_R}$ are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 , $1 \leq \tan\beta \leq 60$ and $-2 \leq \mu \leq 2$ TeV. See Fig. 4 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$. This limit supersedes ACCIARRI 99W.

⁷ ABDALLAH 03M looked for acoplanar dimuon + \cancel{E} final states at $\sqrt{s} = 189$ –208 GeV. The limit assumes $B(\tilde{\mu} \rightarrow \mu \tilde{\chi}_1^0) = 100\%$. See Fig. 16 for limits on the $(m_{\tilde{\mu}_R}, m_{\tilde{\chi}_1^0})$ plane. These limits include and update the results of ABREU 01.

⁸ ABDALLAH 03M uses data from $\sqrt{s} = 192$ –208 GeV to obtain limits in the framework of the MSSM with gaugino and sfermion mass universality at the GUT scale. An indirect limit on the mass is derived by constraining the MSSM parameter space by the results from direct searches for neutralinos (including cascade decays) and for sleptons. These limits are valid for values of $M_2 < 1$ TeV, $|\mu| \leq 1$ TeV with the $\tilde{\chi}_1^0$ as LSP. The quoted limit is obtained when there is no mixing in the third family. See Fig. 43 for the mass limits as a function of $\tan\beta$. These limits update the results of ABREU 00W.

⁹ HEISTER 02E looked for acoplanar dimuon + \cancel{E}_T final states from e^+e^- interactions between 183 and 209 GeV. The mass limit assumes $B(\tilde{\mu} \rightarrow \mu \tilde{\chi}_1^0) = 1$. See their Fig. 4 for the dependence of the limit on Δm . These limits include and update the results of BARATE 01.

¹⁰ AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass up to 500 GeV for massless $\tilde{\chi}_1^0$, assuming degeneracy of \tilde{e} , $\tilde{\mu}$, and $\tilde{\tau}$ and exploiting the 2ℓ signature, see their Figure 8(b).

¹¹ AAD 14G searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of slepton pairs, decaying to a final state with two leptons (e and μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models of slepton pair production, see Fig. 8. An interpretation in the pMSSM is also given, see Fig. 10.

¹² KHACHATRYAN 14i searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for electroweak production of slepton pairs decaying to a final state with opposite-sign lepton pairs (e or μ) and missing transverse momentum. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in simplified models, see Fig. 18.

¹³ ABREU 00v use data from $\sqrt{s} = 130$ –189 GeV to search for tracks with large impact parameter or visible decay vertices. Limits are obtained as function of $m_{\tilde{G}}$, after combining these results with the search for slepton pair production in the SUGRA framework from ABREU 01 to cover prompt decays and on stable particle searches from ABREU 00G. For limits at different $m_{\tilde{G}}$, see their Fig. 12.

¹ AABOUD 18z searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{133} to charged leptons, see their Figures 7, 8.

² AAD 14x searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass in an R-parity violating simplified model where the decay $\tilde{\ell} \rightarrow \ell \tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^{\pm} \tilde{\ell} \nu$, takes place with a branching ratio of 100%, see Fig. 9.

³ SIRUNYAN 19A0 searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for events containing two same-sign muons and at last two jets, originating from resonant production of second-generation sleptons ($\tilde{\mu}_L, \tilde{\nu}_\mu$) via the R-parity violating coupling λ'_{211} to quarks. No significant excess above the Standard Model expectations is observed. Upper limits on cross sections are derived in the context of two simplified models, see their Figure 4. The cross section limits are translated into limits on λ'_{211} for a modified CMSSM, see their Figure 5.

⁴ ABDALLAH 04M use data from $\sqrt{s} = 192$ –208 GeV to derive limits on sparticle masses under the assumption of RPV with $LL\bar{E}$ or $U\bar{D}\bar{D}$ couplings. The results are valid for μ

$= -200$ GeV, $\tan\beta = 1.5$, $\Delta m \geq 5$ GeV and assuming a BR of 1 for the given decay. The limit quoted is for indirect $U\bar{D}\bar{D}$ decays using the neutralino constraint of 39.5 GeV for $LL\bar{E}$ and of 38.0 GeV for $U\bar{D}\bar{D}$ couplings, also derived in ABDALLAH 04M. For indirect decays via $LL\bar{E}$ the limit improves to 90 GeV if the constraint from the neutralino is used and remains at 87 GeV if it is not used. For indirect decays via $U\bar{D}\bar{D}$ couplings it degrades to 85 GeV when the neutralino constraint is not used. Supersedes the result of ABREU 00U.

⁵ HEISTER 03G searches for the production of smuons in the case of RPV prompt decays with $LL\bar{E}$, $LQ\bar{D}$ or $U\bar{D}\bar{D}$ couplings at $\sqrt{s} = 189$ –209 GeV. The search is performed for direct and indirect decays, assuming one coupling at a time to be non-zero. The limit holds for direct decays mediated by RPV $LQ\bar{D}$ couplings and improves to 90 GeV for indirect decays (for $\Delta m > 10$ GeV). Limits are also given for $LL\bar{E}$ direct ($m_{\tilde{\mu}_R} > 87$ GeV) and indirect decays ($m_{\tilde{\mu}_R} > 96$ GeV for $m(\tilde{\chi}_1^0) > 23$ GeV from BARATE 98s) and for $U\bar{D}\bar{D}$ indirect decays ($m_{\tilde{\mu}_R} > 85$ GeV for $\Delta m > 10$ GeV). Supersedes the results from BARATE 01b.

R-parity conserving $\tilde{\tau}$ (Stau) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

¹ ABBIENDI 04 search for $\tilde{\tau}\tilde{\tau}$ production in acoplanar di-tau final states in the 183–208 GeV data. See Fig. 15 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ and for the limit

at $\tan\beta=35$. Under the assumption of 100% branching ratio for $\tilde{\tau}_R \rightarrow \tau \tilde{\chi}_1^0$, the limit improves to 89.8 GeV for $\Delta m > 8$ GeV. See Fig. 12 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$ at several values of the branching ratio and for their dependence on θ_r . This limit supersedes ABBIENDI 00G.

² ACHARD 04 search for $\tilde{\tau}\tilde{\tau}$ production in acoplanar di-tau final states in the 192–209 GeV data. Limits on $m_{\tilde{\tau}_R}$ are derived from a scan over the MSSM parameter space with universal GUT scale gaugino and scalar masses $m_{1/2}$ and m_0 , $1 \leq \tan\beta \leq 60$ and $-2 \leq \mu \leq 2$ TeV. See Fig. 4 for the dependence of the limits on $m_{\tilde{\chi}_1^0}$.

³ ABDALLAH 03M looked for acoplanar ditau + \cancel{E} final states at $\sqrt{s} = 130$ –208 GeV. A dedicated search was made for low mass $\tilde{\tau}$ s decoupling from the Z^0 . The limit assumes $B(\tilde{\tau} \rightarrow \tau \tilde{\chi}_1^0) = 100\%$. See Fig. 20 for limits on the $(m_{\tilde{\tau}}, m_{\tilde{\chi}_1^0})$ plane and as function

of the $\tilde{\chi}_1^0$ mass and of the branching ratio. The limit in the low-mass region improves to 29.6 and 31.1 GeV for $\tilde{\tau}_R$ and $\tilde{\tau}_L$, respectively, at $\Delta m > m_{\tilde{\tau}}$. The limit in the high-mass region improves to 84.7 GeV for $\tilde{\tau}_R$ and $\Delta m > 15$ GeV. These limits include and update the results of ABREU 01.

⁴ HEISTER 02E looked for acoplanar ditau + \cancel{E}_T final states from e^+e^- interactions between 183 and 209 GeV. The mass limit assumes $B(\tilde{\tau} \rightarrow \tau \tilde{\chi}_1^0) = 1$. See their Fig. 4 for the dependence of the limit on Δm . These limits include and update the results of BARATE 01.

⁵ AABOUD 18BT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13$ TeV for direct electroweak production of charginos, chargino and next-to-lightest neutralinos and sleptons in events with two or three leptons (electrons or muons), with or without jets, and large missing transverse energy. No significant excess above the Standard Model expectations is observed. Limits are set on the slepton mass up to 500 GeV for massless $\tilde{\chi}_1^0$, assuming degeneracy of \tilde{e} , $\tilde{\mu}$, and $\tilde{\tau}$ and exploiting the 2ℓ signature, see their Figure 8(b).

⁶ KHACHATRYAN 17L searched in about 19 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for events with two τ (at least one decaying hadronically) and \cancel{E}_T . Results were interpreted to set constraints on the cross section for production of $\tilde{\tau}_L$ pairs for $m_{\tilde{\chi}_1^0} = 1$ GeV. No mass constraints are set, see their Fig. 7.

⁷ AAD 16AA summarized and extended ATLAS searches for electroweak supersymmetry in final states containing several charged leptons, \cancel{E}_T , with or without hadronic jets, in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV. The paper reports 95% C.L. exclusion limits on the cross-section for production of $\tilde{\tau}_R$ and $\tilde{\tau}_L$ pairs for various $m_{\tilde{\chi}_1^0}$, using the 2 hadronic $\tau + \cancel{E}_T$ analysis. The $m_{\tilde{\tau}_{R/L}} = 109$ GeV is excluded for $m_{\tilde{\chi}_1^0} = 0$ GeV, with the constraints being stronger for $\tilde{\tau}_R$. See their Fig. 12.

⁸ AAD 12AF searched in 2 fb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for events with two tau leptons, jets and large \cancel{E}_T in a GMSB framework. No significant excess above the expected background was found and an upper limit on the visible cross section for new phenomena is set. A 95% C.L. lower limit of 32 TeV on the mGMSB breaking scale A is set for $M_{\text{mess}} = 250$ TeV, $N_5 = 3$, $\mu > 0$ and $C_{\text{grav}} = 1$, independent of $\tan\beta$.

See key on page 999

Searches Particle Listings Supersymmetric Particle Searches

- ⁹ AAD 12AG searched in 2.05 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with at least one hadronically decaying tau lepton, jets, and large E_T in a GMSB framework. No significant excess above the expected background was found and an upper limit on the visible cross section for new phenomena is set. A 95% C.L. lower limit of 30 TeV on the mGMSB breaking scale Λ is set for $M_{mess} = 250$ TeV, $N_S = 3$, $\mu > 0$ and $C_{grav} = 1$, independent of $\tan\beta$. For large values of $\tan\beta$, the limit on Λ increases to 43 TeV.
- ¹⁰ AAD 12CM searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with at least one tau lepton, zero or one additional light lepton (e/μ) jets, and large E_T in a GMSB framework. No significant excess above the expected background was found and an upper limit on the visible cross section for new phenomena is set. A 95% C.L. lower limit of 54 TeV on the mGMSB breaking scale Λ is set for $M_{mess} = 250$ TeV, $N_S = 3$, $\mu > 0$ and $C_{grav} = 1$, for $\tan\beta > 20$. Here the $\tilde{\tau}_1$ is the NLSP.
- ¹¹ ABBIENDI 06B use 600 pb⁻¹ of data from $\sqrt{s} = 189$ –209 GeV. They look for events from pair-produced staus in a GMSB scenario with $\tilde{\tau}$ NLSP including prompt $\tilde{\tau}$ decays to ditau + \cancel{E} final states, large impact parameters, kinked tracks and heavy stable charged particles. Limits on the cross-section are computed as a function of $m(\tilde{\tau})$ and the lifetime, see their Fig. 7. The limit is compared to the $\sigma \cdot BR^2$ from a scan over the GMSB parameter space.
- ¹² ABDALLAH 04H use data from LEP 1 and $\sqrt{s} = 192$ –208 GeV. They re-use results or re-analyze the data from ABDALLAH 03M to put limits on the parameter space of anomaly-mediated supersymmetry breaking (AMSB), which is scanned in the region $1 < m_{3/2} < 50$ TeV, $0 < m_0 < 1000$ GeV, $1.5 < \tan\beta < 35$, both signs of μ . The constraints are obtained from the searches for mass degenerate chargino and neutralino, for SM-like and invisible Higgs, for leptonically decaying charginos and from the limit on non-SM Z width of 3.2 MeV. The limit is for $m_{\tilde{t}} = 174.3$ GeV (see Table 2 for other $m_{\tilde{t}}$ values). The limit improves to 75 GeV for $\mu < 0$.

R-parity violating $\tilde{\tau}$ (Stau) mass limit

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- ¹ AABOUD 18z searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing four or more charged leptons (electrons, muons and up to two hadronically decaying taus). No significant deviation from the expected SM background is observed. Limits are set on the Higgsino mass in simplified models of general gauge mediated supersymmetry Tn1n1A/Tn1n1B/Tn1n1C, see their Figure 9. Limits are also set on the wino, slepton, sneutrino and gluino mass in a simplified model of NLSP pair production with R-parity violating decays of the LSP via λ_{12k} or λ_{133} to charged leptons, see their Figures 7, 8.
- ² ABBIENDI 04F use data from $\sqrt{s} = 189$ –209 GeV. They derive limits on sparticle masses under the assumption of RPV with $LL\tilde{E}$ or $LQ\tilde{D}$ couplings. The results are valid for $\tan\beta = 1.5$, $\mu = -200$ GeV, with, in addition, $\Delta m > 5$ GeV for indirect decays via $LQ\tilde{D}$. The limit quoted applies to direct decays with $LL\tilde{E}$ couplings and improves to 75 GeV for $LQ\tilde{D}$ couplings. The limit on the $\tilde{\tau}_R$ mass for indirect decays is 92 GeV for $LL\tilde{E}$ couplings at $m_{\tilde{\chi}_1^0} = 10$ GeV and no exclusion is obtained for $LQ\tilde{D}$ couplings. Supersedes the results of ABBIENDI 00.
- ³ ABDALLAH 04M use data from $\sqrt{s} = 192$ –208 GeV to derive limits on sparticle masses under the assumption of RPV with $LL\tilde{E}$ couplings. The results are valid for $\mu = -200$ GeV, $\tan\beta = 1.5$, $\Delta m > 5$ GeV and assuming a BR of 1 for the given decay. The limit quoted is for indirect decays using the neutralino constraint of 39.5 GeV, also derived in ABDALLAH 04M. For indirect decays via $LL\tilde{E}$ the limit decreases to 86 GeV if the constraint from the neutralino is not used. Supersedes the result of ABREU 00U.

Long-lived $\tilde{\ell}$ (Slepton) mass limit

Limits on scalar leptons which leave detector before decaying. Limits from Z decays are independent of lepton flavor. Limits from continuum e^+e^- annihilation are also independent of flavor for smuons and staus. Selection limits from e^+e^- collisions in the continuum depend on MSSM parameters because of the additional neutralino exchange contribution.

- ¹ AABOUD 19AT searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for metastable and stable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Results are interpreted in terms of exclusion limits on long-lived stau in the context of GMSB models. Lower limits on the mass for direct production of staus are set at 430 GeV, see their Fig. 10 (left).
- ² KHACHATRYAN 16BW searched in 2.5 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with heavy stable charged particles, identified by their anomalously high energy deposits in the silicon tracker and/or long time-of-flight measurements by the muon system. No evidence for an excess over the expected background is observed. Limits are derived for pair production of tau sleptons as a function of mass, depending on their direct or inclusive production in a minimal GMSB scenario along the Snowmass Points and Slopes (SPS) line 7, see Fig. 4 and Table 7.
- ³ AAD 15AE searched in 19.1 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ATLAS muon system. In the absence of an excess of events above the expected backgrounds, limits are set on stable $\tilde{\tau}$ sleptons in various scenarios, see Figs. 5–7.
- ⁴ AAIJ 15BD searched in 3.0 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ and 8 TeV for evidence of Drell-Yan pair production of long-lived $\tilde{\tau}$ particles. No evidence for such particles is observed and 95% C.L. upper limits on the cross section of $\tilde{\tau}$ pair production are derived, see Fig. 7. In the mGMSB, assuming the SP57 benchmark scenario $\tilde{\tau}$ masses between 124 and 309 GeV are excluded at 95% C.L.
- ⁵ ABBIENDI 03L used e^+e^- data at $\sqrt{s} = 130$ –209 GeV to select events with two high momentum tracks with anomalous dE/dx . The excluded cross section is compared to the theoretical expectation as a function of the heavy particle mass in their Fig. 3. The limit improves to 98.5 GeV for $\tilde{\mu}_L$ and $\tilde{\tau}_L$. The bounds are valid for colorless spin 0 particles with lifetimes longer than 10^{-6} s. Supersedes the results from ACKERSTAFF 98P.
- ⁶ ABREU 00Q searches for the production of pairs of heavy, charged stable particles in e^+e^- annihilation at $\sqrt{s} = 130$ –189 GeV. The upper bound improves to 88 GeV for $\tilde{\mu}_L, \tilde{\tau}_L$. These limits include and update the results of ABREU 98P.
- ⁷ ACCIARRI 99H searched for production of pairs of back-to-back heavy charged particles at $\sqrt{s} = 130$ –183 GeV. The upper bound improves to 82.2 GeV for $\tilde{\mu}_L, \tilde{\tau}_L$.
- ⁸ The BARATE 98k mass limit improves to 82 GeV for $\tilde{\mu}_L, \tilde{\tau}_L$. Data collected at $\sqrt{s} = 161$ –184 GeV.
- ⁹ AAD 13AA searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events containing long-lived massive particles in a GMSB framework. No significant excess above the expected background was found. A 95% C.L. lower limit of 300 GeV is placed on long-lived $\tilde{\tau}$'s in the GMSB model with $M_{mess} = 250$ TeV, $N_S = 3$, $\mu > 0$, for $\tan\beta = 5$ –20. The lower limit on the GMSB breaking scale Λ was found to be 99–110 TeV, for $\tan\beta$ values between 5 and 40, see Fig. 4 (top). Also, directly produced long-lived sleptons, or sleptons decaying to long-lived ones, are excluded at 95% C.L. up to a $\tilde{\tau}$ mass of 278 GeV for models with slepton splittings smaller than 50 GeV.
- ¹⁰ ABAZOV 13b looked in 6.3 fb⁻¹ of pp collisions at $\sqrt{s} = 1.96$ TeV for charged massive long-lived particles in events with muon-like particles that have both speed and ionization energy loss inconsistent with muons produced in beam collisions. In the absence of an excess, limits are set at 95% C.L. on the production cross section of stau leptons in the mass range 100–300 GeV, see their Table 20 and Fig. 23.
- ¹¹ CHATRCHYAN 13AB looked in 5.0 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV and in 18.8 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with heavy stable particles, identified by their anomalous dE/dx in the tracker and additionally requiring that it be identified as muon in the muon chambers, from pair production of $\tilde{\tau}_1$'s. No evidence for an excess over the expected background is observed. Supersedes CHATRCHYAN 12L.
- ¹² CHATRCHYAN 13AB limits are derived for pair production of $\tilde{\tau}_1$ as a function of mass in minimal GMSB scenarios along the Snowmass Points and Slopes (SPS) line 7 (see Fig. 8 and Table 7). The limit given here is valid for direct pair $\tilde{\tau}_1$ production.
- ¹³ CHATRCHYAN 13AB limits are derived for the production of $\tilde{\tau}_1$ as a function of mass in minimal GMSB scenarios along the Snowmass Points and Slopes (SPS) line 7 (see Fig. 8 and Table 7). The limit given here is valid for the production of $\tilde{\tau}_1$ from both direct pair production and from the decay of heavier supersymmetric particles.
- ¹⁴ CHATRCHYAN 12L looked in 5.0 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with heavy stable particles, identified by their anomalous dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of $\tilde{\tau}_1$'s. No evidence for an excess over the expected background is observed. Limits are derived for the production of $\tilde{\tau}_1$ as a function of mass in minimal GMSB scenarios along the Snowmass Points and Slopes (SPS) line 7 (see Fig. 3). The limit given here is valid for the production of $\tilde{\tau}_1$ in the decay of heavier supersymmetric particles.
- ¹⁵ AAD 11P looked in 37 pb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with two heavy stable particles, reconstructed in the Inner tracker and the Muon System and identified by their time of flight in the Muon System. No evidence for an excess over the SM expectation is observed. Limits on the mass are derived, see Fig. 3, for $\tilde{\tau}$ in a GMSB scenario and for sleptons produced by electroweak processes only, in which case the limit degrades to 110 GeV.

\tilde{q} (Squark) mass limit

For $m_{\tilde{q}} > 60\text{--}70$ GeV, it is expected that squarks would undergo a cascade decay via a number of neutralinos and/or charginos rather than undergo a direct decay to photinos as assumed by some papers. Limits obtained when direct decay is assumed are usually higher than limits when cascade decays are included.

Limits from e^+e^- collisions depend on the mixing angle of the lightest mass eigenstate $\tilde{q}_1 = \tilde{q}_R \sin\theta_q + \tilde{q}_L \cos\theta_q$. It is usually assumed that only the sbottom and stop squarks have non-trivial mixing angles (see the stop and sbottom sections). Here, unless otherwise noted, squarks are always taken to be either left/right degenerate, or purely of left or right type. Data from Z decays have set squark mass limits above 40 GeV, in the case of $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ decays if $\Delta m = m_{\tilde{q}} - m_{\tilde{\chi}_1^0} \gtrsim 5$ GeV. For smaller values of Δm , current constraints on the invisible width of the Z ($\Delta\Gamma_{\text{inv}} < 2.0$ MeV, LEP 00) exclude $m_{\tilde{u}_{L,R}} < 44$ GeV, $m_{\tilde{d}_R} < 33$ GeV, $m_{\tilde{d}_L} < 44$ GeV and, assuming all squarks degenerate, $m_{\tilde{q}} < 45$ GeV.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- ¹ SIRUNYAN 19AG searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with two photons and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4B simplified model and on the squark mass in the Tsqk4B simplified model, see their Figure 3.
- ² SIRUNYAN 19CH searched in 137 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 simplified models, see their Figure 14.
- ³ SIRUNYAN 19K searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with a photon, an electron or muon, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tch1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.
- ⁴ AABOUD 18BJ searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk2 model in case of $m_{\tilde{\chi}_1^0} = 1$ GeV: for any $m_{\tilde{\chi}_2^0}$, squark masses below 1200 GeV are excluded, see their Fig. 14(b).
- ⁵ AABOUD 18BV searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one jet identified as c-jet, large missing transverse energy and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tsqk1 models considering only \tilde{c}_1 . In scenarios with massless neutralinos, scharm masses below 850 GeV are excluded. If the differences of the \tilde{c}_1 and $\tilde{\chi}_1^0$ masses is below 100 GeV, scharm masses below 500 GeV are excluded. See their Fig. 6 and Fig. 7.
- ⁶ AABOUD 18I searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one jet with a transverse momentum above 250 GeV and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tsqk1 models. In the compressed scenario with similar squark and neutralino masses, squark masses below 710 GeV are excluded. See their Fig. 10(b).
- ⁷ AABOUD 18U searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results are interpreted in terms of lower limits on the masses of squark in Tsqk4B models. Masses below 1820 GeV are excluded for any NLSP mass, see their Fig. 9.
- ⁸ AABOUD 18V searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk1 model: squark masses below 1550 GeV are excluded for massless LSP, see their Fig. 13(a).
- ⁹ AABOUD 18V searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk3 model. Assuming that $m_{\tilde{\chi}_1^\pm} = 0.5 (m_{\tilde{q}} + m_{\tilde{\chi}_1^0})$, squark masses below 1150 GeV are excluded for massless LSP, see their Fig. 14(a). Exclusions are also shown assuming $m_{\tilde{\chi}_1^0} = 60$ GeV, see their Fig. 14(b).
- ¹⁰ SIRUNYAN 18AA searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one photon and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking (GGM) scenario with bino-like $\tilde{\chi}_1^\pm$ and wino-like $\tilde{\chi}_1^0$ and $\tilde{\chi}_2^0$, see Figure 7. Limits are also set on the NLSP mass in the Tch1n1A and Tch1ch1A simplified models, see their Figure 8. Finally, limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, see their Figure 9, and on the squark mass in the Tsqk4A and Tsqk4B simplified models, see their Figure 10.
- ¹¹ SIRUNYAN 18AY searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing one or more jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range 10^{-3} mm < $c\tau$ < 10⁵ mm, see their Figure 4.

- ¹² AABOUD 17AR searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with one isolated lepton, at least two jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.25 TeV are set on the 1st and 2nd generation squark masses in Tsqk3 simplified models, with $x = (m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}) / (m_{\tilde{q}} - m_{\tilde{\chi}_1^0}) = 1/2$. Similar limits are obtained for variable x and fixed neutralino mass, $m_{\tilde{\chi}_1^0} = 60$ GeV. See their Figure 13.
- ¹³ AABOUD 17N searched in 14.7 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with 2 same-flavour, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. The results are interpreted as 95% C.L. limits in Tsqk2 models, assuming $m_{\tilde{\chi}_1^0} = 0$ GeV and $m_{\tilde{\chi}_2^0} = 600$ GeV. See their Fig. 12 for exclusion limits as a function of $m_{\tilde{\chi}_2^0}$.
- ¹⁴ KHACHATRYAN 17P searched in 2.3 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- ¹⁵ KHACHATRYAN 17V searched in 2.3 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with two photons and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino and squark mass in the context of general gauge mediation models Tglu4B and Tsqk4, see their Fig. 4.
- ¹⁶ SIRUNYAN 17AY searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one photon, jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, and on the squark mass in the Tsqk4A and Tsqk4B simplified models, see their Figure 6.
- ¹⁷ SIRUNYAN 17AZ searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tsqk1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb0t1 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- ¹⁸ SIRUNYAN 17P searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, Tglu3A and Tglu3D simplified models, see their Fig. 12. Limits are also set on the squark mass in the Tsqk1 simplified model, on the stop mass in the Tstop1 simplified model, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 13.
- ¹⁹ AABOUD 16D searched in 3.2 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with an energetic jet and large missing transverse momentum. The results are interpreted as 95% C.L. limits on masses of first and second generation squarks decaying into a quark and the lightest neutralino in scenarios with $m_{\tilde{q}} - m_{\tilde{\chi}_1^0} < 25$ GeV. See their Fig. 6.
- ²⁰ AABOUD 16N searched in 3.2 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing hadronic jets, large \cancel{E}_T , and no electrons or muons. No significant excess above the Standard Model expectations is observed. First- and second-generation squark masses below 1030 GeV are excluded at the 95% C.L. decaying to quarks and a massless lightest neutralino. See their Fig. 7a.
- ²¹ KHACHATRYAN 16BS searched in 2.3 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one energetic jet, no isolated leptons, and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the squark mass in the Tsqk1 simplified model, both in the assumption of a single light squark and of 8 degenerate squarks, see Fig. 11 and Table 3.
- ²² AAD 15BV summarized and extended ATLAS searches for gluinos and first- and second-generation squarks in final states containing jets and missing transverse momentum, with or without leptons or b-jets in the $\sqrt{s} = 8$ TeV data set collected in 2012. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the squark mass in several R-parity conserving models. See their Figs. 9, 11, 18, 22, 24, 27, 28.
- ²³ AAD 15CS searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for evidence of pair production of squarks, decaying into a quark and a neutralino, where a photon was radiated either from an initial-state quark, from an intermediate squark, or from a final-state quark. No evidence was found for an excess above the expected level of Standard Model background and a 95% C.L. exclusion limit was set on the squark mass as a function of the squark-neutralino mass difference, see Fig. 19.
- ²⁴ AAD 15K searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing at least two jets, where the two leading jets are each identified as originating from c-quarks, and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the mass of superpartners of charm quarks (\tilde{c}). Assuming that the decay $\tilde{c} \rightarrow c \tilde{\chi}_1^0$ takes place 100% of the time, a scalar charm mass below 490 GeV is excluded for $m_{\tilde{\chi}_1^0} < 200$ GeV. For more details, see their Fig. 2.
- ²⁵ KHACHATRYAN 15AF searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least two energetic jets and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the squark mass in simplified models where the decay $\tilde{q} \rightarrow q \tilde{\chi}_1^0$ takes place with a branching ratio of 100%, both for the case of a single light squark or 8 degenerate squarks, see Fig. 12. See also Table 5. Exclusions in the CMSSM, assuming $\tan\beta = 30$, $A_0 = -2 \max(m_0, m_{1/2})$ and $\mu > 0$, are also presented, see Fig. 15.
- ²⁶ AAD 14AE searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for strongly produced supersymmetric particles in events containing jets and large missing transverse momentum, and no electrons or muons. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing squarks that decay via $\tilde{q} \rightarrow q \tilde{\chi}_1^0$, where either a single light state or two degenerate generations of squarks are assumed, see Fig. 10.
- ²⁷ CHATRCHYAN 14AH searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and

Searches Particle Listings

Supersymmetric Particle Searches

- R^2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on squark masses in simplified models where the decay $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 28. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- 28 CHATRCHYAN 14i searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multijets and large \cancel{E}_T . No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing squarks that decay via $\tilde{q} \rightarrow q\tilde{\chi}_1^0$, where either a single light state or two degenerate generations of squarks are assumed, see Fig. 7a.
- 29 AAD 13l searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for the production of squarks and gluinos in events containing jets, missing transverse momentum and no high- p_T electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 1360 GeV at 95% C.L. In a simplified model containing only squarks of the first two generations, a gluino octet and a massless neutralino, squark masses below 1320 GeV are excluded at 95% C.L. for gluino masses below 2 TeV. See Figures 10–15 for more precise bounds.
- 30 AAD 13q searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing a high- p_T isolated photon, at least one jet identified as originating from a bottom quark, and high missing transverse momentum. Such signatures may originate from supersymmetric models with gauge-mediated supersymmetry breaking in events in which one of a pair of higgsino-like neutralinos decays into a photon and a gravitino while the other decays into a Higgs boson and a gravitino. No significant excess above the expected background was found and limits were set on the squark mass as a function of the neutralino mass in a generalized GMSB model (GGM) with a higgsino-like neutralino NLSP, see their Fig. 4. For neutralino masses greater than 220 GeV, squark masses below 1020 GeV are excluded at 95% C.L.
- 31 CHATRCHYAN 13 looked in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two opposite-sign leptons (e, μ, τ), jets and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in the mSUGRA/CMSSM model with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, see Fig. 6.
- 32 CHATRCHYAN 13c searched in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for the production of squarks and gluinos in events containing $0, 1, 2, \geq 3$ b -jets, missing transverse momentum and no electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$, and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 1250 GeV at 95% C.L. Exclusions are also derived in various simplified models, see Fig. 7.
- 33 CHATRCHYAN 13h searched in 4.96 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two photons, ≥ 4 jets and low \cancel{E}_T due to $\tilde{q} \rightarrow \gamma\tilde{\chi}_1^0$ decays in a stealth SUSY framework, where the $\tilde{\chi}_1^0$ decays through a singlino (\tilde{S}) intermediate state to $\gamma S\tilde{G}$, with the singlet state S decaying to two jets. No significant excess above the expected background was found and limits were set in a particular R -parity conserving stealth SUSY model. The model assumes $m_{\tilde{\chi}_1^0} = 0.5 m_{\tilde{q}}$, $m_S = 100 \text{ GeV}$ and $m_S = 90 \text{ GeV}$. Under these assumptions, squark masses less than 1430 GeV were excluded at the 95% C.L.
- 34 CHATRCHYAN 13t searched in 11.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the α_T variable to discriminate between processes with genuine and misreconstructed \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on squark masses in simplified models where the decay $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, assuming an eightfold degeneracy of the masses of the first two generation squarks, see Fig. 8 and Table 9. Also limits in the case of a single light squark are given.
- 35 AAD 12ax searched in 1.04 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for supersymmetry in events containing jets, missing transverse momentum and one isolated electron or muon. No excess over the expected SM background is observed and model-independent limits are set on the cross section of new physics contributions to the signal regions. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 820 GeV at 95% C.L. Limits are also set on simplified models for squark production and decay via an intermediate chargino and on supersymmetric models with bilinear R -parity violation. Supersedes AAD 11g.
- 36 AAD 12c searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing one or more isolated leptons (electrons or muons), jets and \cancel{E}_T . The observations are in good agreement with the SM expectations and exclusion limits have been set in number of SUSY models. In the mSUGRA/CMSSM model with $\tan\beta = 10$, $A_0 = 0$, and $\mu > 0$, 95% C.L. exclusion limits have been derived for $m_{\tilde{q}} < 1200 \text{ GeV}$, assuming equal squark and gluino masses. In minimal GMSB, values of the effective SUSY breaking scale $\Lambda < 50 \text{ TeV}$ are excluded at 95% C.L. for $\tan\beta < 45$. Also exclusion limits in a number of simplified models have been presented, see Figs. 10 and 12.
- 37 AAD 12cp searched in 4.8 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two photons and large \cancel{E}_T due to $\tilde{\chi}_1^0 \rightarrow \gamma\tilde{G}$ decays in a GMSB framework. No significant excess above the expected background was found and limits were set on the squark mass as a function of the neutralino mass in a generalized GMSB model (GGM) with a bino-like neutralino NLSP. The other sparticle masses were decoupled, $\tan\beta = 2$ and $c\tau_{NLSP} < 0.1 \text{ mm}$. Also, in the framework of the SPS8 model, a 95% C.L. lower limit was set on the breaking scale Λ of 196 TeV.
- 38 AAD 12w searched in 1.04 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for the production of squarks and gluinos in events containing jets, missing transverse momentum and no electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 950 GeV at 95% C.L. In a simplified model containing only squarks of the first two generations, a gluino octet and a massless neutralino, squark masses below 875 GeV are excluded at 95% C.L.
- 39 CHATRCHYAN 12 looked in 35 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with e and/or μ and/or jets, a large total transverse energy, and \cancel{E}_T . The event selection is based on the dimensionless razor variable R , related to the \cancel{E}_T and M_R , an indicator of the heavy particle mass scale. No evidence for an excess over the expected background is observed. Limits are derived in the CMSSM ($m_0, m_{1/2}$) plane for $\tan\beta = 3, 10$ and 50 (see Fig. 7 and 8). Limits are also obtained for Simplified Model Spectra.
- 40 CHATRCHYAN 12ae searched in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least three jets and large missing transverse momentum. No significant excesses over the expected SM backgrounds are observed and 95% C.L. limits on the production cross section of squarks in a scenario where $\tilde{q} \rightarrow q\tilde{\chi}_1^0$ with a 100% branching ratio, see Fig. 3. For $m_{\tilde{\chi}_1^0} < 200 \text{ GeV}$, values of $m_{\tilde{q}}$ below 760 GeV are excluded at 95% C.L. Also limits in the CMSSM are presented, see Fig. 2.
- 41 CHATRCHYAN 12at searched in 4.73 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for the production of squarks and gluinos in events containing jets, missing transverse momentum and no electrons or muons. No excess over the expected SM background is observed. In mSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks with masses below 1110 GeV are excluded at 95% C.L. Squarks and gluinos of equal mass are excluded for masses below 1180 GeV at 95% C.L. Exclusions are also derived in various simplified models, see Fig. 6.
- 42 AABOU 18v searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tsqk5 model. Squark masses below 1100 GeV are excluded if $(m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0})/(m_{\tilde{q}} - m_{\tilde{\chi}_1^0}) < 0.95$ and $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$, see their Fig. 16(a).
- 43 KHACHATRYAN 16bt performed a global Bayesian analysis of a wide range of CMS results obtained with data samples corresponding to 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The set of searches considered, both individually and in combination, includes those with all-hadronic final states, same-sign and opposite-sign dileptons, and multi-lepton final states. An interpretation was given in a scan of the 19-parameter pMSSM. No scan points with a gluino mass less than 500 GeV survived and 98% of models with a squark mass less than 300 GeV were excluded.
- 44 AAD 15ai searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing at least one isolated lepton (electron or muon), jets, and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the squark masses in the CMSSM/mSUGRA, see Fig. 15, in the NUHMG, see Fig. 16, and in various simplified models, see Figs. 19–21.
- 45 KHACHATRYAN 15ar searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing jets, either a charged lepton or a photon, and low missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the squark mass in a stealth SUSY model where the decays $\tilde{q} \rightarrow q\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow \tilde{S} W^\pm$, $\tilde{S} \rightarrow S\tilde{G}$ and $S \rightarrow gg$, with $m_S = 100 \text{ GeV}$ and $m_S = 90 \text{ GeV}$, take place with a branching ratio of 100%. See Fig. 6 for γ or Fig. 7 for e^\pm analyses.
- 46 KHACHATRYAN 15az searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with either at least one photon, hadronic jets and \cancel{E}_T (single photon channel) or with at least two photons and at least one jet and using the razor variables. No significant excess above the Standard Model expectations is observed. Limits are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for both a bino-like and wino-like neutralino NLSP scenario, see Fig. 8 and 9.
- 47 AAD 14e searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilizes jets originating from b -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5 and 6. In the $\tilde{q} \rightarrow q'\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_2^0$, $\tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = 0.5 m_{\tilde{\chi}_2^0} + m_{\tilde{g}}$, $m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^\pm} + m_{\tilde{\chi}_1^\pm})$. In the $\tilde{q} \rightarrow q'\tilde{\chi}_1^\pm$ or $\tilde{q} \rightarrow q'\tilde{\chi}_2^0$, $\tilde{\chi}_1^\pm \rightarrow e^\pm \nu_{\chi_1^0}$ or $\tilde{\chi}_2^0 \rightarrow e^\pm e^\mp (\nu\nu)\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^\pm} + m_{\tilde{q}})$, $m_{\tilde{\chi}_2^0} < 460 \text{ GeV}$. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- 48 CHATRCHYAN 13ao searched in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with two opposite-sign isolated leptons accompanied by hadronic jets and \cancel{E}_T . No significant excesses over the expected SM backgrounds are observed and 95% C.L. exclusion limits are derived in the mSUGRA/CMSSM model with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, see Fig. 8.
- 49 CHATRCHYAN 13av searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for new heavy particle pairs decaying into jets (possibly b -tagged), leptons and \cancel{E}_T using the Razor variables. No significant excesses over the expected SM backgrounds are observed and 95% C.L. exclusion limits are derived in the mSUGRA/CMSSM model with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, see Fig. 3. The results are also interpreted in various simplified models, see Fig. 4.
- 50 CHATRCHYAN 13w searched in 4.93 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with one or more photons, hadronic jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on squark masses in the general gauge-mediated SUSY breaking model (GGM), for both a wino-like and bino-like neutralino NLSP scenario, see Fig. 5.
- 51 DREINER 12a reassesses constraints from CMS (at 7 TeV, $\sim 4.4 \text{ fb}^{-1}$) under the assumption that the first and second generation squarks and the lightest SUSY particle are quasi-degenerate in mass (compressed spectrum).
- 52 DREINER 12a reassesses constraints from CMS (at 7 TeV, $\sim 4.4 \text{ fb}^{-1}$) under the assumption that the first and second generation squarks, the gluino, and the lightest SUSY particle are quasi-degenerate in mass (compressed spectrum).

- 1 SIRUNYAN 18ea searched in 38.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of resonances, each decaying to at least four quarks. Reconstructed particles are clustered into two large jets of similar mass, each consistent with four-parton substructure. No statistically significant excess over the Standard Model expectation is observed. Limits are set on the squark and gluino mass in RPV supersymmetry models where squarks (gluinos) decay, through intermediate higgsinos, to four (five) quarks, see their Figure 4.

- ² KHACHATRYAN 16BX searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 4 leptons coming from R-parity-violating decays of $\tilde{\chi}_1^0 \rightarrow \ell\ell\nu$ with $\lambda_{121} \neq 0$ or $\lambda_{122} \neq 0$. No excess over the expected background is observed. Limits are derived on the gluino, squark and stop masses, see Fig. 23.
- ³ AAD 15CB searched for events containing at least one long-lived particle that decays at a significant distance from its production point (displaced vertex, DV) into two leptons or into five or more charged particles in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The dilepton signature is characterised by DV formed from at least two lepton candidates. Four different final states were considered for the multitrack signature, in which the DV must be accompanied by a high-transverse momentum muon or electron candidate that originates from the DV, jets or missing transverse momentum. No events were observed in any of the signal regions. Results were interpreted in SUSY scenarios involving R-parity violation, split supersymmetry, and gauge mediation. See their Fig. 14–20.
- ⁴ AAD 12AX searched in 1.04 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for supersymmetry in events containing jets, missing transverse momentum and one isolated electron or muon. No excess over the expected SM background is observed and model-independent limits are set on the cross section of new physics contributions to the signal regions. In MSUGRA/CMSSM models with $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, squarks and gluinos of equal mass are excluded for masses below 820 GeV at 95% C.L. Limits are also set on simplified models for squark production and decay via an intermediate chargino and on supersymmetric models with bilinear R-parity violation. Supersedes AAD 11G.
- ⁵ CHATRCHYAN 12AL looked in 4.98 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for anomalous production of events with three or more isolated leptons. Limits on squark and gluino masses are set in RPV SUSY models with leptonic $L\tilde{L}E$ couplings, $\lambda_{123} > 0.05$, and hadronic $U\tilde{D}\tilde{D}$ couplings, $\lambda_{112}^U > 0.05$, see their Fig. 5. In the $U\tilde{D}\tilde{D}$ case the leptons arise from supersymmetric cascade decays. A very specific supersymmetric spectrum is assumed. All decays are prompt.

Long-lived \tilde{q} (Squark) mass limit

The following are bounds on long-lived scalar quarks, assumed to hadronise into hadrons with lifetime long enough to escape the detector prior to a possible decay. Limits may depend on the mixing angle of mass eigenstates: $\tilde{q}_1 = \tilde{q}_L \cos\theta_q + \tilde{q}_R \sin\theta_q$.

The coupling to the Z^0 boson vanishes for up-type squarks when $\theta_u = 0.98$, and for down type squarks when $\theta_d = 1.17$.

