- 29 MCNEILE 10 determines m_c by comparing the order α_s^3 perturbative results for the pseudo-scalar current to lattice simulations with $N_f = 2+1$ sea-quarks by the HPQCD collaboration.
- 30 NARISON 10 determines m_c from ratios of moments of vector current correlators computed to order α_s^3 and including the dimension-six gluon condensate.
- 31 CHETYRKIN 09 determine m_c and m_b from the $e^+e^- \rightarrow Q\overline{Q}$ cross-section and sum rules, using an order α_s^3 computation of the heavy quark vacuum polarization. They also determine $m_c(3 \text{ GeV}) = 0.986 \pm 0.013 \text{ GeV}$.
- 32 ALLISON 08 determine m_c by comparing four-loop perturbative results for the pseudo-scalar current correlator to lattice simulations by the HPQCD collaboration. The result has been updated in MCNEILE 10.
- 33 KUHN 07 determine $\overline{m}_c(\mu = 3 \text{ GeV}) = 0.986 \pm 0.013 \text{ GeV}$ and $\overline{m}_c(\overline{m}_c)$ from a four-loop sum-rule computation of the cross-section for $e^+e^- \rightarrow$ hadrons in the charm threshold region.
- 34 BOUGHEZAL 06 result comes from the first moment of the hadronic production cross-section to order α_s^3 .
- 35 BUCHMUELLER 06 determine m_b and m_c by a global fit to inclusive B decay spectra.
- 36 HOANG 06 determines $\overline{m}_c(\overline{m}_c)$ from a global fit to inclusive B decay data. The B decay distributions were computed to order $\alpha_s^2\beta_0$, and the conversion between different m_c mass schemes to order α_s^3 .
- 37 AUBERT 04x obtain m_c from a fit to the hadron mass and lepton energy distributions in semileptonic B decay. The paper quotes values in the kinetic scheme. The MS value has been provided by the BABAR collaboration.
- 38 HOANG 04 determines $\overline{m}_c(\overline{m}_c)$ from moments at order α_s^2 of the charm production cross-section in e^+e^- annihilation.
- 39 DEDIVITIIS 03 use a quenched lattice computation of heavy-heavy and heavy-light meson masses.
- 40 EIDEMULLER 03 determines m_b and m_c using QCD sum rules.
- 41 ERLER 03 determines m_b and m_c using QCD sum rules. Includes recent BES data.
- 42 ZYABLYUK 03 determines m_c by using QCD sum rules in the pseudoscalar channel and comparing with the η_c mass.

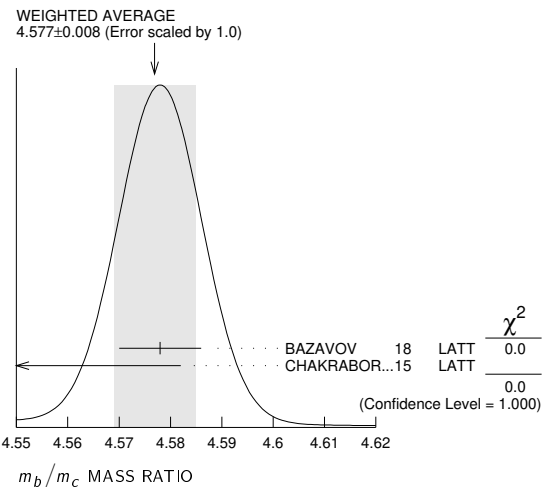

- 5 DAVIES 10 determine m_c/m_s from meson masses calculated on gluon fields including $u, d,$ and s sea quarks with lattice spacing down to 0.045 fm. The Highly Improved Staggered quark formalism is used for the valence quarks.
- 6 BAZAVOV 14A is a lattice computation using 4 dynamical flavors of HISQ fermions.
- 7 BLOSSIER 10 determine m_c/m_s from a computation of the hadron spectrum using $N_f = 2$ dynamical twisted-mass Wilson fermions.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- 1 BAZAVOV 18 determine the quark masses using a lattice computation with staggered fermions and four active quark flavors.
- 2 CHAKRABORTY 15 is a lattice QCD computation on gluon field configurations with $2+1+1$ dynamical flavors of HISQ quarks with u/d masses down to the physical value. m_c and m_s are tuned from pseudoscalar meson masses.
- 3 CARRASCO 14 is a lattice QCD computation of light quark masses using $2+1+1$ dynamical quarks, with $m_u = m_d \neq m_s \neq m_c$. The u and d quark masses are obtained separately by using the K meson mass splittings and lattice results for the electromagnetic contributions.
- 4 DURR 12 determine m_c/m_s using a lattice computation with $N_f = 2$ dynamical fermions. The result is combined with other determinations of m_c to obtain $m_s(2 \text{ GeV}) = 97.0 \pm 2.6 \pm 2.5 \text{ MeV}$.

b-QUARK MASS

b-quark mass corresponds to the "running mass" $\overline{m}_b(\mu = \overline{m}_b)$ in the \overline{MS} scheme. We have converted masses in other schemes to the \overline{MS} mass using two-loop QCD perturbation theory with $\alpha_s(\mu = \overline{m}_b) = 0.223 \pm 0.008$. The value $4.18^{+0.04}_{-0.03}$ GeV for the \overline{MS} mass corresponds to 4.78 ± 0.06 GeV for the pole mass, using the two-loop conversion formula. A discussion of masses in different schemes can be found in the "Note on Quark Masses."

- NARISON 20 determines the quark mass using QCD Laplace sum rules from the B_c mass, combined with previous determinations of the QCD condensates and c and b masses.
- ABRAMOWICZ 18 determine $\overline{m}_b(\overline{m}_b) = 4.049^{+0.104+0.090+0.001}_{-0.109-0.032-0.031}$ from the production of b quarks in ep collisions at HERA using combined H1 and ZEUS data. The experimental/fitting errors, and those from modeling and parameterization have been combined in quadrature.
- BAZAVOV 18 determine the b mass using a lattice computation with staggered fermions and five active quark flavors.
- PESET 18 determine $\overline{m}_c(\overline{m}_c)$ and $\overline{m}_b(\overline{m}_b)$ using an N3LO calculation of the η_c, η_b and B_c masses.
- KIYO 16 determine $\overline{m}_b(\overline{m}_b)$ from the $\Upsilon(1S)$ mass at order α_s^3 (N3LO).
- ALBERTI 15 determine $\overline{m}_b(\overline{m}_b)$ from fits to inclusive $B \rightarrow X_c e \overline{\nu}$ decay. They also find $m_b^{\text{kin}}(1 \text{ GeV}) = 4.553 \pm 0.020 \text{ GeV}$.
- BENEKE 15 determine $\overline{m}_b(\overline{m}_b)$ using sum rules for $e^+e^- \rightarrow$ hadrons at order N3LO including finite m_c effects. They find $m_b^{\overline{MS}}(2 \text{ GeV}) = 4.532^{+0.013}_{-0.039} \text{ GeV}$, and $\overline{m}_b(\overline{m}_b) = 4.193^{+0.022}_{-0.035} \text{ GeV}$. The value quoted is obtained using the four-loop conversion given in BENEKE 16.
- COLQUHOUN 15 determine $\overline{m}_b(\overline{m}_b)$ from moments of the vector current correlator computed with a lattice simulation using the NRQCD action.
- DEHNADI 15 determine $\overline{m}_b(\overline{m}_b)$ using sum rules for $e^+e^- \rightarrow$ hadrons at order α_s^3 (N3LO), and fitting to both experimental data and lattice results.
- BERNARDONI 14 determine m_b from $N_f = 2$ lattice calculations using heavy quark effective theory non-perturbatively renormalized and matched to QCD at $1/m$ order.
- PENIN 14 determine $\overline{m}_b(\overline{m}_b) = 4.169 \pm 0.008 \pm 0.002 \pm 0.002$ using an estimate of the order α_s^3 b-quark vacuum polarization function in the threshold region, including finite m_c effects. The errors of ± 0.008 from theoretical uncertainties, and ± 0.002 from α_s have been combined in quadrature.
- LEE 13o determines m_b using lattice calculations of the Υ and B_s binding energies in NRQCD, including three light dynamical quark flavors. The quark mass shift in NRQCD is determined to order α_s^2 , with partial α_s^3 contributions.
- LUCHA 13 determines m_b from QCD sum rules for heavy-light currents using the lattice value for f_B of $191.5 \pm 7.3 \text{ GeV}$.
- BODENSTEIN 12 determine m_b using sum rules for the vector current correlator and the $e^+e^- \rightarrow Q\overline{Q}$ total cross-section.
- DIMOPOULOS 12 determine quark masses from a lattice computation using $N_f = 2$ dynamical flavors of twisted mass fermions.
- LASCHKA 11 determine the b mass from the charmonium spectrum. The theoretical computation uses the heavy $Q\overline{Q}$ potential to order $1/m_Q$ obtained by matching the short-distance perturbative result onto lattice QCD result at larger scales.
- AUBERT 10A determine the b- and c-quark masses from a fit to the inclusive decay spectra in semileptonic B decays in the kinetic scheme (and convert it to the \overline{MS} scheme).
- CHETYRKIN 09 determine m_c and m_b from the $e^+e^- \rightarrow Q\overline{Q}$ cross-section and sum rules, using an order α_s^3 (N3LO) computation of the heavy quark vacuum polarization.
- SCHWANDA 08 measure moments of the inclusive photon spectrum in $B \rightarrow X_s \gamma$ decay to determine m_b^1S . We have converted this to \overline{MS} scheme.
- NARISON 18A determines $\overline{m}_b(\overline{m}_b)$ as a function of α_s using QCD exponential sum rules and their ratios evaluated at the optimal scale $\mu = 9.5 \text{ GeV}$ at N2LO-N3LO of perturbative QCD and including condensates up to dimension 6-8 in the (axial-)vector and (pseudo-)scalar bottomonium channels.
- NARISON 18B determines $\overline{m}_b(\overline{m}_b)$ using QCD vector moment sum rules and their ratios at N2LO-N3LO of perturbative QCD and including condensates up to dimension 8.
- ABRAMOWICZ 14A determine $\overline{m}_b(\overline{m}_b) = 4.07^{+0.14+0.01+0.05+0.08}_{-0.07-0.00-0.05}$ from the production of b quarks in ep collisions at HERA. The errors due to fitting, modeling, PDF parameterization, and theoretical QCD uncertainties due to the values of α_s, m_c , and the renormalization scale μ have been combined in quadrature.
- AYALA 14A determine $\overline{m}_b(\overline{m}_b)$ from the $\Upsilon(1S)$ mass computed to N3LO order in perturbation theory using a renormalon subtracted scheme.
- NARISON 13 determines m_b using QCD spectral sum rules to order α_s^2 (NNLO) and including condensates up to dimension 6.
- NARISON 13A determines m_b using HQET sum rules to order α_s^2 (NNLO) and the B meson mass and decay constant.
- HOANG 12 determine m_b using non-relativistic sum rules for the Υ system at order α_s^2 (NNLO) with renormalization group improvement.
- NARISON 12 determines m_b using exponential sum rules for the vector current correlator to order α_s^3 , including the effect of gluon condensates up to dimension eight.
- Determines m_b to order α_s^3 (N3LO), including the effect of gluon condensates up to dimension eight combining the methods of NARISON 12 and NARISON 12A.
- NARISON 12A determines m_b using sum rules for the vector current correlator to order α_s^3 , including the effect of gluon condensates up to dimension eight.