¹ AABOUD 19AT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for metastable and stable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Sbottom R-hadrons are excluded at 95% C.L. for masses below 1250 GeV . Less stringent constraints are achieved with the muon-spectrometer agnostic analysis. See their Figure 9 (bottom-left).

² AABOUD 19AT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for metastable and stable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Stop R-hadrons are excluded at 95% C.L. for masses below 1340 GeV . Similar constraints are achieved with the muon-spectrometer agnostic analysis. See their Figure 9 (bottom-right).

³ SIRUNYAN 19BH searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles decaying into jets, with each long-lived particle having a decay vertex well displaced from the production vertex. The selected events are found to be consistent with standard model predictions. Limits are set on the gluino mass in a GMSB model where the gluino is decaying via $\tilde{g} \rightarrow g\tilde{g}$, see their Figure 4 and in an RPV model of supersymmetry where the gluino is decaying via $\tilde{g} \rightarrow \tilde{t}\tilde{b}$, see their Figures 5. Limits are also set on the stop mass in two RPV models, see their Figure 6 (for $\tilde{t} \rightarrow b\tilde{l}$ decays) and Figure 7 (for $\tilde{t} \rightarrow \tilde{d}\tilde{d}$ decays).

⁴ AABOUD 16B searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived R-hadrons using observables related to large ionization losses and slow propagation velocities, which are signatures of heavy charged particles traveling significantly slower than

the speed of light. Exclusion limits at 95% C.L. are set on the long-lived sbottom masses exceeding 805 GeV . See their Fig. 5.

⁵ AABOUD 16B searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived R-hadrons using observables related to large ionization losses and slow propagation velocities, which are signatures of heavy charged particles traveling significantly slower than the speed of light. Exclusion limits at 95% C.L. are set on the long-lived stop masses exceeding 890 GeV . See their Fig. 5.

⁶ KHACHATRYAN 16BW searched in 2.5 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with heavy stable charged particles, identified by their anomalously high energy deposits in the silicon tracker and/or long time-of-flight measurements by the muon system. No evidence for an excess over the expected background is observed. Limits are derived for pair production of top squarks as a function of mass, depending on the interaction model, see Fig. 4 and Table 7.

⁷ AAD 15AE searched in 19.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ALTAS muon system. In the absence of an excess of events above the expected backgrounds, limits are set R-hadrons in various scenarios, see Fig. 11. Limits are also set in LeptoSUSY models where the gluino decays to stable 300 GeV leptons, see Fig. 9.

⁸ AAD 15BM searched in 18.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for stable and metastable non-relativistic charged particles through their anomalously specific ionization energy loss in the ATLAS pixel detector. In absence of an excess of events above the expected backgrounds, limits are set on stable bottom and top squark R-hadrons, see Table 5.

⁹ KHACHATRYAN 15AK looked in a data set corresponding to fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$, and a search interval corresponding to 281 h of trigger lifetime, for long-lived particles that have stopped in the CMS detector. No evidence for an excess over the expected background in a cloud interaction model is observed. Assuming the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and lifetimes between $1 \mu\text{s}$ and 1000 s , limits are derived on \tilde{t} production as a function of $m_{\tilde{\chi}_1^0}$, see Figs. 4 and 7. The exclusions require that $m_{\tilde{\chi}_1^0}$ is kinematically consistent with the minimum values of the jet energy thresholds used.

¹⁰ AAD 13AA searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing colored long-lived particles that hadronize forming R-hadrons. No significant excess above the expected background was found. Long-lived R-hadrons containing a \tilde{t} are excluded for masses up to 683 GeV at 95% C.L. in a general interaction model. Also, limits independent of the fraction of R-hadrons that arrive charged in the muon system were derived, see Fig. 6.

¹¹ AAD 13AA searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing colored long-lived particles that hadronize forming R-hadrons. No significant excess above the expected background was found. Long-lived R-hadrons containing a \tilde{b} are excluded for masses up to 612 GeV at 95% C.L. in a general interaction model. Also, limits independent of the fraction of R-hadrons that arrive charged in the muon system were derived, see Fig. 6.

¹² AAD 13BC searched in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 22.9 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for bottom squark R-hadrons that have come to rest within the ATLAS calorimeter and decay at some later time to hadronic jets and a neutralino. In absence of an excess of events above the expected backgrounds, limits are set on sbottom masses for the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$, for different lifetimes, and for a neutralino mass of 100 GeV , see their Table 6 and Fig. 10.

¹³ AAD 13BC searched in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 22.9 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for bottom squark R-hadrons that have come to rest within the ATLAS calorimeter and decay at some later time to hadronic jets and a neutralino. In absence of an excess of events above the expected backgrounds, limits are set on stop masses for the decay $\tilde{t} \rightarrow t\tilde{\chi}_1^0$, for different lifetimes, and for a neutralino mass of 100 GeV , see their Table 6 and Fig. 10.

¹⁴ CHATRCHYAN 13AB looked in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 18.8 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with heavy stable particles, identified by their anomalous dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of \tilde{t}_1 's. No evidence for an excess over the expected background is observed. Limits are derived for pair production of stops as a function of mass in the cloud interaction model (see Fig. 8 and Table 6). In the charge-suppressed model, the limit decreases to 818 GeV .

\tilde{b} (Sbottom) mass limit

Limits in e^+e^- depend on the mixing angle of the mass eigenstate $\tilde{b}_1 = \tilde{b}_L \cos\theta_b + \tilde{b}_R \sin\theta_b$. Coupling to the Z vanishes for $\theta_b \sim 1.17$. As a consequence, no absolute constraint in the mass region $\lesssim 40 \text{ GeV}$ is available in the literature at this time from e^+e^- collisions. In the Listings below, we use $\Delta m = m_{\tilde{b}_1} - m_{\tilde{\chi}_1^0}$.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics C38 070001 (2014) (<http://pdg.lbl.gov>).

- 11 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 700 GeV are set on the bottom squark mass in Tsb02 simplified models assuming $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$. See their Figure 4(d).
- 12 AABOUD 17AX searched in 36 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of bottom squarks. In the Tsb01 simplified model, a \tilde{b}_1 mass below 950 GeV is excluded for $m_{\tilde{\chi}_1^0} = 0$ (<420) GeV. See their Fig. 7(a).
- 13 AABOUD 17AX searched in 36 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum, with or without leptons. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of bottom squarks. Assuming 50% BR for Tsb01 and Tsb02 simplified models, a \tilde{b}_1 mass below 880 (860) GeV is excluded for $m_{\tilde{\chi}_1^0} = 0$ (<250) GeV. See their Fig. 7(b).
- 14 KHACHATRYAN 17A searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two forward jets, produced through vector boson fusion, and missing transverse momentum. No significant excess above the Standard Model expectations is observed. A limit is set on sbottom masses in the Tsb01 simplified model, see Fig. 3.
- 15 KHACHATRYAN 17AW searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least three charged leptons, in any combination of electrons and muons, and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, and on the sbottom mass in the Tsb02 simplified model, see their Figure 4.
- 16 KHACHATRYAN 17P searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb01 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- 17 SIRUANYAN 17AZ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tsqk1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb01 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- 18 SIRUANYAN 17K searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct production of stop or sbottom pairs in events with multiple jets and significant \cancel{E}_T . A second search also requires an isolated lepton and is combined with the all-hadronic search. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop8 and Tstop4 simplified models, see their Figures 7, 8 and 9 (for the Tstop4 limits, only the results of the all-hadronic search are used). Limits are also set on the sbottom mass in the Tsb01 simplified model, see Fig. 10 (also here, only the results of the all-hadronic search are used).
- 19 SIRUANYAN 17S searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign leptons, jets, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the gluino mass in the Tglu3A, Tglu3B, Tglu3C, Tglu3D and Tglu1B simplified models, see their Figures 5 and 6, and on the sbottom mass in the Tsb02 simplified model, see their Figure 6.
- 20 AABOUD 16D searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with an energetic jet and large missing transverse momentum. The results are interpreted as 95% C.L. limits on mass of sbottom decaying into a b -quark and the lightest neutralino in scenarios with $m_{\tilde{b}_1} - m_{\tilde{\chi}_1^0}$ between 5 and 20 GeV. See their Fig. 6.
- 21 AABOUD 16Q searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks. Assuming that the decay $\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$ (Tsb01) takes place 100% of the time, a \tilde{b}_1 mass below 840 (800) GeV is excluded for $m_{\tilde{\chi}_1^0} < 100$ (360) GeV. Differences in mass above 100 GeV between the \tilde{b}_1 and the $\tilde{\chi}_1^0$ are excluded up to a \tilde{b}_1 mass of 500 GeV. For more details, see their Fig. 4.
- 22 AAD 16BB searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with exactly two same-sign leptons or at least three leptons, multiple hadronic jets, b -jets, and \cancel{E}_T . No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. are set on the sbottom mass for the Tsb02 model, assuming $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$. See their Fig. 4c.
- 23 KHACHATRYAN 16BJ searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb02 simplified model, see Fig. 6.
- 24 KHACHATRYAN 16BS searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one energetic jet, no isolated leptons, and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb01 simplified model, see Fig. 11 and Table 3.
- 25 KHACHATRYAN 16BY searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-sign, same-flavour leptons, jets, and missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see Fig. 4, and on sbottom masses in the Tsb03 simplified model, see Fig. 5.
- 26 AAD 15CJ searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of third generation squarks by combining a large number of searches covering various final states. Limits on the sbottom mass are shown, either assuming the $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ decay, see Fig. 11, or assuming the $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$ decay, with $\tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_1^0$, see Fig. 12a, or assuming the $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ decay, with $\tilde{\chi}_1^0 \rightarrow h\tilde{\chi}_1^0$, see Fig. 12b. Interpretations in the pMSSM are also discussed, see Figures 13–15.
- 27 KHACHATRYAN 15AF searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in simplified models where the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 12. See also Table 5. Exclusions in the CMSSM, assuming $\tan\beta = 30$, $A_0 = -2 \max(m_0, m_{1/2})$ and $\mu > 0$, are also presented, see Fig. 15.
- 28 KHACHATRYAN 15AH searched in 19.4 or 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing either a fully reconstructed top quark, or events containing dijets requiring one or both jets to originate from b -quarks, or events containing a mono-jet. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in simplified models where the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 12. Limits are also set in a simplified model where the decay $\tilde{b} \rightarrow c\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 12.
- 29 KHACHATRYAN 15I searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events in which b -jets and four W -bosons are produced. Five individual search channels are combined (fully hadronic, single lepton, same-sign dilepton, opposite-sign dilepton, multi-lepton). No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in a simplified model where the decay $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$, with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$, takes place with a branching ratio of 100%, see Fig. 7.
- 30 AAD 14T searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for monojet-like events. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which assume that the decay $\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$ takes place 100% of the time, see Fig. 12.
- 31 CHATRCHYAN 14AH searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a b -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- 32 CHATRCHYAN 14R searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a simplified model where the decay $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$, with $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$, takes place with a branching ratio of 100%, see Fig. 11.
- 33 KHACHATRYAN 15AD searched in 19.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two opposite-sign same flavor isolated leptons featuring either a kinematic edge, or a peak at the Z -boson mass, in the invariant mass spectrum. No evidence for a statistically significant excess over the expected SM backgrounds is observed and 95% C.L. exclusion limits are derived in a simplified model of sbottom pair production where the sbottom decays into a b -quark, two opposite-sign dileptons and a neutralino LSP, through an intermediate state containing either an off-shell Z -boson or a slepton, see Fig. 8.
- 34 AAD 14AX searched in 20.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for the strong production of supersymmetric particles in events containing either zero or at least one high p_T lepton, large missing transverse momentum, high jet multiplicity and at least three jets identified as originating from b -quarks. No excess over the expected SM background is observed. Limits are derived in mSUGRA/CMSSM models with $\tan\beta = 30$, $A_0 = -2 m_0$ and $\mu > 0$, see their Fig. 14. Also, exclusion limits are set in simplified models containing scalar bottom quarks, where the decay $\tilde{b} \rightarrow b\tilde{\chi}_2^0$ and $\tilde{\chi}_2^0 \rightarrow h\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see their Figures 11.
- 35 AAD 14E searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilizes jets originating from b -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing bottom, see Fig. 7. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- 36 CHATRCHYAN 14H searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in a simplified models where the decay $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\tilde{\chi}_1^\pm$, for $m_{\tilde{\chi}_1^0} = 50 \text{ GeV}$, see Fig. 6.
- 37 AAD 13AU searched in 20.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks. Assuming that the decay $\tilde{b}_1 \rightarrow b\tilde{\chi}_1^0$ takes place 100% of the time, a \tilde{b}_1 mass below 620 GeV is excluded for $m_{\tilde{\chi}_1^0} < 120 \text{ GeV}$. For more details, see their Fig. 5.
- 38 CHATRCHYAN 13AT provides interpretations of various searches for supersymmetry by the CMS experiment based on $4.73\text{--}4.98 \text{ fb}^{-1}$ of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ in the framework of simplified models. Limits are set on the sbottom mass in a simplified models where sbottom quarks are pair-produced and the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 4.
- 39 CHATRCHYAN 13T searched in 11.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the α_T variable to discriminate between processes with genuine and misreconstructed \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{b} \rightarrow b\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 8 and Table 9.
- 40 CHATRCHYAN 13V searched in 10.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two isolated same-sign dileptons and at least two b -jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the bottom mass in a simplified models where the decay $\tilde{b} \rightarrow t\tilde{\chi}_1^\pm$, $\tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\tilde{\chi}_1^\pm$, for $m_{\tilde{\chi}_1^0} = 50 \text{ GeV}$, see Fig. 4.

Supersymmetric Particle Searches

41	AAD 12AN searched in 2.05 fb ⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for scalar bottom quarks in events with large missing transverse momentum and two b-jets in the final state. The data are found to be consistent with the Standard Model expectations. Limits are set in an R-parity conserving minimal supersymmetric scenario, assuming $B(\bar{b}_1 \rightarrow b\tilde{\chi}_1^0) = 100\%$, see their Fig. 2.	>1190	95	2	SIRUNYAN	19CH CMS	jets+ \cancel{E}_T , Tstop1, $m_{\tilde{\chi}_1^0} = 0$ GeV	
		>1140	95	3	SIRUNYAN	19S CMS	1 or 2 $\ell +$ jets + \cancel{E}_T , Tstop1, $m_{\tilde{\chi}_1^0} < 200$ GeV	
42	CHATRCHYAN 12AI looked in 4.98 fb ⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with two same-sign leptons (e, μ), but not necessarily same flavor, at least 2 b-jets and missing transverse energy. No excess beyond the Standard Model expectation is observed. Exclusion limits are derived in a simplified model for sbottom pair production, where the sbottom decays through $\bar{b}_1 \rightarrow t\tilde{\chi}_1^- W$, see Fig. 8.	> 208	95	4	SIRUNYAN	19U CMS	$e^\pm \mu^\mp + \geq 1b$ -jet, Tstop1, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 175$ GeV	
		> 235	95	4	SIRUNYAN	19U CMS	$e^\pm \mu^\mp + \geq 1b$ -jet, Tstop1, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 182.5$ GeV	
43	CHATRCHYAN 12BO searched in 4.7 fb ⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for scalar bottom quarks in events with large missing transverse momentum and two b-jets in the final state. The data are found to be consistent with the Standard Model expectations. Limits are set in an R-parity conserving minimal supersymmetric scenario, assuming $B(\bar{b}_1 \rightarrow b\tilde{\chi}_1^0) = 100\%$, see their Fig. 2.	> 242	95	4	SIRUNYAN	19U CMS	$e^\pm \mu^\mp + \geq 1b$ -jet, Tstop1, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 167.5$ GeV	
		> 940	95	5	AABOUD	18AQ ATLS	$1\ell +$ jets + \cancel{E}_T , Tstop1, $m_{\tilde{\chi}_1^0} = 0$ GeV	
44	AAD 11K looked in 34 pb ⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with heavy stable particles, identified by their anomalous dE/dx in the tracker or time of flight in the tile calorimeter, from pair production of \tilde{b} . No evidence for an excess over the SM expectation is observed and limits on the mass are derived for pair production of sbottom, see Fig. 4.	> 270	95	6	AABOUD	18AQ ATLS	$1\ell +$ jets + \cancel{E}_T , Tstop3, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 20$ GeV	
		> 840	95	7	AABOUD	18AQ ATLS	$1\ell +$ jets + \cancel{E}_T , Tstop2, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 10$ GeV	
45	AAD 11O looked in 35 pb ⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with jets, of which at least one is a b-jet, and \cancel{E}_T . No excess above the Standard Model was found. Limits are derived in the $(m_{\tilde{g}}, m_{\tilde{b}_1})$ plane (see Fig. 2) under the assumption of 100% branching ratios and \tilde{b}_1 being the lightest squark. The quoted limit is valid for $m_{\tilde{b}_1} < 500$ GeV. A similar approach for \tilde{t}_1 as the lightest squark with $\tilde{g} \rightarrow \tilde{t}_1 t$ and $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm$ with 100% branching ratios leads to a gluino mass limit of 520 GeV for $130 < m_{\tilde{t}_1} < 300$ GeV. Limits are also derived in the CMSSM $(m_0, m_{1/2})$ plane for $\tan\beta = 40$, see Fig. 4, and in scenarios based on the gauge group SO(10).	> 500	95	8	AABOUD	18BV ATLS	c-jets + \cancel{E}_T , Tstop4, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} < 100$ GeV	
		> 850	95	9	AABOUD	18BV ATLS	c-jets + \cancel{E}_T , Tstop4, $m_{\tilde{\chi}_1^0} = 0$ GeV	
		> 390	95	10	AABOUD	18I ATLS	≥ 1 jets + \cancel{E}_T , Tstop3, $m_{\tilde{t}_1} \sim m_{\tilde{\chi}_1^0}$	
		> 430	95	11	AABOUD	18I ATLS	≥ 1 jets + \cancel{E}_T , Tstop4, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 5$ GeV	
46	CHATRCHYAN 11D looked in 35 pb ⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with ≥ 2 jets, at least one of which is b-tagged, and \cancel{E}_T , where the b-jets are decay products of \tilde{t} or \tilde{b} . No evidence for an excess over the expected background is observed. Limits are derived in the CMSSM $(m_0, m_{1/2})$ plane for $\tan\beta = 50$ (see Fig. 2).	>1160	95	12	AABOUD	18Y ATLS	$2\ell (\geq 1 \text{ hadronic } \tau) + b$ -jets + \cancel{E}_T , Tstop5, $m_{\tilde{t}_1} \sim 800$ GeV	
		> 450	95	13	SIRUNYAN	18AJ CMS	2ℓ (soft) + \cancel{E}_T , Tstop10, $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{t}_1} + m_{\tilde{\chi}_1^0})/2$, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 40$ GeV	
47	AALTONEN 10R searched in 2.65 fb ⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for events with \cancel{E}_T and exactly two jets, at least one of which is b-tagged. The results are in agreement with the SM prediction, and a limit on the cross section of 0.1 pb is obtained for the range of masses $80 < m_{\tilde{b}_1} < 280$ GeV assuming that the sbottom decays exclusively to $b\tilde{\chi}_1^0$. The excluded mass region in the framework of conserved R_p is shown in a plane of $(m_{\tilde{b}_1}, m_{\tilde{\chi}_1^0})$, see their Fig. 2.	> 720	95	14	SIRUNYAN	18AL CMS	$\geq 3\ell^\pm +$ jets + \cancel{E}_T , Tstop7, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 175$ GeV, $m_{\tilde{t}_1} = 200$ GeV, BR($\tilde{t}_2 \rightarrow \tilde{t}_1 H$) = 100%	
		> 780	95	14	SIRUNYAN	18AL CMS	$\geq 3\ell^\pm +$ jets + \cancel{E}_T , Tstop7, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 175$ GeV, $m_{\tilde{t}_1} = 200$ GeV, BR($\tilde{t}_2 \rightarrow \tilde{t}_1 Z$) = 100%	
48	ABAZOV 10L looked in 5.2 fb ⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for events with at least 2 b-jets and \cancel{E}_T from the production of $\tilde{b}_1 \tilde{b}_1$. No evidence for an excess over the SM expectation is observed, and a limit on the cross section is derived under the assumption of 100% branching ratio. The excluded mass region in the framework of conserved R_p is shown in a plane of $(m_{\tilde{b}_1}, m_{\tilde{\chi}_1^0})$, see their Fig. 3b. The exclusion also extends to $m_{\tilde{\chi}_1^0} = 110$ GeV for $160 < m_{\tilde{b}_1} < 200$ GeV.	> 710	95	14	SIRUNYAN	18AL CMS	$\geq 3\ell^\pm +$ jets + \cancel{E}_T , Tstop7, $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 175$ GeV, $m_{\tilde{t}_1} = 200$ GeV, BR($\tilde{t}_2 \rightarrow \tilde{t}_1 Z$) = 100%

1	KHACHATRYAN 16BX searched in 19.5 fb ⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing 2 leptons coming from R-parity-violating decays of supersymmetric particles. No excess over the expected background is observed. Limits are derived on the sbottom mass, assuming the RPV $\tilde{b} \rightarrow t d$ or $\tilde{b} \rightarrow ts$ decay, see Fig. 15.	> 800	95	18	SIRUNYAN	18C CMS	$\ell^\pm \ell^\mp + b$ -jets + \cancel{E}_T , Tstop1, $m_{\tilde{\chi}_1^0} = 0$			
2	AAD 14E searched in 20.3 fb ⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from b-quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing bottom, see Fig. 7. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.	> 750	95	18	SIRUNYAN	18C CMS	$\ell^\pm \ell^\mp + b$ -jets + \cancel{E}_T , Tstop2, $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{t}_1} + m_{\tilde{\chi}_1^0})/2$, $m_{\tilde{\chi}_1^0} = 0$

\tilde{t} (Stop) mass limit

Limits depend on the decay mode. In e^+e^- collisions they also depend on the mixing angle of the mass eigenstate $\tilde{t}_1 = \tilde{t}_L \cos\theta_t + \tilde{t}_R \sin\theta_t$. The coupling to the Z vanishes when $\theta_t = 0.98$. In the Listings below, we use $\Delta m \equiv m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$ or $\Delta m \equiv m_{\tilde{t}_1} - m_{\tilde{t}_2}$, depending on relevant decay mode. See also bounds in "q (Squark) MASS LIMIT."

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics C38 070001 (2014) (<http://pdg.lbl.gov>).

Searches Particle Listings

Supersymmetric Particle Searches

> 450	95	53	KHACHATRY...15AF CMS	$\tilde{t} \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 0, m_{\tilde{t}} > m_t + m_{\tilde{\chi}_1^0}$	2	SIRUNYAN 19CH searched in 137 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing multiple jets and large E_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tstot1, Tstop1 simplified models, see their Figure 14.
> 560	95	54	KHACHATRY...15AH CMS	$\tilde{t} \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 0, m_{\tilde{t}} > m_t + m_{\tilde{\chi}_1^0}$	3	SIRUNYAN 19s searched in 35.9 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with zero or one charged leptons, jets and E_T . The razor variables (M_R and R^2) are used to categorize the events. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu3C simplified models, see Figures 22 and 23, and on the stop mass in the Tstop1 simplified model, see their Figure 24.
> 250	95	55	KHACHATRY...15AH CMS	$\tilde{t} \rightarrow c\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 0, m_{\tilde{t}} - m_{\tilde{\chi}_1^0} < 10$ GeV	4	SIRUNYAN 19u searched in 35.9 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing one electron-muon pair with opposite charge. The search targets a region of parameter space where the kinematics of top squark pair production and top quark pair production is very similar, due to the mass difference between the top squark and the neutralino being close to the top quark mass. No excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 model, with $m_{\tilde{t}} - m_{\tilde{\chi}_1^0}$ close to m_t , see Figure 5.
none, 200–350	95	56	KHACHATRY...15L CMS	$\tilde{t} \rightarrow qq, \text{RPV}, \lambda_{\beta 12}'' \neq 0$	5	AABOUD 18AQ searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for top squark pair production in final states with one isolated electron or muon, several energetic jets, and missing transverse momentum. No significant excess over the Standard Model prediction is observed. In case of Tstop1 models, top squark masses up to 940 GeV are excluded assuming $m_{\tilde{\chi}_1^0} = 0$ GeV, see their Fig. 20. If the top quark is not on-shell (3-body) decay, exclusions up to 500 GeV are obtained for $m_{\tilde{\chi}_1^0} = 300$ GeV. Exclusions as a function of $m_{\tilde{t}} - m_{\tilde{\chi}_1^0}$ are given in their Fig. 21.
none, 200–385	95	56	KHACHATRY...15L CMS	$\tilde{t} \rightarrow qb, \text{RPV}, \lambda_{323} \neq 0$	6	AABOUD 18AQ searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for top squark pair production in final states with one isolated electron or muon, several energetic jets, and missing transverse momentum. No significant excess over the Standard Model prediction is observed. In case of Tstop3 models (4-body), top squark masses up to 370 GeV are excluded for $m_{\tilde{t}} - m_{\tilde{\chi}_1^0}$ as low as 20 GeV. Top squark masses below 195 GeV are excluded for all $m_{\tilde{\chi}_1^0}$, see their Fig. 20 and Fig. 21.
> 730	95	57	KHACHATRY...15x CMS	$\tilde{t} \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 100$ GeV, $m_{\tilde{t}} > m_t + m_{\tilde{\chi}_1^0}$	7	AABOUD 18AQ searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for top squark pair production in final states with one isolated electron or muon, several energetic jets, and missing transverse momentum. No significant excess over the Standard Model prediction is observed. In case of Tstop2 models, top squark masses up to 840 GeV are excluded for $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} = 10$ GeV. See their Fig. 23. Exclusion limits for this decay mode are presented also in the context of Higgsino-LSP phenomenological MSSM models, where $m_{\tilde{\chi}_1^0} = 5$ GeV, see their Fig 26.
none 400–645	95	57	KHACHATRY...15x CMS	$\tilde{t} \rightarrow t\tilde{\chi}_1^0$ or $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm, m_{\tilde{\chi}_1^0} = 100$ GeV, $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 5$ GeV	8	AABOUD 18BV searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one jet identified as c -jet, large missing transverse energy and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop4 models. In scenarios with differences of the stop and neutralino masses below 100 GeV, stop masses below 500 GeV are excluded. See their Fig.6 and Fig.7.
none 270–645	95	58	AAD	14AJ ATLS ≥ 4 jets + $E_T, \tilde{t}_1 \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} < 30$ GeV	9	AABOUD 18BV searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one jet identified as c -jet, large missing transverse energy and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop1 models. In scenarios with massless neutralinos, top squark masses below 850 GeV are excluded. See their Fig.6.
none 250–550	95	58	AAD	14AJ ATLS ≥ 4 jets + $E_T, B(\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm) = 50\%, m_{\tilde{\chi}_1^\pm} = 2 m_{\tilde{\chi}_1^0}, m_{\tilde{\chi}_1^0} < 60$ GeV	10	AABOUD 18i searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one jet with a transverse momentum above 250 GeV and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop3 models. Stop masses below 390 GeV are excluded for $m_{\tilde{t}} - m_{\tilde{\chi}_1^0} = m_b$. See their Fig.9(b).
none 210–640	95	59	AAD	14BD ATLS $\ell^\pm + \text{jets} + E_T, \tilde{t}_1 \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 0$ GeV	11	AABOUD 18i searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one jet with a transverse momentum above 250 GeV and no leptons. Good agreement is observed between the number of events in data and Standard Model predictions. The results are translated into exclusion limits in Tstop4 models. In scenarios with differences of the stop and neutralino masses around 5 GeV, stop masses below 430 GeV are excluded. See their Fig.9(a).
> 500	95	59	AAD	14BD ATLS $\ell^\pm + \text{jets} + E_T, \tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm, m_{\tilde{\chi}_1^\pm} = 2 m_{\tilde{\chi}_1^0}, 100$ GeV < $m_{\tilde{\chi}_1^0} < 150$ GeV	12	AABOUD 18y searched in 36.1 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for direct pair production of top squarks in final states with two tau leptons, b -jets, and missing transverse momentum. At least one hadronic τ is required. No significant deviation from the SM predictions is observed in the data. The analysis results are interpreted in Tstop5 models with a nearly massless gravitino. Top squark masses up to 1.16 TeV and tau slepton masses up to 1 TeV are excluded, see their Fig. 7.
none 150–445	95	60	AAD	14F ATLS $\ell^\pm \ell^\mp$ final state, $\tilde{t}_1 \rightarrow b\tilde{\chi}_1^\pm, m_{\tilde{t}} - m_{\tilde{\chi}_1^\pm} = 10$ GeV, $m_{\tilde{\chi}_1^0} = 1$ GeV	13	SIRUNYAN 18AJ searched in 35.9 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing two low-momentum, oppositely charged leptons (electrons or muons) and E_T . No excess over the expected background is observed. Limits are derived on the wino mass in the Tch1n2F simplified model, see their Figure 5. Limits are also set on the stop mass in the Tstop10 simplified model, see their Figure 6. Finally, limits are set on the Higgsino mass in the Tch1n2G simplified model, see Figure 8 and in the pMSSM, see Figure 7.
none 215–530	95	60	AAD	14F ATLS $\ell^\pm \ell^\mp$ final state, $\tilde{t}_1 \rightarrow t\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 1$ GeV	14	SIRUNYAN 18AL searched in 35.9 fb ⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least three charged leptons, in any combination of electrons and muons, jets and significant E_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, see their Figure 5. Limits are also set on the sbottom mass in the Tstot2 simplified model, see their Figure 6, and on the stop mass in the Tstop7 simplified model, see their Figure 7.
> 270	95	61	AAD	14T ATLS $\tilde{t}_1 \rightarrow c\tilde{\chi}_1^0, m_{\tilde{\chi}_1^0} = 200$ GeV	15	SIRUNYAN 18AN searched in 19.7 fb ⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing one or two photons and a pair of top quarks from the decay of a pair of top squark in a natural gauge-mediated scenario. The final state consists of a lepton (electron or muon), jets and one or two photons. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop12 simplified model, see their Figure 6.

¹ SIRUNYAN 19AU searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one photon, jets, some of which are identified as originating from b -quarks, and large E_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the gluino mass in the Tglu4C, Tglu4D and Tglu4E simplified models, and on the top squark mass in the Tstop13 simplified model, see their Figure 5.

- 16 SIRUNYAN 18AY searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one or more jets and significant $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$, see their Figure 4.
- 17 SIRUNYAN 18B searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of third-generation squarks in events with jets and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the sbottom mass in the Tsb0t1 simplified model, see their Figure 5, and on the stop mass in the Tstop4 simplified model, see their Figure 6.
- 18 SIRUNYAN 18C searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for the pair production of top squarks in events with two oppositely charged leptons (electrons or muons), jets identified as originating from a b -quark and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2 and Tstop11 simplified models, see their Figures 11 and 12. The Tstop1 and Tstop2 results are combined with complementary searches in the all-hadronic and single lepton channels, see their Figures 13 and 14.
- 19 SIRUNYAN 18D searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing identified hadronically decaying top quarks, no leptons, and $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see their Figure 8, and on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3E simplified models, see their Figure 9.
- 20 SIRUNYAN 18Di searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for pair production of top squarks in events with a low transverse momentum lepton (electron or muon), a high-momentum jet and significant missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop3 and Tstop10 simplified models, see their Figures 7 and 8. A combination of this search with the all-hadronic search is presented in Figure 9.
- 21 SIRUNYAN 18DN searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct electroweak production of charginos and for pair production of top squarks in events with two leptons (electrons or muons) of the opposite electric charge. No significant excess above the Standard Model expectations is observed. Limits are set on the chargino mass in the Tch1Ch1C and Tch1Ch1E simplified models, see their Figure 8. Limits are also set on the stop mass in the Tstop1 and Tstop2 simplified models, see their Figure 9.
- 22 ABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 700 GeV are set on the top squark mass in Tstop11 simplified models, assuming $m_{\tilde{\chi}_1^0} = m_{\tilde{t}} - 275 \text{ GeV}$ and $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$. See their Figure 4(e).
- 23 ABOUD 17AX searched in 36 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two jets identified as originating from b -quarks and large missing transverse momentum, with or without leptons. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of top squarks. Assuming 50% BR for Tstop1 and Tstop2 simplified models, a \tilde{t}_1 mass below 880 (860) GeV is excluded for $m_{\tilde{\chi}_1^0} = 0$ (<250) GeV. See their Fig. 7(b).
- 24 ABOUD 17AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits in the range 250–1000 GeV are set on the top squark mass in Tstop1 simplified models. For the first time, additional constraints are set for the region $m_{\tilde{t}_1} \sim m_{\tilde{t}} + m_{\tilde{\chi}_1^0}$, with exclusion of the \tilde{t}_1 mass range 235–590 GeV. See their Figure 8.
- 25 ABOUD 17AZ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits in the range 450–850 GeV are set on the top squark mass in a mixture of Tstop1 and Tstop2 simplified models with BR=50% and assuming $m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$ and $m_{\tilde{\chi}_1^0} < 240 \text{ GeV}$. Constraints are given for various values of the BR. See their Figure 9.
- 26 ABOUD 17BE searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 720 GeV are set on the top squark mass in Tstop1 simplified models, assuming massless neutralinos. See their Figure 9 (2-body area).
- 27 ABOUD 17BE searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 400 GeV are set on the top squark mass in Tstop3 simplified models, assuming $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 40 \text{ GeV}$. See their Figure 9 (4-body area).
- 28 ABOUD 17BE searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 430 GeV are set on the top squark mass in Tstop1 simplified models where top quarks are offshell, assuming $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$ close to the W mass. See their Figure 9 (3-body area).
- 29 ABOUD 17BE searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-charge leptons (electrons and muons) and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 700 GeV are set on the top squark mass in Tstop2 simplified models, assuming $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0} = 10 \text{ GeV}$ and massless neutralinos. See their Figure 10.
- 30 KHACHATRYAN 17 searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing four or more jets, no more than one lepton, and missing transverse momentum, using the razor variables (M_R and R^2) to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop1 simplified model, see Fig. 17.
- 31 KHACHATRYAN 17AD searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing at least four jets (including b -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Top squark masses in the range 250–740 GeV and neutralino masses up to 240 GeV are excluded at 95% C.L. See Fig. 12.
- 32 KHACHATRYAN 17AD searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing at least four jets (including b -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Limits are derived on the \tilde{t} mass in simplified models that are a mixture of Tstop1 and Tstop2 with branching fractions 50% for each of the two decay modes: top squark masses of up to 610 GeV and neutralino masses up to 190 GeV are excluded at 95% C.L. The $\tilde{\chi}_1^\pm$ and the $\tilde{\chi}_1^0$ are assumed to be nearly degenerate in mass, with a 5 GeV difference between their masses. See Fig. 12.
- 33 KHACHATRYAN 17P searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tsqk1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- 34 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop4 model: for $\Delta m = m_{\tilde{t}} - m_{\tilde{\chi}_1^0}$ equal to 10 and 80 GeV, masses of stop below 240 and 260 GeV are excluded, respectively. See their Fig. 3.
- 35 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop3 model: for $\Delta m = m_{\tilde{t}} - m_{\tilde{\chi}_1^0}$ equal to 10 and 80 GeV, masses of stop below 225 and 130 GeV are excluded, respectively. See their Fig. 3.
- 36 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop2 model: assuming $m_{\tilde{\chi}_1^\pm} = 0.25 m_{\tilde{t}} + 0.75 m_{\tilde{\chi}_1^0}$, masses of stop up to 325 GeV and masses of the neutralino up to 225 GeV are excluded. See their Fig. 3.
- 37 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop2 model: assuming $m_{\tilde{\chi}_1^\pm} = 0.75 m_{\tilde{t}} + 0.25 m_{\tilde{\chi}_1^0}$, masses of stop up to 400 GeV are excluded for low neutralino masses. See their Fig. 3.
- 38 KHACHATRYAN 17s searched in 18.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing multiple jets and missing transverse momentum, using the α_T variable to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the stop mass in the Tstop1 model: assuming masses of stop up to 500 GeV and masses of the neutralino up to 105 GeV are excluded. See their Fig. 3.
- 39 SIRUNYAN 17As searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a single lepton (electron or muon), jets, and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2 and Tstop8 simplified models, see their Figures 5, 6 and 7.
- 40 SIRUNYAN 17AT searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct production of top squarks in events with jets and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop2, Tstop3, Tstop4, Tstop8 and Tstop10 simplified models, see their Figures 9 to 14.
- 41 SIRUNYAN 17AZ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tsqk1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb0t1 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- 42 SIRUNYAN 17k searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for direct production of stop or sbottom pairs in events with multiple jets and significant $E_{\cancel{T}}$. A second search also requires an isolated lepton and is combined with the all-hadronic search. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1, Tstop8 and Tstop4 simplified models, see their Figures 7, 8 and 9 (for the Tstop4 limits, only the results of the all-hadronic search are used). Limits are also set on the sbottom mass in the Tsb0t1 simplified model, see Fig. 10 (also here, only the results of the all-hadronic search are used).
- 43 SIRUNYAN 17P searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with multiple jets and large $E_{\cancel{T}}$. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, Tglu3A and Tglu3D simplified models, see their Fig. 12. Limits are also set on the squark mass in the Tsqk1 simplified model, on the stop mass in the Tstop1 simplified model, and on the sbottom mass in the Tsb0t1 simplified model, see Fig. 13.
- 44 ABOUD 16D searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with an energetic jet and large missing transverse momentum. The results are interpreted as 95% C.L. limits on mass of stop decaying into a charm-quark and the lightest neutralino in scenarios with $m_{\tilde{t}_1} - m_{\tilde{\chi}_1^0}$ between 5 and 20 GeV. See their Fig. 5.
- 45 ABOUD 16J searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with one isolated electron or muon, jets, and missing transverse momentum. For the direct stop pair production model where the stop decays via top and lightest neutralino, the results exclude at 95% C.L. stop masses between 745 GeV and 780 GeV for a massless $\tilde{\chi}_1^0$. See their Fig. 8.
- 46 AAD 16AY searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with either two hadronically decaying tau leptons, one hadronically decaying tau and one light lepton, or two light leptons. No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. on the mass of top squarks decaying via \tilde{t} to a nearly massless gravitino are placed depending on $m_{\tilde{\tau}}$ which is ranging from the 87 GeV LEP limit to $m_{\tilde{t}_1}$. See their Figs. 9 and 10.

Searches Particle Listings

Supersymmetric Particle Searches

- 47 KHACHATRYAN 16AV searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or two isolated leptons, hadronic jets, b -jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 and Tstop2 simplified models, see Fig. 11.
- 48 KHACHATRYAN 16BK searched in 18.9 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with hadronic jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 and Tstop2 simplified models, see Fig. 16.
- 49 KHACHATRYAN 16BS searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one energetic jet, no isolated leptons, and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see Fig. 11 and Table 3.
- 50 KHACHATRYAN 16V searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or two soft isolated leptons, hadronic jets, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop3 simplified model, see Fig. 3.
- 51 AAD 15CJ searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of third generation squarks by combining a large number of searches covering various final states. Stop decays with and without charginos in the decay chain are considered and summaries of all ATLAS Run 1 searches for direct stop production can be found in Fig. 4 (no intermediate charginos) and Fig. 7 (intermediate charginos). Limits are set on stop masses in compressed mass regions, with $B(\bar{t} \rightarrow c\bar{\chi}_1^0) + B(\bar{t} \rightarrow b\bar{f}'\bar{\chi}_1^0) = 1$, see Fig. 5. Limits are also set on stop masses assuming that both the decay $\bar{t} \rightarrow t\bar{\chi}_1^0$ and $\bar{t} \rightarrow b\bar{\chi}_1^\pm$ are possible, with both their branching ratios summing up to 1, assuming $\bar{\chi}_1^\pm \rightarrow W^{(*)}\bar{\chi}_1^0$ and $m_{\bar{\chi}_1^\pm} = 2m_{\bar{\chi}_1^0}$, see Fig. 6. Limits on the mass of the next-to-lightest stop \bar{t}_2 , decaying either to $Z\bar{t}_1$, $h\bar{t}_1$ or $t\bar{\chi}_1^0$, are also presented, see Figs. 9 and 10. Interpretations in the pMSSM are also discussed, see Figs 13–15.
- 52 AAD 15J interpreted the measurement of spin correlations in $t\bar{t}$ production using 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ in exclusion limits on the pair production of light \bar{t}_1 squarks with masses similar to the top quark mass. The \bar{t}_1 is assumed to decay through $\bar{t}_1 \rightarrow t\bar{\chi}_1^0$ with predominantly right-handed top and a 100% branching ratio. The data are found to be consistent with the Standard Model expectations and masses between the top quark mass and 191 GeV are excluded, see their Fig. 2
- 53 KHACHATRYAN 15AF searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay $\bar{t} \rightarrow t\bar{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 12. See also Table 5. Exclusions in the CMSSM, assuming $\tan\beta = 30$, $A_0 = -2 \max(m_0, m_{1/2})$ and $\mu > 0$, are also presented, see Fig. 15.
- 54 KHACHATRYAN 15AH searched in 19.4 or 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing either a fully reconstructed top quark, or events containing dijets requiring one or both jets to originate from b -quarks, or events containing a mono-jet. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay $\bar{t} \rightarrow t\bar{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 9. Limits are also set in simplified models where the decays $\bar{t} \rightarrow t\bar{\chi}_1^0$ and $\bar{t} \rightarrow b\bar{\chi}_1^\pm$, with $m_{\bar{\chi}_1^\pm} - m_{\bar{\chi}_1^0} = 5 \text{ GeV}$, each take place with a branching ratio of 50%, see Fig. 10, or with other fractions, see Fig. 11. Finally, limits are set in a simplified model where the decay $\bar{t} \rightarrow c\bar{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 9, 10 and 11.
- 55 KHACHATRYAN 15AH searched in 19.4 or 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing either a fully reconstructed top quark, or events containing dijets requiring one or both jets to originate from b -quarks, or events containing a mono-jet. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay $\bar{t} \rightarrow t\bar{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 9. Limits are also set in simplified models where the decays $\bar{t} \rightarrow t\bar{\chi}_1^0$ and $\bar{t} \rightarrow b\bar{\chi}_1^\pm$, with $m_{\bar{\chi}_1^\pm} - m_{\bar{\chi}_1^0} = 5 \text{ GeV}$, each take place with a branching ratio of 50%, see Fig. 10, or with other fractions, see Fig. 11. Finally, limits are set in a simplified model where the decay $\bar{t} \rightarrow c\bar{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 9, 10, and 11.
- 56 KHACHATRYAN 15L searched in 19.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for pair production of heavy resonances decaying to pairs of jets in four jet events. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in R -parity-violating supersymmetry models where $\bar{t} \rightarrow qq$ ($\lambda_{323}^u \neq 0$), see Fig. 6 (top) and $\bar{t} \rightarrow qb$ ($\lambda_{323}^u \neq 0$), see Fig. 6 (bottom).
- 57 KHACHATRYAN 15x searched in 19.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets, at least one of which is required to originate from a b quark, possibly a lepton, and significant \cancel{E}_T , using the razor variables (M_R and R_2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in simplified models where the decay $\bar{t} \rightarrow t\bar{\chi}_1^0$ and the decay $\bar{t} \rightarrow b\bar{\chi}_1^\pm$, with $m_{\bar{\chi}_1^\pm} - m_{\bar{\chi}_1^0} = 5 \text{ GeV}$, take place with branching ratios varying between 0 and 100%, see Figs. 15, 16 and 17.
- 58 AAD 14AJ searched in 20.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing four or more jets and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which either assume that the decay $\bar{t}_1 \rightarrow t\bar{\chi}_1^0$ takes place 100% of the time, see Fig. 8, or that this decay takes place 50% of the time, while the decay $\bar{t}_1 \rightarrow b\bar{\chi}_1^\pm$ takes place the other 50% of the time, see Fig. 9.
- 59 AAD 14BD searched in 20 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing one isolated lepton, jets and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which either assume that the decay $\bar{t}_1 \rightarrow t\bar{\chi}_1^0$ takes place 100% of the time, see Fig. 15, or the decay $\bar{t}_1 \rightarrow b\bar{\chi}_1^\pm$ takes place 100% of the time, see Fig. 16–22. For the mixed decay scenario, see Fig. 23.
- 60 AAD 14F searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing two leptons (e or μ), and possibly jets and missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which either assume that the decay $\bar{t}_1 \rightarrow b\bar{\chi}_1^\pm$ takes place 100% of the time, see Figs. 14–17 and 20, or that the decay $\bar{t}_1 \rightarrow t\bar{\chi}_1^0$ takes place 100% of the time, see Figs. 18 and 19.
- 61 AAD 14T searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for monojet-like and c -tagged events. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the masses of third-generation squarks in simplified models which assume that the decay $\bar{t}_1 \rightarrow c\bar{\chi}_1^0$ takes place 100% of the time, see Fig. 9 and 10. The results of the monojet-like analysis are also interpreted in terms of stop pair production in the four-body decay $\bar{t}_1 \rightarrow b\bar{f}'\bar{\chi}_1^0$, see Fig. 11.
- 62 CHATRCHYAN 14AH searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R_2) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a b -quark. No significant excess above the Standard Model expectations is observed. Limits are set on bottom masses in simplified models where the decay $\bar{t} \rightarrow t\bar{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- 63 CHATRCHYAN 14R searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in a natural higgsino NLSP simplified model (GMSB) where the decay $\bar{t} \rightarrow b\bar{\chi}_1^\pm$, with $\bar{\chi}_1^\pm \rightarrow (qq'/\ell\nu)H$, $Z\bar{G}$, takes place with a branching ratio of 100% (the particles between brackets have a soft p_T spectrum), see Figs. 4–6.
- 64 KHACHATRYAN 14T searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with τ -leptons and b -quark jets, possibly with extra light-flavour jets. No excess above the Standard Model expectations is observed. Limits are set on stop masses in RPV SUSY models with $LQ\bar{D}$ couplings, in two simplified models. In the first model, the decay $\bar{t} \rightarrow \tau b$ is considered, with $\lambda_{333}^t \neq 0$, see Fig. 3. In the second model, the decay $\bar{t} \rightarrow \bar{\chi}^\pm b$, with the subsequent decay $\bar{\chi}^\pm \rightarrow qq\tau^\pm$ is considered, with $\lambda_{3jk}^t \neq 0$ and the mass splitting between the top squark and the chargin chosen to be 100 GeV, see Fig. 4.
- 65 AABOUD 17AF searched in 36 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for evidence of top squarks in events containing 2 leptons, jets, b -jets and \cancel{E}_T . In Tstop6 model, assuming $m_{\bar{\chi}_1^0} = 0 \text{ GeV}$, \bar{t}_1 masses up to 850 GeV are excluded for $m_{\bar{\chi}_2^0} > 200 \text{ GeV}$.
- 66 AABOUD 17AF searched in 36 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for evidence of \bar{t}_2 in events containing 2 leptons, jets, b -jets and \cancel{E}_T . In Tstop7 model, assuming $m_{\bar{\chi}_1^0} = 50 \text{ GeV}$ and 100% decays via Z boson, \bar{t}_2 masses up to 800 GeV are excluded. Exclusion limits are also shown as a function of the \bar{t}_2 branching ratios in their Figure 7.
- 67 AABOUD 17AF searched in 36 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for evidence of \bar{t}_2 in events containing 2 leptons, jets, b -jets and \cancel{E}_T . In Tstop7 model, assuming $m_{\bar{\chi}_1^0} = 50 \text{ GeV}$ and 100% decays via higgs boson, \bar{t}_2 masses up to 880 GeV are excluded. Exclusion limits are also shown as a function of the \bar{t}_2 branching ratios in their Figure 7.
- 68 AABOUD 17AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the top squark mass assuming three pMSSM-inspired models. The first one, referred to as Higgsino LSP model, assumes $m_{\bar{\chi}_1^\pm} - m_{\bar{\chi}_1^0} = 5 \text{ GeV}$ and $m_{\bar{\chi}_2^0} - m_{\bar{\chi}_1^0} = 10 \text{ GeV}$, with a mixture of decay modes as in Tstop1, Tstop2 and Tstop6. See their Figure 10. The second and third models are referred to as Wino NLSP and well-tempered pMSSM models, respectively. See their Figure 11 and Figure 12, and text for details on assumptions.
- 69 AAD 14B searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing a Z boson, with or without additional leptons, plus jets originating from b -quarks and significant missing transverse momentum. No excess over the expected SM background is observed. Limits are derived in simplified models featuring \bar{t}_2 production, with $\bar{t}_2 \rightarrow Z\bar{t}_1$, $\bar{t}_1 \rightarrow t\bar{\chi}_1^0$ with a 100% branching ratio, see Fig. 4, and in the framework of natural GMSB, see Fig. 6.
- 70 CHATRCHYAN 14U searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of direct pair production of top squarks, with Higgs bosons in the decay chain. The search is performed using a selection of events containing two Higgs bosons, each decaying to a photon pair, missing transverse energy and possibly b -quark jets. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of a "natural SUSY" simplified model where the decays $\bar{t}_1 \rightarrow b\bar{\chi}_1^\pm$, with $\bar{\chi}_1^\pm \rightarrow f\bar{f}'\bar{\chi}_1^0$, and $\bar{\chi}_1^0 \rightarrow H\bar{G}$, all happen with 100% branching ratio, see Fig. 4.
- 71 KHACHATRYAN 14C searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for evidence of direct pair production of top squarks, with Higgs or Z -bosons in the decay chain. The search is performed using a selection of events containing leptons and b -quark jets. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in the context of a simplified model with pair production of a heavier top-squark mass eigenstate \bar{t}_2 decaying to a lighter top-squark eigenstate \bar{t}_1 via either $\bar{t}_2 \rightarrow H\bar{t}_1$ or $\bar{t}_2 \rightarrow Z\bar{t}_1$, followed in both cases by $\bar{t}_1 \rightarrow t\bar{\chi}_1^0$. The interpretation is performed in the region where the mass difference between the \bar{t}_1 and $\bar{\chi}_1^0$ is approximately equal to the top-quark mass, which is not probed by searches for direct \bar{t}_1 pair production, see Figs. 5 and 6. The analysis excludes top squarks with masses $m_{\bar{t}_2} < 575 \text{ GeV}$ and $m_{\bar{t}_1} < 400 \text{ GeV}$ at 95% C.L.

- 1 SIRUNYAN 19BI searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV in final states with two muons and two jets, or with one muon, two jets, and missing transverse momentum. Limits are set in a model of pair-produced, prompt or long-lived top squarks with R-parity violating decays to a b -quark and a lepton (Tstop2RPV), branching fraction of $\tilde{t} \rightarrow b\mu$ equal to 1/3 and $c\tau$ between 0.1 cm and 10 cm in the case of long-lived top squarks. See their Fig. 10.
- 2 SIRUNYAN 19BJ searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV in final states with two electrons and two jets, or with one electron, two jets, and missing transverse momentum. Limits are set in a model of pair-produced, prompt top squarks with R-parity violating decays to a b -quark and a lepton (Tstop2RPV), assuming branching fraction of $\tilde{t} \rightarrow be$ equal to 1/3 and $c\tau = 0$ cm. See their Fig. 10.
- 3 AABOUD 18BB searched in 36.7 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for massive colored resonances which are pair-produced and decay into two jets. No significant deviation from the background prediction is observed. Results are interpreted in a SUSY simplified model as Tstop1RPV with $\tilde{t} \rightarrow ds$. Top squarks with masses in the range 100-410 GeV are excluded, see their Figure 9(a). The λ''_{312} coupling is assumed to be sufficiently large for the decays to be prompt, but small enough to neglect the single-top-squark resonant production through RPV couplings.
- 4 AABOUD 18BB searched in 36.7 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for massive coloured resonances which are pair-produced and decay into two jets. No significant deviation from the background prediction is observed. Results are interpreted in Tstop1RPV. Top squarks with masses in the range 100-470 GeV or 480-610 GeV are excluded, see their Figure 9(b). The λ''_{323} coupling is assumed to be sufficiently large for the decays to be prompt, but small enough to neglect the single-top-squark resonant production through RPV couplings.
- 5 AABOUD 18P searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for pair-produced top squarks that decay through RPV λ''_{333} ($i = 1, 2, 3$) couplings to a final state with two leptons and two jets, at least one of which is identified as a b -jet. No significant excess is observed over the SM background. In the Tstop2RPV model, lower limits on the top squark masses between 600 and 1500 GeV are set depending on the branching fraction to be , $b\mu$, and $b\tau$ final states. See their Figs 6 and 7.
- 6 SIRUNYAN 18AD searched in 2.6 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for long-lived particles by exploiting the multiplicity of displaced jets to search for the presence of signal decays occurring at distances between 1 and 1000 mm. Limits are set in a model of pair-produced, long-lived top squarks with R-parity violating decays to a b -quark and a lepton, see their Figure 3.
- 7 SIRUNYAN 18DV searched in 38.5 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for long-lived particles in events with multiple jets and two displaced vertices composed of many tracks. No events with two well-separated high-track-multiplicity vertices were observed. Limits are set on the stop and the gluino mass in RPV models of supersymmetry where the stop (gluino) is decaying solely into dijet (multijet) final states, see their Figures 6 and 7.
- 8 SIRUNYAN 18DY searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for the pair production of resonances, each decaying to two quarks. The search is conducted separately in a boosted (two-jet) and resolved (four-jet) jet topology. The mass spectra are found to be consistent with the Standard Model expectations. Limits are set on the stop mass in the Tstop3RPV and Tstop1RPV simplified models, see their Figure 11.
- 9 AABOUD 17AI searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with one or more isolated lepton, at least eight jets, either zero or many b -jets, for evidence of R-parity violating decays of the top squark. No significant excess above the Standard Model expectations is observed. Limits up to 1.25 (1.10) TeV are set on the top squark mass in R-parity-violating supersymmetry models where \tilde{t}_1 decays for a bino LSP as: $\tilde{t} \rightarrow t\tilde{\chi}_1^0$ and for a higgsino LSP as $\tilde{t} \rightarrow t\tilde{\chi}_{1,2}^0/b\tilde{\chi}_1^+$. This is followed by the decays through the non-zero λ''_{323} coupling $\tilde{\chi}_{1,2}^0 \rightarrow tbs$, $\tilde{\chi}_1^\pm \rightarrow bbs$. See their Figure 10 and text for details on model assumptions.

- 10 AAD 16AM searched in 17.4 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing two large-radius hadronic jets. No deviation from the background prediction is observed. Top squarks with masses between 100 and 315 GeV are excluded at 95% C.L. in the hypothesis that they both decay via R-parity violating coupling λ''_{323} to b - and s -quarks. See their Fig. 10.
- 11 KHACHATRYAN 16AC searched in 19.7 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with low missing transverse momentum, two oppositely charged electrons or muons, and at least five jets, at least one of which is a b -jet, for evidence of R-parity violating, charging-mediated decays of the top squark. No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in R-parity-violating supersymmetry models where $\tilde{t} \rightarrow b\tilde{\chi}_1^\pm$ with $\tilde{\chi}_1^\pm \rightarrow \ell^\pm jj$, $\lambda'_{ijk} \neq 0$ ($i, j, k \leq 2$), and with $m_{\tilde{t}} - m_{\tilde{\chi}_1^\pm} = 100$ GeV, see Fig. 3.
- 12 KHACHATRYAN 16BX searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing 4 leptons coming from R-parity-violating decays of $\tilde{\chi}_1^0 \rightarrow \ell\ell\nu$ with $\lambda_{121} \neq 0$ or $\lambda_{122} \neq 0$. No excess over the expected background is observed. Limits are derived on the gluino, squark and stop masses, see Fig. 23.
- 13 KHACHATRYAN 15E searched for long-lived particles decaying to leptons in 19.7 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV. Events were selected with an electron and muon with opposite charges and each with transverse impact parameter values between 0.02 and 2 cm. Limits are set on SUSY benchmark models with pair production of top squarks decaying into an $e\mu$ final state via RPV interactions. See their Fig. 2

Heavy \tilde{g} (Gluino) mass limit

For $m_{\tilde{g}} > 60$ -70 GeV, it is expected that gluinos would undergo a cascade decay via a number of neutralinos and/or charginos rather than undergo a direct decay to photinos as assumed by some papers. Limits obtained when direct decay is assumed are usually higher than limits when cascade decays are included.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics C38 070001 (2014) (<http://pdg.lbl.gov>).

R-parity conserving heavy \tilde{g} (Gluino) mass limit

1 SIRUNYAN 20b searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one photon and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on chargino masses in a general gauge-mediated SUSY breaking (GGM) scenario Tchi1n12-GGM, see Figure 4. Limits are also set on the NLSP mass in the Tchi1chi1F and Tchi1chi1G simplified models, see their Figure 5. Finally, limits are set on the gluino mass in the Tglu4A simplified model, see their Figure 6.

2 AABOUD 19f searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV in final states with hadronic jets, 1 or two hadronically decaying τ and \cancel{E}_T . In Tglu1F, gluino masses are excluded at 95% C.L. up to 2000 GeV for neutralino masses of 100 GeV or below. Neutralino masses up to 1000 GeV are excluded for all gluino masses below 1400 GeV. See their Fig. 9. Limits are also presented in the context of Gauge-Mediated Symmetry Breaking models: in this case, values of Λ below 110 TeV are excluded at the 95% CL for all values of $\tan\beta$ in the range $2 < \tan\beta < 60$, see their Fig 10.

3 SIRUNYAN 19AG searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with two photons and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4B simplified model and on the squark mass in the Tsqk4B simplified model, see their Figure 3.

4 SIRUNYAN 19AU searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least one photon, jets, some of which are identified as originating from b -quarks, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the gluino mass in the Tglu4C, Tglu4D and Tglu4E simplified models, and on the top squark mass in the Tstop13 simplified model, see their Figure 5.

5 SIRUNYAN 19CE searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for new particles decaying to a photon and two gluons in events with at least three large-radius jets of which two have substructure and are composed of a photon and two gluons. No statistically significant excess is observed above the SM background expectation. Upper limits at 95% confidence level on the cross section for gluino pair production are set, using a simplified Tglu1A-like stealth SUSY model. Gluino masses up to 1500-1700 GeV are excluded, depending on the neutralino mass, with the highest exclusion set for $m_{\tilde{\chi}_1^0} = 200$ GeV. See their Fig 4.

6 SIRUNYAN 19CH searched in 137 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events containing multiple jets and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A and Tglu3A simplified models, see their Figure 13. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tstop1, Tstop1 simplified models, see their Figure 14.

7 SIRUNYAN 19K searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with a photon, an electron or muon, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. In the framework of GMSB, limits are set on the chargino and neutralino mass in the Tchi1n1A simplified model, see their Figure 6. Limits are also set on the gluino mass in the Tglu4A simplified model, and on the squark mass in the Tsqk4A simplified model, see their Figure 7.

8 SIRUNYAN 19s searched in 35.9 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with zero or one charged leptons, jets and \cancel{E}_T . The razor variables (M_R and R^2) are used to categorize the events. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu3C simplified models, see Figures 22 and 23, and on the stop mass in the Tstop1 simplified model, see their Figure 24.

9 AABOUD 18AR searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for gluino pair production in events containing large missing transverse momentum and several energetic jets, at least three of which must be identified as originating from b -quarks. No excess is found above the predicted background. In Tglu3A models, gluino masses of less than 1.97 TeV are excluded for $m_{\tilde{\chi}_1^0}$ below 300 GeV, see their Fig. 10(a). Interpretations are also provided for scenarios where Tglu3A modes mix with Tglu2A and Tglu3D, see their Fig 11.

- 10 AABOUD 18AR searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for gluino pair production in events containing large missing transverse momentum and several energetic jets, at least three of which must be identified as originating from b -quarks. No excess is found above the predicted background. In Tglu2A models, gluino masses of less than 1.92 TeV are excluded for $m_{\tilde{\chi}_1^0}$ below 600 GeV, see their Fig. 10(b). Interpretations are also provided for scenarios where Tglu2A modes mix with Tglu3A and Tglu3D, see their Fig. 11.
- 11 AABOUD 18AS searched for in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for gluino pair production in the context of AMSB or phenomenological MSSM scenarios with wino-like LSP and long-lived charginos. Events with a disappearing track due to a low-momentum pion accompanied by at least four jets are considered. No significant excess above the Standard Model expectations is observed. Exclusion limits are set at 95% confidence level on the mass of gluinos for different chargino lifetimes. Gluino masses up to 1.65 TeV are excluded assuming a chargino mass of 460 GeV and lifetime of 0.2 ns, corresponding to a mass-splitting between the charged and neutral wino of around 160 MeV. See their Fig. 9.
- 12 AABOUD 18BJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1G model: gluino masses below 1850 GeV are excluded for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$, see their Fig. 12(a).
- 13 AABOUD 18BJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1H model: gluino masses below 1650 GeV are excluded for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$, see their Fig. 13(a).
- 14 AABOUD 18U searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results for the di-photon channel are interpreted in terms of lower limits on the masses of gluinos in Tglu4B models, which reach as high as 2.3 TeV. Gluinos with masses below 2.15 TeV are excluded for any NLSP mass, see their Fig. 8.
- 15 AABOUD 18U searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with at least one isolated photon, possibly jets and significant transverse momentum targeting generalised models of gauge-mediated SUSY breaking. No significant excess of events is observed above the SM prediction. Results of the $\gamma + \text{jets} + \cancel{E}_T$ channel are interpreted in terms of lower limits on the masses of gluinos in GGM higgsino-bino models (mix of Tglu4B and Tglu4C), which reach as high as 2050 GeV. Gluino masses below 1600 GeV are excluded for any NLSP mass provided that $m_{\tilde{g}} - m_{\tilde{\chi}_1^0} > 50 \text{ GeV}$. See their Fig. 11.
- 16 AABOUD 18V searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1A model: gluino masses below 2030 GeV are excluded for massless LSP, see their Fig. 13(b).
- 17 AABOUD 18V searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1B model. Assuming that $m_{\tilde{\chi}_1^+} = 0.5(m_{\tilde{g}} + m_{\tilde{\chi}_1^0})$, gluino masses below 1980 GeV are excluded for massless LSP, see their Fig. 14(c). Exclusions are also shown assuming $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$, see their Fig. 14(d).
- 18 AABOUD 18V searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1E model: gluino masses below 1750 GeV are excluded for $m_{\tilde{\chi}_1^0} = 1 \text{ GeV}$ and any $m_{\tilde{\chi}_2^0}$ above 100 GeV, see their Fig. 15. Gluino mass exclusion up to 2 TeV is found for $m_{\tilde{\chi}_2^0} = 1 \text{ TeV}$.
- 19 SIRUNYAN 18AA searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on wino masses in a general gauge-mediated SUSY breaking (GGM) scenario with bino-like $\tilde{\chi}_1^0$ and wino-like $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_2^0$, see Figure 7. Limits are also set on the NLSP mass in the Tch1n1A and Tch1ch1A simplified models, see their Figure 8. Finally, limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, see their Figure 9, and on the squark mass in the Tskq4A and Tskq4B simplified models, see their Figure 10.
- 20 SIRUNYAN 18AC searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a single electron or muon and multiple jets. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1B simplified models, see their Figure 5.
- 21 SIRUNYAN 18AL searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least three charged leptons, in any combination of electrons and muons, jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, see their Figure 5. Limits are also set on the sbottom mass in the Tsb0t2 simplified model, see their Figure 6, and on the stop mass in the Tstop7 simplified model, see their Figure 7.
- 22 SIRUNYAN 18AR searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing two opposite-charge, same-flavour leptons (electrons or muons), jets and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see their Figure 7. Limits are also set on the chargino/neutralino mass in the Tch1n2F simplified models, see their Figure 8, and on the higgsino mass in the Tn1n1B and Tn1n1C simplified models, see their Figure 9. Finally, limits are set on the sbottom mass in the Tsb0t3 simplified model, see their Figure 10.
- 23 SIRUNYAN 18AY searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one or more jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tskq1, Tsb0t1, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$, see their Figure 4.
- 24 SIRUNYAN 18b searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing identified hadronically decaying top quarks, no leptons, and \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the stop mass in the Tstop1 simplified model, see their Figure 8, and on the gluino mass in the Tglu3A, Tglu3B, Tglu3C and Tglu3E simplified models, see their Figure 9.
- 25 SIRUNYAN 18m searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more high-momentum Higgs bosons, decaying to pairs of b -quarks, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1I and Tglu1J simplified models, see their Figure 3.
- 26 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.75 TeV are set on the gluino mass in Tglu3A simplified models in case of off-shell top squarks and for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$. See their Figure 4(a).
- 27 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.57 TeV are set on the gluino mass in Tglu1E simplified models (2-step models) for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$. See their Figure 4(b).
- 28 AABOUD 17AJ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two same-sign or three leptons, jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.86 TeV are set on the gluino mass in Tglu1G simplified models for $m_{\tilde{\chi}_1^0} = 200 \text{ GeV}$. See their Figure 4(c).
- 29 AABOUD 17AR searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one isolated lepton, at least two jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 2.1 TeV are set on the gluino mass in Tglu1B simplified models, with $x = (m_{\tilde{\chi}_1^\pm} - m_{\tilde{\chi}_1^0}) / (m_{\tilde{g}} - m_{\tilde{\chi}_1^0}) = 1/2$. Similar limits are obtained for variable x and fixed neutralino mass, $m_{\tilde{\chi}_1^0} = 60 \text{ GeV}$. See their Figure 13.
- 30 AABOUD 17AR searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one isolated lepton, at least two jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.74 TeV are set on the gluino mass in Tglu1E simplified model. Limits up to 1.7 TeV are also set on pMSSM models leading to similar signal event topologies. See their Figure 13.
- 31 AABOUD 17AY searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least four jets and large missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in Tglu3A simplified models assuming $m_{\tilde{\tau}_1} - m_{\tilde{\chi}_1^0} = 5 \text{ GeV}$. See their Figure 13.
- 32 AABOUD 17AZ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R -jets or b -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits up to 1.8 TeV are set on the gluino mass in Tglu1E simplified models. See their Figure 6b.
- 33 AABOUD 17AZ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R -jets or b -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits up to 1.54 TeV are set on the gluino mass in Tglu3A simplified models. See their Figure 7a.
- 34 AABOUD 17N searched in 14.7 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with 2 same-flavor, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. In Tglu1J models, gluino masses are excluded at 95% C.L. up to 1300 GeV for $m_{\tilde{\chi}_1^0} = 0 \text{ GeV}$ and $m_{\tilde{\chi}_2^0} = 1100 \text{ GeV}$. See their Fig. 12 for exclusion limits as a function of $m_{\tilde{\chi}_2^0}$. Limits are also presented assuming $m_{\tilde{\chi}_2^0} = m_{\tilde{\chi}_1^0} + 100 \text{ GeV}$, see their Fig. 13.
- 35 AABOUD 17N searched in 14.7 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with 2 same-flavor, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. In Tglu1H models, gluino masses are excluded at 95% C.L. up to 1310 GeV for $m_{\tilde{\chi}_1^0} < 400 \text{ GeV}$ and assuming $m_{\tilde{\chi}_2^0} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$. See their Fig. 15.
- 36 AABOUD 17N searched in 14.7 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with 2 same-flavor, opposite-sign leptons (electrons or muons), jets and large missing transverse momentum. In Tglu1G models, gluino masses are excluded at 95% C.L. up to 1700 GeV for small $m_{\tilde{\chi}_1^0}$. The results probe kinematic endpoints as small as $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0} = (m_{\tilde{g}} - m_{\tilde{\chi}_1^0})/2 = 50 \text{ GeV}$. See their Fig. 14.
- 37 KHACHATRYAN 17 searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing four or more jets, no more than one lepton, and missing transverse momentum, using the razor variables (M_R and R^2) to discriminate between signal and background processes. No evidence for an excess over the expected background is observed. Limits are derived on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see Figs. 16 and 17. Also, assuming gluinos decay only via three-body processes involving third-generation quarks plus a neutralino/chargino, and assuming $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_1^0} + 5 \text{ GeV}$, a branching ratio-independent limit on the gluino mass is given, see Fig. 16.
- 38 KHACHATRYAN 17AD searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing at least four jets (including b -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Gluino masses up to 1550 GeV and neutralino masses up to 900 GeV are excluded at 95% C.L. See Fig. 13.
- 39 KHACHATRYAN 17AD searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing at least four jets (including b -jets), missing transverse momentum and tagged top quarks. No evidence for an excess over the expected background is observed. Gluino masses up to 1450 GeV and neutralino masses up to 820 GeV are excluded at 95% C.L. See Fig. 13.
- 40 KHACHATRYAN 17AS searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a single electron or muon and multiple jets. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1B simplified models, see their Fig. 7.
- 41 KHACHATRYAN 17AW searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least three charged leptons, in any combination of electrons and muons, and

Supersymmetric Particle Searches

- significant \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu1C simplified models, and on the sbottom mass in the Tsb02 simplified model, see their Figure 4.
- 42 KHACHATRYAN 17P searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A, Tglu3B, Tglu3C and Tglu3D simplified models, see their Figures 7 and 8. Limits are also set on the squark mass in the Tskq1 simplified model, see their Fig. 7, and on the sbottom mass in the Tsb01 simplified model, see Fig. 8. Finally, limits are set on the stop mass in the Tstop1, Tstop3, Tstop4, Tstop6 and Tstop7 simplified models, see Fig. 8.
- 43 KHACHATRYAN 17V searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two photons and large \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino and squark mass in the context of general gauge mediation models Tglu4B and Tskq4, see their Fig. 4.
- 44 SIRUNYAN 17AF searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with a single lepton (electron or muon), jets, including at least one jet originating from a b -quark, and large \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A and Tglu3B simplified models, see their Figure 2.
- 45 SIRUNYAN 17AV searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one photon, jets and large \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4A and Tglu4B simplified models, and on the squark mass in the Tskq4A and Tskq4B simplified models, see their Figure 6.
- 46 SIRUNYAN 17AZ searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with one or more jets and large \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A, Tglu3A simplified models, see their Figures 6. Limits are also set on the squark mass in the Tskq1 simplified model (for single light squark and for 8 degenerate light squarks), on the sbottom mass in the Tsb01 simplified model and on the stop mass in the Tstop1 simplified model, see their Fig. 7. Finally, limits are set on the stop mass in the Tstop2, Tstop4 and Tstop8 simplified models, see Fig. 8.
- 47 SIRUNYAN 17P searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with multiple jets and large \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, Tglu3A and Tglu3D simplified models, see their Fig. 12. Limits are also set on the squark mass in the Tskq1 simplified model, on the stop mass in the Tstop1 simplified model, and on the sbottom mass in the Tsb01 simplified model, see Fig. 13.
- 48 SIRUNYAN 17S searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign leptons, jets, and large \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the mass of the gluino mass in the Tglu3A, Tglu3B, Tglu3C, Tglu3D and Tglu1B simplified models, see their Figures 5 and 6, and on the sbottom mass in the Tsb02 simplified model, see their Figure 6.
- 49 AABOUD 16AC searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with hadronic jets, 1 or two hadronically decaying τ and \mathcal{E}_T . In Tglu1F, gluino masses are excluded at 95% C.L. up to 1570 GeV for neutralino masses of 100 GeV or below. Neutralino masses up to 700 GeV are excluded for all gluino masses between 800 GeV and 1500 GeV, while the strongest neutralino-mass exclusion of 750 GeV is achieved for gluino masses around 1400 GeV. See their Fig. 8. Limits are also presented in the context of Gauge-Mediated Symmetry Breaking models: in this case, values of A below 92 TeV are excluded at the 95% C.L. corresponding to gluino masses below 2000 GeV. See their Fig. 9.
- 50 AABOUD 16I searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with one isolated electron or muon, hadronic jets, and \mathcal{E}_T . Gluino-mediated pair production of stops with a nearly mass-degenerate stop and neutralino are targeted and gluino masses are excluded at 95% C.L. up to 1460 GeV. A 100% of stops decaying via charm + neutralino is assumed. The results are also valid in case of 4-body decays $\tilde{t}_1 \rightarrow f f' b \tilde{\chi}_1^0$. See their Fig. 8.
- 51 AABOUD 16M searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two photons, hadronic jets and \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Exclusion limits at 95% C.L. are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for bino-like NLSP. See their Fig. 3.
- 52 AABOUD 16N searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing hadronic jets, large \mathcal{E}_T , and no electrons or muons. No significant excess above the Standard Model expectations is observed. Gluino masses below 1510 GeV are excluded at the 95% C.L. in a simplified model with only gluinos and the lightest neutralino. See their Fig. 7b.
- 53 AABOUD 16N searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing hadronic jets, large \mathcal{E}_T , and no electrons or muons. No significant excess above the Standard Model expectations is observed. Gluino masses below 1500 GeV are excluded at the 95% C.L. in a simplified model with gluinos decaying via an intermediate $\tilde{\chi}_1^\pm$ to two quarks, a W boson and a $\tilde{\chi}_1^0$ for $m_{\tilde{\chi}_1^0} = 200 \text{ GeV}$. See their Fig. 8.
- 54 AAD 16AD searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing several energetic jets, of which at least three must be identified as b -jets, large \mathcal{E}_T and no electrons or muons. No significant excess above the Standard Model expectations is observed. For $\tilde{\chi}_1^0$ below 800 GeV, gluino masses below 1780 GeV are excluded at 95% C.L. for gluinos decaying via bottom squarks. See their Fig. 7a.
- 55 AAD 16AD searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing several energetic jets, of which at least three must be identified as b -jets, large \mathcal{E}_T and one electron or muon. Large-radius jets with a high mass are also used to identify highly boosted top quarks. No significant excess above the Standard Model expectations is observed. For $\tilde{\chi}_1^0$ below 700 GeV, gluino masses below 1760 GeV are excluded at 95% C.L. for gluinos decaying via top squarks. See their Fig. 7b.
- 56 AAD 16BB searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with exactly two same-sign leptons or at least three leptons, multiple hadronic jets, b -jets, and \mathcal{E}_T . No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. are set on the gluino mass in various simplified models (Tglu1D, Tglu1E, Tglu3A). See their Figs. 4a, 4b, and 4d.
- 57 AAD 16BG searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ in final states with one isolated electron or muon, hadronic jets, and \mathcal{E}_T . The data agree with the SM background expectation in the six signal selections defined in the search, and the largest deviation is a 2.1 standard deviation excess. Gluinos are excluded at 95% C.L. up to 1600 GeV assuming they decay via the lightest chargino to the lightest neutralino as in the model Tglu1B for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$, assuming $m_{\tilde{\chi}_1^\pm} = (m_{\tilde{g}} + m_{\tilde{\chi}_1^0})/2$. See their Fig. 6.
- 58 AAD 16V searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with \mathcal{E}_T various hadronic jet multiplicities from ≥ 7 to ≥ 10 and with various b -jet multiplicity requirements. No significant excess over the Standard Model expectation is found. Exclusion limits at 95% C.L. are set on the gluino mass in one simplified model (Tglu1E) and a pMSSM-inspired model. See their Fig. 5.
- 59 KHACHATRYAN 16AM searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with highly boosted W -bosons and b -jets, using the razor variables (M_R and R^2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3C and Tglu3B simplified models, see Fig. 12.
- 60 KHACHATRYAN 16BJ searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the following simplified models: Tglu3A and Tglu3D, see Fig. 4, Tglu3B and Tglu3C, see Fig. 5, and Tglu1B, see Fig. 7.
- 61 KHACHATRYAN 16BS searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least one energetic jet, no isolated leptons, and significant \mathcal{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see Fig. 10 and Table 3.
- 62 KHACHATRYAN 16BY searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two opposite-sign, same-flavour leptons, jets, and missing transverse momentum. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu4C simplified model, see Fig. 4, and on sbottom masses in the Tsb03 simplified model, see Fig. 5.
- 63 KHACHATRYAN 16V searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least four energetic jets and significant \mathcal{E}_T , no identified isolated electron or muon or charged track. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu1C, Tglu2A, and Tglu3A simplified models, see Fig. 8.
- 64 AAD 15BG searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with jets, missing \mathcal{E}_T , and two opposite-sign same flavor isolated leptons featuring either a kinematic edge, or a peak at the Z -boson mass, in the invariant mass spectrum. No evidence for a statistically significant excess over the expected SM backgrounds are observed and 95% C.L. exclusion limits are derived in a GGM simplified model of gluino pair production where the gluino decays into quarks, a Z -boson, and a massless gravitino LSP, see Fig. 12. Also, limits are set in simplified models with slepton/sneutrino intermediate states, see Fig. 13.
- 65 AAD 15BV summarized and extended ATLAS searches for gluinos and first- and second-generation squarks in final states containing jets and missing transverse momentum, with or without leptons or b -jets in the $\sqrt{s} = 8 \text{ TeV}$ data set collected in 2012. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the gluino mass in several R-parity conserving models, leading to a generalized constraint on gluino masses exceeding 1150 GeV for lightest supersymmetric particle masses below 100 GeV. See their Figs. 10, 19, 20, 21, 23, 25, 26, 29-37.
- 66 AAD 15BX interpreted the results of a wide range of ATLAS direct searches for supersymmetry, during the first run of the LHC using the $\sqrt{s} = 7 \text{ TeV}$ and $\sqrt{s} = 8 \text{ TeV}$ data set collected in 2012, within the wider framework of the phenomenological mSMM (pMSSM). The integrated luminosity was up to 20.3 fb^{-1} . From an initial random sampling of 500 million pMSSM points, generated from the 19-parameter pMSSM, a total of 310,327 model points with $\tilde{\chi}_1^0$ LSP were selected each of which satisfies constraints from previous collider searches, precision measurements, cold dark matter energy density measurements and direct dark matter searches. The impact of the ATLAS Run 1 searches on this space was presented, considering the fraction of model points surviving, after projection into two-dimensional spaces of sparticle masses. Good complementarity is observed between different ATLAS analyses, with almost all showing regions of unique sensitivity. ATLAS searches have good sensitivity at LSP mass below 800 GeV.
- 67 AAD 15CA searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with one or more photons, hadronic jets or b -jets and \mathcal{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for bino-like or higgsino-bino admixtures NLSP, see Fig. 8, 10, 11.
- 68 KHACHATRYAN 15AF searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets and significant \mathcal{E}_T , using the transverse mass variable M_{T2} to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 13(a), or where the decay $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 13(b), or where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 13(c). See also Table 5. Exclusions in the CMSSM, assuming $\tan\beta = 30$, $A_0 = -2 \max(m_0, m_{1/2})$ and $\mu > 0$, are also presented, see Fig. 15.
- 69 KHACHATRYAN 15I searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events in which b -jets and four W -bosons are produced. Five individual search channels are combined (fully hadronic, single lepton, same-sign dilepton, opposite-sign dilepton, multi-lepton). No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a simplified model where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 5. Also a simplified model with gluinos decaying into on-shell top squarks is considered, see Fig. 6.
- 70 KHACHATRYAN 15X searched in 19.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least two energetic jets, at least one of which is required to originate from a b quark, and significant \mathcal{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^0$ and the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ take place with branching ratios varying between 0, 50 and 100%, see Figs. 13 and 14.
- 71 AAD 14AE searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and large missing transverse momentum, and no electrons or muons. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5, 6 and 7. Limits are also derived in the mSUGRA/CMSSM with parameters $\tan\beta = 30$, $A_0 = -2 m_0$ and $\mu > 0$, see their Fig. 8.