Quark Particle Listings

b, t

- 30 MCNEILE 10 determines m_b by comparing order α_s^3 (N3LO) perturbative results for the pseudo-scalar current to lattice simulations with $N_f = 2+1$ sea-quarks by the HPQCD collaboration.
- 31 NARISON 10 determines m_b from ratios of moments of vector current correlators computed to order α_s^2 and including the dimension-six gluon condensate. These values are taken from the erratum to that reference.
- 32 ABDALLAH 08d determine $\overline{m}_b(M_Z) = 3.76 \pm 1.0$ GeV from a leading order study of four-jet rates at LEP.
- 33 GUAZZINI 08 determine $\overline{m}_b(\overline{m}_b)$ from a quenched lattice simulation of heavy meson masses. The ± 0.08 is an estimate of the quenching error.
- 34 DELLA-MORTE 07 determine $\overline{m}_b(\overline{m}_b)$ from a computation of the spin-averaged B meson mass using quenched lattice HQET at order $1/m$. The ± 0.08 is an estimate of the quenching error.
- 35 KUHN 07 determine $\overline{m}_b(\mu = 10 \text{ GeV}) = 3.609 \pm 0.025$ GeV and $\overline{m}_b(\overline{m}_b)$ from a four-loop sum-rule computation of the cross-section for $e^+e^- \rightarrow$ hadrons in the bottom threshold region.
- 36 ABDALLAH 06d determine $m_b(M_Z) = 2.85 \pm 0.32$ GeV from Z -decay three-jet events containing a b -quark.
- 37 BOUGHEZAL 06 \overline{MS} scheme result comes from the first moment of the hadronic production cross-section to order α_s^3 .
- 38 BUCHMUELLER 06 determine m_b and m_c by a global fit to inclusive B decay spectra.
- 39 PINEDA 06 \overline{MS} scheme result comes from a partial NNLL evaluation (complete at order α_s^2 (NNLO)) of sum rules of the bottom production cross-section in e^+e^- annihilation.
- 40 GRAY 05 determines $\overline{m}_b(\overline{m}_b)$ from a lattice computation of the Υ spectrum. The simulations have $2+1$ dynamical light flavors. The b quark is implemented using NRQCD.
- 41 AUBERT 04x obtain m_b from a fit to the hadron mass and lepton energy distributions in semileptonic B decay. The paper quotes values in the kinetic scheme. The \overline{MS} value has been provided by the BABAR collaboration.
- 42 BAUER 04 determine m_b , m_c and $m_b - m_c$ by a global fit to inclusive B decay spectra.
- 43 HOANG 04 determines $\overline{m}_b(\overline{m}_b)$ from moments at order α_s^2 of the bottom production cross-section in e^+e^- annihilation.
- 44 MCNEILE 04 use lattice QCD with dynamical light quarks and a static heavy quark to compute the masses of heavy-light mesons.
- 45 BAUER 03 determine the b quark mass by a global fit to B decay observables. The experimental data includes lepton energy and hadron invariant mass moments in semileptonic $B \rightarrow X_c \ell \nu_\ell$ decay, and the inclusive photon spectrum in $B \rightarrow X_S \gamma$ decay. The theoretical expressions used are of order $1/m^3$, and $\alpha_s^2 \beta_0$.
- 46 BORDES 03 determines m_b using QCD finite energy sum rules to order α_s^2 .
- 47 CORCELLA 03 determines \overline{m}_b using sum rules computed to order α_s^2 . Includes charm quark mass effects.
- 48 DEDIVITIIS 03 use a quenched lattice computation of heavy-heavy and heavy-light meson masses.
- 49 EIDEMULLER 03 determines \overline{m}_b and \overline{m}_c using QCD sum rules.
- 50 ERLER 03 determines \overline{m}_b and \overline{m}_c using QCD sum rules. Includes recent BES data.
- 51 MAHMOOD 03 determines m_b^{1S} by a fit to the lepton energy moments in $B \rightarrow X_c \ell \nu_\ell$ decay. The theoretical expressions used are of order $1/m^3$ and $\alpha_s^2 \beta_0$. We have converted their result to the \overline{MS} scheme.
- 52 BRAMBILLA 02 determine $\overline{m}_b(\overline{m}_b)$ from a computation of the $\Upsilon(1S)$ mass to order α_s^4 , including finite m_c corrections.
- 53 PENIN 02 determines \overline{m}_b from the spectrum of the Υ system.

Top Quark

t-QUARK MASS

We first list the direct measurements of the top quark mass which employ the event kinematics and then list the measurements which extract a top quark mass from the measured $t\bar{t}$ cross-section using theory calculations. A discussion of the definition of the top quark mass in these measurements can be found in the review "The Top Quark."

For earlier search limits see PDG 96, Physical Review **D54** 1 (1996). We no longer include a compilation of indirect top mass determinations from Standard Model Electroweak fits in the Listings (our last compilation can be found in the Listings of the 2007 partial update). For a discussion of current results see the reviews "The Top Quark" and "Electroweak Model and Constraints on New Physics."

t-Quark Mass (Direct Measurements)

The following measurements extract a t -quark mass from the kinematics of $t\bar{t}$ events. They are sensitive to the top quark mass used in the MC generator that is usually interpreted as the pole mass, but the theoretical uncertainty in this interpretation is hard to quantify. See the review "The Top Quark" and references therein for more information.

OUR AVERAGE of 172.76 ± 0.30 GeV is an average of top mass measurements from LHC and Tevatron Runs. The latest Tevatron average, $174.30 \pm 0.35 \pm 0.54$ GeV, was provided by the Tevatron Electroweak Working Group (TEVEWWG).

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT

172.35 ± 0.16 ± 0.48	^{18,19}	KHACHATRYAN	^{16AK}	CMS	$\ell + \geq 4j$ (2b)	<ol style="list-style-type: none"> 1 AABOUD 19AC is an ATLAS combination of 7 and 8 TeV top-quark mass determination in the dilepton, lepton + jets, and all jets channels. 2 SIRUNYAN 19AP based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. A combined measurement using the lepton+jets and all-jets channels through a single likelihood function. See SIRUNYAN 18DE and SIRUNYAN 19AP below. 3 SIRUNYAN 18AP based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Obtained from a simultaneous fit of the cross section and the top quark mass in the POWHEG simulation. The cross section is used also to extract the \overline{MS} mass and the strong coupling constant for different PDF sets. 4 SIRUNYAN 17L based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. m_t is reconstructed from a fit to the invariant mass distribution of $\mu\nu b$, where p_t^{miss} and W mass constraint are used to reconstruct ν momentum. The number of events for various contributions, except for the t-channel single top one, are fixed to the values extracted from simulation. 5 KHACHATRYAN 16AK based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Combination of the three top mass measurements in KHACHATRYAN 16AK and with the CMS results at $\sqrt{s} = 7$ TeV. 6 TEVEWWG 16 is the latest Tevatron average (July 2016) provided by the Tevatron Electroweak Working Group. It takes correlated uncertainties into account and has a χ^2 of 10.8 for 11 degrees of freedom. 7 AABOUD 19AC based on 20.2 fb⁻¹ in pp collisions at $\sqrt{s} = 8$ TeV. Uses optimized event selection to suppress less-well-reconstructed events and template fits to determine m_t together with a global jet energy scale factor and a relative b-to-light-jet energy scale factor. 8 SIRUNYAN 19AP based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. A kinematical fit is applied to each event assuming the signal event topology. m_t is determined simultaneously with a jet energy scale factor (JSF). The second error represents stat.+JSF. Modeling uncertainties are larger than in the measurements at $\sqrt{s} = 7$ and 8 TeV because of the use of new alternative color reconnection models. 9 SIRUNYAN 18DE based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. m_t is determined simultaneously with an overall jet energy scale factor constrained by the mass of the hadronically decayed W. Compared to the Run 1 analysis a more advanced treatment of modeling uncertainties are employed, in particular concerning color-reconnection models. 10 AABOUD 17AH based on 20.2 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Uses template fits to the ratio of the masses of three-jets (from t candidate) and dijets (from W candidate), to suppress jet energy scale uncertainty. Large QCD background is modelled using a data-driven method. 11 ABAZOV 17B is a combination of measurements of the top quark mass by D0 in the lepton+jets and dilepton channels, using all data collected in Run I (1992-1996) at $\sqrt{s} = 1.8$ TeV and Run II (2001-2011) at $\sqrt{s} = 1.96$ TeV of the Tevatron, corresponding to integrated luminosities of 0.1 fb⁻¹ and 9.7 fb⁻¹, respectively. 12 SIRUNYAN 17N based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The fully hadronic decay of a highly-boosted t is reconstructed in the $\ell+jets$ channel and unfolded at the particle level. The sensitivity of the peak position of the m_{jet} distribution is used to test quality of the modelling by the simulation. 13 SIRUNYAN 17O based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Analysis is based on the kinematical observables $M(b\ell)$, M_T and $M(b\ell\nu)$. A fit is performed to determine m_t and an overall jet energy scale factor simultaneously. 14 AABOUD 16T based on 20.2 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The analysis is refined using the p_T and invariant mass distributions of $\ell+b$-jet system. A combination with measurements from $\sqrt{s} = 7$ TeV data in the dilepton and lepton+jets channels gives $172.84 \pm 0.34 \pm 0.61$ GeV. 15 AABOUD 16T is an ATLAS combination of 8 TeV top-quark mass in the dilepton channel with previous measurements from $\sqrt{s} = 7$ TeV data in the dilepton and lepton + jets channels. 16 ABAZOV 16 based on 9.7 fb⁻¹ of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. Employs improved fit to minimize statistical errors and improved jet energy calibration, using lepton + jets mode, which reduces error of jet energy scale. Based on previous determination in ABAZOV 12AB with increased integrated luminosity and improved fit and calibrations. 17 ABAZOV 16D based on 9.7 fb⁻¹ of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV, using the matrix element technique. Based on previous determination in ABAZOV 11R with increased integrated luminosity. There is a strong correlation with the determination in ABAZOV 16. (See ABAZOV 17B.) 18 KHACHATRYAN 16AK based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Combination of the three top mass measurements in KHACHATRYAN 16AK and with the CMS results at $\sqrt{s} = 7$ TeV gives $172.44 \pm 0.13 \pm 0.47$ GeV. 19 The top mass and jet energy scale factor are determined by a fit. 20 Uses the analytical matrix weighting technique method. 21 KHACHATRYAN 16AL based on 19.7 fb⁻¹ in pp collisions at $\sqrt{s} = 8$ TeV. Determined from the invariant mass distribution of leptons and reconstructed secondary vertices from b decays using only charged particles. The uncertainty is dominated by modeling of b fragmentation and top p_T distribution. 22 KHACHATRYAN 16CB based on 666 candidate reconstructed events corresponding to 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The measurement exploits correlation of m_t with $M(J/\psi b)$ in the same top quark decay, using a high-purity event sample. A study on modeling of b-quark fragmentation is given in Sec.3.3. 23 AAD 15AW based on 4.6 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. Uses template fits to the ratio of the masses of three-jets (from t candidate) and dijets (from W candidate). Large background from multijet production is modeled with data-driven methods. 24 AAD 15BF based on 4.6 fb⁻¹ in pp collisions at $\sqrt{s} = 7$ TeV. Using a three-dimensional template likelihood technique the lepton plus jets ($\geq 1b$-tagged) channel gives $172.33 \pm 0.75 \pm 1.02$ GeV, while exploiting a one dimensional template method using $m_{\ell b}$ the dilepton channel (1 or 2b-tags) gives $173.79 \pm 0.54 \pm 1.30$ GeV. The results are combined.

Quark Particle Listings

t

- 25 AALTONEN 15D based on 9.1 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. Uses a template technique to fit a distribution of a variable defined by a linear combination of variables sensitive and insensitive to jet energy scale to optimize reduction of systematic errors. b -tagged and non- b -tagged events are separately analyzed and combined.
- 26 Based on 9.3 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. Multivariate algorithm is used to discriminate signal from backgrounds, and templates are used to measure m_t .
- 27 Based on 9.7 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 1.96 \text{ TeV}$. A matrix element method is used to calculate the probability of an event to be signal or background, and the overall jet energy scale is constrained *in situ* by m_W . See ABAZOV 15G for further details.
- 28 Based on 3.54 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. The mass is reconstructed for each event employing a kinematic fit of the jets to a $t\bar{t}$ hypothesis. The combination with the previous CMS measurements in the dilepton and the lepton+jets channels gives $173.54 \pm 0.33 \pm 0.96 \text{ GeV}$.
- 29 Based on 8.7 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Events with an identified charged lepton or small E_T are rejected from the event sample, so that the measurement is statistically independent from those in the $\ell + \text{jets}$ and all hadronic channels while being sensitive to those events with a τ lepton in the final state.
- 30 Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 13s studied events with di-lepton + $E_T + \geq 2$ b -jets, and looked for kinematic endpoints of MT2, MT2 $_T$, and subsystem variables.
- 31 AAD 12i based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. Uses 2d-template analysis (MT) with m_t and jet energy scale factor (JSF) from m_W mass fit.
- 32 Based on 8.7 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV . The JES is calibrated by using the dijet mass from the W boson decay.
- 33 Use the ME method based on 2.2 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV .
- 34 Combination based on up to 5.8 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV .
- 35 Based on 5.8 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV the quoted value is $m_t = 172.5 \pm 1.4(\text{stat}) \pm 1.0(\text{JES}) \pm 1.1(\text{syst}) \text{ GeV}$. The measurement is performed with a likelihood fit technique which simultaneously determines m_t and JES (Jet Energy Scale).
- 36 Based on 4.3 fb^{-1} of data in p - p bar collisions at 1.96 TeV . The measurement reduces the JES uncertainty by using the single lepton channel study of ABAZOV 11P.
- 37 Combination with the result in 1 fb^{-1} of preceding data reported in ABAZOV 09AH as well as the MWT result of ABAZOV 11R with a statistical correlation of 60%.
- 38 Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. Uses an analytical matrix weighting technique (AMWT) and full kinematic analysis (KIN).
- 39 Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. The first error is statistical and JES combined, and the second is systematic. Ideogram method is used to obtain 2D likelihood for the kinematical fit with two parameters m_{top} and JES.
- 40 Based on 3.2 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and JES combined, and the latter is from the other systematic uncertainties. The result is obtained using an unbinned maximum likelihood method where the top quark mass and the JES are measured simultaneously, with $\Delta_{JES} = 0.3 \pm 0.3(\text{stat})$.
- 41 Based on 5.7 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Events with an identified charged lepton or small E_T are rejected from the event sample, so that the measurement is statistically independent from those in the $\ell + \text{jets}$ and all hadronic channels while being sensitive to those events with a τ lepton in the final state. Supersedes AALTONEN 07B.
- 42 AALTONEN 11E based on 5.6 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Employs a multi-dimensional template likelihood technique where the lepton plus jets (one or two b -tags) channel gives $172.2 \pm 1.2 \pm 0.9 \text{ GeV}$ while the dilepton channel yields $170.3 \pm 2.0 \pm 3.1 \text{ GeV}$. The results are combined. OUR EVALUATION includes the measurement in the dilepton channel only.
- 43 Uses a likelihood fit of the lepton p_T distribution based on 2.7 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$.
- 44 Based on 3.6 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. ABAZOV 11P reports $174.94 \pm 0.83 \pm 0.78 \pm 0.96 \text{ GeV}$, where the first uncertainty is from statistics, the second from JES, and the last from other systematic uncertainties. We combine the JES and systematic uncertainties. A matrix-element method is used where the JES uncertainty is constrained by the W mass. ABAZOV 11P describes a measurement based on 2.6 fb^{-1} that is combined with ABAZOV 08AH, which employs an independent 1 fb^{-1} of data.
- 45 Based on a matrix-element method which employs 5.4 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Superseded by ABAZOV 12AB.
- 46 Based on 36 pb^{-1} of pp collisions at $\sqrt{s} = 7 \text{ TeV}$. A Kinematic Method using b -tagging and an analytical Matrix Weighting Technique give consistent results and are combined. Superseded by CHATRCHYAN 12BA.
- 47 Based on 5.6 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The likelihood calculated using a matrix element method gives $m_t = 173.0 \pm 0.7(\text{stat}) \pm 0.6(\text{JES}) \pm 0.9(\text{syst}) \text{ GeV}$, for a total uncertainty of 1.2 GeV .
- 48 Based on 3.4 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The result is obtained by combining the MT2 variable method and the NWA (Neutrino Weighting Algorithm). The MT2 method alone gives $m_t = 168.0^{+4.8}_{-4.0}(\text{stat}) \pm 2.9(\text{syst}) \text{ GeV}$ with smaller systematic error due to small JES uncertainty.
- 49 Based on 1.9 fb^{-1} in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The result is from the measurement using the transverse decay length of b -hadrons and that using the transverse momentum of the W decay muons, which are both insensitive to the JES (jet energy scale) uncertainty. OUR EVALUATION uses only the measurement exploiting the decay length significance which yields $166.9^{+9.5}_{-8.5}(\text{stat}) \pm 2.9(\text{syst}) \text{ GeV}$. The measurement that uses the lepton transverse momentum is excluded from the average because of a statistical correlation with other samples.
- 50 Based on 2.9 fb^{-1} of $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and JES uncertainty, and the latter is from the other systematics. Neural-network-based kinematical selection of 6 highest E_T jets with a $vt\bar{t}$ b -tag is used to distinguish signal from background. Superseded by AALTONEN 12G.
- 51 Based on 2 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The top mass is obtained from the measurement of the invariant mass of the lepton (e or μ) from W decays and the soft μ in b -jet. The result is insensitive to jet energy scaling.
- 52 Based on 1.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and jet energy scale uncertainty, and the latter is from the other systematics. Matrix element method with effective propagators.
- 53 Based on 943 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistical and jet-energy-scale uncertainties, and the latter is from other systematics. AALTONEN 09k selected 6 jet events with one or more vertex b -tags and used the tree-level matrix element to construct template models of signal and background.
- 54 Based on 1.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistical and jet-energy-scale (JES) uncertainties, and the second is from other systematics. Events with lepton + jets and those with dilepton + jets were simultaneously fit to constrain m_t and JES. Lepton + jets data only give $m_t = 171.8 \pm 2.2 \text{ GeV}$, and dilepton data only give $m_t = 171.2^{+5.3}_{-5.1} \text{ GeV}$.
- 55 Based on 2 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Matrix Element method. Optimal selection criteria for candidate events with two high p_T leptons, high E_T , and two or more jets with and without b -tag are obtained by neural network with neuroevolution technique to minimize the statistical error of m_t .
- 56 Based on 2.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Mass m_t is estimated from the likelihood for the eight-fold kinematical solutions in the plane of the azimuthal angles of the two neutrino momenta.
- 57 Based on 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Events with two identified leptons, and those with one lepton plus one isolated track and a b -tag were used to constrain m_t . The result is a combination of the ν WT (ν Weighting Technique) result of $176.2 \pm 4.8 \pm 2.1 \text{ GeV}$ and the MWT (Matrix-element Weighting Technique) result of $173.2 \pm 4.9 \pm 2.0 \text{ GeV}$.
- 58 Reports measurement of $170.7^{+4.2}_{-3.9} \pm 2.6 \pm 2.4 \text{ GeV}$ based on 1.2 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The last error is due to the theoretical uncertainty on $\sigma_{t\bar{t}}$. Without the cross-section constraint a top mass of $169.7^{+5.2}_{-4.9} \pm 3.1 \text{ GeV}$ is obtained.
- 59 Template method.
- 60 Result is based on 1 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is from statistics and jet energy scale uncertainty, and the latter is from the other systematics.
- 61 Based on 310 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 62 Ideogram method.
- 63 Based on 311 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Events with 4 or more jets with $E_T > 15 \text{ GeV}$, significant missing E_T , and secondary vertex b -tag are used in the fit. About 44% of the signal acceptance is from $\tau\nu + 4$ jets. Events with identified e or μ are vetoed to provide a statistically independent measurement.
- 64 Based on 1.02 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Superseded by AALTONEN 12G.
- 65 Based on 955 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. m_t and JES (Jet Energy Scale) are fitted simultaneously, and the first error contains the JES contribution of 1.5 GeV .
- 66 Matrix element method.
- 67 Based on 425 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error is a combination of statistics and JES (Jet Energy Scale) uncertainty, which has been measured simultaneously to give $JES = 0.989 \pm 0.029(\text{stat})$.
- 68 Based on 370 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Combined result of MWT (Matrix-element Weighting Technique) and ν WT (ν Weighting Technique) analyses is $178.1 \pm 6.7 \pm 4.8 \text{ GeV}$.
- 69 Based on 1.0 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. ABULENCIA 07D improves the matrix element description by including the effects of initial-state radiation.
- 70 Based on 695 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. The transverse decay length of the b hadron is used to determine m_t , and the result is free from the JES (jet energy scale) uncertainty.
- 71 Based on $\sim 400 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.96 \text{ TeV}$. The first error includes statistical and systematic jet energy scale uncertainties, the second error is from the other systematics. The result is obtained with the b -tagging information. The result without b -tagging is $169.2^{+5.0+1.5}_{-7.4-1.4} \text{ GeV}$. Superseded by ABAZOV 08AH.
- 72 Based on 318 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 73 Dynamical likelihood method.
- 74 Based on 340 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 75 Based on 360 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- 76 Based on $110.2 \pm 5.8 \text{ pb}^{-1}$ at $\sqrt{s} = 1.8 \text{ TeV}$.
- 77 Based on the all hadronic decays of $t\bar{t}$ pairs. Single b -quark tagging via the decay chain $b \rightarrow c \rightarrow \mu$ was used to select signal enriched multijet events. The result was obtained by the maximum likelihood method after bias correction.
- 78 Obtained by re-analysis of the lepton + jets candidate events that led to ABBOTT 98F. It is based upon the maximum likelihood method which makes use of the leading order matrix elements.
- 79 Based on $125 \pm 7 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$.
- 80 Based on $\sim 106 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$.
- 81 Obtained by combining the measurements in the lepton + jets [AFFOLDER 01], all-jets [ABE 97R, ABE 99B], and dilepton [ABE 99B] decay topologies.
- 82 Obtained by combining the D0 result $m_t(\text{GeV}) = 168.4 \pm 12.3 \pm 3.6$ from 6 di-lepton events (see also ABBOTT 98B) and $m_t(\text{GeV}) = 173.3 \pm 5.6 \pm 5.5$ from lepton+jets events (ABBOTT 98F).
- 83 Obtained by combining the CDF results of $m_t(\text{GeV}) = 167.4 \pm 10.3 \pm 4.8$ from 8 dilepton events, $m_t(\text{GeV}) = 175.9 \pm 4.8 \pm 5.3$ from lepton+jets events (ABE 98E), and $m_t(\text{GeV}) = 186.0 \pm 10.0 \pm 5.7$ from all-jet events (ABE 97R). The systematic errors in the latter two measurements are changed in this paper.
- 84 See AFFOLDER 01 for details of systematic error re-evaluation.
- 85 Based on $109 \pm 7 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8 \text{ TeV}$.
- 86 See ABAZOV 04G.
- 87 The updated systematic error is listed. See AFFOLDER 01, appendix C.
- 88 Obtained by combining the D0 results of $m_t(\text{GeV}) = 168.4 \pm 12.3 \pm 3.6$ from 6 dilepton events and $m_t(\text{GeV}) = 173.3 \pm 5.6 \pm 5.5$ from 77 lepton+jets events.
- 89 Obtained by combining the D0 results from dilepton and lepton+jets events, and the CDF results (ABE 99B) from dilepton, lepton+jets events, and all-jet events.
- 90 Based on the first observation of all hadronic decays of $t\bar{t}$ pairs. Single b -quark tagging with jet-shape variable constraints was used to select signal enriched multi-jet events. The updated systematic error is listed. See AFFOLDER 01, appendix C.

t-Quark Mass from Cross-Section Measurements

The top quark $M\bar{S}$ or pole mass can be extracted from a measurement of $\sigma(t\bar{t})$ by using theory calculations. We quote below the $M\bar{S}$ mass. See the review "The Top Quark" and references therein for more information.