- ⁷² AAD 14AG searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing one hadronically decaying τ -lepton, zero or one additional light leptons (electrons or muons), jets and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set in several SUSY scenarios. For an interpretation in the minimal GMSB model, see their Fig. 8. For an interpretation in the mSUGRA/CMSSM with parameters $\tan\beta = 30$, $A_0 = -2m_0$ and $\mu > 0$, see their Fig. 9. For an interpretation in the framework of natural Gauge Mediation, see Fig. 10. For an interpretation in the bRPV scenario, see their Fig. 11.
- ⁷³ AAD 14X searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a general gauge-mediation model (GGM) where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \tilde{G}$, takes place with a branching ratio of 100%, for two choices of $\tan\beta = 1.5$ and 30, see Fig. 11. Also some constraints on the higgsino mass parameter μ are discussed.
- ⁷⁴ CHATRCHYAN 14AH searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 28. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- ⁷⁵ CHATRCHYAN 14AH searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a b -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- ⁷⁶ CHATRCHYAN 14AH searched in 4.7 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV for events with at least two energetic jets and significant \cancel{E}_T , using the razor variables (M_R and R^2) to discriminate between signal and background processes. A second analysis requires at least one of the jets to be originating from a b -quark. No significant excess above the Standard Model expectations is observed. Limits are set on sbottom masses in simplified models where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Figs. 28 and 29. Exclusions in the CMSSM, assuming $\tan\beta = 10$, $A_0 = 0$ and $\mu > 0$, are also presented, see Fig. 26.
- ⁷⁷ CHATRCHYAN 14I searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing multijets and large \cancel{E}_T . No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos that decay via $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$ with a 100% branching ratio, see Fig. 7b, or via $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ with a 100% branching ratio, see Fig. 7c, or via $\tilde{g} \rightarrow q\bar{q}W/Z\tilde{\chi}_1^0$, see Fig. 7d.
- ⁷⁸ CHATRCHYAN 14N searched in 19.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing a single isolated electron or muon and multiple jets, at least two of which are identified as originating from a b -quark. No significant excesses over the expected SM backgrounds are observed. The results are interpreted in three simplified models of gluino pair production with subsequent decay into virtual or on-shell top squarks, where each of the top squarks decays in turn into a top quark and a $\tilde{\chi}_1^0$, see Fig. 4. The models differ in which masses are allowed to vary.
- ⁷⁹ CHATRCHYAN 14R searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a slepton co-NLSP simplified model (GMSB) where the decay $\tilde{g} \rightarrow q\bar{q}\ell^\pm\ell^\mp\tilde{G}$ takes place with a branching ratio of 100%, see Fig. 8.
- ⁸⁰ CHATRCHYAN 14R searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with at least three leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in a simplified model where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, see Fig. 11.
- ⁸¹ AABOUD 18BJ searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV in events with two opposite-sign charged leptons (electrons and muons), jets and missing transverse momentum, with various requirements to be sensitive to signals with different kinematic endpoint values in the dilepton invariant mass distribution. The data are found to be consistent with the SM expectation. Results are interpreted in the Tglu1H model in case of $m_{\tilde{\chi}_1^0} = 1$ GeV: for any $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$, gluino masses below 1500 GeV are excluded, see their Fig. 14(a).
- ⁸² AABOUD 18v searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV in events with no charged leptons, jets and missing transverse momentum. The data are found to be consistent with the SM expectation. Results are interpreted in a Tglu1C-like model, assuming 50% BR for each gluino decay mode. Gluino masses below 1770 GeV are excluded for any $m_{\tilde{\chi}_2^0} - m_{\tilde{\chi}_1^0}$ and $m_{\tilde{\chi}_1^0} = 60$ GeV, see their Fig. 16(b).
- ⁸³ AABOUD 17AZ searched in 36.1 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R -jets or b -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits are set for pMSSM models with $M_1 = 60$ GeV, $\tan(\beta) = 10$, $\mu < 0$ varying the soft-breaking parameters M_3 and μ . Gluino masses up to 1600 GeV are excluded for $m_{\tilde{\chi}_1^0} = 200$ GeV. See their Figure 6a and text for details on the model.
- ⁸⁴ KHACHATRYAN 16AY searched in 2.3 fb⁻¹ of pp collisions at $\sqrt{s} = 13$ TeV for events with one isolated high transverse momentum lepton (e or μ), hadronic jets of which at least one is identified as coming from a b -quark, and large \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu3A simplified model, see Fig. 10, and in the Tglu3B model, see Fig. 11.
- ⁸⁵ KHACHATRYAN 16BT performed a global Bayesian analysis of a wide range of CMS results obtained with data samples corresponding to 5.0 fb⁻¹ of pp collisions at $\sqrt{s} = 7$ TeV and in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV. The set of searches considered, both individually and in combination, includes those with all-hadronic final states, same-sign and opposite-sign dileptons, and multi-lepton final states. An interpretation was given in a scan of the 19-parameter pMSSM. No scan points with a gluino mass less than 500 GeV survived and 98% of models with a squark mass less than 300 GeV were excluded.
- ⁸⁶ AAD 15AB searched for the decay of neutral, weakly interacting, long-lived particles in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV. Signal events require at least two reconstructed vertices possibly originating from long-lived particles decaying to jets in the inner tracking detector and muon spectrometer. No significant excess of events over the expected background was found. Results were interpreted in Stealth SUSY benchmark models where a pair of gluinos decay to long-lived singlinos, S , which in turn each decay to a low-mass gravitino and a pair of jets. The 95% confidence-level limits are set on the cross section \times branching ratio for the decay $\tilde{g} \rightarrow \tilde{S}g$, as a function of the singlino proper lifetime ($c\tau$). See their Fig. 10(f).
- ⁸⁷ AAD 15AI searched in 20 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events containing at least one isolated lepton (electron or muon), jets, and large missing transverse momentum. No excess of events above the expected level of Standard Model background was found. Exclusion limits at 95% C.L. are set on the gluino mass in the CMSSM/mSUGRA, see Fig. 15, in the NUHM2, see Fig. 16, and in various simplified models, see Figs. 18–22.
- ⁸⁸ AAD 15CB searched for events containing at least one long-lived particle that decays at a significant distance from its production point (displaced vertex, DV) into two leptons or into five or more charged particles in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV. The dilepton signature is characterised by DV formed from at least two lepton candidates. Four different final states were considered for the multitrack signature, in which the DV must be accompanied by a high-transverse momentum muon or electron candidate that originates from the DV, jets or missing transverse momentum. No events were observed in any of the signal regions. Results were interpreted in SUSY scenarios involving R -parity violation, split supersymmetry, and gauge mediation. See their Fig. 12–20.
- ⁸⁹ KHACHATRYAN 15AD searched in 19.4 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with two opposite-sign same flavor isolated leptons featuring either a kinematic edge, or a peak at the Z -boson mass, in the invariant mass spectrum. No evidence for a statistically significant excess over the expected SM backgrounds is observed and 95% C.L. exclusion limits are derived in a simplified model of gluino pair production where the gluino decays into quarks, a Z -boson, and a massless gravitino LSP, see Fig. 9.
- ⁹⁰ KHACHATRYAN 15AZ searched in 19.7 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with either at least one photon, hadronic jets and \cancel{E}_T (single photon channel) or with at least two photons and at least one jet and using the razor variables. No significant excess above the Standard Model expectations is observed. Limits are set on gluino masses in the general gauge-mediated SUSY breaking model (GGM), for both a bino-like and wino-like neutralino NLSP scenario, see Fig. 8 and 9.
- ⁹¹ AAD 14AX searched in 20.1 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for the strong production of supersymmetric particles in events containing either zero or at least one high- p_T lepton, large missing transverse momentum, high jet multiplicity and at least three jets identified as originating from b -quarks. No excess over the expected SM background is observed. Limits are derived in mSUGRA/CMSSM models with $\tan\beta = 30$, $A_0 = -2m_0$ and $\mu > 0$, see their Fig. 14. Also, exclusion limits in simplified models containing gluinos and scalar top and bottom quarks are set, see their Figures 12, 13.
- ⁹² AAD 14E searched in 20.3 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from b -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5 and 6. In the $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = 0.5 m_{\tilde{\chi}_1^0} + m_{\tilde{g}}$, $m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{\chi}_1^\pm})$, $m_{\tilde{\chi}_1^0} < 520$ GeV. In the $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow \ell^\pm\nu\tilde{\chi}_1^0$ or $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow \ell^\pm\ell^\mp(\nu\nu)\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{g}})$, $m_{\tilde{\chi}_1^0} < 660$ GeV. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.
- ⁹³ CHATRCHYAN 14H searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow t\bar{t}\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, or where the decay $\tilde{g} \rightarrow \tilde{t}t, \tilde{t} \rightarrow t\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\tilde{\chi}_1^0$, or where the decay $\tilde{g} \rightarrow b\bar{b}, \tilde{b} \rightarrow t\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\tilde{\chi}_1^\pm$, see Fig. 5.
- ⁹⁴ CHATRCHYAN 14H searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, with varying mass of the $\tilde{\chi}_1^\pm$ and $\tilde{\chi}_1^0$, see Fig. 7.
- ⁹⁵ CHATRCHYAN 14H searched in 19.5 fb⁻¹ of pp collisions at $\sqrt{s} = 8$ TeV for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the decay $\tilde{g} \rightarrow b\bar{b}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^\pm\tilde{\chi}_1^0$ takes place with a branching ratio of 100%, for two choices of $m_{\tilde{\chi}_1^\pm}$ and fixed $m_{\tilde{\chi}_1^0}$, see Fig. 6.

- excess above the Standard Model expectations is observed. Limits up to 400 GeV are set on the down type squark (\tilde{d}_R mass in R-parity-violating supersymmetry models where $\tilde{d}_R \rightarrow tb$ through the non-zero λ''_{313} coupling or $\tilde{d}_R \rightarrow ts$ through the non-zero λ''_{321} . See their Figure 5(e) and 5(f).
- 14 AABOUD 17AZ searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with at least seven jets and large missing transverse momentum. Selected events are further classified based on the presence of large R-jets or b -jets and no leptons. No significant excess above the Standard Model expectations is observed. Limits are set for R-parity violating decays of the gluino assuming $\tilde{g} \rightarrow t\bar{t}_1$ and $\tilde{t}_1 \rightarrow bs$ through the non-zero λ''_{323} couplings. The range 625–1375 GeV is excluded for $m_{\tilde{t}_1} = 400 \text{ GeV}$. See their Figure 7b.
- 15 KHACHATRYAN 17Y searched in 19.7 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing at least 8 or 10 jets, possibly b -tagged, coming from R-parity-violating decays of supersymmetric particles. No excess over the expected background is observed. Limits are derived on the gluino mass, assuming various RPV decay modes, see Fig. 7.
- 16 KHACHATRYAN 16BJ searched in 2.3 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the following simplified models: Tglu3A and Tglu3D, see Fig. 4, Tglu3B and Tglu3C, see Fig. 5, and Tglu1B, see Fig. 7.
- 17 KHACHATRYAN 16BX searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 0 or 1 leptons and b -tagged jets, coming from R-parity-violating decays of supersymmetric particles. No excess over the expected background is observed. Limits are derived on the gluino mass, assuming the RPV $\tilde{g} \rightarrow tbs$ decay, see Fig. 7 and 10.
- 18 AAD 15BV summarized and extended ATLAS searches for gluinos and first- and second-generation squarks in final states containing jets and missing transverse momentum, with or without leptons or b -jets in the $\sqrt{s} = 8 \text{ TeV}$ data set collected in 2012. The paper reports the results of new interpretations and statistical combinations of previously published analyses, as well as new analyses. Exclusion limits at 95% C.L. are set on the gluino mass in several R-parity conserving models, leading to a generalized constraint on gluino masses exceeding 1150 GeV for lightest supersymmetric particle masses below 100 GeV. See their Figs. 10, 19, 20, 21, 23, 25, 26, 29–37.
- 19 AAD 14X searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with at least four leptons (electrons, muons, taus) in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in an R-parity violating simplified model where the decay $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^0$, with $\tilde{\chi}_1^0 \rightarrow \ell^\pm \ell^\mp \nu$, takes place with a branching ratio of 100%, see Fig. 8.
- 20 CHATRCHYAN 14P searched in 19.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for three-jet resonances produced in the decay of a gluino in R-parity violating supersymmetric models. No excess over the expected SM background is observed. Assuming a 100% branching ratio for the gluino decay into three light-flavour jets, limits are set on the cross section of gluino pair production, see Fig. 7, and gluino masses below 650 GeV are excluded at 95% C.L. Assuming a 100% branching ratio for the gluino decaying to one b -quark jet and two light-flavour jets, gluino masses between 200 GeV and 835 GeV are excluded at 95% C.L.
- 21 AABOUD 18cf searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with several jets, possibly b -jets, and large-radius jets for evidence of R-parity violating decays of the gluino. No significant excess above the Standard Model expectations is observed. Limits between 1000 and 1875 GeV are set on the gluino mass in R-parity-violating supersymmetry models as Tglu2RPV with the LSP decay through the non-zero λ'' coupling as $\tilde{\chi}_1^0 \rightarrow qq\bar{q}$. The most stringent limit is obtained for $m_{\tilde{\chi}_1^0} = 1000 \text{ GeV}$, the weakest for $m_{\tilde{\chi}_1^0} = 50 \text{ GeV}$. See their Figure 7(b). Figure 7(a) presents results for gluinos directly decaying into 3 quarks, Tglu1RPV.
- 22 KHACHATRYAN 16BX searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing 4 leptons coming from R-parity-violating decays of $\tilde{\chi}_1^0 \rightarrow \ell\ell\nu$ with $\lambda_{121} \neq 0$ or $\lambda_{122} \neq 0$. No excess over the expected background is observed. Limits are derived on the gluino, squark and stop masses, see Fig. 23.
- 23 AAD 15CB searched for events containing at least one long-lived particle that decays at a significant distance from its production point (displaced vertex, DV) into two leptons or into five or more charged particles in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$. The dilepton signature is characterised by DV formed from at least two lepton candidates. Four different final states were considered for the multitrak signature, in which the DV must be accompanied by a high-transverse momentum muon or electron candidate that originates from the DV, jets or missing transverse momentum. No events were observed in any of the signal regions. Results were interpreted in SUSY scenarios involving R-parity violation, split supersymmetry, and gauge mediation. See their Fig. 12–20.
- 24 AAD 15X searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events containing large number of jets, no requirements on missing transverse momentum and no isolated electrons or muons. The sensitivity of the search is enhanced by considering the number of b -tagged jets and the scalar sum of masses of large-radius jets in an event. No evidence was found for excesses above the expected level of Standard Model background. Exclusion limits at 95% C.L. are set on the gluino mass assuming the gluino decays to various quark flavors, and for various neutralino masses. See their Fig. 11–16.
- 25 AAD 14AX searched in 20.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for the strong production of supersymmetric particles in events containing either zero or at least one high- p_T lepton, large missing transverse momentum, high jet multiplicity and at least three jets identified as originating from b -quarks. No excess over the expected SM background is observed. Limits are derived in mSUGRA/CMSSM models with $\tan\beta = 30$, $A_0 = -2m_0$ and $\mu > 0$, see their Fig. 14. Also, exclusion limits in simplified models containing gluinos and scalar top and bottom quarks are set, see their Figures 12, 13.
- 26 AAD 14E searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for strongly produced supersymmetric particles in events containing jets and two same-sign leptons or three leptons. The search also utilises jets originating from b -quarks, missing transverse momentum and other variables. No excess over the expected SM background is observed. Exclusion limits are derived in simplified models containing gluinos and squarks, see Figures 5 and 6. In the $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow W^{(*)}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow Z^{(*)}\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = 0.5 m_{\tilde{\chi}_2^0} + m_{\tilde{g}}$, $m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{\chi}_1^\pm})$, $m_{\tilde{\chi}_1^0} < 520 \text{ GeV}$. In the $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_1^\pm, \tilde{\chi}_1^\pm \rightarrow \ell^\pm\nu\tilde{\chi}_1^0$ or $\tilde{g} \rightarrow q\bar{q}\tilde{\chi}_2^0, \tilde{\chi}_2^0 \rightarrow \ell^\pm\ell^\mp(\nu\nu)\tilde{\chi}_1^0$ simplified model, the following assumptions have been made: $m_{\tilde{\chi}_1^\pm} = m_{\tilde{\chi}_2^0} = 0.5 (m_{\tilde{\chi}_1^0} + m_{\tilde{g}})$, $m_{\tilde{\chi}_1^0} < 660 \text{ GeV}$. Limits are also derived in the mSUGRA/CMSSM, bRPV and GMSB models, see their Fig. 8.

- 27 CHATRCHYAN 14H searched in 19.5 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with two isolated same-sign dileptons and jets in the final state. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in simplified models where the R-parity violating decay $\tilde{g} \rightarrow tbs$ takes place with a branching ratio of 100%, see Fig. 8.

Long-lived \tilde{g} (Gluino) mass limit

Limits on light gluinos ($m_{\tilde{g}} < 5 \text{ GeV}$) were last listed in our PDG 14 edition: K. Olive, et al. (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

- ¹ AABOUD 19AT searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for metastable and stable R-hadrons. Multiple search strategies for a wide range of lifetimes, corresponding to path lengths of a few meters, are defined. No significant deviations from the expected Standard Model background are observed. Gluino R-hadrons with lifetimes of the order of 50 ns are excluded at 95% C.L. for masses below 1980 GeV using the muon-spectrometer agnostic analysis. Using the full-detector search, the observed lower limits on the mass are 2000 GeV. See their Figure 9 (top).
- ² AABOUD 19c searched in 36.1 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for metastable and stable R-hadrons arising as excesses in the mass distribution of reconstructed tracks with high transverse momentum and large dE/dx . Gluino R-hadrons with lifetimes above 10 ns are excluded at 95% C.L. with lower mass limit range between 1000 GeV and 2060 GeV, see their Figure 5(a). Masses smaller than 1290 GeV are excluded for a lifetime of 1 ns, see their Figure 6. In the case of stable R-hadrons, the lower mass limit is 1890 GeV, see their Figure 5(b).
- ³ SIRUNYAN 19BH searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles decaying into jets, with each long-lived particle having a decay vertex well displaced from the production vertex. The selected events are found to be consistent with standard model predictions. Limits are set on the gluino mass in a GMSB model where the gluino is decaying via $\tilde{g} \rightarrow g\tilde{G}$, see their Figure 4 and in an RPV model of supersymmetry where the gluino is decaying via $\tilde{g} \rightarrow t\bar{b}s$, see their RPV 5. Limits are also set on the stop mass in two RPV models, see their Figure 6 (for $t \rightarrow b\bar{l}$ decays) and Figure 7 (for $\tilde{t} \rightarrow \bar{d}\bar{d}$ decays).
- ⁴ SIRUNYAN 19BT searched in 137 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles decaying to displaced, nonprompt jets and missing transverse momentum. Candidate signal events are identified using the timing capabilities of the CMS electromagnetic calorimeter. The results of the search are found to be consistent with the background predictions. Limits are set on the gluino mass in a GMSB model where long-lived gluinos are pair produced and decaying via $\tilde{g} \rightarrow g\tilde{G}$, see their Figures 4 and 5.
- ⁵ AABOUD 18s searched in 32.8 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived gluinos in final states with large missing transverse momentum and at least one high-mass displaced vertex with five or more tracks. The observed yield is consistent with the expected background. Exclusion limits are derived for Tglu1A models predicting the existence of long-lived gluinos reaching roughly $m(\tilde{g}) = 2000 \text{ GeV}$ to 2370 GeV for $m(\tilde{\chi}_1^0) = 100 \text{ GeV}$ and gluino lifetimes between 0.02 and 10 ns, see their Fig. 8. Limits are presented also as a function of the lifetime (for a fixed gluino-neutralino mass difference of 100 GeV) and of the gluino and neutralino masses (for a fixed lifetime of 1 ns). See their Fig. 9 and 10 respectively.
- ⁶ SIRUNYAN 18AY searched in 35.9 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events containing one or more jets and significant \cancel{E}_T . No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass in the Tglu1A, Tglu2A and Tglu3A simplified models, see their Figure 3. Limits are also set on squark, sbottom and stop masses in the Tsqk1, Tsb0t1, Tstop1 and Tstop4 simplified models, see their Figure 3. Finally, limits are set on long-lived gluino masses in a Tglu1A simplified model where the gluino is metastable or long-lived with proper decay lengths in the range $10^{-3} \text{ mm} < c\tau < 10^5 \text{ mm}$, see their Figure 4.
- ⁷ SIRUNYAN 18bv searched in 38.5 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived particles in events with multiple jets and two displaced vertices composed of many tracks. No events with two well-separated high-track-multiplicity vertices were observed. Limits are set on the stop and the gluino mass in RPV models of supersymmetry where the stop (gluino) is decaying solely into dijet (multijet) final states, see their Figures 6 and 7.
- ⁸ KHACHATRYAN 17AR searched in 17.6 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for R-parity-violating SUSY in which long-lived neutralinos or gluinos decay into multijet final states. No significant excess above the Standard Model expectations is observed. Limits are set on the gluino mass for a range of mean proper decay lengths ($c\tau$), see their Fig. 7. The upper limits on the production cross section times branching ratio squared (Fig. 7) are also applicable to long-lived neutralinos.
- ⁹ AABOUD 16b searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived R-hadrons using observables related to large ionization losses and slow propagation velocities, which are signatures of heavy charged particles traveling significantly slower than the speed of light. Exclusion limits at 95% C.L. are set on the long-lived gluino masses exceeding 1580 GeV. See their Fig. 5.
- ¹⁰ AABOUD 16c searched in 3.2 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for long-lived and stable R-hadrons identified by anomalously specific ionization energy loss in the ATLAS Pixel detector. Gluino R-hadrons with lifetimes above 0.4 ns are excluded at 95% C.L. with lower mass limit range between 740 GeV and 1590 GeV. In the case of stable R-hadrons, the lower mass limit is 1570 GeV. See their Figs. 5 and 6.

- ¹¹ KHACHATRYAN 16BW searched in 2.5 fb^{-1} of pp collisions at $\sqrt{s} = 13 \text{ TeV}$ for events with heavy stable charged particles, identified by their anomalously high energy deposits in the silicon tracker and/or long time-of-flight measurements by the muon system. No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass, depending on the interaction model and on the fraction f , of produced gluinos hadronizing into a \tilde{g} -gluon state, see Fig. 4 and Table 7.
- ¹² AAD 15AE searched in 19.1 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for heavy long-lived charged particles, measured through their specific ionization energy loss in the ATLAS pixel detector or their time-of-flight in the ALTAS muon system. In the absence of an excess of events above the expected backgrounds, limits are set R-hadrons in various scenarios, see Fig. 11. Limits are also set in LeptoSUSY models where the gluino decays to stable 300 GeV leptons, see Fig. 9.
- ¹³ AAD 15BM searched in 18.4 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for stable and metastable non-relativistic charged particles through their anomalous specific ionization energy loss in the ATLAS pixel detector. In absence of an excess of events above the expected backgrounds, limits are set within a generic R-hadron model, on stable gluino R-hadrons (see Table 5) and on metastable gluino R-hadrons decaying to $(g/q\bar{q})$ plus a light $\tilde{\chi}_1^0$ (see Fig. 7) and decaying to $t\bar{t}$ plus a light $\tilde{\chi}_1^0$ (see Fig. 9).
- ¹⁴ KHACHATRYAN 15AK looked in a data set corresponding to 18.6 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$, and a search interval corresponding to 281 h of trigger lifetime, for long-lived particles that have stopped in the CMS detector. No evidence for an excess over the expected background in a cloud interaction model is observed. Assuming the decay $\tilde{g} \rightarrow g\tilde{\chi}_1^0$ and lifetimes between 1 μs and 1000 s, limits are derived on \tilde{g} production as a function of $m_{\tilde{\chi}_1^0}$, see Figs. 4 and 6. The exclusions require that $m_{\tilde{\chi}_1^0}$ is kinematically consistent with the minimum values of the jet energy thresholds used.
- ¹⁵ AAD 13AA searched in 4.7 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events containing colored long-lived particles that hadronize forming R-hadrons. No significant excess above the expected background was found. Long-lived R-hadrons containing a \tilde{g} are excluded for masses up to 985 GeV at 95% C.L. in a general interaction model. Also, limits independent of the fraction of R-hadrons that arrive charged in the muon system were derived, see Fig. 6.
- ¹⁶ AAD 13BC searched in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 22.9 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for bottom squark R-hadrons that have come to rest within the ATLAS calorimeter and decay at some later time to hadronic jets and a neutralino. In absence of an excess of events above the expected backgrounds, limits are set on gluino masses for different decays, lifetimes, and neutralino masses, see their Table 6 and Fig. 10.
- ¹⁷ CHATRCHYAN 13AB looked in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ and in 18.8 fb^{-1} of pp collisions at $\sqrt{s} = 8 \text{ TeV}$ for events with heavy stable particles, identified by their anomalously dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of \tilde{g} 's. No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 8 and Table 5), depending on the fraction, f , of formation of \tilde{g} - \tilde{g} (R-gluonball) states. The quoted limit is for $f = 0.1$, while for $f = 0.5$ it degrades to 1276 GeV. In the conservative scenario where every hadronic interaction causes it to become neutral, the limit decreases to 928 GeV for $f = 0.1$.
- ¹⁸ AAD 12P looked in 31 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with pair production of long-lived gluinos. The hadronization of the gluinos leads to R-hadrons which may stop inside the detector and later decay via $\tilde{g} \rightarrow g\tilde{\chi}_1^0$ during gaps between the proton bunches. No significant excess over the expected background is observed. From a counting experiment, a limit at 95% C.L. on the cross section as a function of $m_{\tilde{g}}$ is derived for $m_{\tilde{\chi}_1^0} = 100 \text{ GeV}$, see Fig. 4. The limit is valid for lifetimes between 10^{-5} and 10^3 seconds and assumes the Generic matter interaction model for the production cross section.
- ¹⁹ CHATRCHYAN 12AN looked in 4.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with pair production of long-lived gluinos. The hadronization of the gluinos leads to R-hadrons which may stop inside the detector and later decay via $\tilde{g} \rightarrow g\tilde{\chi}_1^0$ during gaps between the proton bunches. No significant excess over the expected background is observed. From a counting experiment, a limit at 95% C.L. on the cross section as a function of $m_{\tilde{g}}$ is derived, see Fig. 3. The mass limit is valid for lifetimes between 10^{-5} and 10^3 seconds, for what they call "the daughter gluon energy $E_g > 100 \text{ GeV}$ and assuming the cloud interaction model for R-hadrons. Supersedes KHACHATRYAN 11.
- ²⁰ CHATRCHYAN 12L looked in 5.0 fb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with heavy stable particles, identified by their anomalously dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of \tilde{g} 's. No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 3), depending on the fraction, f , of formation of \tilde{g} - \tilde{g} (R-gluonball) states. The quoted limit is for $f = 0.1$, while for $f = 0.5$ it degrades to 1046 GeV. In the conservative scenario where every hadronic interaction causes it to become neutral, the limit decreases to 928 GeV for $f = 0.1$. Supersedes KHACHATRYAN 11c.
- ²¹ AAD 11K looked in 34 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with heavy stable particles, identified by their anomalously dE/dx in the tracker or time of flight in the tile calorimeter, from pair production of \tilde{g} . No evidence for an excess over the SM expectation is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 4), for a fraction, $f = 10\%$, of formation of \tilde{g} - \tilde{g} (R-gluonball). If instead of a phase space driven approach for the hadronic scattering of the R-hadrons, a triple-Regge model or a bag-model is used, the limit degrades to 566 and 562 GeV, respectively.
- ²² AAD 11P looked in 37 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with heavy stable particles, reconstructed and identified by their time of flight in the Muon System. There is no requirement on their observation in the tracker to increase the sensitivity to cases where gluinos have a large fraction, f , of formation of neutral \tilde{g} - \tilde{g} (R-gluonball). No evidence for an excess over the SM expectation is observed. Limits are derived as a function of mass (see Fig. 4), for $f = 0.1$. For fractions $f = 0.5$ and 1.0 the limit degrades to 537 and 530 GeV, respectively.
- ²³ KHACHATRYAN 11 looked in 10 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$ for events with pair production of long-lived gluinos. The hadronization of the gluinos leads to R-hadrons which may stop inside the detector and later decay via $\tilde{g} \rightarrow g\tilde{\chi}_1^0$ during gaps between the proton bunches. No significant excess over the expected background is observed. From a counting experiment, a limit at 95% C.L. on the cross section times branching ratio is derived for $m_{\tilde{g}} - m_{\tilde{\chi}_1^0} > 100 \text{ GeV}$, see their Fig. 2. Assuming 100% branching

ratio, lifetimes between 75 ns and 3×10^5 s are excluded for $m_{\tilde{g}} = 300$ GeV. The \tilde{g} mass exclusion is obtained with the same assumptions for lifetimes between 10 μ s and 1000 s, but shows some dependence on the model for R-hadron interactions with matter, illustrated in Fig. 3. From a time-profile analysis, the mass exclusion is 382 GeV for a lifetime of 10 μ s under the same assumptions as above.

²⁴ KHACHATRYAN 11c looked in 3.1 pb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for events with heavy stable particles, identified by their anomalous dE/dx in the tracker or additionally requiring that it be identified as muon in the muon chambers, from pair production of \tilde{g} . No evidence for an excess over the expected background is observed. Limits are derived for pair production of gluinos as a function of mass (see Fig. 3), depending on the fraction, f , of formation of $\tilde{g} - g$ (R-gluonball). The quoted limit is for $f=0.1$, while for $f=0.5$ it degrades to 357 GeV. In the conservative scenario where every hadronic interaction causes it to become neutral, the limit decreases to 311 GeV for $f=0.1$.

Light \tilde{G} (Gravitino) mass limits from collider experiments

The following are bounds on light ($< 1 \text{ eV}$) gravitino indirectly inferred from its coupling to matter suppressed by the gravitino decay constant.

Unless otherwise stated, all limits assume that other supersymmetric particles besides the gravitino are too heavy to be produced. The gravitino is assumed to be undetected and to give rise to a missing energy (\cancel{E}) signature.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

¹ AAD 15BH searched in 20.3 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV for associated production of a light gravitino and a squark or gluino. The squark (gluino) is assumed to decay exclusively to a quark (gluon) and a gravitino. No evidence was found for an excess above the expected level of Standard Model background and 95% C.L. lower limits were set on the gravitino mass as a function of the squark/gluino mass, both in the case of degenerate and non-degenerate squark/gluino masses, see Figs. 14 and 15.

² ABDALLAH 05B use data from $\sqrt{s} = 180\text{--}208$ GeV. They look for events with a single photon + \cancel{E} final states from which a cross section limit of $\sigma < 0.18 \text{ pb}$ at 208 GeV is obtained, allowing a limit on the mass to be set. Supersedes the results of ABREU 00Z.

³ ACHARD 04E use data from $\sqrt{s} = 189\text{--}209$ GeV. They look for events with a single photon + \cancel{E} final states from which a limit on the gravitino mass is set corresponding to $\sqrt{\sigma} > 238$ GeV. Supersedes the results of ACCIARRI 99R.

⁴ HEISTER 03c use the data from $\sqrt{s} = 189\text{--}209$ GeV to search for $\gamma\tilde{E}$ final states.

⁵ ACOSTA 02H looked in 87 pb^{-1} of $p\bar{p}$ collisions at $\sqrt{s}=1.8$ TeV for events with a high- E_T photon and \cancel{E}_T . They compared the data with a GMSB model where the final state could arise from $q\bar{q} \rightarrow \tilde{G}\tilde{G}\gamma$. Since the cross section for this process scales as $1/|F|^4$, a limit at 95% CL is derived on $|F|^{1/2} > 221$ GeV. A model independent limit for the above topology is also given in the paper.

⁶ ABBIENDI,G 00D searches for $\gamma\tilde{E}$ final states from $\sqrt{s}=189$ GeV.

Supersymmetry miscellaneous results

Results that do not appear under other headings or that make nonminimal assumptions.

Some earlier papers are now obsolete and have been omitted. They were last listed in our PDG 14 edition: K. Olive, *et al.* (Particle Data Group), Chinese Physics **C38** 070001 (2014) (<http://pdg.lbl.gov>).

¹ AAD 20c uses a statistical combination of six final states $b\bar{b}b\bar{b}, b\bar{b}WW, b\bar{b}\tau\tau, WWWW, b\bar{b}\gamma\gamma$, and $WW\gamma\gamma$ to search for non-resonant and resonant production of Higgs boson pairs. The search uses 36.1 fb^{-1} of pp collisions data at $\sqrt{s} = 13$ TeV. Constraints in the habemus Minimal Supersymmetric Standard Model in the $(m_A, \tan\beta)$ parameter space are placed, see their Figure 7(b).

² AABOUD 16AF uses a selection of searches by ATLAS for the electroweak production of SUSY particles studying resulting constraints on dark matter candidates. They use 20 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV. A likelihood-driven scan of an effective model focusing on the gaugino-higgsino and Higgs sector of the pMSSM is performed. The ATLAS searches impact models where $m_{\tilde{\chi}_1^0} < 65$ GeV, excluding 86% of them. See their Figs. 2, 4, and 6.

³ AAD 16AG searches for prompt lepton-jets using 20 fb^{-1} of pp collisions at $\sqrt{s} = 8$ TeV collected with the ATLAS detector. Lepton-jets are expected from decays of low-mass dark photons in SUSY-portal and Higgs-portal models. No significant excess of events is observed and 95% CL upper limits are computed on the production cross section times branching ratio for two prompt lepton-jets in models predicting 2 or 4 γ_D via SUSY-portal topologies, for γ_D mass values between 0 and 2 GeV. See their Figs 9 and 10. The results are also interpreted in terms of a 90% CL exclusion region in kinetic mixing and dark-photon mass parameter space. See their Fig. 13.

⁴ AAD 13P searched in 5 fb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for single lepton-jets with at least four muons; pairs of lepton-jets, each with two or more muons; and pairs of lepton-jets with two or more electrons. All of these could be signatures of Hidden Valley supersymmetric models. No statistically significant deviations from the Standard Model expectations are found. 95% C.L. limits are placed on the production cross section times branching ratio of dark photons for several parameter sets of a Hidden Valley model.

⁵ AALTONEN 12AB looked in 5.1 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for anomalous production of multiple low-energy leptons in association with a W or Z boson. Such events may occur in hidden valley models in which a supersymmetric Higgs boson is produced in association with a W or Z boson, with $H \rightarrow \tilde{\chi}_1^0\tilde{\chi}_1^0$ pair and with the $\tilde{\chi}_1^0$ further decaying into a dark photon (γ_D) and the unobservable lightest SUSY particle of the hidden sector. As the γ_D is expected to be light, it may decay into a lepton pair. No significant excess over the SM expectation is observed and a limit at 95% C.L. is set on the cross section for a benchmark model of supersymmetric hidden-valley Higgs production.

⁶ AAD 11AA looked in 34 pb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for events with ≥ 4 jets originating from pair production of scalar gluons, each decaying to two gluons. No two-jet resonances are observed over the SM background. Limits are derived on the cross section times branching ratio (see Fig. 3). Assuming 100% branching ratio for the decay to two gluons, the quoted exclusion range is obtained, except for a 5 GeV mass window around 140 GeV.

⁷ CHATRCHYAN 11E looked in 35 pb^{-1} of pp collisions at $\sqrt{s} = 7$ TeV for events with collimated μ pairs (leptonic jets) from the decay of hidden sector states. No evidence for new resonance production is found. Limits are derived and compared to various SUSY models (see Fig. 4) where the LSP, either the $\tilde{\chi}_1^0$ or a \tilde{q} , decays to dark sector particles.

⁸ ABAZOV 10N looked in 5.8 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV for events from hidden valley models in which a $\tilde{\chi}_1^0$ decays into a dark photon, γ_D , and the unobservable lightest SUSY particle of the hidden sector. As the γ_D is expected to be light, it may decay into a tightly collimated lepton pair, called lepton jet. They searched for events with \cancel{E}_T and two isolated lepton jets observable by an opposite charged lepton pair e^+e^- or $\mu^+\mu^-$. No significant excess over the SM expectation is observed, and a limit at 95% C.L. on the cross section times branching ratio is derived, see their Table I. They also examined the invariant mass of the lepton jets for a narrow resonance, see their Fig. 4, but found no evidence for a signal.

¹ AAD 16w search for color octet vector resonance decaying to $b\bar{b}$ in pp collisions at $\sqrt{s} = 8$ TeV. The vector like quark B is assumed to decay to bH . See their Fig.3 and Fig.4 for limits on σ_B .
² KHACHATRYAN 16E search for top-color Z' decaying to $t\bar{t}$. The quoted limit is for $\Gamma_{Z'}/m_{Z'} = 0.012$. Also exclude $m_{Z'} < 2.9$ TeV for wider topcolor Z' with $\Gamma_{Z'}/m_{Z'} = 0.1$.

- AAD 15AB search for long-lived hidden valley π_V particles which are produced in pairs by the decay of a scalar boson. π_V is assumed to decay into dijets. See their Fig. 10 for the limit on σ_B .
- AAD 15A0 search for top-color Z' decaying to $t\bar{t}$. The quoted limit is for $\Gamma_{Z'}/m_{Z'} = 0.012$.
- AAD 15BB search for minimal walking technicolor (MWT) isotriplet vector and axial-vector resonances decaying to Wh or Zh . See their Fig. 3 for the exclusion limit in the MWT parameter space.
- AAD 15Q search for long-lived hidden valley π_V particles which are produced in pairs by the decay of scalar boson. π_V is assumed to decay into dijets. See their Fig. 5 and Fig. 6 for the limit on σ_B .
- AAIJ 15AN search for long-lived hidden valley π_V particles which are produced in pairs by the decay of scalar boson with a mass of 120GeV. π_V is assumed to decay into dijets. See their Fig. 4 for the limit on σ_B .
- KHACHATRYAN 15c search for a vector techni-resonance decaying to WZ . The limit assumes $M_{\pi_T} = (3/4) M_{\rho_T} - 25$ GeV. See their Fig.3 for the limit in $M_{\pi_T} - M_{\rho_T}$ plane of the low scale technicolor model.
- KHACHATRYAN 15w search for long-lived hidden valley π_V particles which are produced in pairs in the decay of heavy higgs boson H . π_V is assumed to decay into $\ell^+ \ell^-$. See their Fig. 7 and Fig. 8 for the limits on σ_B .
- AAD 14AT search for techni- ω and techni- a resonances decaying to $V\gamma$ with $V \equiv W(\rightarrow \ell\nu)$ or $Z(\rightarrow \ell^+ \ell^-)$.
- AAD 14V search for vector techni-resonances decaying into electron or muon pairs in pp collisions at $\sqrt{s} = 8$ TeV. See their table IX for exclusion limits with various assumptions.
- AAD 13AN search for vector techni-resonance a_T decaying into $W\gamma$.
- AAD 13AN search for vector techni-resonance ω_T decaying into $Z\gamma$.
- Search for top-color Z' decaying to $t\bar{t}$. The quoted limit is for $\Gamma_{Z'}/m_{Z'} = 0.012$.
- CHATRCHYAN 13AP search for top-color leptophobic Z' decaying to $t\bar{t}$. The quoted limit is for $\Gamma_{Z'}/m_{Z'} = 0.012$.
- BAAK 12 give electroweak oblique parameter constraints on the QCD-like technicolor models. See their Fig. 28.
- CHATRCHYAN 12AF search for a vector techni-resonance decaying to WZ . The limit assumes $M_{\pi_T} = (3/4) M_{\rho_T} - 25$ GeV. See their Fig. 3 for the limit in $M_{\pi_T} - M_{\rho_T}$ plane of the low scale technicolor model.
- Using the LHC limit on the Higgs boson production cross section, CHIVUKULA 11 obtain a limit on the top-Higgs mass > 300 GeV at 95% CL assuming 150 GeV top-pion mass.
- Using the LHC limit on the Higgs boson production cross section, CHIVUKULA 11A obtain a limit on the technipion mass ruling out the region $110 \text{ GeV} < m_P < 2m_t$. Existence of color techni-fermions, top-color mechanism, and $N_{TC} \geq 3$ are assumed.
- AALTONEN 10I search for the vector techni-resonances (ρ_T, ω_T) decaying into $W\pi_T$ with $W \rightarrow \ell\nu$ and $\pi_T \rightarrow b\bar{b}, b\bar{c}$, or $b\bar{u}$. See their Fig.3 for the exclusion plot in $M_{\pi_T} - M_{\rho_T}$ plane.
- ABAZOV 10A search for a vector techni-resonance decaying into WZ . The limit assumes $M_{\rho_T} < M_{\pi_T} + M_W$.
- ABAZOV 07I search for the vector techni-resonances (ρ_T, ω_T) decaying into $W\pi_T$ with $W \rightarrow e\nu$ and $\pi_T \rightarrow b\bar{b}$ or $b\bar{c}$. See their Fig. 2 for the exclusion plot in $M_{\pi_T} - M_{\rho_T}$ plane.
- ABULENCIA 05A search for resonances decaying to electron or muon pairs in $p\bar{p}$ collisions. at $\sqrt{s} = 1.96$ TeV. The limit assumes Technicolor-scale mass parameters $M_V = M_A = 500$ GeV.
- CHEKANOV 02B search for color octet techni- π P decaying into dijets in ep collisions. See their Fig. 5 for the limit on $\sigma(ep \rightarrow ePX) \cdot B(P \rightarrow 2j)$.
- ABAZOV 01B searches for vector techni-resonances (ρ_T, ω_T) decaying to $e^+ e^-$. The limit assumes $M_{\rho_T} = M_{\omega_T} < M_{\pi_T} + M_W$.
- The limit is independent of the π_T mass. See their Fig. 9 and Fig. 10 for the exclusion plot in the $M_{\rho_T} - M_{\pi_T}$ plane. ABDALLAH 01 limit on the technipion mass is $M_{\pi_T} > 79.8$ GeV for $N_D = 2$, assuming its point-like coupling to gauge bosons.
- AFFOLDER 00f search for ρ_T decaying into $W\pi_T$ or $\pi_T\pi_T$ with $W \rightarrow \ell\nu$ and $\pi_T \rightarrow b\bar{b}, b\bar{c}$. See Fig. 1 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the exclusion plot in the $M_{\rho_T} - M_{\pi_T}$ plane.
- AFFOLDER 00k search for the ρ_{T8} decaying into $\pi_{LQ}\pi_{LQ}$ with $\pi_{LQ} \rightarrow b\nu$. For $\pi_{LQ} \rightarrow c\nu$, the limit is $M_{\rho_{T8}} > 510$ GeV. See their Fig. 2 and Fig. 3 for the exclusion plot in the $M_{\rho_{T8}} - M_{\pi_{LQ}}$ plane.
- ABE 99f search for a new particle X decaying into $b\bar{b}$ in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. See Fig. 7 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the upper limit on $\sigma(p\bar{p} \rightarrow X) \cdot B(X \rightarrow b\bar{b})$. ABE 99f also exclude top gluons of width $\Gamma = 0.3M$ in the mass interval $280 < M < 670$ GeV, of width $\Gamma = 0.5M$ in the mass interval $340 < M < 640$ GeV, and of width $\Gamma = 0.7M$ in the mass interval $375 < M < 560$ GeV.
- ABE 99n search for the techni- ω decaying into $\gamma\pi_T$. The technipion is assumed to decay $\pi_T \rightarrow b\bar{b}$. See Fig. 2 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the exclusion plot in the $M_{\omega_T} - M_{\pi_T}$ plane.
- ABE 97g search for a new particle X decaying into dijets in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. See Fig. 5 in the above Note on "Dynamical Electroweak Symmetry Breaking" for the upper limit on $\sigma(p\bar{p} \rightarrow X) \cdot B(X \rightarrow 2j)$.

>5.0	>5.4	95	¹ MCFARLAND	98	CCFR νN scattering

¹ MCFARLAND 98 assumed a flavor universal interaction. Neutrinos were mostly of muon type.

MASS LIMITS for Excited e (e^*)

Most e^+e^- experiments assume one-photon or Z exchange. The limits from some e^+e^- experiments which depend on λ have assumed transition couplings which are chirality violating ($\eta_L = \eta_R$). However they can be interpreted as limits for chirality-conserving interactions after multiplying the coupling value λ by $\sqrt{2}$; see Note.

Excited leptons have the same quantum numbers as other ortholeptons. See also the searches for ortholeptons in the "Searches for Heavy Leptons" section.

Limits for Excited e (e^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow e^*e^*$ and thus rely only on the (electroweak) charge of e^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the e^* coupling is assumed to be of sequential type. Possible t channel contribution from transition magnetic coupling is neglected. All limits assume a dominant $e^* \rightarrow e\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

Quark and Lepton Compositeness

Limits for Excited e (e^*) from $e^+e^- \rightarrow \gamma\gamma$

These limits are derived from indirect effects due to e^* exchange in the t channel and depend on transition magnetic coupling between e and e^* . All limits are for $\lambda_\gamma = 1$. All limits except ABE 89j and ACHARD 02d are for nonchiral coupling with $\eta_L = \eta_R = 1$. We choose the chiral coupling limit as the best limit and list it in the Summary Table.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>356	95	¹ ABDALLAH 04N	DLPH	$\sqrt{s} = 161\text{--}208$ GeV
•••		We do not use the following data for averages, fits, limits, etc. •••		
>310	95	ACHARD 02d	L3	$\sqrt{s} = 192\text{--}209$ GeV

¹ ABDALLAH 04N also obtain a limit on the excited electron mass with e^*e^* chiral coupling, $m_{e^*} > 295$ GeV at 95% CL.