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹ AAD 19g based on 20.2 fb⁻¹ of data in *pp* collisions at $\sqrt{s} = 8$ TeV. Normalized $t\bar{t} + 1$ -jet differential cross section as a function of $t\bar{t}j$ invariant mass is measured in the $\ell +$ jets mode. The unfolded parton-level distribution is compared with the NLO QCD prediction. The three errors are from statistics, systematics, and theory.

² Based on 5.3 fb⁻¹ in *p* \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. ABAZOV 11s uses the measured $t\bar{t}$ production cross section of $8.13^{+1.02}_{-0.90}$ pb [ABAZOV 11E] in the lepton plus jets channel to obtain the top quark \overline{MS} mass by using an approximate NNLO computation (MOCH 08, LANGENFELD 09). The corresponding top quark pole mass is $167.5^{+5.4}_{-4.9}$ GeV. A different theory calculation (AHRENS 10, AHRENS 10A) is also used and yields $m_t^{\overline{MS}} = 154.5^{+5.0}_{-4.3}$ GeV.

³ Based on 1 fb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. Uses the $\ell +$ jets, $\ell\ell$, and $\ell\tau +$ jets channels. ABAZOV 09AG extract the pole mass of the top quark using two different calculations that yield $169.1^{+5.9}_{-5.2}$ GeV (MOCH 08, LANGENFELD 09) and $168.2^{+5.9}_{-5.4}$ GeV (KIDONAKIS 08).

⁴ Based on 1 fb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. Uses the $\ell\ell$ and $\ell\tau +$ jets channels. ABAZOV 09R extract the pole mass of the top quark using two different calculations that yield $173.3^{+9.8}_{-8.6}$ GeV (MOCH 08, LANGENFELD 09) and $171.5^{+9.9}_{-8.8}$ GeV (CACIARI 08).

176.7±3.0 ^{+2.8} _{-2.8}	8 CHATRCHYAN14	CMS	<i>pp</i> at $\sqrt{s} = 7$ TeV

¹ AAD 19g based on 20.2 fb⁻¹ of data in *pp* collisions at $\sqrt{s} = 8$ TeV. Normalized $t\bar{t} + 1$ -jet differential cross section as a function of $t\bar{t}j$ invariant mass is measured in the $\ell +$ jets mode. The unfolded parton-level distribution is compared with the NLO QCD prediction. The three errors are from statistics, systematics, and theory.

² AABOUD 17bC based on 20.2 fb⁻¹ of *pp* data at $\sqrt{s} = 8$ TeV. The pole mass is extracted from a fit of NLO predictions to eight single lepton and dilepton differential distributions, while simultaneously constraining uncertainties due to PDFs and QCD scales. The three reported uncertainties come from statistics, experimental systematics, and theoretical sources.

³ SIRUNYAN 17W based on 2.2 fb⁻¹ of *pp* data at $\sqrt{s} = 13$ TeV. Events are categorized according to the jet multiplicity and the number of *b*-tagged jets. The pole mass is obtained from the inclusive cross section measurement and the NNLO prediction.

⁴ ABAZOV 16F based on 9.7 fb⁻¹ of data in *p* \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. The result is obtained from the inclusive cross section measurement and the NNLO+NNLL prediction.

⁵ KHACHATRYAN 16AW based on 5.0 fb⁻¹ of *pp* collisions at 7 TeV and 19.7 fb⁻¹ at 8 TeV. The 7 TeV data include those used in CHATRCHYAN 14. The result is obtained from the inclusive cross sections.

⁶ AAD 15bW based on 4.6 fb⁻¹ of *pp* data at $\sqrt{s} = 7$ TeV. Uses normalized differential cross section for $t\bar{t} + 1$ jet as a function of the inverse of the invariant mass of the $t\bar{t} + 1$ jet system. The measured cross section is corrected to the parton level. Then a fit to the data using NLO + parton shower prediction is performed.

⁷ AAD 14AY used $\sigma(t\bar{t})$ for $e\mu$ events. The result is a combination of the measurements $m_t = 171.4 \pm 2.6$ GeV based on 4.6 fb⁻¹ of data at 7 TeV and $m_t = 174.1 \pm 2.6$ GeV based on 20.3 fb⁻¹ of data at 8 TeV.

⁸ CHATRCHYAN 14 used $\sigma(t\bar{t})$ from *pp* collisions at $\sqrt{s} = 7$ TeV measured in CHATRCHYAN 12AX to obtain $m_t(\text{pole}) = 0.1184 \pm 0.0007$. The errors have been corrected in KHACHATRYAN 14K.

$$m_t - m_{\bar{t}}$$

Test of *CP*T conservation. OUR AVERAGE assumes that the systematic uncertainties are uncorrelated.

<13.1	95	7 AALTONEN	09M CDF	$m_t(\text{rec})$ distribution

¹ Based on 20.2 fb⁻¹ of *pp* data at $\sqrt{s} = 8$ TeV. Γ_t is measured using a template fit to the reconstructed invariant mass of the *b*-jet of the semileptonically decaying top quark and the corresponding lepton, and the angular distance between j_b and j_l in hadronic top decay. Signal templates are generated by reweighting events at parton-level to Breit-Wigner distribution with different Γ_t hypotheses for $m_t = 172.5$ GeV. The result is consistent with the NNLO SM prediction of 1.322 GeV.

² Based on 19.7 fb⁻¹ of *pp* data at $\sqrt{s} = 8$ TeV. The result is obtained by combining the measurement of $R = \Gamma(t \rightarrow Wb)/\Gamma(t \rightarrow Wq (q=b,s,d))$ and a previous CMS measurement of the *t*-channel single top production cross section of CHATRCHYAN 12BQ, by using the theoretical calculation of $\Gamma(t \rightarrow Wb)$ for $m_t = 172.5$ GeV.

³ Based on 5.4 fb⁻¹ of data in *p* \bar{p} collisions at 1.96 TeV. $\Gamma(t \rightarrow bW) = 1.87^{+0.44}_{-0.40}$ GeV is obtained from the observed *t*-channel single top quark production cross section, whereas $\Gamma(t \rightarrow bW) = 0.90 \pm 0.04$ is used assuming $\sum_q \Gamma(t \rightarrow qW) = 1$. The result is valid for $m_t = 172.5$ GeV. See the paper for the values for $m_t = 170$ or 175 GeV.

⁴ Based on 8.7 fb⁻¹ of data. The two sided 68% CL interval is $1.10 \text{ GeV} < \Gamma_t < 4.05$ GeV for $m_t = 172.5$ GeV.

⁵ Based on 2.3 fb⁻¹ in *p* \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. ABAZOV 11B extracted Γ_t from the partial width $\Gamma(t \rightarrow Wb) = 1.92^{+0.58}_{-0.51}$ GeV measured using the *t*-channel single top production cross section, and the branching fraction $\text{br}(t \rightarrow Wb) = 0.962^{+0.068}_{-0.066}(\text{stat})^{+0.064}_{-0.052}(\text{syst})$. The $\Gamma(t \rightarrow Wb)$ measurement gives the 95% CL lowerbound of $\Gamma(t \rightarrow Wb)$ and hence that of Γ_t .

⁶ Results are based on 4.3 fb⁻¹ of data in *p* \bar{p} collisions at $\sqrt{s} = 1.96$ TeV. The top quark mass and the hadronically decaying *W* boson mass are reconstructed for each candidate events and compared with templates of different top quark width. The two sided 68% CL interval is $0.3 \text{ GeV} < \Gamma_t < 4.4 \text{ GeV}$ for $m_t = 172.5$ GeV.

⁷ Based on 955 pb⁻¹ of *p* \bar{p} collision data at $\sqrt{s} = 1.96$ TeV. AALTONEN 09M selected $t\bar{t}$ candidate events for the $\ell + E_T +$ jets channel with one or two *b*-tags, and examine the decay width dependence of the reconstructed m_t distribution. The result is for $m_t = 175$ GeV, whereas the upper limit is lower for smaller m_t .

¹ Based on 8.7 fb⁻¹ of data. This measurement gives $|V_{tb}| = 0.93 \pm 0.04$ and $|V_{tb}| > 0.85$ (95% CL) in the SM.

² Based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The result is obtained by counting the number of b jets per $t\bar{t}$ signal events in the dilepton channel. The $t\bar{t}$ production cross section is measured to be $\sigma(t\bar{t}) = 238 \pm 1 \pm 15$ pb, in good agreement with the SM prediction and the latest CMS measurement of CHATRCHYAN 14F. The measurement gives $R > 0.995$ (95% CL), or $|V_{tb}| > 0.975$ (95% CL) in the SM, requiring $R \leq 1$.

³ Based on 8.7 fb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. Measure the fraction of $t \rightarrow Wb$ decays simultaneously with the $t\bar{t}$ cross section. The correlation coefficient between those two measurements is -0.434 . Assume unitarity of the 3×3 CKM matrix and set $|V_{tb}| > 0.89$ at 95% CL.

⁴ Based on 5.4 fb⁻¹ of data. The error is statistical and systematic combined. The result is a combination of 0.95 ± 0.07 from $\ell +$ jets channel and 0.86 ± 0.05 from $\ell\ell$ channel. $|V_{tb}| = 0.95 \pm 0.02$ follows from the result by assuming unitarity of the 3×3 CKM matrix.

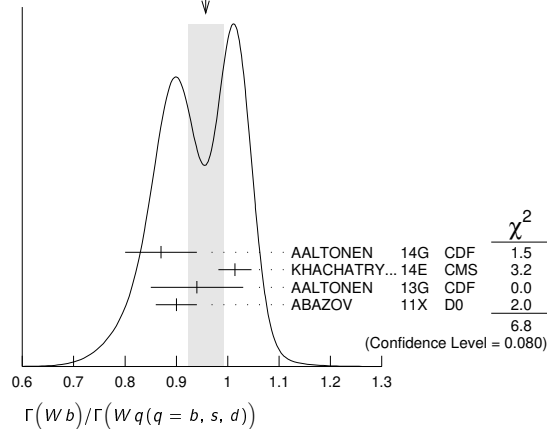

⁵ Result is based on 0.9 fb⁻¹ of data. The 95% CL lower bound $R > 0.79$ gives $|V_{tb}| > 0.89$ (95% CL).

⁶ ABAZOV 06k result is from the analysis of $t\bar{t} \rightarrow \ell\nu_\ell + \geq 3$ jets with 230 pb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. It gives $R > 0.61$ and $|V_{tb}| > 0.78$ at 95% CL. Superseded by ABAZOV 08M.

⁷ ACOSTA 05A result is from the analysis of lepton + jets and di-lepton + jets final states of $t\bar{t}$ candidate events with ~ 162 pb⁻¹ of data at $\sqrt{s} = 1.96$ TeV. The first error is statistical and the second systematic. It gives $R > 0.61$, or $|V_{tb}| > 0.78$ at 95% CL.

⁸ AFFOLDER 01c measures the top-quark decay width ratio $R = \Gamma(Wb)/\Gamma(Wq)$, where q is a d , s , or b quark, by using the number of events with multiple b tags. The first error is statistical and the second systematic. A numerical integration of the likelihood function gives $R > 0.61$ (0.56) at 90% (95%) CL. By assuming three generation unitarity, $|V_{tb}| = 0.97^{+0.16}_{-0.12}$ or $|V_{tb}| > 0.78$ (0.75) at 90% (95%) CL is obtained. The result is based on 109 pb⁻¹ of data at $\sqrt{s} = 1.8$ TeV.

³ ABULENCIA	06R CDF	$\ell\tau +$ jets
⁴ ABE	97V CDF	$\ell\tau +$ jets

¹ AAD 15cc based on 4.6 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. The original value is given by $7.0 \pm 0.3 \pm 0.5\%$, which includes only the hadronic decay of τ leptons. It is assumed that the top branching ratios to leptons and jets add up to one and that only SM processes contribute to the background. The event selection criteria are optimized for the $\ell\tau_h +$ jets channel. We have converted the original value to include leptonic decays of τ 's, by using the AAD 15cc measurements of the branching ratios to e and μ channels, as well as the PDG values of τ branching ratios into e and μ channels.