Indirect Limits for Excited e (e^*)

These limits make use of loop effects involving e^* and are therefore subject to theoretical uncertainty.

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
•••	We do not use the following data for averages, fits, limits, etc. •••		
	¹ DORENBOS... 89	CHRM	$\mathcal{T}_{\mu e} \rightarrow \mathcal{T}_{\mu e}, \nu_{\mu e} \rightarrow \nu_{\mu e}$
	² GRIFOLS 86	THEO	$\nu_{\mu e} \rightarrow \nu_{\mu e}$
	³ RENARD 82	THEO	$g-2$ of electron

¹ DORENBOSCH 89 obtain the limit $\lambda_{\text{cut}}^2 \Lambda_{\text{cut}}^2 / m_{e^*}^2 < 2.6$ (95% CL), where Λ_{cut} is the cutoff scale, based on the one-loop calculation by GRIFOLS 86. If one assumes that $\Lambda_{\text{cut}} = 1$ TeV and $\lambda_\gamma = 1$, one obtains $m_{e^*} > 620$ GeV. However, one generally expects $\lambda_\gamma \approx m_{e^*} / \Lambda_{\text{cut}}$ in composite models.

² GRIFOLS 86 uses $\nu_{\mu e} \rightarrow \nu_{\mu e}$ and $\mathcal{T}_{\mu e} \rightarrow \mathcal{T}_{\mu e}$ data from CHARM Collaboration to derive mass limits which depend on the scale of compositeness.

³ RENARD 82 derived from $g-2$ data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.

MASS LIMITS for Excited μ (μ^*)

Limits for Excited μ (μ^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow \mu^*\mu^*$ and thus rely only on the (electroweak) charge of μ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the μ^* coupling is assumed to be of sequential type. All limits assume a dominant $\mu^* \rightarrow \mu\gamma$ decay except the limits from $\Gamma(Z)$.

³ KHACHATRYAN 16AQ search for single μ^* production in pp collisions at $\sqrt{s} = 8$ TeV. The limit above is from the $\mu^* \rightarrow \mu\gamma$ search channel assuming $f = f' = 1$, $m_{\mu^*} = \Lambda$. See their Table 7 for limits in other search channels or with different assumptions.

⁴ AAD 15AP search for μ^* production in events with three or more charged leptons in pp collisions at $\sqrt{s} = 8$ TeV. The quoted limit assumes $\Lambda = m_{\mu^*}$, $f = f' = 1$. The contact interaction is included in the μ^* production and decay amplitudes.

⁵ AAD 13BB search for single μ^* production in pp collisions with $\mu^* \rightarrow \mu\gamma$ decay. $f = f' = 1$, and μ^* production via contact interaction with $\Lambda = m_{\mu^*}$ are assumed.

⁶ CHATRCHYAN 13AE search for single μ^* production in pp collisions with $\mu^* \rightarrow \mu\gamma$ decay. $f = f' = 1$, and μ^* production via contact interaction with $\Lambda = m_{\mu^*}$ are assumed.

⁷ AAD 12AZ search for μ^* production via four-fermion contact interaction in pp collisions with $\mu^* \rightarrow \mu\gamma$ decay. The quoted limit assumes $\Lambda = m_{\mu^*}$. See their Fig. 8 for the exclusion plot in the mass-coupling plane.

Indirect Limits for Excited μ (μ^*)

These limits make use of loop effects involving μ^* and are therefore subject to theoretical uncertainty.

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
•••	We do not use the following data for averages, fits, limits, etc. •••		
	¹ RENARD 82	THEO	$g-2$ of muon

¹ RENARD 82 derived from $g-2$ data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.

MASS LIMITS for Excited τ (τ^*)

Limits for Excited τ (τ^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow \tau^*\tau^*$ and thus rely only on the (electroweak) charge of τ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the τ^* coupling is assumed to be of sequential type. All limits assume a dominant $\tau^* \rightarrow \tau\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

¹ From e^+e^- collisions at $\sqrt{s} = 183\text{--}209$ GeV. $f = f'$ is assumed.

² From e^+e^- collisions at $\sqrt{s} = 189\text{--}209$ GeV. $f = f'$ is assumed. ACHARD 03B also obtain limit for $f = -f'$: $m_{\tau^*} > 96.6$ GeV.

Limits for Excited τ (τ^*) from Single Production

These limits are from $e^+e^- \rightarrow \tau^*\tau$ and depend on transition magnetic coupling between τ and τ^* . All limits assume $\tau^* \rightarrow \tau\gamma$ decay. Limits from LEP are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda\text{--}m_{\tau^*}$ plane. See the original papers.

Quark and Lepton Compositeness, Extra Dimensions

- ¹ BARGER 89 used ABE 89B limit for events with large missing transverse momentum. Two-body decay $\nu_g \rightarrow \nu g$ is assumed.
- ² KIM 90 is at $E_{cm} = 50\text{--}60.8$ GeV. The same assumptions as in BARTEL 87b are used.
- ³ BARTEL 87b is at $E_{cm} = 46.3\text{--}46.78$ GeV. The limit assumes the ν_g pair production cross section to be eight times larger than that of the corresponding heavy neutrino pair production. This assumption is not valid in general for the weak couplings, and the limit can be sensitive to its $SU(2)_L \times U(1)_Y$ quantum numbers.

Extra Dimensions

For explanation of terms used and discussion of significant model dependence of following limits, see the "Extra Dimensions" review. Footnotes describe originally quoted limit. δ indicates the number of extra dimensions.

Limits not encoded here are summarized in the "Extra Dimensions" review, where the latest unpublished results are also described.

See the related review(s): Extra Dimensions

Limits on R from Deviations in Gravitational Force Law

This section includes limits on the size of extra dimensions from deviations in the Newtonian ($1/r^2$) gravitational force law at short distances. Deviations are parametrized by a gravitational potential of the form $V = -(G m m'/r) [1 + \alpha \exp(-r/R)]$. For δ toroidal extra dimensions of equal size, $\alpha = 8\delta/3$. Quoted bounds are for $\delta = 2$ unless otherwise noted.

- ¹ KAPNER 07 search for new forces, probing a range of $\alpha \approx 10^{-3}\text{--}10^5$ and length scales $R \approx 10\text{--}1000$ μm . For $\delta = 1$ the bound on R is 44 μm . The bound is expressed in terms of M_* , here translated to a bound on the radius. See their Fig. 6 for details on the bound.
- ² BERGE 18 uses results from the MICROSCOPE experiment to obtain constraints on non-Newtonian forces with strengths $10^{-11} \lesssim |\alpha| \lesssim 10^{-7}$ and length scales $R \gtrsim 10^5$ m. See their Figure 1 for more details. These constraints do not place limits on the size of extra flat dimensions.
- ³ FAYET 18A uses results from the MICROSCOPE experiment to obtain constraints on an EP-violating force possibly arising from a new $U(1)$ gauge boson. For $R \gtrsim 10^7$ m the limits are $|\alpha| \lesssim$ a few 10^{-13} to a few 10^{-11} depending on the coupling, corresponding to $|\epsilon| \gtrsim 10^{-24}$ for the coupling of the new spin-1 or spin-0 mediator. These constraints do not place limits on the size of extra flat dimensions. This extends the results of FAYET 18.
- ⁴ HADDOCK 18 obtain constraints on non-Newtonian forces with strengths $10^{22} \lesssim |\alpha| \lesssim 10^{24}$ and length scales $R \approx 0.01\text{--}10$ nm. See their Figure 8 for more details. These constraints do not place limits on the size of extra flat dimensions.
- ⁵ KLIMCHITSKAYA 17A uses an experiment that measures the difference of Casimir forces to obtain bounds on non-Newtonian forces with strengths $|\alpha| \approx 10^5\text{--}10^{17}$ and length scales $R = 0.03\text{--}10$ μm . See their Fig. 3. These constraints do not place limits on the size of extra flat dimensions.
- ⁶ XU 13 obtain constraints on non-Newtonian forces with strengths $|\alpha| \approx 10^{34}\text{--}10^{36}$ and length scales $R \approx 1\text{--}10$ fm. See their Fig. 4 for more details. These constraints do not place limits on the size of extra flat dimensions.
- ⁷ BEZERRA 11 obtain constraints on non-Newtonian forces with strengths $10^{11} \lesssim |\alpha| \lesssim 10^{18}$ and length scales $R = 30\text{--}1260$ nm. See their Fig. 2 for more details. These constraints do not place limits on the size of extra flat dimensions.
- ⁸ SUSHKOV 11 obtain improved limits on non-Newtonian forces with strengths $10^7 \lesssim |\alpha| \lesssim 10^{11}$ and length scales 0.4 $\mu\text{m} < R < 4$ μm (95% CL). See their Fig. 2. These bounds do not place limits on the size of extra flat dimensions. However, a model dependent bound of $M_* > 70$ TeV is obtained assuming gauge bosons that couple to baryon number also propagate in $(4 + \delta)$ dimensions.
- ⁹ BEZERRA 10 obtain improved constraints on non-Newtonian forces with strengths $10^{19} \lesssim |\alpha| \lesssim 10^{29}$ and length scales $R = 1.6\text{--}14$ nm (95% CL). See their Fig. 1. This bound does not place limits on the size of extra flat dimensions.

Extra Dimensions

- ¹⁰ MASUDA 09 obtain improved constraints on non-Newtonian forces with strengths $10^9 \lesssim |\alpha| \lesssim 10^{11}$ and length scales $R = 1.0\text{--}2.9 \mu\text{m}$ (95% CL). See their Fig. 3. This bound does not place limits on the size of extra flat dimensions.
- ¹¹ GERACI 08 obtain improved constraints on non-Newtonian forces with strengths $|\alpha| > 14,000$ and length scales $R = 5\text{--}15 \mu\text{m}$. See their Fig. 9. This bound does not place limits on the size of extra flat dimensions.
- ¹² TRENKEL 08 uses two independent measurements of Newton's constant G to constrain new forces with strength $|\alpha| \simeq 10^{-4}$ and length scales $R = 0.02\text{--}1 \text{ m}$. See their Fig. 1. This bound does not place limits on the size of extra flat dimensions.
- ¹³ DECCA 07A search for new forces and obtain bounds in the region with strengths $|\alpha| \simeq 10^{13}\text{--}10^{18}$ and length scales $R = 20\text{--}86 \text{ nm}$. See their Fig. 6. This bound does not place limits on the size of extra flat dimensions.
- ¹⁴ TU 07 search for new forces probing a range of $|\alpha| \simeq 10^{-1}\text{--}10^5$ and length scales $R \simeq 20\text{--}1000 \mu\text{m}$. For $\delta = 1$ the bound on R is $53 \mu\text{m}$. See their Fig. 3 for details on the bound.
- ¹⁵ SMULLIN 05 search for new forces, and obtain bounds in the region with strengths $\alpha \simeq 10^3\text{--}10^8$ and length scales $R = 6\text{--}20 \mu\text{m}$. See their Figs. 1 and 16 for details on the bound. This work does not place limits on the size of extra flat dimensions.
- ¹⁶ HOYLE 04 search for new forces, probing α down to 10^{-2} and distances down to $10 \mu\text{m}$. Quoted bound on R is for $\delta = 2$. For $\delta = 1$, bound goes to $160 \mu\text{m}$. See their Fig. 34 for details on the bound.
- ¹⁷ CHIAVERINI 03 search for new forces, probing α above 10^4 and λ down to $3 \mu\text{m}$, finding no signal. See their Fig. 4 for details on the bound. This bound does not place limits on the size of extra flat dimensions.
- ¹⁸ LONG 03 search for new forces, probing α down to 3, and distances down to about $10 \mu\text{m}$. See their Fig. 4 for details on the bound.
- ¹⁹ HOYLE 01 search for new forces, probing α down to 10^{-2} and distances down to $20 \mu\text{m}$. See their Fig. 4 for details on the bound. The quoted bound is for $\alpha \geq 3$.
- ²⁰ HOSKINS 85 search for new forces, probing distances down to 4 mm. See their Fig. 13 for details on the bound. This bound does not place limits on the size of extra flat dimensions.

Limits on R from On-Shell Production of Gravitons: $\delta = 2$

This section includes limits on on-shell production of gravitons in collider and astrophysical processes. Bounds quoted are on R , the assumed common radius of the flat extra dimensions, for $\delta = 2$ extra dimensions. Studies often quote bounds in terms of derived parameter; experiments are actually sensitive to the masses of the KK gravitons: $m_{\vec{n}} = |\vec{n}|/R$. See the Review on "Extra Dimensions" for details. Bounds are given in μm for $\delta = 2$.

- ¹ SIRUNYAN 18s search for $pp \rightarrow jG$, using 35.9 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place lower limits on M_D for two to six extra dimensions (see their Table VII), from which this bound on R is derived. This limit supersedes that in KHACHATRYAN 15AL.
- ² HANNESTAD 03 obtain a limit on R from the heating of old neutron stars by the surrounding cloud of trapped KK gravitons. Limits for all $\delta \leq 7$ are given in their Tables V and VI. These limits supersede those in HANNESTAD 02.
- ³ AABOUD 18f search for $pp \rightarrow jG$, using 36.1 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place lower limits on M_D for two to six extra dimensions (see their Table 7), from which this bound on R is derived. This limit supersedes that in AABOUD 16f.
- ⁴ SIRUNYAN 18bv search for $pp \rightarrow ZG$, using 35.9 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place lower limits on M_D for two to seven extra dimensions (see their Figure 11), from which this bound on R is derived.
- ⁵ SIRUNYAN 17aq search for $pp \rightarrow \gamma G$, using 12.9 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place limits on M_D for three to six extra dimensions (see their Table 3).
- ⁶ AABOUD 16f search for $pp \rightarrow \gamma G$, using 3.2 fb^{-1} of data at $\sqrt{s} = 13 \text{ TeV}$ to place limits on M_D for two to six extra dimensions (see their Figure 9), from which this bound on R is derived.
- ⁷ KHACHATRYAN 16n search for $pp \rightarrow \gamma G$, using 19.6 fb^{-1} of data at $\sqrt{s} = 8 \text{ TeV}$ to place limits on M_D for three to six extra dimensions (see their Table 5).
- ⁸ AAD 15cs search for $pp \rightarrow \gamma G$, using 20.3 fb^{-1} of data at $\sqrt{s} = 8 \text{ TeV}$ to place lower limits on M_D for two to six extra dimensions (see their Fig. 18).

- ⁹ AAD 13c search for $pp \rightarrow \gamma G$, using 4.6 fb^{-1} of data at $\sqrt{s} = 7 \text{ TeV}$ to place bounds on M_D for two to six extra dimensions, from which this bound on R is derived.
- ¹⁰ AAD 13d search for the dijet decay of quantum black holes in 4.8 fb^{-1} of data produced in pp collisions at $\sqrt{s} = 7 \text{ TeV}$ to place bounds on M_D for two to seven extra dimensions, from which these bounds on R are derived. Limits on M_D for all $\delta \leq 7$ are given in their Table 3.
- ¹¹ AJELLO 12 obtain a limit on R from the gamma-ray emission of point γ sources that arise from the photon decay of KK gravitons which are gravitationally bound around neutron stars. Limits for all $\delta \leq 7$ are given in their Table 7.
- ¹² AALTONEN 08ac search for $p\bar{p} \rightarrow \gamma G$ and $p\bar{p} \rightarrow jG$ at $\sqrt{s} = 1.96 \text{ TeV}$ with 2.0 fb^{-1} and 1.1 fb^{-1} respectively, in order to place bounds on the fundamental scale and size of the extra dimensions. See their Table III for limits on all $\delta \leq 6$.
- ¹³ ABAZOV 08s search for $p\bar{p} \rightarrow \gamma G$, using 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$ to place bounds on M_D for two to eight extra dimensions, from which these bounds on R are derived. See their paper for intermediate values of δ .
- ¹⁴ DAS 08 obtain a limit on R from Kaluza-Klein graviton cooling of SN1987A due to plasmon-plasmon annihilation.
- ¹⁵ ABULENCIA, A 06 search for $p\bar{p} \rightarrow jG$ using 368 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. See their Table II for bounds for all $\delta \leq 6$.
- ¹⁶ ABDALLAH 05b search for $e^+e^- \rightarrow \gamma G$ at $\sqrt{s} = 180\text{--}209 \text{ GeV}$ to place bounds on the size of extra dimensions and the fundamental scale. Limits for all $\delta \leq 6$ are given in their Table 6. These limits supersede those in ABREU 00z.
- ¹⁷ ACHARD 04e search for $e^+e^- \rightarrow \gamma G$ at $\sqrt{s} = 189\text{--}209 \text{ GeV}$ to place bounds on the size of extra dimensions and the fundamental scale. See their Table 8 for limits with $\delta \leq 8$. These limits supersede those in ACCIARRI 99r.
- ¹⁸ ACOSTA 04c search for $p\bar{p} \rightarrow jG$ at $\sqrt{s} = 1.8 \text{ TeV}$ to place bounds on the size of extra dimensions and the fundamental scale. See their paper for bounds on $\delta = 4, 6$.
- ¹⁹ CASSE 04 obtain a limit on R from the gamma-ray emission of point γ sources that arises from the photon decay of gravitons around newly born neutron stars, applying the technique of HANNESTAD 03 to neutron stars in the galactic bulge. Limits for all $\delta \leq 7$ are given in their Table I.
- ²⁰ ABAZOV 03 search for $p\bar{p} \rightarrow jG$ at $\sqrt{s} = 1.8 \text{ TeV}$ to place bounds on M_D for 2 to 7 extra dimensions, from which these bounds on R are derived. See their paper for bounds on intermediate values of δ . We quote results without the approximate NLO scaling introduced in the paper.
- ²¹ HANNESTAD 03 obtain a limit on R from graviton cooling of supernova SN1987A. Limits for all $\delta \leq 7$ are given in their Tables V and VI.
- ²² HANNESTAD 03 obtain a limit on R from gravitons emitted in supernovae and which subsequently decay, contaminating the diffuse cosmic γ background. Limits for all $\delta \leq 7$ are given in their Tables V and VI. These limits supersede those in HANNESTAD 02.
- ²³ HANNESTAD 03 obtain a limit on R from gravitons emitted in two recent supernovae and which subsequently decay, creating point γ sources. Limits for all $\delta \leq 7$ are given in their Tables V and VI. These limits are corrected in the published erratum.
- ²⁴ HEISTER 03c use the process $e^+e^- \rightarrow \gamma G$ at $\sqrt{s} = 189\text{--}209 \text{ GeV}$ to place bounds on the size of extra dimensions and the scale of gravity. See their Table 4 for limits with $\delta \leq 6$ for derived limits on M_D .
- ²⁵ FAIRBAIRN 01 obtains bounds on R from over production of KK gravitons in the early universe. Bounds are quoted in paper in terms of fundamental scale of gravity. Bounds depend strongly on temperature of QCD phase transition and range from $R < 0.13 \mu\text{m}$ to $0.001 \mu\text{m}$ for $\delta=2$; bounds for $\delta=3,4$ can be derived from Table 1 in the paper.
- ²⁶ HANHART 01 obtain bounds on R from limits on graviton cooling of supernova SN 1987a using numerical simulations of proto-neutron star neutrino emission.
- ²⁷ CASSISI 00 obtain rough bounds on M_D (and thus R) from red giant cooling for $\delta=2,3$. See their paper for details.
- ²⁸ ACCIARRI 99s search for $e^+e^- \rightarrow ZG$ at $\sqrt{s}=189 \text{ GeV}$. Limits on the gravity scale are found in their Table 2, for $\delta \leq 4$.

Mass Limits on M_{TT}

This section includes limits on the cut-off mass scale, M_{TT} , of dimension-8 operators from KK graviton exchange in models of large extra dimensions. Ambiguities in the UV-divergent summation are absorbed into the parameter λ , which is taken to be $\lambda = \pm 1$ in the following analyses. Bounds for $\lambda = -1$ are shown in parenthesis after the bound for $\lambda = +1$, if appropriate. Different papers use slightly different definitions of the mass scale. The definition used here is related to another popular convention by $M_{TT}^4 = (2/\pi) \Lambda_{*}^4$, as discussed in the above Review on "Extra Dimensions."

- SIRUNYAN 18DD use dijet angular distributions in 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to place a lower bound on Λ_T , here converted to M_{TT} . This updates the results of SIRUNYAN 17F.
- GIUDICE 03 place bounds on Λ_6 , the coefficient of the gravitationally-induced dimension-6 operator $(2\pi\lambda/\Lambda_6^2)(\sum \bar{T}_i\gamma_i^5\eta)(\sum \bar{T}_i\gamma_i^5\eta)$, using data from a variety of experiments. Results are quoted for $\lambda=\pm 1$ and are independent of δ .
- SIRUNYAN 19AC use 35.9 (36.3) fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV in the dielectron (dimuon) channels to place a lower limit on Λ_T , here converted to M_{TT} . The dielectron and dimuon channels are combined with previous results in the diphoton channel to set the best limit. Bounds on individual channels and different priors can be found in their Table 2. This updates the results in KHACHATRYAN 15AE.
- SIRUNYAN 18DU use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to place lower limits on M_{TT} (equivalent to their M_S). This updates the results of CHATRCHYAN 12R.
- ABOUD 17AP use 36.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to place lower limits on M_{TT} (equivalent to their M_S). This updates the results of AAD 13As.
- AAD 14BE use 20 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV in the dielectron channel to place lower limits on M_{TT} (equivalent to their M_S).
- AAD 13E use 4.9 and 5.0 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV in the dielectron and dimuon channels, respectively, to place lower limits on M_{TT} (equivalent to their M_S). The dielectron and dimuon channels are combined with previous results in the diphoton channel to set the best limit. Bounds on individual channels and different priors can be found in their Table VIII.
- BAAK 12 use electroweak precision observables to place bounds on the ratio Λ_T/M_D as a function of M_D . See their Fig. 22 for constraints with a Higgs mass of 120 GeV.
- AARON 11C search for deviations in the differential cross section of $e^\pm p \rightarrow e^\pm X$ in 446 pb⁻¹ of data taken at $\sqrt{s} = 301$ and 319 GeV to place a bound on M_{TT} .
- ABAZOV 09AE use dijet angular distributions in 0.7 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place lower bounds on Λ_T (equivalent to their M_S), here converted to M_{TT} .
- ABAZOV 09B use 1.05 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place lower bounds on Λ_T (equivalent to their M_S), here converted to M_{TT} .
- SCHAEEL 07A use e^+e^- collisions at $\sqrt{s} = 189-209$ GeV to place lower limits on Λ_T , here converted to limits on M_{TT} .
- ABDALLAH 06C use e^+e^- collisions at $\sqrt{s} \sim 130-207$ GeV to place lower limits on M_{TT} , which is equivalent to their definition of M_S . Bound shown includes all possible final state leptons, $\ell = e, \mu, \tau$. Bounds on individual leptonic final states can be found in their Table 31.
- GERDES 06 use 100 to 110 pb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.8$ TeV, as recorded by the CDF Collaboration during Run I of the Tevatron. Bound shown includes a K -factor of 1.3. Bounds on individual e^+e^- and $\gamma\gamma$ final states are found in their Table I.
- ABAZOV 05V use 246 pb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for deviations in the differential cross section to $\mu^+\mu^-$ from graviton exchange.
- CHEKANOV 04B search for deviations in the differential cross section of $e^\pm p \rightarrow e^\pm X$ with 130 pb⁻¹ of combined data and Q^2 values up to 40,000 GeV² to place a bound on M_{TT} .
- ABBIENDI 03D use e^+e^- collisions at $\sqrt{s}=181-209$ GeV to place bounds on the ultraviolet scale M_{TT} , which is equivalent to their definition of M_S .
- ACHARD 03D look for deviations in the cross section for $e^+e^- \rightarrow ZZ$ from $\sqrt{s} = 200-209$ GeV to place a bound on M_{TT} .
- ADLOFF 03 search for deviations in the differential cross section of $e^\pm p \rightarrow e^\pm X$ at $\sqrt{s}=301$ and 319 GeV to place bounds on M_{TT} .
- GIUDICE 03 review existing experimental bounds on M_{TT} and derive a combined limit.
- HEISTER 03C use e^+e^- collisions at $\sqrt{s} = 189-209$ GeV to place bounds on the scale of dim-8 gravitational interactions. Their M_S^\pm is equivalent to our M_{TT} with $\lambda=\pm 1$.
- ACHARD 02 search for s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma$ at $E_{cm} = 192-209$ GeV.
- ABBOTT 01 search for variations in differential cross sections to e^+e^- and $\gamma\gamma$ final states at the Tevatron.
- ABBIENDI 00R uses e^+e^- collisions at $\sqrt{s} = 189$ GeV.
- ABREU 00A search for s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma$ at $E_{cm} = 189-202$ GeV.
- ABREU 00S uses e^+e^- collisions at $\sqrt{s}=183$ and 189 GeV. Bounds on μ and τ individual final states given in paper.
- CHANG 00B derive 3σ limit on M_{TT} of (28,19,15) TeV for $\delta=(2,4,6)$ respectively assuming the presence of a torsional coupling in the gravitational action. Highly model dependent.
- CHEUNG 00 obtains limits from anomalous diphoton production at OPAL due to graviton exchange. Original limit for $\delta=4$. However, unknown UV theory renders δ dependence unreliable. Original paper works in HLZ convention.
- GRAESSER 00 obtains a bound from graviton contributions to $g-2$ of the muon through loops of 0.29 TeV for $\delta=2$ and 0.38 TeV for $\delta=4,6$. Limits scale as $\lambda^{1/2}$. However

- calculational scheme not well-defined without specification of high-scale theory. See the "Extra Dimensions Review."
- HAN 00 calculates corrections to gauge boson self-energies from KK graviton loops and constrain them using S and T . Bounds on M_{TT} range from 0.5 TeV ($\delta=6$) to 1.1 TeV ($\delta=2$); see text. Limits have strong dependence, $\lambda^{\delta+2}$, on unknown λ coefficient.
 - MATHEWS 00 search for evidence of graviton exchange in CDF and D0 dijet production data. See their Table 2 for slightly stronger δ -dependent bounds. Limits expressed in terms of $\bar{M}_S^4 = M_{TT}^4/8$.
 - MELE 00 obtains bound from KK graviton contributions to $e^+e^- \rightarrow VV$ ($V=\gamma, W, Z$) at LEP. Authors use Hewett conventions.
 - ABBIENDI 99P search for s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma$ at $E_{cm}=189$ GeV. The limits $G_\pm > 660$ GeV and $G_- > 634$ GeV are obtained from combined $E_{cm}=183$ and 189 GeV data, where G_\pm is a scale related to the fundamental gravity scale.
 - ACCIARRI 99M search for the reaction $e^+e^- \rightarrow \gamma G$ and s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma, W^+W^-, ZZ, e^+e^-, \mu^+\mu^-, \tau^+\tau^-, q\bar{q}$ at $E_{cm}=183$ GeV. Limits on the gravity scale are listed in their Tables 1 and 2.
 - ACCIARRI 99S search for the reaction $e^+e^- \rightarrow ZG$ and s-channel graviton exchange effects in $e^+e^- \rightarrow \gamma\gamma, W^+W^-, ZZ, e^+e^-, \mu^+\mu^-, \tau^+\tau^-, q\bar{q}$ at $E_{cm}=189$ GeV. Limits on the gravity scale are listed in their Tables 1 and 2.
 - BOURLIKOV 99 performs global analysis of LEP data on e^+e^- collisions at $\sqrt{s}=183$ and 189 GeV. Bound is on Λ_T .

Limits on $1/R = M_C$

This section includes limits on $1/R = M_C$, the compactification scale in models with one TeV-sized extra dimension, due to exchange of Standard Model KK excitations. Bounds assume fermions are not in the bulk, unless stated otherwise. See the "Extra Dimensions" review for discussion of model dependence.

- AAD 12cc use 4.9 and 5.0 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV in the dielectron and dimuon channels, respectively, to place a lower bound on the mass of the lightest KK Z/γ boson (equivalent to $1/R = M_C$). The limit quoted here assumes a flat prior corresponding to when the pure Z/γ KK cross section term dominates. See their Section 15 for more details.
- BARBIERI 04 use electroweak precision observables to place a lower bound on the compactification scale $1/R$. Both the gauge bosons and the Higgs boson are assumed to propagate in the bulk.
- ABOUD 18AV use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV in final states with multiple b-jets, to place a lower bound on the compactification scale in a model with two universal extra dimensions. Assuming the radii of the two extra dimensions are equal, a lower limit of 1.8 TeV for the Kaluza-Klein mass is obtained.
- ABOUD 18CE use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV in final states with same-charge leptons and b-jets, to place a lower bound on the compactification scale in a model with two universal extra dimensions. Assuming the radii of the two extra dimensions are equal, a lower limit of 1.45 TeV for the Kaluza-Klein mass is obtained.
- ACCOMANDO 15 use electroweak precision observables to place a lower bound on the compactification scale $1/R$. See their Fig. 2 for the bound as a function of $\sin\beta$, which parametrizes the VEV contribution from brane and bulk Higgs fields. The quoted value is for the minimum bound which occurs at $\sin\beta = 0.45$.
- KHACHATRYAN 15T use 19.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to place a lower bound on the compactification scale $1/R$.
- CHATRCHYAN 13AQ use 5.0 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV and a further 3.7 fb⁻¹ of data at $\sqrt{s} = 8$ TeV to place a lower bound on the compactification scale $1/R$, in models with universal extra dimensions and Standard Model fields propagating in the bulk. See their Fig. 5 for the bound as a function of the universal bulk fermion mass parameter μ .
- CHATRCHYAN 13W use diphoton events with large missing transverse momentum in 4.93 fb⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.
- EDELHAUSER 13 use 19.6 and 20.6 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV analyzed by the CMS Collaboration in the dielectron and dimuon channels, respectively,

Ref.	Author(s)	Experiment	Process	Limit
				to place a lower bound on the mass of the second lightest Kaluza-Klein Z/γ boson (converted to a limit on $1/R = M_C$). The bound assumes Standard Model fields propagating in the bulk and that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$.
10	AAD 12CP	use diphoton events with large missing transverse momentum in 4.8 fb ⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.	$pp \rightarrow G \rightarrow ZZ$	>1.8
11	AAD 12X	use diphoton events with large missing transverse momentum in 1.07 fb ⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.	$pp \rightarrow G \rightarrow jj$	>4.1
12	ABAZOV 12M	use same-sign dimuon events in 7.3 fb ⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place a lower bound on the compactification scale $1/R$, in models with universal extra dimensions where all Standard Model fields propagate in the bulk.	$pp \rightarrow G \rightarrow HH$	>4.1
13	BAAK 12	use electroweak precision observables to place a lower bound on the compactification scale $1/R$, in models with universal extra dimensions and Standard Model fields propagating in the bulk. Bound assumes a 125 GeV Higgs mass. See their Fig. 25 for the bound as a function of the Higgs mass.	$pp \rightarrow G \rightarrow ZZ$	>2.68
14	FLACKE 12	use electroweak precision observables to place a lower bound on the compactification scale $1/R$, in models with universal extra dimensions and Standard Model fields propagating in the bulk. See their Fig. 1 for the bound as a function of the universal bulk fermion mass parameter μ .	$pp \rightarrow G \rightarrow WW, ZZ$	>1.23 (>0.84)
15	NISHIWAKI 12	use up to 2 fb ⁻¹ of data from the ATLAS and CMS experiments that constrains the production cross section of a Higgs-like particle to place a lower bound on the compactification scale $1/R$ in universal extra dimension models. The quoted bound assumes Standard Model fields propagating in the bulk and a 125 GeV Higgs mass. See their Fig. 1 for the bound as a function of the Higgs mass.	$pp \rightarrow G \rightarrow ZZ$	>0.94 (>0.71)
16	AAD 11F	use diphoton events with large missing transverse energy in 3.1 pb ⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.	$pp \rightarrow G \rightarrow WW$	>2.23
17	AAD 11X	use diphoton events with large missing transverse energy in 36 pb ⁻¹ of data produced from pp collisions at $\sqrt{s} = 7$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.	$pp \rightarrow G \rightarrow WW, ZZ$	>0.845
18	ABAZOV 10P	use diphoton events with large missing transverse energy in 6.3 fb ⁻¹ of data produced from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place a lower bound on the compactification scale in a universal extra dimension model with gravitational decays. The bound assumes that the cutoff scale Λ , for the radiative corrections to the Kaluza-Klein masses, satisfies $\Lambda/M_C = 20$. The model parameters are chosen such that the decay $\gamma^* \rightarrow G\gamma$ occurs with an appreciable branching fraction.	$pp \rightarrow G \rightarrow ZZ$	>1.058
19	ABAZOV 09AE	use dijet angular distributions in 0.7 fb ⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place a lower bound on the compactification scale.	$pp \rightarrow G \rightarrow ZZ$	>0.754
20	HAISCH 07	use inclusive B -meson decays to place a Higgs mass independent bound on the compactification scale $1/R$ in the minimal universal extra dimension model.	$pp \rightarrow G \rightarrow ZZ$	>0.607
21	GOGOLADZE 06	use electroweak precision observables to place a lower bound on the compactification scale in models with universal extra dimensions. Bound assumes a 115 GeV Higgs mass. See their Fig. 3 for the bound as a function of the Higgs mass.	$pp \rightarrow G \rightarrow ZZ$	>1.05
22	CORNET 00	translates a bound on the coefficient of the 4-fermion operator $(\bar{\ell}\gamma_\mu\tau^a\ell)(\bar{\ell}\gamma^\mu\tau^a\ell)$ derived by Hagiwara and Matsumoto into a limit on the mass scale of KK W bosons.	$pp \rightarrow G \rightarrow ZZ$	>0.90
23	RIZZO 00	obtains limits from global electroweak fits in models with a Higgs in the bulk (3.8 TeV) or on the standard brane (3.3 TeV).	$pp \rightarrow G \rightarrow ZZ$	>0.889
				>0.785

1 SIRUNYAN 18BB use 35.9 (36.3) fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for dilepton resonances in the dilepton (dimuon) channel. See their paper for other limits with warp parameter values $k/\bar{M}_P = 0.01$ and 0.05. This updates the results of KHACHATRYAN 17T.

2 AAD 20C use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $b\bar{b}b\bar{b}, b\bar{b}W^+W^-$, and $b\bar{b}\tau^+\tau^-$ final states. See their Figure 5(b)(c) for limits on the cross section as a function of the KK graviton mass. In the case of $k/\bar{M}_P = 1$ and 2, gravitons are excluded in the mass range 260–3000 GeV and 260–1760 GeV, respectively.

3 AABOUD 19A use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $b\bar{b}b\bar{b}$ final state. See their Figure 9 for limits on the cross section times branching fraction as a function of the KK graviton mass. Assuming $k/\bar{M}_P = 1$, gravitons in the mass range 313–1362 GeV are excluded. This updates the results of AABOUD 16I.

4 AABOUD 19o use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $b\bar{b}WW$ final state. See their Figure 12 for limits on the cross section times branching fraction as a function of the KK graviton mass for $k/\bar{M}_P = 1$ and $k/\bar{M}_P = 2$.

5 AAD 19p use 139 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for diboson resonances in the all-hadronic final state. See their Figure 9(b) for the limit on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\bar{M}_P = 1$. This updates the results of AABOUD 18F.

6 SIRUNYAN 19 use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $\gamma\gamma b\bar{b}$ final state. See their Figure 9 for limits on the cross section times branching fraction as a function of the KK graviton mass. Assuming $k/\bar{M}_P = 1$, gravitons in the mass range 290–810 GeV are excluded. This updates the result of KHACHATRYAN 16BQ.

7 SIRUNYAN 19BE use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production by combining the results from four final states: $b\bar{b}\gamma\gamma, b\bar{b}\tau^+\tau^-, b\bar{b}b\bar{b}$, and $b\bar{b}VV$. See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass.

8 SIRUNYAN 19CF use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $b\bar{b}q\bar{q}\ell\nu$ final state. See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\bar{M}_P = 0.1$ and 0.3.

9 AABOUD 18AK use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for WW resonances in $\ell\nu qq$ final states ($\ell = e, \mu$). See their Figure 7(d) for the limit on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\bar{M}_P = 1$. This updates the results of AABOUD 16AE.

10 AABOUD 18AL use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for diboson resonances in the $\ell\ell q\bar{q}$ and $\nu\tau q\bar{q}$ final states. See their Figure 14 for the limit on cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\bar{M}_P = 0.5$ and 1. This updates the results of AABOUD 16AE.

11 AABOUD 18BF use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for ZZ resonances in the $\ell\ell\ell\ell$ and $\ell\nu\nu\bar{\nu}$ final states ($\ell = e, \mu$). See their Figure 10 for the limit on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\bar{M}_P = 1$.

12 AABOUD 18BI use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for top-quark pairs decaying into the lepton-plus jets topology. See their Figure 16 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for $k/\bar{M}_P = 1$.

13 AABOUD 18CJ combine the searches for heavy resonances decaying into bosonic and leptonic final states from 36.1 fb⁻¹ of pp collision data at $\sqrt{s} = 13$ TeV. The lower limit on the KK graviton mass, with $k/\bar{M}_P = 1$, is 2.3 TeV.

14 AABOUD 18CQ use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $b\bar{b}\tau^+\tau^-$ final state. See their Figure 2 for limits on the cross section times branching fraction as a function of the KK graviton mass. Assuming $k/\bar{M}_P = 1$, gravitons in the mass range 325–885 GeV are excluded.

Limits on Kaluza-Klein Gravitons in Warped Extra Dimensions

This section places limits on the mass of the first Kaluza-Klein (KK) excitation of the graviton in the warped extra dimension model of Randall and Sundrum. Bounds in parenthesis assume Standard Model fields propagate in the bulk. Experimental bounds depend strongly on the warp parameter, k . See the “Extra Dimensions” review for a full discussion.

Here we list limits for the value of the warp parameter $k/\bar{M}_P = 0.1$.

- 15 AABOUD 18CW use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $\gamma\gamma b\bar{b}$ final state. See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass.
- 16 SIRUNYAN 18AF use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $b\bar{b}b\bar{b}$ final state. See their Figure 9 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\overline{M}_P = 0.5$. This updates the results of KHACHATRYAN 15R.
- 17 SIRUNYAN 18AS use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for ZZ resonances in the $\ell\ell\nu\bar{\nu}$ final state ($\ell = e, \mu$). See their Figure 5 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for $k/\overline{M}_P = 0.1, 0.5, \text{ and } 1.0$.
- 18 SIRUNYAN 18AX use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for WW resonances in $\ell\nu q\bar{q}$ final states ($\ell = e, \mu$). See their Figure 6 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for $k/\overline{M}_P = 0.5$. This updates the results of KHACHATRYAN 14A.
- 19 SIRUNYAN 18BK use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for ZZ resonances in the $\nu\bar{\nu}q\bar{q}$ final state. See their Figure 4 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for $k/\overline{M}_P = 0.5$.
- 20 SIRUNYAN 18BO use up to 36 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for dijet resonances. Besides the quoted bound, KK graviton masses between 1.9 TeV and 2.5 TeV are also excluded. See their Figure 11 for the limit on the product of the cross section, branching fraction and acceptance as a function of the KK graviton mass. This updates the results of KHACHATRYAN 17W.
- 21 SIRUNYAN 18CW use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $b\bar{b}b\bar{b}$ final state. See their Figure 8 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\overline{M}_P = 0.5$.
- 22 SIRUNYAN 18DJ use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for ZZ resonances in $2\ell q$ final states ($\ell = e, \mu$). See their Figure 6 for the limit on the KK graviton mass as a function of the cross section times branching fraction. Assuming $k/\overline{M}_P = 0.5$, a graviton mass is excluded below 925 GeV.
- 23 SIRUNYAN 18DU use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV, in the diphoton channel to place a lower limit on the mass of the lightest KK graviton. See their paper for limits with other warp parameter values $k/\overline{M}_P = 0.01$ and 0.2. This updates the results of KHACHATRYAN 16M.
- 24 SIRUNYAN 18F use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for Higgs boson pair production in the $b\bar{b}\ell\nu\ell\nu$ final state. See their Figure 7 for limits on the cross section times branching fraction as a function of the KK graviton mass, including theoretical values for $k/\overline{M}_P = 0.1$.
- 25 SIRUNYAN 18I use 19.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to search for narrow resonances decaying to bottom quark pairs. See their Figure 3 for the limit on the KK graviton mass as a function of the cross section times branching fraction in the mass range of 325–1200 GeV.
- 26 SIRUNYAN 18P use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for diboson resonances with dijet final states. See their Figure 6 for the limit on the KK graviton mass as a function of the cross section times branching fraction, including theoretical values for $k/\overline{M}_P = 0.5$. This updates the results of SIRUNYAN 17AK.
- 27 AABOUD 17AP use 36.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV in the diphoton channel to place a lower limit on the mass of the lightest KK graviton. This updates the results of AABOUD 16H.
- 28 AAD 16R use 20.3 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to place a lower bound on the mass of the lightest KK graviton. See their Figure 4 for the limit on the KK graviton mass as a function of the cross section times branching fraction.
- 29 AAD 15AU use 20 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons. See their Figure 2 for limits on the KK graviton mass as a function of the cross section times branching fraction.
- 30 AAD 15AZ use 20.3 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to place a lower bound on the mass of the lightest KK graviton. See their Figure 2 for limits on the KK graviton mass as a function of the cross section times branching ratio.
- 31 AAD 15CT use 20.3 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to place a lower bound on the mass of the lightest KK graviton. See their Figures 6b and 6c for the limit on the KK graviton mass as a function of the cross section times branching fraction.
- 32 AAD 14V use 20.3 (20.5) fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV in the dielectron (dimuon) channels to place a lower bound on the mass of the lightest KK graviton. This updates the results of AAD 12CC.
- 33 AAD 13A use 4.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV in the $\ell\nu\ell\nu$ channel, to place a lower bound on the mass of the lightest KK graviton.
- 34 AAD 13AO use 4.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV in the $\ell\nu jj$ channel, to place a lower bound on the mass of the lightest KK graviton.
- 35 AAD 13AS use 4.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV in the diphoton channel to place lower limits on the mass of the lightest KK graviton. The diphoton channel is combined with previous results in the dielectron and dimuon channels to set the best limit. See their Table 2 for warp parameter values k/\overline{M}_P between 0.01 and 0.1. This updates the results of AAD 12V.
- 36 AAD 12AD use 1.02 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons in the $lljj$ and $llll$ channels ($\ell = e, \mu$). The limit is quoted for the combined $lljj + llll$ channels. See their Figure 5 for limits on the cross section $\sigma(G \rightarrow ZZ)$ as a function of the graviton mass.
- 37 AALTONEN 12V use 6 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons in the $lljj$ and $llll$ channels ($\ell = e, \mu$). It provides improved limits over the previous analysis in AALTONEN 11G. See their Figure 16 for limits from all channels combined on the cross section times branching ratio $\sigma(p\bar{p} \rightarrow G^* \rightarrow ZZ)$ as a function of the graviton mass.
- 38 BAAK 12 use electroweak precision observables to place a lower bound on the compactification scale $k e^{-\pi k R}$, assuming Standard Model fields propagate in the bulk and the Higgs is confined to the IR brane. See their Fig. 27 for more details.
- 39 AALTONEN 11G use 2.5–2.9 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for KK gravitons in a warped extra dimension decaying to ZZ dibosons via the $e\bar{e}e, e\bar{e}\mu\mu, \mu\bar{\mu}\mu\mu, e\bar{e}jj, \text{ and } \mu\bar{\mu}jj$ channels. See their Fig. 20 for limits on the cross section $\sigma(G \rightarrow ZZ)$ as a function of the graviton mass.
- 40 AALTONEN 11R uses 5.7 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV in the dielectron channel to place a lower bound on the mass of the lightest graviton. It provides combined limits with the diphoton channel analysis of AALTONEN 11U. For

warp parameter values k/\overline{M}_P between 0.01 to 0.1 the lower limit on the mass of the lightest graviton is between 612 and 1058 GeV. See their Table 1 for more details.

- 41 ABAZOV 11H use 5.4 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place a lower bound on the mass of the lightest graviton. Their 95% C.L. exclusion limit does not include masses less than 300 GeV.
- 42 AALTONEN 10N use 2.9 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place a lower bound on the mass of the lightest graviton.
- 43 ABAZOV 10F use 5.4 fb⁻¹ of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to place a lower bound on the mass of the lightest graviton. For warp parameter values of k/\overline{M}_P between 0.01 and 0.1 the lower limit on the mass of the lightest graviton is between 560 and 1050 GeV. See their Fig. 3 for more details.
- 44 AALTONEN 08s use $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to four electrons via two Z bosons using 1.1 fb⁻¹ of data. See their Fig. 8 for limits on $\sigma \cdot \text{B}(G \rightarrow ZZ)$ versus the graviton mass.
- 45 ABAZOV 08j use $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to electrons and photons using 1 fb⁻¹ of data. For warp parameter values of k/\overline{M}_P between 0.01 and 0.1 the lower limit on the mass of the lightest excitation is between 300 and 900 GeV. See their Fig. 4 for more details.
- 46 AALTONEN 07G use $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to photons using 1.2 fb⁻¹ of data. For warp parameter values of $k/\overline{M}_P = 0.1, 0.05, \text{ and } 0.01$ the bounds on the graviton mass are 850, 694, and 230 GeV, respectively. See their Fig. 3 for more details. See also AALTONEN 07H.
- 47 AALTONEN 07H use $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to electrons using 1.3 fb⁻¹ of data. For a warp parameter value of $k/\overline{M}_P = 0.1$ the bound on the graviton mass is 807 GeV. See their Fig. 4 for more details. A combined analysis with the diphoton data of AALTONEN 07G yields for $k/\overline{M}_P = 0.1$ a graviton mass lower bound of 889 GeV.
- 48 ABAZOV 05n use $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to muons, electrons or photons, using 260 pb⁻¹ of data. For warp parameter values of $k/\overline{M}_P = 0.1, 0.05, \text{ and } 0.01$, the bounds on the graviton mass are 785, 650 and 250 GeV respectively. See their Fig. 3 for more details.
- 49 ABULENCIA 05A use $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV to search for KK gravitons in warped extra dimensions. They search for graviton resonances decaying to muons or electrons, using 200 pb⁻¹ of data. For warp parameter values of $k/\overline{M}_P = 0.1, 0.05, \text{ and } 0.01$, the bounds on the graviton mass are 710, 510 and 170 GeV respectively.

Limits on Kaluza-Klein Gluons in Warped Extra Dimensions

This section places limits on the mass of the first Kaluza-Klein (KK) excitation of the gluon in warped extra dimension models with Standard Model fields propagating in the bulk. Bounds are given for a specific benchmark model with $\Gamma/m = 15.3\%$ where Γ is the width and m the mass of the KK gluon. See the "Extra Dimensions" review for more discussion.

- 1 AABOUD 18BI use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV. This result updates AAD 13AQ.
- 2 AABOUD 19AS use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV. An upper bound of 3.4 TeV is placed on the KK gluon mass for $\Gamma/m = 30\%$.
- 3 SIRUNYAN 19AL use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to place limits on a KK gluon decaying to a top quark and a heavy vector-like fermion, T. KK gluon masses between 1.5 and 2.3 TeV and between 2.0 and 2.4 TeV are excluded for T masses of 1.2 and 1.5 TeV, respectively.
- 4 CHATRCHYAN 13BM use 19.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV. Bound is for a width of approximately 15–20% of the KK gluon mass.
- 5 CHEN 13A place limits on the KK mass scale for a specific warped model with custodial symmetry and bulk fermions. See their Figures 4 and 5.
- 6 AAD 12BV use 2.05 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV.

Black Hole Production Limits

Semiclassical Black Holes

- ¹ AABOUD 18BA use 36.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays to final states with a photon and a jet. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the Planck scale, mass thresholds below 7.1 TeV and 4.4 TeV are excluded for the ADD and RS1 models, respectively. These limits supersede those in AAD 16A1.
- ² AABOUD 18CM use 36.1 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays with different-flavor high-mass dilepton final states. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 5.6 (3.4), 4.9 (2.9), and 4.5 (2.6) TeV are excluded in the $e\mu, e\tau$ and $\mu\tau$ channels for the ADD (RS1) models, respectively. These limits supersede those in AABOUD 16P.
- ³ SIRUNYAN 18AT use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays to $e\mu$ final states. In Figure 4, lower mass limits of 5.3, 5.5 and 5.6 TeV are placed in a model with 4, 5 and 6 extra dimensions, respectively, and a lower mass limit of 3.6 TeV is found for a single warped dimension.
- ⁴ SIRUNYAN 18DD use 35.9 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays in dijet angular distributions. A lower mass limit of 5.9 (8.2) TeV is placed in the RS (ADD) model with one (six) extra dimension(s).
- ⁵ AABOUD 17AK use 37 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black hole decays to final states with dijets. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in an ADD (6 extra dimensions) model. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 8.9 TeV are excluded.
- ⁶ SIRUNYAN 17CP use 2.3 fb⁻¹ of data from pp collisions at $\sqrt{s} = 13$ TeV to search for quantum black holes decaying to dijet final states. No excess of events above the expected level of standard model background was observed. Limits on the quantum black hole mass threshold are set as a function of the higher-dimensional Planck scale, under the assumption that the mass threshold must exceed the above Planck scale. Depending on the model, mass thresholds in the range up to 5.1–9.0 TeV are excluded.
- ⁷ KHACHATRYAN 16BE use 19.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to search for quantum black holes undergoing lepton flavor violating decay to the $e\mu$ final state. No excess of events above the expected level of standard model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in the ADD (2–6 flat extra dimensions), RS1 (1 warped extra dimension), and a model with a Planck scale at the TeV scale from a renormalization of the gravitational constant (no extra dimensions). Limits on the black hole mass threshold are set assuming that it is equal to the higher-dimensional Planck scale. Mass thresholds for quantum black holes in the range up to 3.15–3.63 TeV are excluded in the ADD model. In the RS1 model, mass thresholds below 2.81 TeV are excluded in the PDG convention for the Schwarzschild radius. In the model with no extra dimensions, mass thresholds below 1.99 TeV are excluded.
- ⁸ KHACHATRYAN 15V use 19.7 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to search for quantum black holes decaying to dijet final states. No excess of events above the expected level of standard model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in the ADD (2–6 flat extra dimensions) and RS1 (1 warped extra dimension) model. Limits on the black hole mass threshold are set as a function of the higher-dimensional Planck scale, under the assumption that the mass threshold must exceed the above Planck scale. Depending on the model, mass thresholds in the range up to 5.0–6.3 TeV are excluded. This paper supersedes CHATRCHYAN 13Aa.
- ⁹ AAD 14AL use 20.3 fb⁻¹ of data from pp collisions at $\sqrt{s} = 8$ TeV to search for quantum black hole decays to final states with high-invariant-mass lepton + jet. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 5.3 TeV are excluded.
- ¹⁰ AAD 14V use 20.3 (20.5) fb⁻¹ of data in the dielectron (dimuon) channels from pp collisions at $\sqrt{s} = 8$ TeV to search for quantum black hole decays involving high-mass dilepton resonances. No excess of events above the expected level of Standard Model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in ADD (6 extra dimensions) and RS1 models. Assuming the black hole mass threshold is equal to the higher-dimensional Planck scale, mass thresholds below 3.65 TeV and 2.24 TeV are excluded for the ADD and RS1 models, respectively.

- ¹¹ CHATRCHYAN 13A use 5 fb⁻¹ of data from pp collisions at $\sqrt{s} = 7$ TeV to search for quantum black holes decaying to dijet final states. No excess of events above the expected level of standard model background was observed. Exclusion limits at 95% C.L. are set on mass thresholds for black hole production in the ADD (2–6 flat extra dimensions) and RS (1 warped extra dimension) model. Limits on the black hole mass threshold are set as a function of the higher-dimensional Planck scale, under assumption that the mass threshold must exceed the above Planck scale. Depending on the model, mass thresholds in the range up to 4.0–5.3 TeV are excluded.

- 1 ABDELHAMEED 19A search for GeV scale dark matter SI scatter on CaWO₄; no signal, limits placed in σ vs. mass plane for $m(\text{DM}) \sim 0.1\text{--}10$ GeV. The listed limit is for $m(\text{DM}) = 1$ GeV.
- 2 AGNESE 19A search for 1.5–10 GeV WIMP scatter on Ge in CDMSlite dataset. Limits set in a likelihood analysis. No signal was observed. Limit reported for $m(\chi) = 5$ GeV.
- 3 AKERIB 19 search for 0.4–5 GeV DM using bremsstrahlung photons and "Migdal" electrons; 1.4×10^4 kg d exposure of liquid Xe; constraint $\sigma^{SI}(\chi N) < 1$ pb for $m(\chi) = 5$ GeV in light scalar mediator model.
- 4 AMOLE 19 search for SI WIMP scatter on C₃F₈ in PICO-60 bubble chamber; no signal; set limit for spin independent coupling $\sigma^{SI}(\chi N) < 1 \times 10^{-6}$ pb for $m(\chi) = 5$ GeV.
- 5 APRILE 19c search for light DM scatter on Xe via atomic excitation, ionization (Migdal effect) or bremsstrahlung; no signal, limits placed in σ vs. $m(\text{DM})$ plane for $m(\text{DM}) \sim 0.085\text{--}2$ GeV. The listed limit is for $m(\text{DM}) = 1$ GeV.
- 6 APRILE 19d search for light DM scatter on Xe via ionization to probe SI, SD, and χ e cross sections; with 22 t d exposure, limits placed in various σ vs. $m(\text{DM})$ planes. Quoted limit is for $m(\text{DM}) = 5$ GeV.
- 7 ARMENGAUD 19 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.045\text{--}10$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 8 KOBAYASHI 19 search for sub-GeV WIMP annual modulation in Xe via brems; no signal; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 0.3\text{--}1$ GeV; quoted limit is for $m(\chi) = 0.5$ GeV.
- 9 LIU 19b search for sub-GeV DM using Migdal effect on Ge at CDEX-IB; no signal, require $\sigma^{SI}(\chi N) < 7 \times 10^2$ pb for $m(\chi) = 0.1$ GeV.
- 10 AGNES 18 search for 1.8–20 GeV WIMP SI scatter on Ar; quoted limit is for $m(\chi) = 5$ GeV.
- 11 AGNESE 18 search for GeV scale WIMPs using CDMSlite; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 1.5\text{--}20$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 12 APRILE 18 search for WIMP scatter on 1 t yr Xe; no signal, limits set in $\sigma(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6\text{--}1000$ GeV; quoted limit is for $m = 6$ GeV.
- 13 ARNAUD 18 search for low mass WIMP scatter on Ne via SPC at NEWS-G; limits set in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 0.5\text{--}20$ GeV; quoted limit is for $m = 5$ GeV.
- 14 JIANG 18 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 3\text{--}10$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 15 YANG 18 search for WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 2\text{--}10$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 16 AKERIB 17 search for WIMP scatter on Xe; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}1 \times 10^5$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 17 ANGLÖHER 17A search for GeV scale WIMP scatter on Al₂O₃ crystal; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.15\text{--}10$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 18 ANGLÖHER 16 search for GeV scale WIMP scatter on CaWO₄; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.5\text{--}30$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 19 APRILE 16 search for low mass WIMPs via ionization at XENON100; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 3.5\text{--}20$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 20 ARMENGAUD 16 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 21 HEHN 16 search for low mass WIMPs via SI scatter on Ge target using profile likelihood analysis; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV; quoted limit is for $m(\chi) = 5$ GeV.

WIMP and Dark Matter Searches

We omit papers on CHAMPs, millicharged particles, and other exotic particles.

GALACTIC WIMP SEARCHES

These limits are for weakly-interacting stable particles that may constitute the invisible mass in the galaxy. Unless otherwise noted, a local mass density of $0.3 \text{ GeV}/\text{cm}^3$ is assumed; see each paper for velocity distribution assumptions. In the papers the limit is given as a function of the χ^0 mass. Here we list limits only for typical mass values of sub-GeV, GeV, 20 GeV, 100 GeV, and 1 TeV. Specific limits on supersymmetric dark matter particles may be found in the Supersymmetry section.

Searches Particle Listings

WIMP and Dark Matter Searches

- 22 ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 23 AMOLE 15 search for WIMP scatter on C_3F_8 in PICO-2L; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}25$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 24 XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}100$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 25 AGNESE 14 search for GeV scale WIMPs SI scatter at SuperCDMS; no signal, limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 3.5\text{--}30$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 26 AKERIB 14 search for WIMP scatter on Xe; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}5000$ GeV. Limit given for $m(\chi) = 5$ GeV.
- 27 LI 13b search for WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}100$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 28 ARCHAMBAULT 12 search for low mass WIMP scatter on C_4F_{10} ; limits set in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 4\text{--}12$ GeV; quoted limit is for $m = 5$ GeV.
- 29 AALSETH 11 search for GeV-scale SI WIMP scatter on Ge; limits placed on $\sigma^{SI}(\chi N)$ for $m(\chi) \sim 3.5\text{--}100$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 30 AHMED 11b search for GeV scale WIMP scatter on Ge in CDMS II; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m \sim 4\text{--}12$ GeV.
- 31 ANGLE 11 search for GeV scale WIMPs in Xenon-10; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}20$ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- 32 AKERIB 10 search for WIMP scatter on Ge/Si in CDMS2; limits place in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for m 3-100 GeV . Limit given for $m(\text{DM})=5$ GeV

For $m_{\chi 0} = 20$ GeV

For limits from X^0 annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- 1 ANGLOHER 19 search for low mass WIMP scatter on CaWO₄; no signal; limits placed on Wilson coefficients for $m(\chi) = 0.6\text{--}60$ GeV.
- 2 KIM 19a search for WIMP scatter in Nal KIMS experiment; no signal; require $\sigma^{SI}(\chi n) < 7 \times 10^{-5}$ pb for $m(\chi) = 20$ GeV.
- 3 KOBAYASHI 19 search for WIMP scatter in XMASS single-phase liquid Xe detector; no signal; require $\sigma^{SI}(\chi N) < 3 \times 10^{-7}$ pb for $m(\chi) = 20$ GeV.
- 4 SEONG 19 search for $\Upsilon \rightarrow \gamma A, A \rightarrow \chi\chi$ via CP-odd Higgs; no signal; limits on BF set; model dependent conversion to WIMP-nucleon scattering cross section limits $\sigma^{SI} < 10^{-36}$ cm² for $m(\chi) = 0.01\text{--}1$ GeV.
- 5 YANG 19 search for low mass wimps via annual modulation in Ge; no signal; require $\sigma^{SI}(\chi N) < 3.5 \times 10^{-5}$ pb for $m(\chi) = 20$ GeV.
- 6 ABE 18c search for WIMP annual modulation signal for $m(\text{WIMP})$: 6–20 GeV; limits set on SI WIMP-nucleon cross section: see Fig. 6.
- 7 ADHIKARI 18 search for WIMP scatter on Nal; no signal; require $\sigma^{SI} < 1.44 \times 10^{-5}$ pb for $m(\text{WIMP}) = 20$ GeV; inconsistent with DAMA/LIBRA result.
- 8 AGNES 18 search low mass $m(\text{WIMP})$: 1.8–20 GeV scatter on Ar; limits on SI WIMP-nucleon cross section set in Fig. 8.
- 9 AGNESE 18 give limits for $\sigma^{SI}(\chi N)$ for $m(\text{WIMP})$ between 1.5 and 20 GeV using CDMSlite mode data.
- 10 AGNESE 18a search for WIMP scatter on Ge at SuperCDMS; 1 event, consistent with expected background; set limit in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 10\text{--}250$ GeV.
- 11 APRILE 18 search for WIMP scatter on 1 t yr Xe; no signal, limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6\text{--}1000$ GeV.
- 12 ARNAUD 18 search for low mass WIMP scatter on Ne via SPC at NEWS-G; limits set in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 0.5\text{--}20$ GeV.
- 13 AARTSEN 17 obtain $\sigma(\text{Si}) < 6 \times 10^{-6}$ pb for $m(\text{wimp}) = 20$ GeV from ν from earth.
- 14 AKERIB 17 search for WIMP scatter on Xe; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}1 \times 10^5$ GeV.
- 15 BARBOSA-DE-SOUZA 17 search for annual modulation of WIMP scatter on Nal using an exposure of 61 kg yr of DM-Ice17 for recoil energy in the 4–20 keV range (DAMA found modulation for recoil energy < 5 keV). No modulation seen. Sensitivity insufficient to distinguish DAMA signal from null.
- 16 CUI 17a search for SI WIMP scatter; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 10\text{--}1 \times 10^4$ GeV using 54 ton-day exposure of Xe.
- 17 AGNESE 16 CDMSlite excludes low mass WIMPs 1.6–5.5 GeV and SI scattering cross section depending on $m(\text{WIMP})$; see Fig. 4.
- 18 AGUILAR-AREVALO 16 search low mass 1–10 GeV WIMP scatter on Si CCDs; set limits Fig. 11.
- 19 ANGLOHER 16 search for GeV scale WIMP scatter on CaWO₄; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.5\text{--}30$ GeV.
- 20 APRILE 16 search for low mass WIMPs via ionization at XENON100; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 3.5\text{--}20$ GeV.
- 21 ARMENGAUD 16 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV.
- 22 HEHN 16 search for low mass WIMPs via Si scatter on Ge target using profile likelihood analysis; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV.
- 23 ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}30$ GeV.
- 24 AGNESE 15a reanalyse AHMED 11b low threshold data. See their Fig. 12 (left) for improved limits extending down to 5 GeV.
- 25 AGNESE 15b reanalyse AHMED 10 data.
- 26 See their Fig. 7 for limits extending down to 4 GeV.
- 27 XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}100$ GeV.
- 28 This limit value is provided by the authors. See their Fig. 4 for limits extending down to $m_{\chi 0} = 3.5$ GeV.
- 29 This limit value is provided by the authors. AGNESE 14a result is from CDMSlite mode operation with enhanced sensitivity to low mass $m_{\chi 0}$. See their Fig. 3 for limits extending down to $m_{\chi 0} = 3.5$ GeV (see also Fig. 4 in AGNESE 14).
- 30 See their Fig. 5 for limits extending down to $m_{\chi 0} = 5.5$ GeV.
- 31 See their Fig. 5 for limits extending down to $m_{\chi 0} = 1$ GeV.
- 32 See their Fig. 5 for limits extending down to $m_{\chi 0} = 5$ GeV.
- 33 LIU 14a result is based on prototype CDEX-0 detector. See their Fig. 13 for limits extending down to $m_{\chi 0} = 2$ GeV.
- 34 See their Fig. 4 for limits extending down to $m_{\chi 0} = 4.5$ GeV.
- 35 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between June 2010 and May 2011.
- 36 See their Fig. 8 for limits extending down to $m_{\chi 0} = 7$ GeV.
- 37 This limit value is provided by the authors. AGNESE 13 use data taken between Oct. 2006 and July 2007. See their Fig. 4 for limits extending down to $m_{\chi 0} = 7$ GeV.

- ³⁸This limit value is provided by the authors. AGNESE 13A use data taken between July 2007 and Sep. 2008. Three candidate events are seen. Assuming these events are real, the best fit parameters are $m_{\chi^0} = 8.6$ GeV and $\sigma = 1.9 \times 10^{-5}$ pb.
- ³⁹This limit value is provided by the authors. Limit from combined data of AGNESE 13 and AGNESE 13A. See their Fig. 4 for limits extending down to $m_{\chi^0} = 5.5$ GeV.
- ⁴⁰BERNABEI 13A search for annual modulation of counting rate in the 2–6 keV recoil energy interval, in a 14 yr live time exposure of 1.33 t yr. Find a modulation of 0.0112 ± 0.0012 counts/(day kg keV) with 9.3 sigma C.L. Find period and phase in agreement with expectations from DM particles.
- ⁴¹LI 13b search for WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ –100 GeV.
- ⁴²See their Fig. 5 for limits for $m_{\chi^0} = 4$ –12 GeV.
- ⁴³ANGLOHER 12 observe excess events above the expected background which are consistent with χ^0 with mass ~ 25 GeV (or 12 GeV) and spin-independent χ^0 -nucleon cross section of 2×10^{-6} pb (or 4×10^{-5} pb).
- ⁴⁴Reanalysis of ANGLOHER 09 data with all three nuclides. See also BROWN 12. See also APRILE 14A.
- ⁴⁶See their Fig. 4 for limits extending down to $m_{\chi^0} = 7$ GeV.
- ⁴⁷See their Fig. 13 for cross section limits for m_{χ^0} between 1.2 and 10 GeV.
- ⁴⁸See also DAHL 12 for a criticism.
- ⁴⁹See their Fig. 4 for limits extending to $m_{\chi^0} = 3.5$ GeV.
- ⁵⁰AALSETH 11A find indications of annual modulation of the data, the energy spectrum being compatible with χ^0 mass around 8 GeV. See also AALSETH 13.
- ⁵¹AHMED 11 search for χ^0 inelastic scattering. See their Fig. 8–10 for limits. The inelastic cross section reduces to the elastic cross section at the limit of zero mass splitting (Fig. 8, left).
- ⁵²AHMED 11A combine CDMS II and EDELWEISS data.
- ⁵³ANGLE 11 show limits down to $m_{\chi^0} = 4$ GeV on Fig. 3.
- ⁵⁴APRILE 11 reanalyze APRILE 10 data.
- ⁵⁵APRILE 11A search for χ^0 inelastic scattering. See their Fig. 2 and 3 for limits. See also APRILE 14A.
- ⁵⁶HORN 11 perform detector calibration by neutrons. Earlier results are only marginally affected.
- ⁵⁷See their Fig. 10 and 12 for limits extending to χ^0 mass of 1 GeV.
- ⁵⁸Superseded by AHMED 10.
- ⁵⁹See their Fig. 6(a) for cross section limits for m_{χ^0} extending down to 2 GeV.
- ⁶⁰See their Fig. 2 for cross section limits for m_{χ^0} between 4 and 10 GeV.

For $m_{\chi^0} = 100$ GeV

For limits from χ^0 annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- ¹ABE 19 search for SI DD in single phase Xe; no signal; require $\sigma^{SI}(\chi p) < 4 \times 10^{-8}$ pb for $m(\chi) \sim 100$ GeV.
- ²AJAJ 19 search for SI WIMP-nucleon scatter with 758 tonne day exposure of single phase liquid Ar; no signal; require $\sigma^{SI}(\chi N) < 3.9 \times 10^{-9}$ pb for $m(\chi) = 100$ GeV.
- ³ADHIKARI 18 search for WIMP scatter on NaI; limit set $\sigma^{SI}(\chi p) < 2.3 \times 10^{-6}$ pb for $m(\chi) = 100$ GeV.
- ⁴AGNES 18A search for WIMP scatter on 46.4 kg Ar; no signal; require $\sigma^{SI}(\chi N) < 1.4 \times 10^{-8}$ pb for $m(\chi) = 100$ GeV.
- ⁵AGNESE 18A set limit $\sigma^{SI}(\chi N) < 2 \times 10^{-8}$ pb for $m(\text{WIMP}) = 100$ GeV.
- ⁶AMAUDRUZ 18 search for WIMP scatter on Ar with DEAP-3600; limits set: $\sigma^{SI}(\chi p) < 1.2 \times 10^{-8}$ pb for $m(\text{WIMP}) = 100$ GeV.
- ⁷APRILE 18 search for WIMP scatter on 1.3 t liquid Xe; no signal; require $\sigma^{SI}(\chi p) < 9.12 \times 10^{-11}$ pb for $m(\chi) = 100$ GeV.
- ⁸REN 18 search for self-interacting DM at PandaX-II with a total exposure of 54 ton day; limits set in $m(\text{DM})$ vs. $m(\text{mediator})$ plane.
- ⁹AKERIB 17 exclude SI cross section $> 1.7 \times 10^{-10}$ pb for $m(\text{WIMP}) = 100$ GeV. Uses complete LUX data set.
- ¹⁰APRILE 17G set limit $\sigma^{SI}(\chi p) < 1.2 \times 10^{-10}$ pb for $m(\text{WIMP}) = 100$ GeV using 1 ton fiducial mass Xe TPC. Exposure is 34.2 live days.
- ¹¹CUI 17A search for SI WIMP scatter; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m \sim 10$ – 1×10^4 GeV using 54 ton-day exposure of Xe.
- ¹²AKERIB 16 re-analysis of 2013 data exclude SI cross section $> 1 \times 10^{-9}$ pb for $m(\text{WIMP}) = 100$ GeV on Xe target.
- ¹³APRILE 16B combined 447 live days using Xe target exclude $\sigma(\text{SI}) > 1.1 \times 10^{-9}$ pb for $m(\text{WIMP}) = 50$ GeV.
- ¹⁴TAN 16 search for WIMP scatter off Xe target; see SI exclusion plot Fig. 6.
- ¹⁵TAN 16B search for WIMP-p scatter off Xe target; see Fig. 5 for SI exclusion.
- ¹⁶AGNESE 15B reanalyze AHMED 10 data.
- ¹⁷XIAO 15 search for WIMP scatter on Xe with PandaX-I; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ –100 GeV.
- ¹⁸AVROBIN 14 search for neutrinos from the Sun arising from the pair annihilation of χ^0 trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- ¹⁹AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of χ^0 trapped by the sun in data taken between June 2010 and May 2011.
- ²⁰ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of χ^0 trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- ²¹AGNESE 13 use data taken between Oct. 2006 and July 2007.
- ²²BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of χ^0 trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- ²³LI 13b search for WIMP scatter on Ge; limits placed in $\sigma^{SI}(\chi N)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ –100 GeV.
- ²⁴ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of χ^0 trapped by the Sun. The amount of χ^0 depends on the χ^0 -proton cross section.
- ²⁵Reanalysis of ANGLOHER 09 data with all three nuclides. See also BROWN 12.
- ²⁶See also APRILE 14A.
- ²⁷See their Fig. 6 for a limit on inelastically scattering χ^0 for $m_{\chi^0} = 70$ GeV.
- ²⁸AHMED 11 search for χ^0 inelastic scattering. See their Fig. 8–10 for limits.
- ²⁹AHMED 11A combine CDMS and EDELWEISS data.
- ³⁰AJELLO 11 search for e^\pm flux from χ^0 annihilations in the Sun. Models in which χ^0 annihilates into an intermediate long-lived weakly interacting particles or χ^0 scatters inelastically are constrained. See their Fig. 6–8 for limits.
- ³¹APRILE 11 reanalyze APRILE 10 data.
- ³²APRILE 11A search for χ^0 inelastic scattering. See their Fig. 2 and 3 for limits. See also APRILE 14A.
- ³³Supersedes ARMENGAUD 10. A limit on inelastic cross section is also given.
- ³⁴HORN 11 perform detector calibration by neutrons. Earlier results are only marginally affected.
- ³⁵AKIMOV 10 give cross section limits for inelastically scattering dark matter. See their Fig. 4.
- ³⁶Superseded by AHMED 10.
- ³⁷ANGLE 09 search for χ^0 inelastic scattering. See their Fig. 4 for limits.
- ³⁸GIULIANI 05 analyzes the spin-independent χ^0 -nucleon cross section limits with both isoscalar and isovector couplings. See their Fig. 3 and 4 for limits on the couplings.

• • • We do not use the following data for averages, fits, limits, etc. • • •

1 ABDELHAMEED 19 search for SD WIMP scatter on ⁷Li; limits placed on $\sigma^{SD}(\chi p)$ for $m(\chi) \sim 0.8-20 \text{ GeV}$; quoted limit is for $m(\chi) = 1 \text{ GeV}$.

2 AMOLE 19 search for SD WIMP scatter on C₃F₈ in PICO-60 bubble chamber; no signal; set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 2 \times 10^{-4} \text{ pb}$ for $m(\chi) = 5 \text{ GeV}$.

3 APRILE 19c search for light DM on Xe via Migdal/brem effect; no signal, require $\sigma^{SD}(\chi p) < 1.7 \times 10^4 \text{ pb}$ for $m(\chi) = 1 \text{ GeV}$.

4 ARMENGAUD 19 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.5-10 \text{ GeV}$; quoted limit is for $m(\chi) = 5 \text{ GeV}$.

5 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5-1 \times 10^5 \text{ GeV}$; quoted limit is for $m(\chi) = 5 \text{ GeV}$.

6 AGNESE 18 search for GeV scale WIMPs with CDM2lite; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 1.5-20 \text{ GeV}$; quoted limit is for $m(\chi) = 5 \text{ GeV}$.

7 AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6-1 \times 10^5 \text{ GeV}$.

8 FU 17 search for SD WIMP scatter on Xe; limits set in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4-1 \times 10^3 \text{ GeV}$; quoted limit is for $m(\chi) = 5 \text{ GeV}$.

9 AMOLE 15 search for WIMP scatter on C₃F₈ in PICO-2L; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4-1 \times 10^4 \text{ GeV}$; quoted limit is for $m(\chi) = 5 \text{ GeV}$.

10 ARCHAMBAULT 12 search for SD WIMP scatter in ¹⁹F with PICASSO; limits set in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m \sim 4-500 \text{ GeV}$; quoted limit is for $m(\chi) = 5 \text{ GeV}$.

For $m_{\chi^0} = 20 \text{ GeV}$

For limits from X^0 annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- 1 ABDELHAMEED 19 uses Li_2MoO_4 target to set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 3. \times 10^5$ pb for $m(\chi) = 20$ GeV.
- 2 AMOLE 19 search for SD WIMP scatter on C_3F_8 in PICO-60 bubble chamber; no signal: set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 2.5 \times 10^{-5}$ pb for $m(\chi) = 20$ GeV.
- 3 APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m \sim 6\text{--}1000$ GeV.
- 4 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}1 \times 10^5$ GeV.
- 5 AGNESE 18 give limits for $\sigma^{SD}(\rho\chi)$ for $m(\text{WIMP})$ between 1.5 and 20 GeV using CDMSlite mode data.
- 6 AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6\text{--}1 \times 10^5$ GeV.
- 7 BEHNKE 17 show final Picasso results based on 231.4 kg d exposure at SNOLab for WIMP scatter on C_4F_{10} search via superheated droplet; require $\sigma(\text{SD}) < 1.32 \times 10^{-2}$ pb for $m(\text{WIMP}) = 20$ GeV.
- 8 FU 17 search for SD WIMP scatter on Xe; limits set in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4\text{--}1 \times 10^3$ GeV.
- 9 AMOLE 16A require SD WIMP- p scattering $< 5 \times 10^{-4}$ pb for $m(\text{WIMP}) = 20$ GeV; bubbles from C_3F_8 target.
- 10 KHACHATRYAN 16AJ require SD WIMP- $p < 2 \times 10^{-6}$ pb for $m(\text{WIMP}) = 20$ GeV from $pp \rightarrow Z + \cancel{eT}; Z \rightarrow \ell\bar{\ell}$ signal.
- 11 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between June 2010 and May 2011.
- 12 The value has been provided by the authors. APRILE 13 note that the proton limits on Xe are highly sensitive to the theoretical model used. See also APRILE 14A.
- 13 ARCHAMBAULT 12 search for WIMP scatter on C_4F_{10} ; limits set in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m \sim 4\text{--}500$ GeV.
- 14 Use a direction-sensitive detector.
- 15 TANAKA 11 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- 16 See also AKERIB 05.

For $m_{X^0} = 100$ GeV

For limits from X^0 annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- 1 AMOLE 19 search for SD WIMP scatter on C_3F_8 in PICO-60 bubble chamber; no signal: set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 4 \times 10^{-5}$ pb for $m(\chi) = 100$ GeV.
- 2 APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m \sim 6\text{--}1000$ GeV.
- 3 XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5\text{--}1 \times 10^5$ GeV.
- 4 AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6\text{--}1 \times 10^5$ GeV.
- 5 AMOLE 17 require $\sigma(\text{WIMP-}p)^{SD} < 5 \times 10^{-5}$ pb for $m(\text{WIMP}) = 100$ GeV using PICO-60 1167 kg-days exposure at SNOLab.
- 6 APRILE 17A require $\sigma(\text{WIMP-}p)(\text{inelastic})^{SD} < 3.3 \times 10^{-2}$ pb for $m(\text{WIMP}) = 100$ GeV, based on 7640 kg day exposure at LNGS.
- 7 BATTAT 17 use directional detection of CS_2 ions to require $\sigma(\text{SD}) < 2.8 \times 10^{-1}$ pb for 100 GeV WIMP with a 55 days exposure at the Bouby Underground Science Facility.
- 8 FU 17 from a 33000 kg d exposure at CJPL, PANDAX II derive for $m(\text{DM}) = 100$ GeV, $\sigma^{SD}(\text{WIMP-}p) < 2 \times 10^{-3}$ pb.
- 9 AABOUD 16b use ATLAS 13 TeV 3.2 fb^{-1} of data to search for monojet plus missing E_T ; agree with SM rates; present limits on large extra dimensions, compressed SUSY spectra and wimp pair production.
- 10 AABOUD 16f search for monophoton plus missing E_T events at ATLAS with 13 TeV and 3.2 fb^{-1} ; signal agrees with SM background; place limits on SD WIMP-proton scattering vs. mediator mass and large extra dimension models.
- 11 AARTSEN 16c search for high energy ν s from WIMP annihilation in solar core; limits set on SD WIMP- p scattering (Fig. 8).
- 12 ADRIAN-MARTINEZ 16 search for WIMP annihilation into ν s from solar core; exclude SD cross section $< \text{few } 10^{-4}$ depending on $m(\text{WIMP})$.
- 13 AKERIB 16A using 2013 data exclude SD WIMP-proton scattering $> 3 \times 10^{-3}$ pb for $m(\text{WIMP}) = 100$ GeV.
- 14 AMOLE 16 use bubble technique on CF_3I target to exclude SD WIMP- p scattering $> 5 \times 10^{-4}$ pb for $m(\text{WIMP}) = 100$ GeV.
- 15 Use a direction-sensitive detector.
- 16 AVRORIN 14 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- 17 AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between June 2010 and May 2011.
- 18 ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- 19 The value has been provided by the authors. APRILE 13 note that the proton limits on Xe are highly sensitive to the theoretical model used. See also APRILE 14A.
- 20 BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- 21 ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- 22 ARCHAMBAULT 12 search for WIMP scatter on C_4F_{10} ; limits set in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m \sim 4\text{--}500$ GeV.
- 23 TANAKA 11 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- 24 See their Fig. 3 for limits on spin-dependent proton couplings for X^0 mass of 50 GeV.
- 25 See also AKERIB 05.
- 26 GIULIANI 05A analyze available data and give combined limits.
- 27 GIULIANI 04 reanalyze COLLAR 00 data and give limits for spin-dependent X^0 -proton coupling.
- 28 GIULIANI 04A give limits for spin-dependent X^0 -proton couplings from existing data.

For $m_{X^0} = 1$ TeV

For limits from X^0 annihilation in the Sun, the assumed annihilation final state is shown in parenthesis in the comment.

- AMOLE 19 search for SD WIMP scatter on C₃F₈ in PICO-60 bubble chamber; no signal: set limit for spin dependent coupling $\sigma^{SD}(\chi p) < 3 \times 10^{-4}$ pb for $m(\chi) = 1000$ GeV.
- APRILE 19A search for SD WIMP scatter on 1 t yr Xe; no signal, limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m \sim 6$ -1000 GeV.
- XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ -1 × 10⁵ GeV.
- ALBERT 18c search for DM annihilation in Sun to long-lived mediator (LLM) which decays outside Sun, for DM masses above 1 TeV; assuming LLM, limits set on $\sigma^{SD}(\chi p)$.
- AARTSEN 17A search for neutrinos from solar WIMP annihilation into $\tau^+ \tau^-$ in 532 days of live time.
- AKERIB 17A search for SD WIMP scatter on Xe using 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 6$ -1 × 10⁵ GeV.
- FU 17 search for SD WIMP scatter on Xe; limits set in $\sigma^{SD}(\chi p)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ -1 × 10³ GeV.
- ADRIAN-MARTINEZ 16B search for secluded DM via WIMP annihilation in solar core into light mediator which later decays to μ or ν s; limits presented in Figures 3 and 4.
- AVROVIN 14 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun in data taken between 1998 and 2003. See their Table 1 for limits assuming annihilation into neutrino pairs.
- AARTSEN 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between June 2010 and May 2011.
- ADRIAN-MARTINEZ 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken between Jan. 2007 and Dec. 2008.
- The value has been provided by the authors. APRILE 13 note that the proton limits on Xe are highly sensitive to the theoretical model used. See also APRILE 14A.
- BOLIEV 13 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the sun in data taken from 1978 to 2009. See also SUVOROVA 13 for an older analysis of the same data.
- ABBASI 12 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- Use a direction-sensitive detector.
- TANAKA 11 search for neutrinos from the Sun arising from the pair annihilation of X^0 trapped by the Sun. The amount of X^0 depends on the X^0 -proton cross section.
- ABBASI 10 search for ν_μ from annihilations of Kaluza-Klein photon dark matter in the Sun.
- See also AKERIB 05.

Spin-Dependent Cross Section Limits for Dark Matter Particle (X^0) on Neutron

For m_{X^0} in GeV range

We provide here limits for $m_{X^0} < 5$ GeV

- ABDELHAMEED 19 search for GeV-scale WIMP SD scatter on ⁷Li crystal; set limit $\sigma^{SD}(\chi n)$ for $m(\chi) \sim 0.8$ -20 GeV; quoted limit for $m(\chi) = 1$ GeV.
- APRILE 19c search for light DM on Xe via Migdal/bremsstrahlung effect; no signal, require $\sigma^{SD}(\chi n) < 230$ pb for $m(\chi) = 1$ GeV.
- APRILE 19d search for light DM scatter on Xe via ionization; no signal, limits placed in σ vs. $m(\text{DM}) \sim 3$ -6 GeV; quoted limit is for $m(\text{DM}) = 5$ GeV.
- ARMENGAUD 19 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 0.5$ -10 GeV; quoted limit is for $m(\chi) = 5$ GeV.
- XIA 19A search for WIMP scatter on Xe in PandaX-II; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ -1 × 10⁵ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- AGNESE 18 search for GeV scale WIMPs scatter at CDM2site; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m \sim 1.5$ -20 GeV; quoted limit is for $m(\chi) = 5$ GeV.
- JIANG 18 search for GeV scale WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 3$ -10 GeV; quoted limit is for $m(\chi) = 5$ GeV.
- YANG 18 search for WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 2$ -10 GeV; quoted limit is for $m(\chi) = 5$ GeV.
- AKERIB 17A search for SD WIMP scatter on Xe with 129.5 kg yr exposure; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 5$ -1 × 10⁵ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- FU 17 search for SD WIMP scatter on Xe; limits set in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ -1 × 10³ GeV; quoted limit is for $m(\chi) = 5$ GeV.
- ZHAO 16 search for GeV-scale WIMP scatter on Ge; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m(\chi) \sim 4$ -30 GeV; quoted limit is for $m(\chi) = 5$ GeV.
- AHMED 11B search for GeV scale WIMP scatter on Ge in CDM2 II; limits placed in $\sigma^{SD}(\chi n)$ vs. $m(\chi)$ plane for $m \sim 4$ -12 GeV. Limit given for $m(\chi) = 5$ GeV.