² Based on 9 fb⁻¹ of data. The measurement is in the channel $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$, where τ decays into hadrons (τ_h), and ℓ (e or μ) include ℓ from τ decays (τ_ℓ). The result is consistent with lepton universality.

³ ABULENCIA 06R looked for $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau\nu_\tau)b\bar{b}$ events in 194 pb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. 2 events are found where 1.00 ± 0.17 signal and 1.29 ± 0.25 background events are expected, giving a 95% CL upper bound for the partial width ratio $\Gamma(t \rightarrow \tau\nu q) / \Gamma_{SM}(t \rightarrow \tau\nu q) < 5.2$.

⁴ ABE 97V searched for $t\bar{t} \rightarrow (\ell\nu_\ell)(\tau\nu_\tau)b\bar{b}$ events in 109 pb⁻¹ of $p\bar{p}$ collisions at $\sqrt{s} = 1.8$ TeV. They observed 4 candidate events where one expects ~ 1 signal and ~ 2 background events. Three of the four observed events have jets identified as b candidates.

¹ AAD 20B based on 81 fb⁻¹ of data in pp collisions at $\sqrt{s} = 13$ TeV. FCNC through single top production in association with a photon is searched for in the mode $\ell\gamma + E_T + 1j$ (b -tag). Anomalous FCNC left-handed and right-handed couplings are searched for, which result in different kinematical properties of top decay such as the lepton distribution. Limits are set on the $tq\gamma$ couplings in an effective field theory.

² KHACHATRYAN 16AS based on 19.8 fb⁻¹ of data in pp collisions at $\sqrt{s} = 8$ TeV. FCNC through single top production in association with a photon is searched for in the mode $\mu + \gamma + E_T + \geq 1j$ (0,1b). Bounds on the anomalous FCNC couplings are given by $\kappa_{t u \gamma} < 0.025$ and $\kappa_{t c \gamma} < 0.091$.

³ CHEKANOV 03 looked for single top production via FCNC in the reaction $e^\pm p \rightarrow e^\pm (t$ or $\bar{t}) X$ in 130.1 pb⁻¹ of data at $\sqrt{s} = 300$ –318 GeV. No evidence for top production and its decay into bW was found. The result is obtained for $m_t = 175$ GeV when $B(\gamma c) = B(\gamma u) = 0$, where q is a u or c quark. Bounds on the effective $t-u-\gamma$ and $t-u-Z$ couplings are found in their Fig. 4. The conversion to the constraint listed is from private communication, E. Gallo, January 2004.

⁴ AARON 09A looked for single top production via FCNC in $e^\pm p$ collisions at HERA with 474 pb⁻¹. The upper bound of the cross section gives the bound on the FCNC coupling $\kappa_{t u \gamma} / \Lambda < 1.03$ TeV⁻¹, which corresponds to the result for $m_t = 175$ GeV.

⁵ ABDALLAH 04c looked for single top production via FCNC in the reaction $e^+ e^- \rightarrow \bar{t} c$ or $\bar{t} u$ in 541 pb⁻¹ of data at $\sqrt{s} = 189$ –208 GeV. No deviation from the SM is found, which leads to the bound on $B(t \rightarrow \gamma q)$, where q is a u or a c quark, for $m_t = 175$ GeV when $B(t \rightarrow Zq) = 0$ is assumed. The conversion to the listed bound is from private communication, O. Yushchenko, April 2005. The bounds on the effective $t-q-\gamma$ and $t-q-Z$ couplings are given in their Fig. 7 and Table 4, for $m_t = 170$ –180 GeV, where most conservative bounds are found by choosing the chiral couplings to maximize the negative interference between the virtual γ and Z exchange amplitudes.

⁶ AKTAS 04 looked for single top production via FCNC in e^\pm collisions at HERA with 118.3 pb⁻¹, and found 5 events in the e or μ channels. By assuming that they are due to statistical fluctuation, the upper bound on the $t u \gamma$ coupling $\kappa_{t u \gamma} < 0.27$ (95% CL) is obtained. The conversion to the partial width limit, when $B(\gamma c) = B(Zu) = B(Zc) = 0$, is from private communication, E. Perez, May 2005.

⁷ ACHARD 02J looked for single top production via FCNC in the reaction $e^+ e^- \rightarrow \bar{t} c$ or $\bar{t} u$ in 634 pb⁻¹ of data at $\sqrt{s} = 189$ –209 GeV. No deviation from the SM is found, which leads to a bound on the top-quark decay branching fraction $B(\gamma q)$, where q is a u or c quark. The bound assumes $B(Zq) = 0$ and is for $m_t = 175$ GeV; bounds for $m_t = 170$ GeV and 180 GeV and $B(Zq) \neq 0$ are given in Fig. 5 and Table 7.

⁸ ABE 98G looked for $t\bar{t}$ events where one t decays into $q\gamma$ while the other decays into bW . The quoted bound is for $\Gamma(\gamma q)/\Gamma(Wb)$.

- ¹Based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. The final states $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu$ + jets ($\ell, \ell' = e, \mu$) are investigated and no significant excess over the SM background contributions is observed.
- ²SIRUNYAN 17E based on 19.7 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The final states $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu$ + jets ($\ell, \ell' = e, \mu$) are investigated and the cross section $\sigma(pp \rightarrow tZq \rightarrow \ell\nu b\ell^+ \ell^- q) = 10^{+8}_{-7} \text{ fb}$ is measured, giving no sign of FCNC decays of the top quark.
- ³AAD 16D based on 20.3 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The FCNC decay is searched for in $t\bar{t}$ events in the final state $(bW)(qZ)$ when both W and Z decay leptonically, giving 3 charged leptons.
- ⁴CHATRCHYAN 14S combined search limit from this and CHATRCHYAN 13F data.
- ⁵Based on 19.7 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The flavor changing decay is searched for in $t\bar{t}$ events in the final state $(bW)(qZ)$ when both W and Z decay leptonically, giving 3 charged leptons.
- ⁶Based on 5.0 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. Search for FCNC decays of the top quark in $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu$ + jets ($\ell, \ell' = e, \mu$) final states found no excess of signal events.
- ⁷Based on 2.1 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$.
- ⁸Based on 4.1 fb^{-1} of data. ABAZOV 11M searched for FCNC decays of the top quark in $t\bar{t} \rightarrow \ell^+ \ell^- \ell'^{\pm} \nu$ + jets ($\ell, \ell' = e, \mu$) final states, and absence of the signal gives the bound.
- ⁹Based on $p\bar{p}$ data of 1.52 fb^{-1} . AALTONEN 09AL compared $t\bar{t} \rightarrow WbWb \rightarrow \ell\nu bjjb$ and $t\bar{t} \rightarrow ZcWb \rightarrow \ell\ell jjb$ decay chains, and absence of the latter signal gives the bound. The result is for 100% longitudinally polarized Z boson and the theoretical $t\bar{t}$ production cross section. The results for different Z polarizations and those without the cross section assumption are given in their Table XII.
- ¹⁰Result is based on 1.9 fb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. $t\bar{t} \rightarrow WbZq \text{ or } ZqZq$ processes have been looked for in $Z + \geq 4$ jet events with and without b -tag. No signal leads to the bound $B(t \rightarrow Zq) < 0.037 (0.041)$ for $m_t = 175 (170) \text{ GeV}$.
- ¹¹ABDALLAH 04C looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{T}c \text{ or } \bar{T}u$ in 541 pb^{-1} of data at $\sqrt{s} = 189\text{--}208 \text{ GeV}$. No deviation from the SM is found, which leads to the bound on $B(t \rightarrow Zq)$, where q is a u or c quark, for $m_t = 175 \text{ GeV}$ when $B(t \rightarrow \gamma q) = 0$ is assumed. The conversion to the listed bound is from private communication, O. Yushchenko, April 2005. The bounds on the effective t - q - γ and t - q - Z couplings are given in their Fig. 7 and Table 4, for $m_t = 170\text{--}180 \text{ GeV}$, where most conservative bounds are found by choosing the chiral couplings to maximize the negative interference between the virtual γ and Z exchange amplitudes.
- ¹²ACHARD 02J looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{T}c \text{ or } \bar{T}u$ in 634 pb^{-1} of data at $\sqrt{s} = 189\text{--}209 \text{ GeV}$. No deviation from the SM is found, which leads to a bound on the top-quark decay branching fraction $B(Zq)$, where q is a u or c quark. The bound assumes $B(\gamma q) = 0$ and is for $m_t = 175 \text{ GeV}$; bounds for $m_t = 170 \text{ GeV}$ and 180 GeV and $B(\gamma q) \neq 0$ are given in Fig. 5 and Table 7. Table 6 gives constraints on t - c - e four-fermi contact interactions.
- ¹³HEISTER 02Q looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{T}c \text{ or } \bar{T}u$ in 214 pb^{-1} of data at $\sqrt{s} = 204\text{--}209 \text{ GeV}$. No deviation from the SM is found, which leads to a bound on the branching fraction $B(Zq)$, where q is a u or c quark. The bound assumes $B(\gamma q) = 0$ and is for $m_t = 174 \text{ GeV}$. Bounds on the effective t - $(c \text{ or } u)$ - γ and t - $(c \text{ or } u)$ - Z couplings are given in their Fig. 2.
- ¹⁴ABBIENDI 01T looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{T}c \text{ or } \bar{T}u$ in 600 pb^{-1} of data at $\sqrt{s} = 189\text{--}209 \text{ GeV}$. No deviation from the SM is found, which leads to bounds on the branching fractions $B(Zq)$ and $B(\gamma q)$, where q is a u or c quark. The result is obtained for $m_t = 174 \text{ GeV}$. The upper bound becomes 9.7% (20.6%) for $m_t = 169 (179) \text{ GeV}$. Bounds on the effective t - $(c \text{ or } u)$ - γ and t - $(c \text{ or } u)$ - Z couplings are given in their Fig. 4.
- ¹⁵BARATE 00S looked for single top production via FCNC in the reaction $e^+e^- \rightarrow \bar{T}c \text{ or } \bar{T}u$ in 411 pb^{-1} of data at c.m. energies between 189 and 202 GeV. No deviation from the SM is found, which leads to a bound on the branching fraction. The bound assumes $B(\gamma q) = 0$. Bounds on the effective t - $(c \text{ or } u)$ - γ and t - $(c \text{ or } u)$ - Z couplings are given in their Fig. 4.
- ¹⁶ABE 98G looked for $t\bar{t}$ events where one t decays into three jets and the other decays into qZ with $Z \rightarrow \ell\ell$. The quoted bound is for $\Gamma(Zq)/\Gamma(Wb)$.