For $m_{X^0} = 20$ GeV

- 1 AKERIB 20 search for mirror DM with LUX 95 d × 118 kg data for mirror e scatter from Xe; no signal, limits placed in kinetic mixing parameter vs. mirror e temperature $T \sim 0.1$ -0.9 keV plane.
- 2 ABRAMOFF 19 search for MeV-scale WIMP scatter from Si skipper-CCD; limits placed on $\sigma(\chi e)$ for $m(\chi) \sim 0.5$ -100 MeV depending on DM form factors. Limit given for $m(\text{DM}) = 1$ MeV.
- 3 AGUILAR-AREVALO 19A search for MeV scale DM scatter from e in Si CCDs at SNO-LAB; no signal, limits placed in $\sigma(e)$ vs. $m(\text{DM})$ plane for $m(\text{DM}) \sim 0.6$ -100 MeV.
- 4 APRILE 19D search for light DM scatter on Xe via ionization; no signal, limits placed in σ on nucleus vs. $m(\text{DM})$ plane for $m(\text{DM}) \sim 0.02$ -10 GeV; quoted limit is for $m(\text{DM}) = 0.2$ GeV.
- 5 AGNES 18B search for MeV scale WIMP scatter from e in Ar; no signal, limits set in σ_e vs. $m(\chi)$ plane for $m \sim 20$ -1000 MeV and two choices of form factor F(DM); quoted limit for $m(\chi) = 100$ MeV and F = 1.
- 6 AGNESE 18B search for e χ scatter in SuperCDMS; limits placed in $\sigma(e\chi)$ vs. $m(\chi)$ plane for $m \sim 0.3$ -1 × 10⁴ MeV for two assumed form factors and also in $m(\text{dark photon})$ vs. kinetic mixing plane. Limit given for $m(\chi) = 1$ GeV and F=1.
- 7 CRISLER 18 search for $\chi e \rightarrow \chi e$ scatter in Si CCD; place limits on MeV DM in σ_e vs. $m(\chi)$ plane for $m \sim 0.5$ -1000 MeV for different form factors; quoted limit is for F(DM) = 1 and $m(\chi) = 10$ MeV.
- 8 APRILE 17 search for WIMP-e annual modulation signal for recoil energy in the 2.0-5.8 keV interval using 4 years data with Xe. No significant effect seen.

Cross-Section Limits for Dark Matter Particles (χ^0) on Nuclei

For m_{χ^0} in GeV range

We provide here limits for $m_{\chi^0} < 5 \text{ GeV}$

- 1 UCHIDA 14 limit is for inelastic scattering $\chi^0 + ^{129}\text{Xe}^* \rightarrow \chi^0 + ^{129}\text{Xe}^*$ (39.58 keV).
- 2 ANGLOHER 02 limit is for spin-dependent WIMP-Aluminum cross section.
- 3 BENOIT 00 find four event categories in Ge detectors and suggest that low-energy surface nuclear recoils can explain anomalous events reported by UKDMC and Saclay NaI experiments.
- 4 KLIMENKO 98 limit is for inelastic scattering $\chi^0 \text{ } ^{73}\text{Ge} \rightarrow \chi^0 \text{ } ^{73}\text{Ge}^*$ (13.26 keV).
- 5 BELL 96 limit for inelastic scattering $\chi^0 \text{ } ^{129}\text{Xe} \rightarrow \chi^0 \text{ } ^{129}\text{Xe}^*$ (39.58 keV).
- 6 BELL 96C use background subtraction and obtain $\sigma < 150$ pb (< 1.5 fb) (90% CL) for spin-dependent (independent) χ^0 -proton cross section. The confidence level is from R. Bernabei, private communication, May 20, 1999.
- 7 BERNABE 96 use pulse shape discrimination to enhance the possible signal. The limit here is from R. Bernabei, private communication, September 19, 1997.
- 8 SARSA 96 search for annual modulation of WIMP signal. See SARSA 97 for details of the analysis. The limit here is from M.L. Sarsa, private communication, May 26, 1997.

Searches Particle Listings

WIMP and Dark Matter Searches

- ⁹ SMITH 96 use pulse shape discrimination to enhance the possible signal. A dark matter density of 0.4 GeV cm^{-3} is assumed.
- ¹⁰ GARCIA 95 limit is from the event rate. A weaker limit is obtained from searches for diurnal and annual modulation.
- ¹¹ SNOWDEN-IFFT 95 look for recoil tracks in an ancient mica crystal. Similar limits are also given for ^{27}Al and ^{28}Si . See COLLAR 96 and SNOWDEN-IFFT 96 for discussion on potential backgrounds.
- ¹² REUSSER 91 limit here is changed from published (0.04) after reanalysis by authors. J.L. Vuilleumier, private communication, March 29, 1996.

For $m_{\chi^0} = 100 \text{ GeV}$

- ¹ UCHIDA 14 limit is for inelastic scattering $\chi^0 + ^{129}\text{Xe}^* \rightarrow \chi^0 + ^{129}\text{Xe}^*$ (39.58 keV).
- ² ANGLOHER 02 limit is for spin-dependent WIMP-Aluminum cross section.
- ³ BELLI 02 discuss dependence of the extracted WIMP cross section on the assumptions of the galactic halo structure.
- ⁴ BERNABEI 02c analyze the DAMA data in the scenario in which χ^0 scatters into a slightly heavier state as discussed by SMITH 01.
- ⁵ GREEN 02 discusses dependence of extracted WIMP cross section limits on the assumptions of the galactic halo structure.
- ⁶ ULLIO 01 disfavor the possibility that the BERNABEI 99 signal is due to spin-dependent WIMP coupling.
- ⁷ BENOIT 00 find four event categories in Ge detectors and suggest that low-energy surface nuclear recoils can explain anomalous events reported by UKDMC and Saclay Nal experiments.
- ⁸ BERNABEI 00D limit is for inelastic scattering $\chi^0 ^{129}\text{Xe} \rightarrow \chi^0 ^{129}\text{Xe}$ (39.58 keV).
- ⁹ AMBROSIO 99 search for upgoing muon events induced by neutrinos originating from WIMP annihilations in the Sun and Earth.
- ¹⁰ BRHLIK 99 discuss the effect of astrophysical uncertainties on the WIMP interpretation of the BERNABEI 99 signal.
- ¹¹ KLIMENKO 98 limit is for inelastic scattering $\chi^0 ^{73}\text{Ge} \rightarrow \chi^0 ^{73}\text{Ge}^*$ (13.26 keV).
- ¹² KLIMENKO 98 limit is for inelastic scattering $\chi^0 ^{73}\text{Ge} \rightarrow \chi^0 ^{73}\text{Ge}^*$ (66.73 keV).
- ¹³ BELLI 96 limit for inelastic scattering $\chi^0 ^{129}\text{Xe} \rightarrow \chi^0 ^{129}\text{Xe}^*$ (39.58 keV).
- ¹⁴ BELLI 96c use background subtraction and obtain $\sigma < 0.35 \text{ pb}$ ($< 0.15 \text{ fb}$) (90% CL) for spin-dependent (independent) χ^0 -proton cross section. The confidence level is from R. Bernabei, private communication, May 20, 1999.
- ¹⁵ BERNABEI 96 use pulse shape discrimination to enhance the possible signal. The limit here is from R. Bernabei, private communication, September 19, 1997.
- ¹⁶ SARSA 96 search for annual modulation of WIMP signal. See SARSA 97 for details of the analysis. The limit here is from M.L. Sarsa, private communication, May 26, 1997.
- ¹⁷ SMITH 96 use pulse shape discrimination to enhance the possible signal. A dark matter density of 0.4 GeV cm^{-3} is assumed.
- ¹⁸ GARCIA 95 limit is from the event rate. A weaker limit is obtained from searches for diurnal and annual modulation.
- ¹⁹ SNOWDEN-IFFT 95 look for recoil tracks in an ancient mica crystal. Similar limits are also given for ^{27}Al and ^{28}Si . See COLLAR 96 and SNOWDEN-IFFT 96 for discussion on potential backgrounds.
- ²⁰ BECK 94 uses enriched ^{76}Ge (86% purity).
- ²¹ REUSSER 91 limit here is changed from published (0.3) after reanalysis by authors. J.L. Vuilleumier, private communication, March 29, 1996.

For $m_{\chi^0} = 1 \text{ TeV}$

- ¹ UCHIDA 14 limit is for inelastic scattering $\chi^0 + ^{129}\text{Xe}^* \rightarrow \chi^0 + ^{129}\text{Xe}^*$ (39.58 keV).
- ² ANGLOHER 02 limit is for spin-dependent WIMP-Aluminum cross section.
- ³ BENOIT 00 find four event categories in Ge detectors and suggest that low-energy surface nuclear recoils can explain anomalous events reported by UKDMC and Saclay Nal experiments.
- ⁴ BERNABEI 99D search for SIMPs (Strongly Interacting Massive Particles) in the mass range 10^3 - 10^{16} GeV. See their Fig. 3 for cross-section limits.
- ⁵ DERBIN 99 search for SIMPs (Strongly Interacting Massive Particles) in the mass range 10^2 - 10^{14} GeV. See their Fig. 3 for cross-section limits.
- ⁶ KLIMENKO 98 limit is for inelastic scattering $\chi^0 ^{73}\text{Ge} \rightarrow \chi^0 ^{73}\text{Ge}^*$ (13.26 keV).
- ⁷ KLIMENKO 98 limit is for inelastic scattering $\chi^0 ^{73}\text{Ge} \rightarrow \chi^0 ^{73}\text{Ge}^*$ (66.73 keV).
- ⁸ BELLI 96 limit for inelastic scattering $\chi^0 ^{129}\text{Xe} \rightarrow \chi^0 ^{129}\text{Xe}^*$ (39.58 keV).
- ⁹ BELLI 96 limit for inelastic scattering $\chi^0 ^{129}\text{Xe} \rightarrow \chi^0 ^{129}\text{Xe}^*$ (236.14 keV).
- ¹⁰ BELLI 96c use background subtraction and obtain $\sigma < 0.7 \text{ pb}$ ($< 0.7 \text{ fb}$) (90% CL) for spin-dependent (independent) χ^0 -proton cross section. The confidence level is from R. Bernabei, private communication, May 20, 1999.
- ¹¹ BERNABEI 96 use pulse shape discrimination to enhance the possible signal. The limit here is from R. Bernabei, private communication, September 19, 1997.
- ¹² SARSA 96 search for annual modulation of WIMP signal. See SARSA 97 for details of the analysis. The limit here is from M.L. Sarsa, private communication, May 26, 1997.
- ¹³ SMITH 96 use pulse shape discrimination to enhance the possible signal. A dark matter density of 0.4 GeV cm^{-3} is assumed.
- ¹⁴ GARCIA 95 limit is from the event rate. A weaker limit is obtained from searches for diurnal and annual modulation.
- ¹⁵ SNOWDEN-IFFT 95 look for recoil tracks in an ancient mica crystal. Similar limits are also given for ^{27}Al and ^{28}Si . See COLLAR 96 and SNOWDEN-IFFT 96 for discussion on potential backgrounds.
- ¹⁶ BECK 94 uses enriched ^{76}Ge (86% purity).
- ¹⁷ REUSSER 91 limit here is changed from published (5) after reanalysis by authors. J.L. Vuilleumier, private communication, March 29, 1996.

- 1 ABRAMOFF 19 search for MeV scale DM via DM-e scattering and dark photon DM via absorption in Si; limits set in coupling vs. $m(\chi)$ plane and on dark photon in $m(A)$ vs. kinetic mixing parameter plane.
- 2 ADHIKARI 19 search for annual modulation signal from WIMP scatter on NaI with 1.7 yr exposure; result consistent with both DAMA/LIBRA and null hypothesis.
- 3 AMARE 19 is ANAIS-112 search for WIMP scatter annual modulation on NaI; 157.55 kg yr exposure; result compatible with null hypothesis; confirm goal of reaching sensitivity at 3σ to DAMA/LIBRA result in 5 years.
- 4 APRILE 19 search for WIMP-pion scattering in Xe; no signal: require $\sigma(\chi\pi) < 6.4 \times 10^{-10}$ pb for $m(\chi) = 30$ GeV.
- 5 BRINGMANN 19 derive theoretically limits on GeV and sub-GeV mass dark matter, in its high energy component generated by interaction with cosmic rays; place limits on σ^{SI} and $\sigma^{SD} < 10^5$ pb.
- 6 BRUNE 19 examine possibility of Majoron dark matter; limits placed on Majoron mass vs. coupling from SN1987a and ν -less double beta decay.
- 7 CHOI 19 from multimessenger observation finds limit on $\sigma(\nu\chi)/m(\text{DM}) < 5.1 \times 10^{-23}$ cm²/GeV based on 290 TeV IceCube neutrino event.
- 8 HA 19 search for inelastic boosted MeV scale dark photon using COSINE-100 data; limits placed in m vs. epsilon plane for various mediators.
- 9 KLOPF 19 search for DM via $n \rightarrow \chi e^+ e^-$; no signal: limits placed in branching fraction vs. $m(e^+ e^-)$ plane.
- 10 AARTSEN 18D search for long-lived DM particles decaying $\chi \rightarrow \nu X$; no excess seen; for DM masses above 10 TeV, excluding lifetimes shorter than 10^{28} s.
- 11 ABE 18r search for keV mass ALPs and hidden photons (HP) scatter on electrons; limits set on mass vs. coupling.
- 12 AGNES 18b search for MeV-scale DM scatter on electrons in Ar; no signal; require $\sigma(\chi e) < 9 \times 10^{-3}$ pb for DM form factor $F(\text{DM}) = 1$ and < 300 pb for $F(\text{DM})$ proportional to $1/q^2$ for $m(\chi) = 100$ MeV.
- 13 AGNESE 18a search for MeV scale DM via DM-e scattering and dark photon DM via absorption in Si; limits set on MeV DM in coupling vs. $m(\chi)$ plane and on dark photon in $m(A')$ vs. kinetic mixing plane.
- 14 AKERIB 18a search for annual and diurnal modulation of DM scattering rate on electrons for recoil energy between 2 and 6 keVee; no signal found.
- 15 ARMENGAUD 18 search for ALP from the Sun and galactic bosonic DM, interacting in Ge; no signal; limits set for 0.8–500 keV DM particles.
- 16 KACHULIS 18 search for an excess of elastically scattered electrons above the atmospheric neutrino background in Super-K; limits placed for simple annihilation or decay in the Sun or galactic center producing "boosted" dark matter.
- 17 AGUILAR-AREVALO 17 search for hidden photon DM scatter on Si target CCD; limit kinetic mixing $\kappa < 1 \times 10^{-12}$ for $m = 10$ eV.
- 18 APRILE 17 search for WIMP-e annual modulation signal for recoil energy in the 2.0–5.8 keV interval using 4 years data with Xe. No significant effect seen.
- 19 APRILE 17D set limits on 14 WIMP-nucleon different interaction operators. No deviations found using 225 live days in the 6.6–240 keV recoil energy range.
- 20 APRILE 17H search for keV bosonic DM via $e\chi \rightarrow e$, looking for electronic recoils with 224.6 live days of data and 34 kg of LXe. Limits set on $\chi e e$ coupling for $m(\chi) = 8$ –125 keV.
- 21 APRILE 17k search for magnetic inelastic DM via $\chi N \rightarrow \chi^* \rightarrow \chi\gamma$. Limits set in DM magnetic moment vs. mass splitting plane for two DM masses corresponding to the DAMA/LIBRA best fit values.
- 22 ANGLOHER 16A require q^2 dependent scattering $< 8 \times 10^{-3}$ pb for asymmetric DM $m(\text{WIMP}) = 3$ GeV on CaWO₄ target. It uses a local dark matter density of 0.38 GeV/cm³.
- 23 APRILE 15 search for periodic variation of electronic recoil event rate in the data between Feb. 2011 and Mar. 2012. No significant modulation is found for periods up to 500 days.
- 24 APRILE 15A search for X^0 scattering off electrons. See their Fig. 4 for limits on cross section through axial-vector coupling for m_{X^0} between 0.6 GeV and 1 TeV. For $m_{X^0} = 2$ GeV, $\sigma < 60$ pb (90%CL) is obtained.

X⁰ Annihilation Cross Section

Limits are on σv for X^0 pair annihilation at threshold.

- 1 ABEYSEKARA 19 search for γ s from DM annihilation in galactic substructures with HAWC; no signal, limits placed in $J(\sigma v)$ vs. declination plane for $m(\text{DM}) \sim 1$ –108 TeV.
- 2 ALBERT 19b search for DM signal from M31 galaxy in μ, τ, t, b, W channels using HAWC for $m(\text{DM}) \sim 1$ –100 TeV; no signal, limits placed in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane.
- 3 CHEUNG 19 derive model-dependent bounds on $\langle\sigma v\rangle$ from EDGES data: $< 4 \times 10^{-26}$ cm³/s for $e^+ e^-$ and $b\bar{b}$ for $m(\chi) = 100$ GeV (including boost factor).
- 4 DI-MAURO 19 place limits on WIMP annihilation via Fermi-LAT observation of M31 and M33 galaxies: $\langle\sigma v\rangle < 7 \times 10^{-27}$ cm³/s for $m(\chi) = 20$ GeV from M31.
- 5 JOHNSON 19 search for γ -rays, 10–600 GeV energy, from P-wave annihilating DM around SgrA* BH using Fermi-LAT; limits set for various models.
- 6 LI 19d search for $\chi\chi \rightarrow \gamma$ in Fermi-LAT data; no signal, require $\langle\sigma v\rangle < 2 \times 10^{-26}$ cm³/s for $m(\chi) = 100$ GeV.
- 7 NG 19 search for X-ray line from sterile ν decay/annihilation using NuStar M-31; no signal: limits placed in $m(\nu)$ vs mixing angle and $\langle\sigma v\rangle$ vs $m(\nu)$.
- 8 QUEIROZ 19 examine $\chi\chi \rightarrow \chi SM$ semi-annihilation of DM reaction; limits placed for various assumed SM particles in $\langle\sigma v\rangle$ vs. $m(\chi)$ plane.
- 9 ABDALLAH 18 search for WIMP WIMP $\rightarrow \gamma X$ in central galactic halo, 10 years of data; limits placed in $\langle\sigma v\rangle$ vs. $m(\text{WIMP})$ plane for $m(\text{WIMP}): 0.3$ –70 TeV.
- 10 AHNEN 18 search for WIMP WIMP $\rightarrow \gamma X$ from Ursa Major II; limits set in $\langle\sigma v\rangle$ vs. $m(\text{WIMP})$ plane for $b\bar{b}, W^+ W^-, \tau^+ \tau^-,$ and $\mu^+ \mu^-$ annihilation modes.
- 11 ALBERT 18b search for TeV-scale WIMPs with WIMP WIMP $\rightarrow \gamma X$ in Andromeda galaxy using HAWC Observatory; limits set in $\langle\sigma v\rangle$ vs $m(\text{WIMP})$ plane.
- 12 CHANG 18a examine $\chi\chi \rightarrow b\bar{b} \rightarrow \gamma$ using Fermi Pass 8 data; no signal; require $\langle\sigma v\rangle < 10^{-26}$ cm³/s for $m(\chi) = 50$ GeV.
- 13 LISANTI 18 examine Fermi Pass 8 γ -ray data from galaxy groups; report $m(\text{WIMP}) > 30$ GeV for annihilation in $b\bar{b}$ channel.
- 14 MAZZIOTTA 18 examine Fermi-LAT electron and positron spectra searching for features originating from DM particles annihilation into $e^+ e^-$ pairs, from 45 GeV to 2 TeV; no signal found, limits are obtained.
- 15 AARTSEN 17c use 1005 days of IceCube data to search for $\chi\chi \rightarrow$ neutrinos via various annihilation channels. Limits set.
- 16 ALBERT 17a search for DM annihilation to ν s using ANTARES data from 2007–2015. No signal. Limits set in $\langle\sigma v\rangle$ vs. $m(\text{DM})$ plane for $m(\text{DM}) \sim 10$ – 10×10^5 GeV. The listed limit is for $m(\text{DM}) = 100$ TeV.
- 17 ARCHAMBAULT 17 set limits for WIMP mass between 100 GeV and 1 TeV on $\langle\sigma v\rangle$ for $W^+ W^-, ZZ, b\bar{b}, s\bar{s}, u\bar{u}, d\bar{d}, t\bar{t}, e^+ e^-, gg, c\bar{c}, hh, \gamma\gamma, \mu^+ \mu^-, \tau^+ \tau^-$ annihilation channels.
- 18 AVRORIN 17 find upper limits for the annihilation cross section in various channels for DM particle mass between 30 GeV and 10 TeV. Strongest upper limits coming from the two neutrino channel require $\langle\sigma v\rangle < 6 \times 10^{-20}$ cm³/s in dwarf galaxies and $\langle\sigma v\rangle < 7 \times 10^{-21}$ cm³/s in LMC for 5 TeV WIMP mass.

Searches Particle Listings

WIMP and Dark Matter Searches

- 19 BOUDAUD 17 use data from the spacecraft Voyager 1, beyond the heliopause, and from AMS02 on $\chi\chi \rightarrow e^+e^-$ to require $\langle\sigma v\rangle < 1. \times 10^{-28} \text{ cm}^3/\text{s}$ for $m(\chi) = 10 \text{ MeV}$.
- 20 AARTSEN 16d search for GeV ν s from WIMP annihilation in galaxy; limits set on $\langle\sigma v\rangle$ in Fig. 6, 7.
- 21 ABDALLAH 16 require $\langle\sigma v\rangle < 6 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1.5 \text{ TeV}$ from 254 hours observation (WW channel) and $< 2 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1.0 \text{ TeV}$ in $\tau^+\tau^-$ channel.
- 22 ABDALLAH 16A search for line spectra from WIMP + WIMP $\rightarrow \gamma\gamma$ in 18 hr HESS data; rule out previous 130 GeV WIMP hint from Fermi-LAT data.
- 23 AHNEN 16 require $\langle\sigma v\rangle < 3 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100 \text{ GeV}$ (WW channel).
- 24 AVRORIN 16 require $\langle\sigma v\rangle < 1.91 \times 10^{-21} \text{ cm}^3/\text{s}$ from WIMP annihilation to ν s via W channel for $m(\text{WIMP}) = 1 \text{ TeV}$.
- 25 CAPUTO 16 place limits on WIMPs from annihilation to gamma rays in Small Magellanic Cloud using Fermi-LAT data: $\langle\sigma v\rangle < 3 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 10 \text{ GeV}$.
- 26 FORNASA 16 use anisotropies in the γ -ray diffuse emission detected by Fermi-LAT to bound $\langle\sigma v\rangle < 10^{-25} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100 \text{ GeV}$ in $b\bar{b}$ channel: see Fig. 28. The limit is driven by dark-matter subhalos in the Milky Way and it refers to their Most Constraining Scenario.
- 27 LEITE 16 constrain WIMP annihilation via search for radio emissions from Smith cloud; $\langle\sigma v\rangle < 5 \times 10^{-27} \text{ cm}^3/\text{s}$ in ee channel for $m(\text{WIMP}) = 5 \text{ GeV}$.
- 28 LI 16 re-analyze Fermi-LAT data on 8 dwarf spheroidal; set limit $\langle\sigma v\rangle < 2 \times 10^{-26} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 100 \text{ GeV}$ in $b\bar{b}$ mode with substructures included.
- 29 LI 16A constrain $\langle\sigma v\rangle < 10^{-25} \text{ cm}^3/\text{s}$ in $b\bar{b}$ channel for $m(\text{WIMP}) = 100 \text{ GeV}$ using Fermi-LAT data from M31; see Fig. 6.
- 30 LIANG 16 search dwarf spheroidal galaxies, Large Magellanic Cloud, and Small Magellanic Cloud for γ -line in Fermi-LAT data.
- 31 LU 16 re-analyze Fermi-LAT and AMS-02 data; require $\langle\sigma v\rangle < 10^{-25} \text{ cm}^3/\text{s}$ for $m_m(\text{WIMP}) = 1 \text{ TeV}$ in $b\bar{b}$ channel.
- 32 SHIRASAKI 16 re-analyze Fermi-LAT extra-galactic data; require $\langle\sigma v\rangle < 10^{-23} \text{ cm}^3/\text{s}$ for $m(\text{WIMP}) = 1 \text{ TeV}$ in $b\bar{b}$ channel; see Fig. 8.
- 33 AARTSEN 15c search for neutrinos from X^0 annihilation in the Galactic halo. See their Figs. 16 and 17, and Table 5 for limits on $\sigma \cdot v$ for X^0 mass between 100 GeV and 100 TeV.
- 34 AARTSEN 15E search for neutrinos from X^0 annihilation in the Galactic center. See their Figs. 7 and 9, and Table 3 for limits on $\sigma \cdot v$ for X^0 mass between 30 GeV and 10 TeV.
- 35 ABRAMOWSKI 15 search for γ from X^0 annihilation in the Galactic center. See their Fig. 4 for limits on $\sigma \cdot v$ for X^0 mass between 250 GeV and 10 TeV.
- 36 ACKERMANN 15 search for monochromatic γ from X^0 annihilation in the Galactic halo. See their Fig. 8 and Tables 2-4 for limits on $\sigma \cdot v$ for X^0 mass between 0.2 GeV and 500 GeV.
- 37 ACKERMANN 15A search for γ from X^0 annihilation (both Galactic and extragalactic) in the isotropic γ background. See their Fig. 7 for limits on $\sigma \cdot v$ for X^0 mass between 10 GeV and 30 TeV.
- 38 ACKERMANN 15B search for γ from X^0 annihilation in 15 dwarf spheroidal satellite galaxies of the Milky Way. See their Figs. 1 and 2 for limits on $\sigma \cdot v$ for X^0 mass between 2 GeV and 10 TeV.
- 39 ADRIAN-MARTINEZ 15 search for neutrinos from X^0 annihilation in the Galactic center. See their Figs. 10 and 11 and Tables 1 and 2 for limits on $\sigma \cdot v$ for X^0 mass between 25 GeV and 10 TeV.
- 40 ACKERMANN 14 search for γ from X^0 annihilation in 25 dwarf spheroidal satellite galaxies of the Milky Way. See their Tables II-VII for limits assuming annihilation into e^+e^- , $\mu^+\mu^-$, $\tau^+\tau^-$, $u\bar{u}$, $b\bar{b}$, and W^+W^- , for X^0 mass ranging from 2 GeV to 10 TeV.
- 41 Limit assuming X^0 pair annihilation into $b\bar{b}$.
- 42 Limit assuming X^0 pair annihilation into W^+W^- .
- 43 ALEKSIC 14 search for γ from X^0 annihilation in the dwarf spheroidal galaxy Segue 1. The listed limit assumes annihilation into W^+W^- . See their Figs. 6, 7, and 16 for limits on $\sigma \cdot v$ for annihilation channels $\mu^+\mu^-$, $\tau^+\tau^-$, $b\bar{b}$, $t\bar{t}$, $\gamma\gamma$, γZ , W^+W^- , ZZ for X^0 mass between 10^2 and 10^4 GeV .
- 44 AARTSEN 13c search for neutrinos from X^0 annihilation in nearby galaxies and galaxy clusters. See their Figs. 5-7 for limits on $\sigma \cdot v$ for X^0 $X^0 \rightarrow \nu\bar{\nu}$, $\mu^+\mu^-$, $\tau^+\tau^-$, and W^+W^- for X^0 mass between 300 GeV and 100 TeV.
- 45 ABRAMOWSKI 13 search for monochromatic γ from X^0 annihilation in the Milky Way halo in the central region. Limit on $\sigma \cdot v$ between 10^{-28} and $10^{-25} \text{ cm}^3 \text{ s}^{-1}$ (95% CL) is obtained for X^0 mass between 500 GeV and 20 TeV for $X^0 X^0 \rightarrow \gamma\gamma$. X^0 density distribution in the Galaxy by Einasto is assumed. See their Fig. 4.
- 46 ACKERMANN 13A search for monochromatic γ from X^0 annihilation in the Milky Way. Limit on $\sigma \cdot v$ for the process $X^0 X^0 \rightarrow \gamma\gamma$ in the range 10^{-29} - $10^{-27} \text{ cm}^3 \text{ s}^{-1}$ (95% CL) is obtained for X^0 mass between 5 and 300 GeV. The limit depends slightly on the assumed density profile of X^0 in the Galaxy. See their Tables VII-X and Fig.10. Supersedes ACKERMANN 12.
- 47 ABRAMOWSKI 12 search for γ 's from X^0 annihilation in the Fornax galaxy cluster. See their Fig. 7 for limits on $\sigma \cdot v$ for X^0 mass between 0.1 and 100 TeV for the annihilation channels $\tau^+\tau^-$, $b\bar{b}$, and W^+W^- .
- 48 ACKERMANN 12 search for monochromatic γ from X^0 annihilation in the Milky Way. Limit on $\sigma \cdot v$ in the range 10^{-28} - $10^{-26} \text{ cm}^3 \text{ s}^{-1}$ (95% CL) is obtained for X^0 mass between 7 and 200 GeV if X^0 annihilates into $\gamma\gamma$. The limit depends slightly on the assumed density profile of X^0 in the Galaxy. See their Table III and Fig. 15.
- 49 ACKERMANN 12 search for γ from X^0 annihilation in the Milky Way in the diffuse γ background. Limit on $\sigma \cdot v$ of $10^{-24} \text{ cm}^3 \text{ s}^{-1}$ or larger is obtained for X^0 mass between 5 GeV and 10 TeV for various annihilation channels including W^+W^- , $b\bar{b}$, $g\bar{g}$, e^+e^- , $\mu^+\mu^-$, $\tau^+\tau^-$. The limit depends slightly on the assumed density profile of X^0 in the Galaxy. See their Figs. 17-20.
- 50 ALIU 12 search for γ 's from X^0 annihilation in the dwarf spheroidal galaxy Segue 1. Limit on $\sigma \cdot v$ in the range 10^{-24} - $10^{-20} \text{ cm}^3 \text{ s}^{-1}$ (95% CL) is obtained for X^0 mass between 10 GeV and 2 TeV for annihilation channels e^+e^- , $\mu^+\mu^-$, $\tau^+\tau^-$, $b\bar{b}$, and W^+W^- . See their Fig. 3.

- 51 ABBASI 11c search for $\nu\mu$ from X^0 annihilation in the outer halo of the Milky Way. The limit assumes annihilation into $\nu\nu$. See their Fig. 9 for limits with other annihilation channels.
- 52 ABRAMOWSKI 11 search for γ from X^0 annihilation near the Galactic center. The limit assumes Einasto DM density profile.
- 53 ACKERMANN 11 search for γ from X^0 annihilation in ten dwarf spheroidal satellite galaxies of the Milky Way. The limit for $m = 10 \text{ GeV}$ assumes annihilation into $b\bar{b}$, the others W^+W^- . See their Fig. 2 for limits with other final states. See also GERINGER-SAMETH 11 for a different analysis of the same data.

Dark Matter Particle (X^0) Production in Hadron Collisions

Searches for X^0 production in association with observable particles (γ , jets, ...) in high energy hadron collisions. If a specific form of effective interaction Lagrangian is assumed, the limits may be translated into limits on X^0 -nucleon scattering cross section.

- 1 AABOUD 19AA searches for BSM physics in more than 700 event classes with more than 10^5 regions at 13 TeV with 3.2 fb^{-1} ; no significant signal.
- 2 AABOUD 19AI searches for vector boson fusion $pp \rightarrow Hq\bar{q}$, $H \rightarrow$ invisible at 13 TeV with 36.1 fb^{-1} ; no signal: require $B(H \rightarrow \text{invisible}) < 0.37$ (0.28 expected).
- 3 AABOUD 19AL perform search in three different channels for $H \rightarrow \chi\chi$ at 7, 8 and 13 TeV; combined result $\text{BF}(H \rightarrow \text{invisible}) < 0.26$ (0.17 expected).
- 4 AABOUD 19Q search for single $t + \cancel{E}_T$ at 13 TeV with 36.1 fb^{-1} of data; no signal; limits set in σ or coupling vs. mass plane for simplified models.
- 5 AABOUD 19V review ATLAS results from 7, 8 and 13 TeV searches for mediator-based DM and DE scalar which couples to gravity; no signal: limits set for large variety of simplified models.
- 6 BANERJEE 19 search for dark photon via $eN \rightarrow eN + \cancel{E}$ in NA64; no signal, limits placed in kinetic mixing ϵ vs. $m(\text{DM})$ plane for $m(\chi) \sim 0.001\text{--}1 \text{ GeV}$.
- 7 SIRUNYAN 19AN search at 13 TeV with 35.9 fb^{-1} for $pp \rightarrow H\chi\chi \rightarrow b\bar{b}\cancel{E}_T$; no signal: limits set in the context of a 2HDM + pseudoscalar (a) model and a baryonic Z' model.
- 8 SIRUNYAN 19BC search for DM via LeptoQuark pair annihilation $LQ LQ \rightarrow \mu j\chi\chi \rightarrow \mu j \cancel{E}_T$ with 77.4 fb^{-1} , 13 TeV; no signal: limits placed in $m(\chi)$ vs. $m(LQ)$ plane. Model dependent limits on DM mass up to 600 GeV depending on $m(LQ)$ placed.
- 9 SIRUNYAN 19BO search for vector boson fusion $VV \rightarrow q\bar{q}H$ with $H \rightarrow \chi\chi$ at 13 TeV with 38.2 fb^{-1} ; no signal: limits placed for several models. Also search for $H \rightarrow$ invisible at 7, 8, and 13 TeV; no signal: limit placed on $\text{BF} < 0.19$.
- 10 SIRUNYAN 19C search for DM via $pp \rightarrow t\bar{t}\chi\chi$ at 13 TeV, 35.9 fb^{-1} ; no signal; limits placed on coupling vs. mediator mass for various simplified models.
- 11 SIRUNYAN 19O search for $pp \rightarrow \gamma$ at 13 TeV with 35.9 fb^{-1} ; no signal: limits placed on parameters of various models.
- 12 SIRUNYAN 19X search for $pp \rightarrow t\bar{t}\cancel{E}_T$ and $pp \rightarrow t \cancel{E}_T + \dots$ at 13 TeV with 35.9 fb^{-1} ; no signal: limits placed on χ production σ for various simplified models with $m(\chi) = 1 \text{ GeV}$.
- 13 AABOUD 18 search for $pp \rightarrow Z + \cancel{E}_T$ with $Z \rightarrow \ell\ell$ at 13 TeV with 36.1 fb^{-1} of data. Limits set for simplified models.
- 14 AABOUD 18A search for $pp \rightarrow t\bar{t}\cancel{E}_T$ or $pp \rightarrow b\bar{b}\cancel{E}_T$ at 13 TeV, 36.1 fb^{-1} of data. Limits set for simplified models.
- 15 AABOUD 18CA search for $pp \rightarrow V\chi\chi$ with $V \rightarrow jj$ at 13 TeV, 36.1 fb^{-1} ; no signal; limits set in $m(\text{DM})$ vs $m(\text{mediator})$ simplified model plane.
- 16 AABOUD 18I search for $pp \rightarrow j + \cancel{E}_T$ at 13 TeV with 36.1 fb^{-1} of data. Limits set for simplified models with pair-produced weakly interacting dark-matter candidates.
- 17 AGUILAR-AREVALO 18B search for WIMP production in MiniBooNE p beam dump; no signal; limits set for $m(\chi) \sim 5\text{--}50 \text{ MeV}$ in vector portal DM model.
- 18 KHACHATRYAN 18 search for $pp \rightarrow Z(\ell\ell) + \cancel{E}_T$; no signal; limits set on effective dark matter interactions and other exotic physics models.
- 19 SIRUNYAN 18BF search for $pp \rightarrow t \cancel{E}_T$ at 13 TeV and 36 fb^{-1} ; no signal; limits placed on DM models involving a flavor changing neutral current, scalar resonance decaying to top quark and DM.
- 20 SIRUNYAN 18BO search for high mass dijet resonances at 13 TeV and 36 fb^{-1} ; no signal: limits placed on various models, including simplified DM models involving a spin $= 1$ Z' mediator.
- 21 SIRUNYAN 18BV search for $pp \rightarrow Z \cancel{E}_T$ at 13 TeV; no signal, limits placed for various exotic physics models including DM.
- 22 SIRUNYAN 18C search for new physics in $pp \rightarrow$ final states with two oppositely charged leptons at 13 TeV with 35.9 fb^{-1} . Limits placed on $m(\text{mediator})$ and top squark for various simplified models.
- 23 SIRUNYAN 18CU search for $pp \rightarrow Z \cancel{E}_T$ at 13 TeV and 2.3 fb^{-1} ; no signal: limits placed for various exotic models including DM.
- 24 SIRUNYAN 18DH search for $pp \rightarrow \chi\chi h$; $h \rightarrow \gamma\gamma$ or $\tau\tau$ at 13 TeV, 35.9 fb^{-1} ; no signal; limits placed on massive boson mediator Z' in the context of $Z'+2\text{HDM}$ and baryonic Z' models. Limits also cast in terms of spin-independent WIMP-nucleon cross section for masses 1–200 GeV.
- 25 SIRUNYAN 18S search for $pp \rightarrow$ jets \cancel{E}_T at 13 TeV; no signal: limits placed on simplified dark matter models, on the branching ratio of the Higgs boson to invisible particles, and on several other exotic physics models including fermion portal DM.
- 26 AABOUD 17A search for $H \rightarrow b\bar{b} + \cancel{E}_T$. See Fig. 4b for limits set on VB mediator vs WIMP mass.
- 27 AABOUD 17AM search for $pp \rightarrow Z' \rightarrow Ah \rightarrow h(b\bar{b}) + \cancel{E}_T$ at 13 TeV. Limits set in $m(Z')$ vs. $m(A)$ plane and on the visible cross section of $h(b\bar{b}) + \cancel{E}_T$ events in bins of \cancel{E}_T .
- 28 AABOUD 17AQ search for WIMP in $pp \rightarrow h(\gamma\gamma) + \cancel{E}_T$ in 36.1 fb^{-1} of data. Limits on the visible cross section are also provided. Model dependent limits on spin independent DM - Nucleon cross-section are also presented, which are more stringent than those from direct searches for DM mass smaller than 2.5 GeV .
- 29 AABOUD 17BD search for $pp \rightarrow \text{jet}(s) + \cancel{E}_T$ at 13 TeV with 3.2 fb^{-1} of data. Limits set for simplified models. Observables corrected for detector effects can be used to constrain other models.
- 30 AABOUD 17R, for an axial vector mediator in the s-channel, excludes $m(\text{mediator}) < 750\text{--}1200 \text{ GeV}$ for $m(\text{DM}) < 230\text{--}480 \text{ GeV}$, depending on the couplings.
- 31 AGUILAR-AREVALO 17A search for DM produced in 8 GeV proton collisions with steel beam dump followed by DM-nucleon scattering in MiniBooNE detector. Limit placed on DM cross section parameter $Y < 2 \times 10^{-8}$ for $\alpha_D = 0.5$ and for $0.01 < m(\text{DM}) < 0.3 \text{ GeV}$.
- 32 BANERJEE 17 search for dark photon invisible decay via eN scattering; exclude $m(\gamma') < 100 \text{ MeV}$ as an explanation of $(g_{\mu-2})$ muon anomaly.
- 33 KHACHATRYAN 17A search for WIMPs in forward jets + \cancel{E}_T channel with 18.5 fb^{-1} at 8 TeV; limits set in effective theory model, Fig. 3.
- 34 KHACHATRYAN 17F search for $H \rightarrow$ invisibles in pp collisions at 7, 8, and 13 TeV; place limits on Higgs portal DM.
- 35 SIRUNYAN 17 search for $pp \rightarrow Z + \cancel{E}_T$ with 2.3 fb^{-1} at 13 TeV; no signal seen; limits placed on WIMPs and unparticles.
- 36 SIRUNYAN 17AP search for $pp \rightarrow Z' \rightarrow Ah \rightarrow h + \text{MET}$ with $h \rightarrow b\bar{b}$ or $\gamma\gamma$ and $A \rightarrow \chi\chi$ with 2.3 fb^{-1} at 13 TeV. Limits set in $m(Z')$ vs. $m(A)$ plane.
- 37 SIRUNYAN 17AQ search for $pp \rightarrow \gamma + \text{MET}$ at 13 TeV with 12.9 fb^{-1} . Limits derived for simplified DM models, effective electroweak-DM interaction and Extra Dimensions models.
- 38 SIRUNYAN 17BB search for WIMPs via $pp \rightarrow t\bar{t} + \cancel{E}_T$, $pp \rightarrow b\bar{b} + \cancel{E}_T$ at 13 TeV with 2.2 fb^{-1} . Limits derived for various simplified models.
- 39 SIRUNYAN 17G search for $pp \rightarrow j + \cancel{E}_T$ with 12.9 fb^{-1} at 13 TeV; limits placed on WIMP mass/mediators in DM simplified models.
- 40 SIRUNYAN 17U search for WIMPs/unparticles via $pp \rightarrow Z\chi\chi$, $Z \rightarrow \ell\bar{\ell}$ at 13 TeV with 2.3 fb^{-1} . Limits derived for various simplified models.
- 41 AABOUD 16AD place limits on VVX effective theory via search for hadronic W or Z plus WIMP pair production. See Fig. 5.
- 42 AAD 16AF search for $VV \rightarrow (H \rightarrow \text{WIMP pair}) +$ forward jets with 20.3 fb^{-1} at 8 TeV; set limits in Higgs portal model, Fig. 8.
- 43 AAD 16AG search for lepton jets with 20.3 fb^{-1} of data at 8 TeV; Fig. 13 excludes dark photons around 0.1–1 GeV for kinetic mixing $10^{-6}\text{--}10^{-2}$.
- 44 AAD 16M search with 20.3 fb^{-1} of data at 8 TeV pp collisions; limits placed on EFT model (Fig. 7) and simplified Z' model (Fig. 6).
- 45 KHACHATRYAN 16BZ search for jet(s) + \cancel{E}_T in 19.7 fb^{-1} at 8 TeV; limits set for variety of simplified models.
- 46 KHACHATRYAN 16CA search for WIMPs via jet(s) + \cancel{E}_T using razor variable; require mediator scale $> 1 \text{ TeV}$ for various effective theories.
- 47 KHACHATRYAN 16N search for $\gamma +$ WIMPs in 19.6 fb^{-1} at 8 TeV; limits set on SI and SD WIMP- p scattering in Fig. 3.
- 48 AAD 15AS search for events with one or more bottom quark and missing E_T , and also events with a top quark pair and missing E_T in pp collisions at $E_{\text{cm}} = 8 \text{ TeV}$ with $L = 20.3 \text{ fb}^{-1}$. See their Figs. 5 and 6 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}700 \text{ GeV}$.
- 49 AAD 15BH search for events with a jet and missing E_T in pp collisions at $E_{\text{cm}} = 8 \text{ TeV}$ with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 12 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}1200 \text{ GeV}$.
- 50 AAD 15CF search for events with a $H^0 (\rightarrow \gamma\gamma)$ and missing E_T in pp collisions at $E_{\text{cm}} = 8 \text{ TeV}$ with $L = 20.3 \text{ fb}^{-1}$. See paper for limits on the strength of some contact interactions containing X^0 and the Higgs fields.
- 51 AAD 15CS search for events with a photon and missing E_T in pp collisions at $E_{\text{cm}} = 8 \text{ TeV}$ with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 13 (see also erratum) for translated limits on X^0 -nucleon cross section for $m = 1\text{--}1000 \text{ GeV}$.
- 52 KHACHATRYAN 15AG search for events with a top quark pair and missing E_T in pp collisions at $E_{\text{cm}} = 8 \text{ TeV}$ with $L = 19.7 \text{ fb}^{-1}$. See their Fig. 8 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}200 \text{ GeV}$.
- 53 KHACHATRYAN 15AL search for events with a jet and missing E_T in pp collisions at $E_{\text{cm}} = 8 \text{ TeV}$ with $L = 19.7 \text{ fb}^{-1}$. See their Figs. 5 and Tables 4–6 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}1000 \text{ GeV}$.
- 54 KHACHATRYAN 15T search for events with a lepton and missing E_T in pp collisions at $E_{\text{cm}} = 8 \text{ TeV}$ with $L = 19.7 \text{ fb}^{-1}$. See their Fig. 17 for translated limits on X^0 -proton cross section for $m = 1\text{--}1000 \text{ GeV}$.
- 55 AAD 14AI search for events with a W and missing E_T in pp collisions at $E_{\text{cm}} = 8 \text{ TeV}$ with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 4 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}1500 \text{ GeV}$.
- 56 AAD 14BK search for hadronically decaying W , Z in association with \cancel{E}_T in 20.3 fb^{-1} at 8 TeV pp collisions. Fig. 5 presents exclusion results for SI and SD scattering cross section. In addition, cross section limits on the anomalous production of W or Z bosons with large missing transverse momentum are also set in two fiducial regions.
- 57 AAD 14K search for events with a Z and missing E_T in pp collisions at $E_{\text{cm}} = 8 \text{ TeV}$ with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 5 and 6 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}10^3 \text{ GeV}$.
- 58 AAD 14O search for ZH^0 production with H^0 decaying to invisible final states. See their Fig. 4 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}60 \text{ GeV}$ in Higgs-portal X^0 scenario.
- 59 AAD 13AD search for events with a jet and missing E_T in pp collisions at $E_{\text{cm}} = 7 \text{ TeV}$ with $L = 4.7 \text{ fb}^{-1}$. See their Figs. 5 and 6 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}1300 \text{ GeV}$.
- 60 AAD 13C search for events with a photon and missing E_T in pp collisions at $E_{\text{cm}} = 7 \text{ TeV}$ with $L = 4.6 \text{ fb}^{-1}$. See their Fig. 3 for translated limits on X^0 -nucleon cross section for $m = 1\text{--}1000 \text{ GeV}$.
- 61 AALTONEN 12K search for events with a top quark and missing E_T in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96 \text{ TeV}$ with $L = 7.7 \text{ fb}^{-1}$. Upper limits on $\sigma(tX^0)$ in the range 0.4–2 pb (95% CL) is given for $m_{X^0} = 0\text{--}150 \text{ GeV}$.
- 62 AALTONEN 12M search for events with a jet and missing E_T in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96 \text{ TeV}$ with $L = 6.7 \text{ fb}^{-1}$. Upper limits on the cross section in the range 2–10 pb (90% CL) is given for $m_{X^0} = 1\text{--}300 \text{ GeV}$. See their Fig. 2 for translated limits on X^0 -nucleon cross section.
- 63 CHATRCHYAN 12AP search for events with a jet and missing E_T in pp collisions at $E_{\text{cm}} = 7 \text{ TeV}$ with $L = 5.0 \text{ fb}^{-1}$. See their Fig. 4 for translated limits on X^0 -nucleon cross section for $m_{X^0} = 0.1\text{--}1000 \text{ GeV}$.
- 64 CHATRCHYAN 12T search for events with a photon and missing E_T in pp collisions at $E_{\text{cm}} = 7 \text{ TeV}$ with $L = 5.0 \text{ fb}^{-1}$. Upper limits on the cross section in the range 13–15 fb (90% CL) is given for $m_{X^0} = 1\text{--}1000 \text{ GeV}$. See their Fig. 2 for translated limits on X^0 -nucleon cross section.