- ¹AABOUD 17BB based on 20.2 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 8 \text{ TeV}$. Triple-differential decay rate of top quark in the t -channel single-top production is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. No assumption is made for the other couplings. See this paper for constraints on other couplings not included here. The paper reported f_1 , and we converted it to F_0 .
- ²KHACHATRYAN 16BU based on 19.8 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 8 \text{ TeV}$ using $t\bar{t}$ events with $\ell + E_T + \geq 4$ jets ($\geq 2 b$). The errors of F_0 and F_{\pm} are correlated with a correlation coefficient $\rho(F_0, F_{\pm}) = -0.87$. The result is consistent with the NNLO SM prediction of 0.687 ± 0.005 for $m_t = 172.8 \pm 1.3 \text{ GeV}$.
- ³Based on 8.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ using $t\bar{t}$ events with $\ell + E_T + \geq 4$ jets ($\geq 1 b$), and under the constraint $F_0 + F_{\pm} + F_{\mp} = 1$. The statistical errors of F_0 and F_{\pm} are correlated with correlation coefficient $\rho(F_0, F_{\pm}) = -0.69$.
- ⁴Based on 5.0 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 13BH studied tt events with large E_T and $\ell + \geq 4$ jets using a constrained kinematic fit.
- ⁵Based on 1.04 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 7 \text{ TeV}$. AAD 12BG studied tt events with large E_T and either $\ell + \geq 4j$ or $\ell\ell + \geq 2j$. The uncertainties are not independent, $\rho(F_0, F_{\pm}) = -0.96$.
- ⁶Based on 2.7 and 5.1 fb^{-1} of CDF data in $\ell +$ jets and dilepton channels, and 5.4 fb^{-1} of D0 data in $\ell +$ jets and dilepton channels. $F_0 = 0.682 \pm 0.035 \pm 0.046$ if $F_{\pm} = 0.0017(1)$, while $F_{\pm} = -0.015 \pm 0.018 \pm 0.030$ if $F_0 = 0.688(4)$, where the assumed fixed values are the SM prediction for $m_t = 173.3 \pm 1.1 \text{ GeV}$ and $m_W = 80.399 \pm 0.023 \text{ GeV}$.
- ⁷Results are based on 5.4 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV , including those of ABAZOV 08B. Under the SM constraint of $f_0 = 0.698$ (for $m_t = 173.3 \text{ GeV}$, $m_W = 80.399 \text{ GeV}$), $f_{\pm} = 0.010 \pm 0.022 \pm 0.030$ is obtained.
- ⁸AFFOLDER 00B studied the angular distribution of leptonic decays of W bosons in $t \rightarrow Wb$ events. The ratio F_0 is the fraction of the helicity zero (longitudinal) W bosons in the decaying top quark rest frame. $B(t \rightarrow W_{\pm} b)$ is the fraction of positive helicity (right-handed) positive charge W bosons in the top quark decays. It is obtained by assuming the Standard Model value of F_0 .
- ⁹Results are based on 2.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. F_0 result is obtained by assuming $F_{\pm} = 0$, while F_{\pm} result is obtained for $F_0 = 0.70$, the SM value. Model independent fits for the two fractions give $F_0 = 0.88 \pm 0.11 \pm 0.06$ and $F_{\pm} = -0.15 \pm 0.07 \pm 0.06$ with correlation coefficient of -0.59 . The results are for $m_t = 175 \text{ GeV}$.
- ¹⁰Results are based on 1.9 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. F_0 result is obtained assuming $F_{\pm} = 0$, while F_{\pm} result is obtained for $F_0 = 0.70$, the SM values.

Model independent fits for the two fractions give $F_0 = 0.66 \pm 0.16 \pm 0.05$ and $F_{\pm} = -0.03 \pm 0.06 \pm 0.03$.

- ¹¹Based on 1 fb^{-1} at $\sqrt{s} = 1.96 \text{ TeV}$.
- ¹²Based on 318 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$.
- ¹³Based on 200 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. $t \rightarrow Wb \rightarrow \ell\nu b$ ($\ell = e$ or μ). The errors are stat + syst.
- ¹⁴ABAZOV 05G studied the angular distribution of leptonic decays of W bosons in $t\bar{t}$ candidate events with lepton + jets final states, and obtained the fraction of longitudinally polarized W under the constraint of no right-handed current, $F_{\pm} = 0$. Based on 125 pb^{-1} of data at $\sqrt{s} = 1.8 \text{ TeV}$.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹AABOUD 17BB based on 20.2 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 8 \text{ TeV}$. Triple-differential decay rate of top quark in the t -channel single-top production is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. No assumption is made for the other couplings. The authors reported $f_1 = 0.30 \pm 0.05$ and $f_1^{\pm} < 0.120$ which we converted to $F_{+} = f_1 f_1^{\pm}$. See this paper for constraints on other couplings not included here.
- ²KHACHATRYAN 16BU based on 19.8 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 8 \text{ TeV}$ using $t\bar{t}$ events with $\ell + E_T + \geq 4$ jets ($\geq 2 b$). The result is consistent with the NNLO SM prediction of 0.0017 ± 0.0001 for $m_t = 172.8 \pm 1.3 \text{ GeV}$.
- ³Based on 8.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$ using $t\bar{t}$ events with $\ell + E_T + \geq 4$ jets ($\geq 1 b$), and under the constraint $F_0 + F_{\pm} + F_{\mp} = 1$. The statistical errors of F_0 and F_{\pm} are correlated with correlation coefficient $\rho(F_0, F_{\pm}) = -0.69$.
- ⁴Based on 5.0 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 7 \text{ TeV}$. CHATRCHYAN 13BH studied tt events with large E_T and $\ell + \geq 4$ jets using a constrained kinematic fit.
- ⁵Based on 1.04 fb^{-1} of $p\bar{p}$ data at $\sqrt{s} = 7 \text{ TeV}$. AAD 12BG studied tt events with large E_T and either $\ell + \geq 4j$ or $\ell\ell + \geq 2j$.
- ⁶Results are based on 5.4 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV , including those of ABAZOV 08B. Under the SM constraint of $f_0 = 0.698$ (for $m_t = 173.3 \text{ GeV}$, $m_W = 80.399 \text{ GeV}$), $f_{\pm} = 0.010 \pm 0.022 \pm 0.030$ is obtained.
- ⁷AFFOLDER 00B studied the angular distribution of leptonic decays of W bosons in $t \rightarrow Wb$ events. The ratio F_0 is the fraction of the helicity zero (longitudinal) W bosons in the decaying top quark rest frame. $B(t \rightarrow W_{\pm} b)$ is the fraction of positive helicity (right-handed) positive charge W bosons in the top quark decays. It is obtained by assuming the Standard Model value of F_0 .
- ⁸Based on 2.7 and 5.1 fb^{-1} of CDF data in $\ell +$ jets and dilepton channels, and 5.4 fb^{-1} of D0 data in $\ell +$ jets and dilepton channels. $F_0 = 0.682 \pm 0.035 \pm 0.046$ if $F_{\pm} = 0.0017(1)$, while $F_{\pm} = -0.015 \pm 0.018 \pm 0.030$ if $F_0 = 0.688(4)$, where the assumed

fixed values are the SM prediction for $m_t = 173.3 \pm 1.1$ GeV and $m_W = 80.399 \pm 0.023$ GeV.

9 Results are based on 2.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. F_0 result is obtained by assuming $F_{\pm} = 0$, while F_{\pm} result is obtained for $F_0 = 0.70$, the SM value. Model independent fits for the two fractions give $F_0 = 0.88 \pm 0.11 \pm 0.06$ and $F_{\pm} = -0.15 \pm 0.07 \pm 0.06$ with correlation coefficient of -0.59 . The results are for $m_t = 175$ GeV.

10 Results are based on 1.9 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV. F_0 result is obtained assuming $F_{\pm} = 0$, while F_{\pm} result is obtained for $F_0 = 0.70$, the SM values. Model independent fits for the two fractions give $F_0 = 0.66 \pm 0.16 \pm 0.05$ and $F_{\pm} = -0.03 \pm 0.06 \pm 0.03$.

11 Based on 1 fb^{-1} at $\sqrt{s} = 1.96$ TeV.

12 Based on 370 pb^{-1} of data at $\sqrt{s} = 1.96$ TeV, using the $\ell +$ jets and dilepton decay channels. The result assumes $F_0 = 0.70$, and it gives $F_{\pm} < 0.23$ at 95% CL.

13 Based on 318 pb^{-1} of data at $\sqrt{s} = 1.96$ TeV.

14 Based on 200 pb^{-1} of data at $\sqrt{s} = 1.96$ TeV. $t \rightarrow Wb \rightarrow \ell\nu b$ ($\ell = e$ or μ). The errors are stat + syst.

15 ABAZOV 05L studied the angular distribution of leptonic decays of W bosons in $t\bar{t}$ events, where one of the W's from t or \bar{t} decays into e or μ and the other decays hadronically. The fraction of the "+" helicity W boson is obtained by assuming $F_0 = 0.7$, which is the generic prediction for any linear combination of V and A currents. Based on $230 \pm 15 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.96$ TeV.

16 ACOSTA 05D measures the $m_{\ell^+ b^-}$ distribution in $t\bar{t}$ production events where one or both W's decay leptonically to $\ell = e$ or μ , and finds a bound on the V+A coupling of the tbW vertex. By assuming the SM value of the longitudinal W fraction $F_0 = B(t \rightarrow W_0 b) = 0.70$, the bound on F_{\pm} is obtained. If the results are combined with those of AFFOLDER 00B, the bounds become $F_{V+A} < 0.61$ (95% CL) and $F_{\pm} < 0.18$ (95% CL), respectively. Based on $109 \pm 7 \text{ pb}^{-1}$ of data at $\sqrt{s} = 1.8$ TeV (run I).

1 AABOUD 17BB based on 20.2 fb^{-1} of pp data at $\sqrt{s} = 8$ TeV. Triple-differential decay rate of top quark is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. No assumption is made for the other couplings. See this paper for constraints on other couplings not included here.

2 KHACHATRYAN 17G based on 5.0 and 19.7 fb^{-1} of pp data at $\sqrt{s} = 7$ and 8 TeV, respectively. A Bayesian neural network technique is used to discriminate between signal and backgrounds. This is a 95% CL exclusion limit obtained by a three-dimensional fit with simultaneous variation of (f_1^L, f_1^R, f_2^R).

3 Based on 1.04 fb^{-1} of pp data at $\sqrt{s} = 7$ TeV. AAD 12BG studied tt events with large E_T and either $\ell + \geq 4j$ or $\ell\ell + \geq 2j$.

4 Based on 5.4 fb^{-1} of data. For each value of the form factor quoted the other two are assumed to have their SM value. Their Fig. 4 shows two-dimensional posterior probability density distributions for the anomalous couplings.

5 Based on 5.4 fb^{-1} of data in p̄p collisions at 1.96 TeV. Results are obtained by combining the limits from the W helicity measurements and those from the single top quark production.

6 Based on 1 fb^{-1} of data at p̄p collisions $\sqrt{s} = 1.96$ TeV. Combined result of the W helicity measurement in t̄t events (ABAZOV 08B) and the search for anomalous tbW couplings in the single top production (ABAZOV 08AI). Constraints when f₁^L and one of the anomalous couplings are simultaneously allowed to vary are given in their Fig. 1 and Table 1.

7 Result is based on 0.9 fb^{-1} of data at $\sqrt{s} = 1.96$ TeV. Single top quark production events are used to measure the Lorentz structure of the tbW coupling. The upper bounds on the non-standard couplings are obtained when only one non-standard coupling is allowed to be present together with the SM one, f₁^L = V_{t b}^{*}.

1 ABAZOV 16A based on 9.7 fb^{-1} of data. A matrix element method is used. It corresponds to evidence of spin correlation at 4.2σ and is in agreement with the NLO SM prediction $0.80^{+0.01}_{-0.02}$.

2 This is a combination of the lepton + jets analysis presented in ABAZOV 12B and the dilepton measurement of ABAZOV 11AE. It provides a 3.1σ evidence for the $t\bar{t}$ spin correlation.

3 Based on 5.3 fb^{-1} of data. The error is statistical and systematic combined. A matrix element method is used.

4 Based on 4.3 fb^{-1} of data. The measurement is based on the angular study of the top quark decay products in the helicity basis. The theory prediction is $\kappa \approx 0.40$.

5 Based on 5.4 fb^{-1} of data using a matrix element method. The error is statistical and systematic combined. The no-correlation hypothesis is excluded at the 97.7% CL.

6 Based on 5.4 fb^{-1} of data. The error is statistical and systematic combined. The NLO QCD prediction is $C = 0.78 \pm 0.03$. The neutrino weighting method is used for reconstruction of kinematics.

Spin Correlation in $t\bar{t}$ Production in pp Collisions

Spin correlation, f_{SM} , measures the strength of the correlation between the spins of the pair produced $t\bar{t}$. $f_{SM} = 1$ for the SM, while $f_{SM} = 0$ for no spin correlation.

1 SIRUNYAN 19bx based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. A set of parton-level normalized differential cross sections sensitive to coefficients of the spin-dependent $t\bar{t}$ production density matrix is measured. The distributions and coefficients are compared with the NLO MC simulations and with the NLO QCD calculation including EW corrections. Three errors are from statistics, experimental systematics, and theory.

2 KHACHATRYAN 16AI based on 19.5 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$, using lepton angular distributions as a function of the $t\bar{t}$ -system kinematical variables.

3 KHACHATRYAN 16x based on 19.7 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. Uses a template fit method. Spin correlation strength in the helicity basis is given by $A_{\text{hel}} = 0.23 \pm 0.03^{+0.05}_{-0.04}$.

4 AAD 15J based on 20.3 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. Uses a fit including a linear superposition of $\Delta\phi$ distribution from the SM NLO simulation with coefficient f_{SM} and from $t\bar{t}$ simulation without spin correlation with coefficient $(1 - f_{SM})$.

5 Based on 4.6 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. The results are for $m_t = 172.5 \text{ GeV}$.

6 The S-ratio is defined as the SM spin correlation in the like-helicity gluon-gluon collisions normalized to the no spin correlation case; see eq. (6) for the LO expression.

7 The polar angle correlation along the helicity axis.

8 The polar angle correlation along the direction which maximizes the correlation.

1 KHACHATRYAN 17G based on 5.0 and 19.7 fb^{-1} of pp data at $\sqrt{s} = 7$ and 8 TeV , respectively. t -channel single top production is used. The result corresponds to $B(t \rightarrow ug) < 2.0 \times 10^{-5}$ or $B(t \rightarrow cg) < 4.1 \times 10^{-4}$.

2 AAD 16As based on 20.3 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The results are obtained from the 95% CL upper limit on the single top-quark production $\sigma(qg \rightarrow t)\text{-}B(t \rightarrow bW) < 3.4 \text{ pb}$, $B(t \rightarrow ug) < 4.0 \times 10^{-5}$ and $B(t \rightarrow cg) < 20 \times 10^{-5}$.

3 Based on 2.05 fb^{-1} of pp data at $\sqrt{s} = 7 \text{ TeV}$. The results are obtained from the 95% CL upper limit on the single top-quark production $\sigma(qg \rightarrow t)\text{-}B(t \rightarrow bW) < 3.9 \text{ pb}$, for $q=u$ or $q=c$, $B(t \rightarrow ug) < 5.7 \times 10^{-5}$ and $B(t \rightarrow cg) < 2.7 \times 10^{-4}$.

4 Based on 2.3 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Upper limit of single top quark production cross section 0.20 pb and 0.27 pb via FCNC t - u - g and t - c - g couplings, respectively, lead to the bounds without assuming the absence of the other coupling. $B(t \rightarrow u + g) < 2.0 \times 10^{-4}$ and $B(t \rightarrow c + g) < 3.9 \times 10^{-3}$ follow.

5 Based on 2.2 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Upper limit of single top quark production cross section $\sigma(u(c) + g \rightarrow t) < 1.8 \text{ pb}$ (95% CL) via FCNC t - u - g and t - c - g couplings lead to the bounds. $B(t \rightarrow u + g) < 3.9 \times 10^{-4}$ and $B(t \rightarrow c + g) < 5.7 \times 10^{-3}$ follow.

6 Result is based on 230 pb^{-1} of data at $\sqrt{s} = 1.96 \text{ TeV}$. Absence of single top quark production events via FCNC t - u - g and t - c - g couplings lead to the upper bounds on the dimensioned couplings, κ_t^{tug}/Λ and κ_t^{dug}/Λ , respectively.

t-Quark Yukawa Coupling from $t\bar{t}$ Kinematic Distributions in pp Collisions

The ratio of t -quark Yukawa coupling to its standard model predicted value.

1 SIRUNYAN 19R based on 35.9 fb^{-1} of pp data at 13 TeV . Multivariate techniques are employed to separate the signal from the dominant $t\bar{t}$ +jets background. The result is for $m_H = 125 \text{ GeV}$. The measured ratio corresponds to a signal significance of 1.6σ above the background-only hypothesis.

2 SIRUNYAN 18BD based on 35.9 fb^{-1} of pp data at 13 TeV . A combined fit of signal and background templates to data is performed in six event categories separated by jet and b -jet multiplicities. An upper limit of 3.8 is obtained for the cross section ratio.

3 SIRUNYAN 18L based on up to $5.1, 19.7,$ and 35.9 fb^{-1} of pp data at $7, 8,$ and 13 TeV , respectively. An excess of events is observed, with a significance of 5.2 standard deviations, over the expectation from the background-only hypothesis. The result is for the Higgs boson mass of 125.09 GeV .

4 Based on 4.5 fb^{-1} of data at 7 TeV and 20.3 fb^{-1} at 8 TeV . The result is for $m_H = 125.4 \text{ GeV}$. The measurement constrains the top quark Yukawa coupling strength parameter $\kappa_t = Y_t/Y_t^{SM}$ to be $-1.3 < \kappa_t < 8.0$ (95% CL).

See key on page 999

t

⁵ Based on 5.1 fb⁻¹ of pp data at 7 TeV and 19.7 fb⁻¹ at 8 TeV. The results are obtained by assuming the SM decay branching fractions for the Higgs boson of mass 125.6 GeV. The signal strength for individual Higgs decay channels are given in Fig. 13, and the preferred region in the (κ_V, κ_f) space is given in Fig. 14.

- ¹ AALTONEN 16 based on 9.5 fb⁻¹ of data. This includes, as a part, the result of AALTONEN 14K. Combination of this result with that of AALTONEN 14o gives a s + t cross section of $3.02^{+0.49}_{-0.48}$ pb and $|V_{tb}| > 0.84$ (95% CL).
- ² AALTONEN 15H based on 9.7 fb⁻¹ of data per experiment. The result is for $m_t = 172.5$ GeV, and is a combination of the CDF measurements (AALTONEN 16) and the D0 measurements (ABAZOV 13o) on the t-channel single top-quark production cross section. The result is consistent with the NLO+NNLL SM prediction and gives $|V_{tb}| = 1.02^{+0.06}_{-0.05}$ and $|V_{tb}| > 0.92$ (95% CL).
- ³ AALTONEN 15H is a combined measurement of s-channel single top cross section by CDF + D0. AALTONEN 14M is not included.
- ⁴ Based on 9.45 fb⁻¹ of data, using neural networks to separate signal from backgrounds. The result is for $m_t = 172.5$ GeV. Combination of this result with the CDF measurement in the 1 lepton channel AALTONEN 14K gives $1.36^{+0.37}_{-0.32}$ pb, consistent with the SM prediction, and is 4.2 sigma away from the background only hypothesis.
- ⁵ Based on 9.4 fb⁻¹ of data, using neural networks to separate signal from backgrounds. The result is for $m_t = 172.5$ GeV. The result is 3.8 sigma away from the background only hypothesis.

⁶ Based on 9.7 fb⁻¹ of data per experiment. The result is for $m_t = 172.5$ GeV, and is a combination of the CDF measurements AALTONEN 14L, AALTONEN 14K and the D0 measurement ABAZOV 13o on the s-channel single top-quark production cross section. The result is consistent with the SM prediction of 1.05 ± 0.06 pb and the significance of the observation is of 6.3 standard deviations.

⁷ Based on 7.5 fb⁻¹ of data. Neural network is used to discriminate signals (s-, t- and Wt-channel single top production) from backgrounds. The result is consistent with the SM prediction, and gives $|V_{tb}| = 0.95 \pm 0.09$ (stat + syst) ± 0.05 (theory) and $|V_{tb}| > 0.78$ (95% CL). The result is for $m_t = 172.5$ GeV.

⁸ Based on 9.7 fb⁻¹ of data. Events with $\ell + \mathcal{E}_T + 2$ or 3 jets (1 or 2 b-tag) are analysed, assuming $m_t = 172.5$ GeV. The combined s- + t-channel cross section gives $|V_{tb} f_1^L| = 1.12^{+0.09}_{-0.08}$, or $|V_{tb}| > 0.92$ at 95% CL for $f_1^L = 1$ and a flat prior within $0 \leq |V_{tb}|^2 \leq 1$.

⁹ Based on 5.4 fb⁻¹ of data. The error is statistical + systematic combined. The results are for $m_t = 172.5$ GeV. Results for other m_t values are given in Table 2 of ABAZOV 11AA.

¹⁰ Based on 5.4 fb⁻¹ of data and for $m_t = 172.5$ GeV. The error is statistical + systematic combined. Results for other m_t values are given in Table III of ABAZOV 11AD. The result is obtained by assuming the SM ratio between $t\bar{b}$ (s-channel) and $tq\bar{b}$ (t-channel) productions, and gives $|V_{tb} f_1^L| = 1.02^{+0.10}_{-0.11}$, or $|V_{tb}| > 0.79$ at 95% CL for a flat prior within $0 < |V_{tb}|^2 < 1$.

¹¹ Based on 3.2 fb⁻¹ of data. For combined s- + t-channel result see AALTONEN 09AT.

¹² Result is based on 2.1 fb⁻¹ of data. Events with large missing E_T and jets with at least one b-jet without identified electron or muon are selected. Result is obtained when observed 2.1 σ excess over the background originates from the signal for $m_t = 175$ GeV, giving $|V_{tb}| = 1.24^{+0.34}_{-0.29} \pm 0.07$ (theory).

¹³ Result is based on 2.3 fb⁻¹ of data. Events with isolated $\ell + \mathcal{E}_T + 2, 3, 4$ jets with one or two b-tags are selected. The analysis assumes $m_t = 170$ GeV.

¹⁴ Result is based on 4.8 fb⁻¹ of data. Events with an isolated reconstructed tau lepton, missing $E_T + 2, 3$ jets with one or two b-tags are selected. When combined with ABAZOV 09Z result for e + μ channels, the s- and t-channels combined cross section is $3.84^{+0.89}_{-0.83}$ pb.

¹⁵ Based on 3.2 fb⁻¹ of data. Events with isolated $\ell + \mathcal{E}_T$ + jets with at least one b-tag are analyzed and s- and t-channel single top events are selected by using the likelihood function, matrix element, neural-network, boosted decision tree, likelihood function optimized for s-channel process, and neural-network based analysis of events with \mathcal{E}_T that has sensitivity for $W \rightarrow \tau\nu$ decays. The result is for $m_t = 175$ GeV, and the mean value decreases by 0.02 pb/GeV for smaller m_t . The signal has 5.0 sigma significance. The result gives $|V_{tb}| = 0.91 \pm 0.11$ (stat+syst) ± 0.07 (theory), or $|V_{tb}| > 0.71$ at 95% CL.

¹⁶ Based on 2.3 fb⁻¹ of data. Events with isolated $\ell + \mathcal{E}_T + \geq 2$ jets with 1 or 2 b-tags are analyzed and s- and t-channel single top events are selected by using boosted decision tree, Bayesian neural networks and the matrix element method. The signal has 5.0 sigma significance. The result gives $|V_{tb}| = 1.07 \pm 0.12$, or $|V_{tb}| > 0.78$ at 95% CL. The analysis assumes $m_t = 170$ GeV.

¹⁷ Result is based on 2.2 fb⁻¹ of data. Events with isolated $\ell + \mathcal{E}_T + 2, 3$ jets with at least one b-tag are selected, and s- and t-channel single top events are selected by using likelihood, matrix element, and neural network discriminants. The result can be interpreted as $|V_{tb}| = 0.88^{+0.13}_{-0.12}$ (stat + syst) ± 0.07 (theory), and $|V_{tb}| > 0.66$ (95% CL) under the $|V_{tb}| < 1$ constraint.

¹⁸ Result is based on 0.9 fb⁻¹ of data. Events with isolated $\ell + \mathcal{E}_T + 2, 3, 4$ jets with one or two b-vertex-tag are selected, and contributions from W + jets, $t\bar{t}$, s- and t-channel single top events are identified by using boosted decision trees, Bayesian neural networks, and matrix element analysis. The result can be interpreted as the measurement of the CKM matrix element $|V_{tb}| = 1.31^{+0.25}_{-0.21}$, or $|V_{tb}| > 0.68$ (95% CL) under the $|V_{tb}| < 1$ constraint.