- Limits on charged particles in e^+e^- collisions
- Limits on charged particles in hadron reactions
- Limits on charged particles in cosmic rays
- Searches for quantum black hole production

Note that searches appear in separate sections elsewhere for Higgs bosons (and technipions), other heavy bosons (including W_R, W', Z' , leptoquarks, axiglons), axions (including pseudo-Goldstone bosons, Majorons, familons), WIMPs, heavy leptons, heavy neutrinos, free quarks, monopoles, supersymmetric particles, and compositeness.

We no longer list for limits on tachyons and centauros. See our 1994 edition for these limits.

CONCENTRATION OF STABLE PARTICLES IN MATTER

Concentration of Heavy (Charge +1) Stable Particles in Matter

- • • We do not use the following data for averages, fits, limits, etc. • • •
- 1 YAMAGATA 93 used deep sea water at 4000 m since the concentration is enhanced in deep sea due to gravity.
- 2 VERKERK 92 looked for heavy isotopes in sea water and put a bound on concentration of stable charged massive particle in sea water. The above bound can be translated into into a bound on charged dark matter particle (5×10^6 GeV), assuming the local density, $\rho=0.3$ GeV/cm³, and the mean velocity (v)=300 km/s.
- 3 See HEMMICK 90 Fig. 7 for other masses 100-10000 m_p .

- 1 JAVORSEK 01 search for (neutral) SIMPs (strongly interacting massive particles) bound to Au nuclei. Here M is the effective SIMP mass.
- 2 JAVORSEK 01B search for (neutral) SIMPs (strongly interacting massive particles) bound to Au and Fe nuclei from various origins with exposures on the earth's surface, in a satellite, heavy ion collisions, etc. Here M is the mass of the anomalous nucleus. See also JAVORSEK 02.
- 3 See HEMMICK 90 Fig. 7 for other masses 100-10000 m_p .
- 4 Bound valid up to $m_{X^-} \sim 100$ TeV.

Other Particle Searches

OMITTED FROM SUMMARY TABLE
OTHER PARTICLE SEARCHES

Revised February 2018 by K. Hikasa (Tohoku University).

We collect here those searches which do not appear in any other search categories. These are listed in the following order:

- Concentration of stable particles in matter
- General new physics searches
- Limits on jet-jet resonance in hadron collisions
- Limits on neutral particle production at accelerators

Searches Particle Listings

Other Particle Searches

GENERAL NEW PHYSICS SEARCHES

This subsection lists some of the search experiments which look for general signatures characteristic of new physics, independent of the framework of a specific model.

The observed events are compatible with Standard Model expectation, unless noted otherwise.

VALUE	DOCUMENT ID	TECN	COMMENT

18	CHATRCHYAN 11C	CMS	$\ell^+\ell^- + \text{jets} + \cancel{E}_T$
19	CHATRCHYAN 11U	CMS	jet + \cancel{E}_T
20	AALTONEN 10AF	CDF	$\gamma\gamma + \ell, \cancel{E}_T$
21	AALTONEN 09AF	CDF	$\ell\gamma b \cancel{E}_T$
22	AALTONEN 09G	CDF	$\ell\ell\ell \cancel{E}_T$

1 SIRUNYAN 20A search for SUSY and LQ production using mT2 or presence of long-lived charged particle; no signal, limits placed in various mass planes for different BSM scenarios and various assumed lifetimes.

2 ALCANTARA 19 place limits on $m(\text{WIMPZilla}=X)$ vs lifetime from upper bound on ultra high energy cosmic rays at Auger experiment: e.g. $\tau(X) < 4 \times 10^{22}$ yr for $m(X) = 10^{16}$ GeV.

3 PORAYKO 18 search for deviations in the residuals of pulsar timing data using PPTA. No signal observed. Limits set on fuzzy DM with $3 \times 10^{-24} < m(\text{DM}) < 2 \times 10^{-22}$ eV.

4 AAD 15AT search for events with a top quark and missing E_T in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$.

5 KHACHATRYAN 15F search for events with a top quark and missing E_T in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 19.7 \text{ fb}^{-1}$.

6 AALTONEN 14J examine events with a W and two jets in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 8.9 \text{ fb}^{-1}$. Invariant mass distributions of the two jets are consistent with the Standard Model expectation.

7 AAD 13A search for resonant WW production in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.7 \text{ fb}^{-1}$.

8 AAD 13C search for events with a photon and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.6 \text{ fb}^{-1}$.

9 AALTONEN 13I search for events with a photon and missing E_T , where the photon is detected after the expected timing, in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 6.3 \text{ fb}^{-1}$. The data are consistent with the Standard Model expectation.

10 CHATRCHYAN 13 search for events with an opposite-sign lepton pair, jets, and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.98 \text{ fb}^{-1}$.

11 AAD 12C search for events with a $t\bar{t}$ pair and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 1.04 \text{ fb}^{-1}$.

12 AALTONEN 12M search for events with a jet and missing E_T in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 6.7 \text{ fb}^{-1}$.

13 CHATRCHYAN 12AP search for events with a jet and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 5.0 \text{ fb}^{-1}$.

14 CHATRCHYAN 12Q search for events with a Z , jets, and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.98 \text{ fb}^{-1}$.

15 CHATRCHYAN 12T search for events with a photon and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 5.0 \text{ fb}^{-1}$.

16 AAD 11S search for events with one jet and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 33 \text{ pb}^{-1}$.

17 AALTONEN 11AF search for high- p_T like-sign dileptons in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 6.1 \text{ fb}^{-1}$.

18 CHATRCHYAN 11C search for events with an opposite-sign lepton pair, jets, and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 34 \text{ pb}^{-1}$.

19 CHATRCHYAN 11U search for events with one jet and missing E_T in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 36 \text{ pb}^{-1}$.

20 AALTONEN 10AF search for $\gamma\gamma$ events with e, μ, τ , or missing E_T in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 1.1\text{--}2.0 \text{ fb}^{-1}$.

21 AALTONEN 09AF search for $\ell\gamma b$ events with missing E_T in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 1.9 \text{ fb}^{-1}$. The observed events are compatible with Standard Model expectation including $t\bar{t}\gamma$ production.

22 AALTONEN 09G search for $\mu\mu\mu$ and $\mu\mu e$ events with missing E_T in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 976 \text{ pb}^{-1}$.

LIMITS ON JET-JET RESONANCES

Heavy Particle Production Cross Section

Limits are for a particle decaying to two hadronic jets.

1 AABOUD 19AJ search for low mass dijet resonance in $pp \rightarrow \gamma X, X \rightarrow jj$ at 13 TeV with 79.8 fb^{-1} of data; no signal found; limits placed on Z' model in coupling vs. $m(Z')$ plane.

2 SIRUNYAN 19B search for low mass resonance $pp \rightarrow jA, A \rightarrow b\bar{b}$ at 13 TeV using 35.9 fb^{-1} ; no signal; exclude resonances 50–350 GeV depending on production and decay.

3 SIRUNYAN 19CD search for $pp \rightarrow Z'\gamma, Z' \rightarrow jj$ with fat jet (jj); no signal, limits placed in $m(Z')$ vs. coupling plane for Z' masses from 10 to 125 GeV.

4 AABOUD 18AD search for new heavy particle $Y \rightarrow HX \rightarrow (bb) + (qq)$. No signal observed. Limits set on $m(Y)$ vs. $m(X)$ in the ranges of $m(Y)$ in 1–4 TeV and $m(X)$ in 50–1000 GeV.

5 AABOUD 18CK search for SUSY Higgsinos in gauge-mediation via $pp \rightarrow bbb + \cancel{E}_T$ at 13 TeV using two complementary analyses with 24.3/36.1 fb^{-1} ; no signal is found and Higgsinos with masses between 130 and 230 GeV and between 290 and 880 GeV are excluded at the 95% confidence level.

6 AABOUD 18CL search for $pp \rightarrow$ vector-like quarks \rightarrow jets at 13 TeV with 36 fb^{-1} ; no signal seen; limits set on various VLQ scenarios. For pure $B \rightarrow Hb$ or $T \rightarrow Ht$, set the mass limit $m > 1010$ GeV.

7 AABOUD 18N search for dijet resonance at Atlas with 13 TeV and 29.3 fb^{-1} ; limits set on $m(Z')$ in the mass range of 450–1800 GeV.

8 SIRUNYAN 18DJ search for $pp \rightarrow ZZ$ or $WZ \rightarrow \ell\bar{\ell}jj$ resonance at 13 TeV, 35.9 fb^{-1} ; no signal; limits set in the 400–4500 GeV mass range, exclusion of W' up to 2270 GeV in the HVT model A, and up to 2330 GeV for HVT model B. WED bulk graviton exclusion up to 925 GeV.

9 SIRUNYAN 18DY search for $pp \rightarrow RR; R \rightarrow jj$ two dijet resonances at 13 TeV 35.9 fb^{-1} ; no signal; limits placed on RPV top-squark pair production.

10 KHACHATRYAN 17W search for dijet resonance in 12.9 fb^{-1} data at 13 TeV; see Fig. 2 for limits on axiguons, diquarks, dark matter mediators etc.

11 KHACHATRYAN 17Y search for $pp \rightarrow (8\text{--}10) j$ in 19.7 fb^{-1} at 8 TeV. No signal seen. Limits set on colorons, axiguons, RPV, and SUSY.

12 SIRUNYAN 17F measure $pp \rightarrow jj$ angular distribution in 2.6 fb^{-1} at 13 TeV; limits set on LEDs and quantum black holes.

13 AABOUD 16 search for resonant dijets including one or two b -jets with 3.2 fb^{-1} at 13 TeV; exclude excited b^* quark from 1.1–2.1 TeV; exclude leptophilic Z' with SM couplings from 1.1–1.5 TeV.

14 AAD 16N search for ≥ 3 jets with 3.6 fb^{-1} at 13 TeV; limits placed on micro black holes (Fig. 10) and string balls (Fig. 11).

15 AAD 16S search for high mass jet-jet resonance with 3.6 fb^{-1} at 13 TeV; exclude portions of excited quarks, W', Z' and contact interaction parameter space.

16 KHACHATRYAN 16K search for dijet resonance in 2.4 fb^{-1} data at 13 TeV; see Fig. 3 for limits on axiguons, diquarks etc.

17 KHACHATRYAN 16L use data scouting technique to search for jj resonance on 18.8 fb^{-1} of data at 8 TeV. Limits on the coupling of a leptophobic Z' to quarks are set, improving on the results by other experiments in the mass range between 500–800 GeV.

18 AAD 13D search for dijet resonances in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.8 \text{ fb}^{-1}$. The observed events are compatible with Standard Model expectation. See their Fig. 6 and Table 2 for limits on resonance cross section in the range $m = 1.0\text{--}4.0$ TeV.

19 AALTONEN 13R search for production of a pair of jet-jet resonances in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 6.6 \text{ fb}^{-1}$. See their Fig. 5 and Tables 1, II for cross section limits.

See key on page 999

Searches Particle Listings

Other Particle Searches

- 20 CHATRCHYAN 13A search for qq , qg , and gg resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 4.8 \text{ fb}^{-1}$. See their Fig. 3 and Table 1 for limits on resonance cross section in the range $m = 1.0\text{--}4.3$ TeV.
- 21 CHATRCHYAN 13A search for $b\bar{b}$ resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 4.8 \text{ fb}^{-1}$. See their Fig. 8 and Table 4 for limits on resonance cross section in the range $m = 1.0\text{--}4.0$ TeV.
- 22 AAD 12s search for dijet resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 1.0 \text{ fb}^{-1}$. See their Fig. 3 and Table 2 for limits on resonance cross section in the range $m = 0.9\text{--}4.0$ TeV.
- 23 CHATRCHYAN 12BL search for $t\bar{t}$ resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 4.4 \text{ fb}^{-1}$. See their Fig. 4 for limits on resonance cross section in the range $m = 0.5\text{--}3.0$ TeV.
- 24 AAD 11AG search for dijet resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 36 \text{ pb}^{-1}$. Limits on number of events for $m = 0.6\text{--}4$ TeV are given in their Table 3.
- 25 AALTONEN 11M find a peak in two jet invariant mass distribution around 140 GeV in $W + 2$ jet events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 4.3 \text{ fb}^{-1}$.
- 26 ABAZOV 11i search for two-jet resonances in $W + 2$ jet events in $p\bar{p}$ collisions at $E_{cm} = 1.96$ TeV with $L = 4.3 \text{ fb}^{-1}$ and give limits $\sigma < (2.6\text{--}1.3) \text{ pb}$ (95% CL) for $m = 110\text{--}170$ GeV. The result is incompatible with AALTONEN 11M.
- 27 AAD 10 search for narrow dijet resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 315 \text{ nb}^{-1}$. Limits on the cross section in the range $10\text{--}10^3 \text{ pb}$ is given for $m = 0.3\text{--}1.7$ TeV.
- 28 KHACHATRYAN 10 search for narrow dijet resonances in pp collisions at $E_{cm} = 7$ TeV with $L = 2.9 \text{ pb}^{-1}$. Limits on the cross section in the range $1\text{--}300 \text{ pb}$ is given for $m = 0.5\text{--}2.6$ TeV separately in the final states qq , qg , and gg .
- 29 ABE 99F search for narrow $b\bar{b}$ resonances in $p\bar{p}$ collisions at $E_{cm} = 1.8$ TeV. Limits on $\sigma(p\bar{p} \rightarrow X + \text{anything}) \times B(X \rightarrow b\bar{b})$ in the range $3\text{--}10^3 \text{ pb}$ (95% CL) are given for $m_X = 200\text{--}750$ GeV. See their Table I.
- 30 ABE 97G search for narrow dijet resonances in $p\bar{p}$ collisions with 106 pb^{-1} of data at $E_{cm} = 1.8$ TeV. Limits on $\sigma(p\bar{p} \rightarrow X + \text{anything}) \times B(X \rightarrow jj)$ in the range $10^4\text{--}10^{-1} \text{ pb}$ (95% CL) are given for dijet mass $m = 200\text{--}1150$ GeV with both jets having $|\eta| < 2.0$ and the dijet system having $|\cos\theta^*| < 0.67$. See their Table I for the list of limits. Supersedes ABE 93c.
- 31 ABE 93c give cross section times branching ratio into light (d, u, s, c, b) quarks for $\Gamma = 0.02 M$. Their Table II gives limits for $M = 200\text{--}900$ GeV and $\Gamma = (0.02\text{--}0.2) M$.

- 1 AABOUD 19H searches for di-photon-jet resonance at 13 TeV and 36.7 fb^{-1} of data; no signal found and limits placed on $\sigma \cdot \text{BR}$ vs. mass plane for various simplified models.
- 2 AABOUD 19V review ATLAS searches for mediator-based DM at 7, 8, and 13 TeV with up to 37 fb^{-1} of data; no signal found and limits set for wide variety of simplified models of dark matter.
- 3 SIRUNYAN 19O search for $pp \rightarrow \gamma E_T$ at 13 TeV with 36.1 fb^{-1} ; no signal found and limits set for various simplified models.
- 4 AABOUD 18CJ make multichannel search for $pp \rightarrow VV/\ell\ell/\ell\nu, V = W, Z, h$ at 13 TeV, 36.1 fb^{-1} ; no signal found; limits placed for several BSM models.
- 5 AABOUD 18CM search for lepton-flavor violating resonance in $pp \rightarrow e\mu/e\tau/\mu\tau$ at 13 TeV, 36.1 fb^{-1} ; no signal is found and limits placed for various BSM models.
- 6 AAIJ 18AJ search for prompt and delayed dark photon decay $A' \rightarrow \mu^+\mu^-$ at LHCb detector using 1.6 fb^{-1} of pp collisions at 13 TeV; limits on $m(A')$ vs. kinetic mixing are set.
- 7 BANERJEE 18 search for dark photon $A'/16.7$ MeV boson X at NA64 via $eZ \rightarrow eZX(A')$; no signal found and limits set on the $X\text{--}e^-$ coupling e_e in the range $1.3 \times 10^{-4} \leq e_e \leq 4.2 \times 10^{-4}$ excluding part of the allowed parameter space.
- 8 BANERJEE 18A search for invisibly decaying dark photons in $eZ \rightarrow eZA', A' \rightarrow$ invisible; no signal found and limits set on mixing for $m(A') < 1$ GeV.
- 9 MARSICANO 18 search for dark photon $e^+e^- \rightarrow A'(\gamma)$ visible decay in SLAC E137 e beam dump data. No signal observed and limits set in e coupling vs $m(A')$ plane, see their figure 7.
- 10 SIRUNYAN 18BB search for high mass dilepton resonance; no signal found and exclude portions of p -space of Z', KK graviton models.
- 11 SIRUNYAN 18DA search for $pp \rightarrow$ Black Hole, string ball, sphaleron via high multiplicity events at 13 TeV, 35.9 fb^{-1} ; no signal, require e.g. $m(\text{BH}) > 10.1$ TeV.
- 12 SIRUNYAN 18DD search for $pp \rightarrow jj$ deviations in dijet angular distribution. No signal observed. Set limits on large extra dimensions, black holes and DM mediators e.g. $m(\text{BH}) > 5.9\text{--}8.2$ TeV.
- 13 SIRUNYAN 18DR search for dimuon resonance in $pp \rightarrow b\mu\bar{\mu}$ at 8 and 13 TeV. Slight excess seen at $m(\mu\bar{\mu}) \sim 28$ GeV in some channels.
- 14 SIRUNYAN 18DU search for high mass diphoton resonance in $pp \rightarrow \gamma\gamma$ at 13 TeV using 35.9 fb^{-1} ; no signal; limits placed on RS Graviton, LED, and clockwork.
- 15 SIRUNYAN 18ED search for $pp \rightarrow V \rightarrow Wh; h \rightarrow b\bar{b}; W \rightarrow \ell\nu$ at 13 TeV with 35.9 fb^{-1} ; no signal; limits set on $m(W')$ > 2.9 TeV.
- 16 AABOUD 17B exclude $m(W', Z') < 1.49\text{--}2.31$ TeV depending on the couplings and W'/Z' degeneracy assumptions via WH, ZH search in pp collisions at 13 TeV with 3.2 fb^{-1} of data.
- 17 AAIJ 17BR search for long-lived hidden valley pions from Higgs decay. Limits are set on the signal strength as a function of the mass and lifetime of the long-lived particle in their Fig. 4 and Tab. 4.
- 18 AAD 16O search for high $E_T \ell + (\ell s \text{ or jets})$ with 3.2 fb^{-1} at 13 TeV; exclude micro black holes mass < 8 TeV (Fig. 3) for models with two extra dimensions.
- 19 AAD 16R search for WW, WZ, ZZ resonance in 20.3 fb^{-1} at 8 TeV data; limits placed on massive RS graviton (Fig. 4).
- 20 KRASZNAHORKAY 16 report $p\text{Li} \rightarrow \text{Be} \rightarrow e\bar{e}N 5\sigma$ resonance at 16.7 MeV— possible evidence for nuclear interference or new light boson. However, such nuclear interference was ruled out already by ZANG 17.
- 21 LEES 15E search for long-lived neutral particles produced in e^+e^- collisions in the Upsilon region, which decays into $e^+e^-, \mu^+\mu^-, e^+\mu^{\mp}, \pi^+\pi^-, K^+K^-, \text{ or } \pi^{\pm}K^{\mp}$. See their Fig. 2 for cross section limits.
- 22 ADAMS 97B search for a hadron-like neutral particle produced in pN interactions, which decays into a p^0 and a weakly interacting massive particle. Upper limits are given for the ratio to K_S production for the mass range 1.2–5 GeV and lifetime $10^{-9}\text{--}10^{-4}$ s. See also our Light Gluino Section.
- 23 GALLAS 95 limit is for a weakly interacting neutral particle produced in 800 GeV/c pN interactions decaying with a lifetime of $10^{-4}\text{--}10^{-8}$ s. See their Figs. 8 and 9. Similar limits are obtained for a stable particle with interaction cross section $10\text{--}29\text{--}10^{-33} \text{ cm}^2$. See Fig. 10.
- 24 AKESSON 91 limit is from weakly interacting neutral long-lived particles produced in pN reaction at 450 GeV/c performed at CERN SPS. Bourquin-Gaillard formula is used as the production model. The above limit is for $\tau > 10^{-7}$ s. For $\tau > 10^{-9}$ s, $\sigma < 10^{-30} \text{ cm}^2/\text{nucleon}$ is obtained.
- 25 BADIER 86 looked for long-lived particles at 300 GeV π^- beam dump. The limit applies for nonstrongly interacting neutral or charged particles with mass > 2 GeV. The limit applies for particle modes, $\mu^+\pi^-, \mu^+\mu^-, \pi^+\pi^-, \pi^+\pi^0, \pi^+\pi^-\pi^0, \text{ or } \pi^+\pi^-\pi^{\pm}$ etc. See their figure 5 for the contours of limits in the mass- τ plane for each mode.

² ABLIKIM 17AA search for dark photon $A \rightarrow \ell\bar{\ell}$ at 3.773 GeV with 2.93 fb⁻¹. Limits are set in ϵ vs $m(A)$ plane.

³ ACKERSTAFF 98P search for pair production of long-lived charged particles at E_{cm} between 130 and 183 GeV and give limits $\sigma < (0.05-0.2)$ pb (95%CL) for spin-0 and spin-1/2 particles with $m=45-89.5$ GeV, charge 1 and 2/3. The limit is translated to the cross section at $E_{\text{cm}}=183$ GeV with the s dependence described in the paper. See their Figs. 2-4.

⁴ ABREU 97D search for pair production of long-lived particles and give limits $\sigma < (0.4-2.3)$ pb (95%CL) for various center-of-mass energies $E_{\text{cm}}=130-136, 161,$ and 172 GeV, assuming an almost flat production distribution in $\cos\theta$.

⁵ BARATE 97K search for pair production of long-lived charged particles at $E_{\text{cm}} = 130, 136, 161,$ and 172 GeV and give limits $\sigma < (0.2-0.4)$ pb (95%CL) for spin-0 and spin-1/2 particles with $m=45-85$ GeV. The limit is translated to the cross section at $E_{\text{cm}}=172$ GeV with the E_{cm} dependence described in the paper. See their Figs. 2 and 3 for limits on $J = 1/2$ and $J = 0$ cases.

⁶ AKERS 95R is a CERN-LEP experiment with $W_{\text{cm}} \sim m_Z$. The limit is for the production of a stable particle in multihadron events normalized to $\sigma(e^+e^- \rightarrow \text{hadrons})$. Constant phase space distribution is assumed. See their Fig. 3 for bounds for $Q = \pm 2/3, \pm 4/3$.

⁷ BUSKULIC 93C is a CERN-LEP experiment with $W_{\text{cm}} = m_Z$. The limit is for a pair or single production of heavy particles with unusual ionization loss in TPC. See their Fig. 5 and Table 1.

⁸ ADACHI 90C is a KEK-TRISTAN experiment with $W_{\text{cm}} = 52-60$ GeV. The limit is for pair production of a scalar or spin-1/2 particle. See Figs. 3 and 4.

⁹ ADACHI 90E is KEK-TRISTAN experiment with $W_{\text{cm}} = 52-61.4$ GeV. The above limit is for inclusive production cross section normalized to $\sigma(e^+e^- \rightarrow \mu^+\mu^-) \cdot \beta(3-\beta^2)/2$, where $\beta = (1 - 4m^2/W_{\text{cm}}^2)^{1/2}$. See the paper for the assumption about the production mechanism.

¹⁰ KINOSHITA 82 is SLAC PEP experiment at $W_{\text{cm}} = 29$ GeV using lexan and ³⁹Cr plastic sheets sensitive to highly ionizing particles.

¹¹ BARTEL 80 is DESY-PETRA experiment with $W_{\text{cm}} = 27-35$ GeV. Above limit is for inclusive pair production and ranges between $1. \times 10^{-1}$ and $1. \times 10^{-2}$ depending on mass and production momentum distributions. (See their figures 9, 10, 11).

Branching Fraction of Z^0 to a Pair of Stable Charged Heavy Fermions

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •				
$<5 \times 10^{-6}$	95	¹ AKERS	95R	OPAL $m = 40.4-45.6$ GeV
$<1 \times 10^{-3}$	95	AKRAWY	90O	OPAL $m = 29-40$ GeV

¹ AKERS 95R give the 95% CL limit $\sigma(X\bar{X})/\sigma(\mu\mu) < 1.8 \times 10^{-4}$ for the pair production of singly- or doubly-charged stable particles. The limit applies for the mass range 40.4-45.6 GeV for X^\pm and < 45.6 GeV for $X^{\pm\pm}$. See the paper for bounds for $Q = \pm 2/3, \pm 4/3$.

LIMITS ON CHARGED PARTICLES IN HADRONIC REACTIONS

MASS LIMITS for Long-Lived Charged Heavy Fermions

Limits are for spin 1/2 particles with no color and $SU(2)_L$ charge. The electric charge Q of the particle (in the unit of e) is therefore equal to its weak hypercharge. Pair production by Drell-Yan like γ and Z exchange is assumed to derive the limits.

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •				
>660	95	¹ AAD	15BJ	ATLS $ Q = 2$

¹ AABOUD 19AA search for BSM physics at 13 TeV with 3.2 fb⁻¹ in $> 10^5$ regions of > 700 event classes; no significant signal found.

² AABOUD 19Q search for single top+MET events at 13 TeV with 36.1 fb⁻¹ of data; no signal found and limits set in σ or coupling vs. mass plane for variety of simplified models including DM and vector-like top quark T .

³ AABOUD 17D search for $WWjj, WZjj$ in pp collisions at 8 TeV with 3.2 fb⁻¹; set limits on anomalous couplings.

⁴ AABOUD 17L search for the pair production of heavy vector-like T quarks in the $Z(\rightarrow \nu\nu) tX$ final state.

⁵ SIRUNYAN 17B search for vector-like quark $pp \rightarrow TX \rightarrow tHX$ in 2.3 fb⁻¹ at 13 TeV; no signal seen; limits placed.

⁶ SIRUNYAN 17C search for vector-like quark $pp \rightarrow TX \rightarrow Z + (t \text{ or } b)$ in 2.3 fb⁻¹ at 13 TeV; no signal seen; limits placed.

⁷ SIRUNYAN 17J search for $pp \rightarrow X_{5/3} X_{5/3} \rightarrow tWtW$ with 2.3 fb⁻¹ at 13 TeV. No signal seen: $m(X) > 1020$ (990) GeV for RH (LH) new charge 5/3 quark.

⁸ AAIJ 15BD search for production of long-lived particles in pp collisions at $E_{\text{cm}} = 7$ and 8 TeV. See their Table 6 for cross section limits.

⁹ AAD 13AH search for production of long-lived particles with $|q|=(2-6)e$ in pp collisions at $E_{\text{cm}} = 7$ TeV with 4.4 fb⁻¹. See their Fig. 8 for cross section limits.

¹⁰ AAD 11I search for production of highly ionizing massive particles in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 3.1$ pb⁻¹. See their Table 5 for similar limits for $|q| = 6e$ and 17e, Table 6 for limits on pair production cross section.

¹¹ AALTONEN 09Z search for long-lived charged particles in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 1.0$ fb⁻¹. The limits are on production cross section for a particle of mass above 100 GeV in the region $|\eta| \lesssim 0.7, p_T > 40$ GeV, and $0.4 < \beta < 1.0$.

¹² Limit for weakly interacting charge-1 particle.

¹³ Limit for up-quark like particle.

¹⁴ ABAZOV 09M search for pair production of long-lived charged particles in $p\bar{p}$ collisions at $E_{\text{cm}} = 1.96$ TeV with $L = 1.1$ fb⁻¹. Limit on the cross section of $(0.31-0.04)$ pb (95% CL) is given for the mass range of 60-300 GeV, assuming the kinematics of stau pair production.

¹⁵ AKTAS 04c look for charged particle photoproduction at HERA with mean c.m. energy of 200 GeV.

¹⁶ ABE 92J look for pair production of unit-charged particles which leave detector before decaying. Limit shown here is for $m=50$ GeV. See their Fig. 5 for different charges and stronger limits for higher mass.

¹⁷ CARROLL 78 look for neutral, $S = -2$ dihyperon resonance in $pp \rightarrow 2K^+X$. Cross section varies within above limits over mass range and $p_{\text{lab}} = 5.1-5.9$ GeV/c.

¹⁸ LEIPUNER 73 is an NAL 300 GeV p experiment. Would have detected particles with lifetime greater than 200 ns.

- ¹ BALDIN 76 is a 70 GeV Serpukhov experiment. Value is per Al nucleus at $\theta = 0$. For other charges in range -0.5 to -3.0 , CL = 90% limit is $(2.6 \times 10^{-36})/|(charge)|$ for mass range $(2.1-9.4 \text{ GeV}) \times |(charge)|$. Assumes stable particle interacting with matter as do antiprotons.
- ² ALBROW 75 is a CERN ISR experiment with $E_{cm} = 53 \text{ GeV}$. $\theta = 40 \text{ mr}$. See figure 5 for mass ranges up to 35 GeV.
- ³ JOVANOVIICH 75 is a CERN ISR 26+26 and 15+15 GeV pp experiment. Figure 4 covers ranges $Q = 1/3$ to 2 and $m = 3$ to 26 GeV. Value is per GeV momentum.
- ⁴ APPEL 74 is NAL 300 GeV pW experiment. Studies forward production of heavy (up to 24 GeV) charged particles with momenta 24-200 GeV ($-$ charge) and 40-150 GeV ($+$ charge). Above typical value is for 75 GeV and is per GeV momentum per nucleon.
- ⁵ ALPER 73 is CERN ISR 26+26 GeV p experiment. $p > 0.9 \text{ GeV}$, $0.2 < \beta < 0.65$.
- ⁶ ANTIPOV 71B is from same 70 GeV p experiment as ANTIPOV 71C and BINON 69.
- ⁷ ANTIPOV 71C limit inferred from flux ratio. 70 GeV p experiment.
- ⁸ DORFAN 65 is a 30 GeV/c p experiment at BNL. Units are per GeV momentum per nucleus.

Long-Lived Heavy Particle Invariant Cross Section

Searches Particle Listings

Other Particle Searches

- 1 ALVIS 18 search for fractional charged flux of cosmic matter at Majorana demonstrator; no signal observed and limits are set on the flux of lightly ionizing particles for charge as low as $e/1000$.
- 2 See AGNESE 15 Fig. 6 for limits extending down to $Q = 1/200$.
- 3 SAITO 90 candidates carry about 450 MeV/nucleon. Cannot be accounted for by conventional backgrounds. Consistent with strange quark matter hypothesis.
- 4 MINCER 85 is high statistics study of calorimeter signals delayed by 20–200 ns. Calibration with AGS beam shows they can be accounted for by rare fluctuations in signals from low-energy hadrons in the shower. Claim that previous delayed signals including BJORNBOE 68, DARDO 72, BHAT 82, SAKUYAMA 83b below may be due to this fake effect.
- 5 SAKUYAMA 83b analyzed 6000 extended air shower events. Increase of delayed particles and change of lateral distribution above 10^{17} eV may indicate production of very heavy parent at top of atmosphere.
- 6 BHAT 82 observed 12 events with delay $> 2 \times 10^{-8}$ s and with more than 40 particles. 1 eV has good hadron shower. However all events are delayed in only one of two detectors in cloud chamber, and could not be due to strongly interacting massive particle.
- 7 MARINI 82 applied PEP-counter for TOF. Above limit is for velocity $= 0.54$ of light. Limit is inconsistent with YOCK 80 YOCK 81 events if isotropic dependence on zenith angle is assumed.
- 8 YOCK 81 saw another 3 events with $Q = \pm 1$ and m about $4.5 m_p$ as well as 2 events with $m > 5.3 m_p$, $Q = \pm 0.75 \pm 0.05$ and $m > 2.8 m_p$, $Q = \pm 0.70 \pm 0.05$ and 1 event with $m = (9.3 \pm 3.) m_p$, $Q = \pm 0.89 \pm 0.06$ as possible heavy candidates.
- 9 YOCK 80 events are with charge exactly or approximately equal to unity.
- 10 BHAT 78 is at Kolar gold fields. Limit is for $\tau > 10^{-6}$ s.
- 11 YOCK 74 events could be tritons.

- 1 ADRIANI 15 search for relatively light quark matter with charge $Z = 1-8$. See their Figs. 2 and 3 for flux upper limits.
- 2 AMBROSIO 00B searched for quark matter ("nuclearites") in the velocity range $(10^{-5}-1)$ c. The listed limit is for 2×10^{-3} c.
- 3 ASTONE 93 searched for quark matter ("nuclearites") in the velocity range $(10^{-3}-1)$ c. Their Table 1 gives a compilation of searches for nuclearites.
- 4 AHLEN 92 searched for quark matter ("nuclearites"). The bound applies to velocity $< 2.5 \times 10^{-3}$ c. See their Fig. 3 for other velocity/c and heavier mass range.
- 5 NAKAMURA 91 searched for quark matter in the velocity range $(4 \times 10^{-5}-1)$ c.
- 6 ORITO 91 searched for quark matter. The limit is for the velocity range $(10^{-4}-10^{-3})$ c.
- 7 LIU 88 searched for quark matter ("nuclearites") in the velocity range $(2.5 \times 10^{-3}-1)$ c. A less stringent limit of 5.8×10^{-11} applies for $(1-2.5) \times 10^{-3}$ c.
- 8 BARISH 87 searched for quark matter ("nuclearites") in the velocity range $(2.7 \times 10^{-4}-5 \times 10^{-3})$ c.
- 9 NAKAMURA 85 at KEK searched for quark-matter. These might be lumps of strange quark matter with roughly equal numbers of u , d , s quarks. These lumps or nuclearites were assumed to have velocity of $(10^{-4}-10^{-3})$ c.
- 10 ULLMAN 81 is sensitive for heavy slow singly charge particle reaching earth with vertical velocity 100–350 km/s.

- 1 AABOUD 16P set limits on quantum BH production in $n = 6$ ADD or $n = 1$ RS models.
- 2 AAD 15AN search for black hole or string ball formation followed by its decay to multijet final states, in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Figs. 6–8 for limits.

- 3 AAD 14A search for quantum black hole formation followed by its decay to a γ and a jet, in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20 \text{ fb}^{-1}$. See their Fig. 3 for limits.
- 4 AAD 14AL search for quantum black hole formation followed by its decay to a lepton and a jet, in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Fig. 2 for limits.
- 5 AAD 14C search for microscopic (semiclassical) black hole formation followed by its decay to final states with a lepton and ≥ 2 (leptons or jets), in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 20.3 \text{ fb}^{-1}$. See their Figures 8–11, Tables 7, 8 for limits.
- 6 AAD 13D search for quantum black hole formation followed by its decay to two jets, in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.8 \text{ fb}^{-1}$. See their Fig. 8 and Table 3 for limits.
- 7 CHATRCHYAN 13A search for quantum black hole formation followed by its decay to two jets, in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 5 \text{ fb}^{-1}$. See their Figs. 5 and 6 for limits.
- 8 CHATRCHYAN 13AD search for microscopic (semiclassical) black hole formation followed by its evaporation to multiparticle final states, in multijet (including γ, ℓ) events in pp collisions at $E_{\text{cm}} = 8$ TeV with $L = 12 \text{ fb}^{-1}$. See their Figs. 5–7 for limits.
- 9 AAD 12AK search for microscopic (semiclassical) black hole formation followed by its decay to final states with a lepton and ≥ 2 (leptons or jets), in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 1.04 \text{ fb}^{-1}$. See their Fig. 4 and 5 for limits.
- 10 CHATRCHYAN 12W search for microscopic (semiclassical) black hole formation followed by its evaporation to multiparticle final states, in multijet (including γ, ℓ) events in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 4.7 \text{ fb}^{-1}$. See their Figs. 5–8 for limits.
- 11 AAD 11AG search for quantum black hole formation followed by its decay to two jets, in pp collisions at $E_{\text{cm}} = 7$ TeV with $L = 36 \text{ pb}^{-1}$. See their Fig. 11 and Table 4 for limits.