¹⁹ Result is based on 0.9 fb⁻¹ of data. This result constrains V_{tb} to $0.68 < |V_{tb}| \leq 1$ at 95% CL.

²⁰ ABAZOV 05P bounds single top-quark production from either the s-channel W-exchange process, $q'\bar{q} \rightarrow t\bar{b}$, or the t-channel W-exchange process, $q'g \rightarrow qt\bar{b}$, based on ~ 230 pb⁻¹ of data.

²¹ ACOSTA 05N bounds single top-quark production from the t-channel W-exchange process ($q'g \rightarrow qt\bar{b}$), the s-channel W-exchange process ($q'\bar{q} \rightarrow t\bar{b}$), and from the combined cross section of t- and s-channel. Based on ~ 162 pb⁻¹ of data.

t-channel Single t Production Cross Section in p Collisions at $\sqrt{s} = 7$ TeV

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹ AABOUD 19R based on 1.17 to 5.1 fb⁻¹ of data from ATLAS and CMS at 7 TeV.
- ² Based on 4.9 fb⁻¹ of data, using neural networks for signal and background separation. $\sigma(tq) = 46 \pm 1 \pm 6$ pb and $\sigma(\bar{t}q) = 23 \pm 1 \pm 3$ pb are separately measured, as well as their ratio $R = \sigma(tq)/\sigma(\bar{t}q) = 2.04 \pm 0.13 \pm 0.12$. The results are for $m_t = 172.5$ GeV, and those for other m_t values are given by eq.(4) and Table IV. The measurements give $|V_{tb}| = 1.02 \pm 0.07$ or $|V_{tb}| > 0.88$ (95% CL).
- ³ Based on 1.04 fb⁻¹ of data. The result gives $|V_{tb}| = 1.13^{+0.14}_{-0.13}$ from the ratio $\sigma(\text{exp})/\sigma(\text{th})$, where $\sigma(\text{th})$ is the SM prediction for $|V_{tb}| = 1$. The 95% CL lower bound of $|V_{tb}| > 0.75$ is found if $|V_{tb}| < 1$ is assumed. $\sigma(t) = 59^{+18}_{-16}$ pb and $\sigma(\bar{t}) = 33^{+13}_{-12}$ pb are found for the separate single t and \bar{t} production cross sections, respectively. The results assume $m_t = 172.5$ GeV for the acceptance.

Quark Particle Listings

t

⁴ Based on 1.17 fb^{-1} of data for $\ell = \mu$, 1.56 fb^{-1} of data for $\ell = e$ at 7 TeV collected during 2011. The result gives $|V_{tb}| = 1.020 \pm 0.046(\text{meas}) \pm 0.017(\text{th})$. The 95% CL lower bound of $|V_{tb}| > 0.92$ is found if $|V_{tb}| < 1$ is assumed. The results assume $m_t = 172.5 \text{ GeV}$ for the acceptance.

⁵ Based on 36 pb^{-1} of data. The first error is statistical + systematic combined, the second is luminosity. The result gives $|V_{tb}| = 1.114 \pm 0.22(\text{exp}) \pm 0.02(\text{th})$ from the ratio $\sigma(\text{exp})/\sigma(\text{th})$, where $\sigma(\text{th})$ is the SM prediction for $|V_{tb}| = 1$. The 95% CL lower bound of $|V_{tb}| > 0.62$ (0.68) is found from the 2D (BDT) analysis under the constraint $0 < |V_{tb}|^2 < 1$.

t-channel Single t Production Cross Section in pp Collisions at $\sqrt{s} = 8 \text{ TeV}$

VALUE (pb)	DOCUMENT ID	TECN	COMMENT
•••	•••	•••	•••
87.7 ± 5.8	¹ AABOUD	19R LHC	combination of ATLAS+CMS
$89.6^{+7.1}_{-6.3}$	² AABOUD	17T ATLS	$\ell + \cancel{E}_T + 2 j$ (1b j)
$83.6 \pm 2.3 \pm 7.4$	³ KHACHATRYAN...14F	CMS	$\ell + \cancel{E}_T + \geq 2 j$ (1,2 b, 1 forward j)

¹ AABOUD 19R based on 12.2 to 20.3 fb^{-1} of data from ATLAS and CMS at 8 TeV.
² AABOUD 17T based on 20.2 fb^{-1} of data. A maximum-likelihood fit to neural-network discriminant distributions is used to separate signal and background events. Individual cross sections are measured as $\sigma(tq) = 56.7^{+4.3}_{-3.8} \text{ pb}$ and $\sigma(\bar{t}q) = 32.9^{+3.0}_{-2.7} \text{ pb}$, while their ratio is given by $\sigma(tq)/\sigma(\bar{t}q) = 1.72 \pm 0.09$. A lower limit $|V_{tb}| > 0.92$ (95% CL) is obtained. Measured total and differential cross sections are described well by the SM.

³ Based on 19.7 fb^{-1} of data. The t and \bar{t} production cross sections are measured separately as $\sigma_{t\text{-ch.}}(t) = 53.8 \pm 1.5 \pm 4.4 \text{ pb}$ and $\sigma_{t\text{-ch.}}(\bar{t}) = 27.6 \pm 1.3 \pm 3.7 \text{ pb}$, respectively, as well as their ratio $R_{t\text{-ch.}} = \sigma_{t\text{-ch.}}(t)/\sigma_{t\text{-ch.}}(\bar{t}) = 1.95 \pm 0.10 \pm 0.19$, in agreement with the SM predictions. Combination with a previous CMS result at $\sqrt{s} = 7 \text{ TeV}$ [CHATRCHYAN 12Bq] gives $|V_{tb}| = 0.998 \pm 0.038 \pm 0.016$. Also obtained is the ratio $R_{8/7} = \sigma_{t\text{-ch.}}(8\text{TeV})/\sigma_{t\text{-ch.}}(7\text{TeV}) = 1.24 \pm 0.08 \pm 0.12$.

¹ SIRUNYAN 20D based on 35.9 fb^{-1} of data. Different categories of jet and b jet multiplicity and multivariate discriminators are used to separate signal and background events. The cross section ratio is measured to be $\sigma(tq)/\sigma(\bar{t}q) = 1.68 \pm 0.02 \pm 0.05$. CKM matrix element is obtained as $|f_{LV} V_{tb}| = 0.98 \pm 0.07(\text{exp}) \pm 0.02(\text{theo})$ where f_{LV} is an anomalous form factor. All results are in agreement with the SM.

² AABOUD 17H based on 3.2 fb^{-1} of data. A maximum-likelihood fit to neural-network discriminant distributions is used to separate signal and background events. The third error is for luminosity. The cross section ratio is measured to be $\sigma(tq)/\sigma(\bar{t}q) = 1.72 \pm 0.09 \pm 0.18$. A lower limit $|V_{tb}| > 0.84$ (95% CL) is obtained. All results are in agreement with the SM.

³ SIRUNYAN 17AA based on 2.2 fb^{-1} of data. A multivariate discriminator is used to separate signal and background events. The four errors are from statistics, experimental systematics, theory, and luminosity. The cross section ratio is measured to be $\sigma(tq)/\sigma(\bar{t}q) = 1.81 \pm 0.18 \pm 0.15$. CKM matrix element is obtained as $|V_{tb}| = 1.05 \pm 0.07(\text{exp}) \pm 0.02(\text{theo})$. All results are in agreement with the SM.

1 ABAZOV 16F based on 9.7 fb^{-1} of data. The result is for $m_t = 172.5 \text{ GeV}$, and the m_t dependence is shown in Table V and Fig. 9. The result agrees with the NNLO+NNLL SM prediction of $7.35^{+0.23}_{-0.27} \text{ pb}$.

2 Based on 9 fb^{-1} of data. The measurement is in the channel $t\bar{t} \rightarrow (b\bar{b})\ell(\nu\tau_\nu)$, where τ decays into hadrons (τ_h), and ℓ (e or μ) include ℓ from τ decays (τ_ℓ). The result is for $m_t = 173 \text{ GeV}$.

3 Based on 8.8 fb^{-1} of data. Combination of CDF and D0 measurements given, respectively, by $\sigma(t\bar{t}; \text{CDF}) = 7.63 \pm 0.31 \pm 0.36 \pm 0.16 \text{ pb}$, $\sigma(t\bar{t}; \text{D0}) = 7.56 \pm 0.20 \pm 0.32 \pm 0.46 \text{ pb}$. All the results are for $m_t = 172.5 \text{ GeV}$. The m_t dependence of the mean value is parametrized in eq. (1) and shown in Fig. 2.

4 Based on 9.7 fb^{-1} of data. Differential cross sections with respect to $m_{t\bar{t}}$, $|y(\text{top})|$, $E_T(\text{top})$ are shown in Figs. 9, 10, 11, respectively, and are compared to the predictions of MC models.

5 Based on 8.8 fb^{-1} of p \bar{p} collisions at $\sqrt{s} = 1.96 \text{ TeV}$.

6 Based on 8.7 fb^{-1} of p \bar{p} collisions at $\sqrt{s} = 1.96 \text{ TeV}$. Measure the $t\bar{t}$ cross section simultaneously with the fraction of $t \rightarrow Wb$ decays. The correlation coefficient between those two measurements is -0.434 . Assume unitarity of the 3×3 CKM matrix and set $|V_{tb}| > 0.89$ at 95% CL.

7 Based on 2.2 fb^{-1} of data in p \bar{p} collisions at 1.96 TeV. The result assumes the acceptance for $m_t = 172.5 \text{ GeV}$.

8 Based on 1.12 fb^{-1} and assumes $m_t = 175 \text{ GeV}$, where the cross section changes by $\pm 0.1 \text{ pb}$ for every $\mp 1 \text{ GeV}$ shift in m_t . AALTONEN 11D fits simultaneously the $t\bar{t}$

production cross section and the b -tagging efficiency and find improvements in both measurements.

9 Based on 2.7 fb^{-1} . The first error is from statistics and systematics, the second is from luminosity. The result is for $m_t = 175 \text{ GeV}$. AALTONEN 11W fits simultaneously a jet flavor discriminator between b -, c -, and light-quarks, and find significant reduction in the systematic error.

10 Based on 2.2 fb^{-1} . The result is for $m_t = 172.5 \text{ GeV}$. AALTONEN 11Y selects multi-jet events with large \cancel{E}_T , and vetoes identified electrons and muons.

11 Based on 5.3 fb^{-1} . The error is statistical + systematic + luminosity combined. The result is for $m_t = 172.5 \text{ GeV}$. The results for other m_t values are given in Table XII and eq.(10) of ABAZOV 11E.

12 Combination of dilepton measurement presented in ABAZOV 11Z (based on 5.4 fb^{-1}), which yields $7.36^{+0.90}_{-0.79}$ (stat+syst) pb, and the lepton + jets measurement of ABAZOV 11E. The result is for $m_t = 172.5 \text{ GeV}$. The results for other m_t values is given by eq.(5) of ABAZOV 11A.

13 Based on 2.8 fb^{-1} . The result is for $m_t = 175 \text{ GeV}$.

14 Based on 2.9 fb^{-1} . Result is obtained from the fraction of signal events in the top quark mass measurement in the all hadronic decay channel.

15 Based on 1.7 fb^{-1} . The result is for $m_t = 175 \text{ GeV}$. AALTONEN 10V uses soft electrons from b -hadron decays to suppress W +jets background events.

16 Based on 4.6 fb^{-1} . The result is for $m_t = 172.5 \text{ GeV}$. The ratio $\sigma(t\bar{t} \rightarrow \ell + \text{jets}) / \sigma(Z/\gamma^* \rightarrow \ell\ell)$ is measured and then multiplied by the theoretical $Z/\gamma^* \rightarrow \ell\ell$ cross section of $\sigma(Z/\gamma^* \rightarrow \ell\ell) = 251.3 \pm 5.0 \text{ pb}$, which is free from the luminosity error.

17 Based on 1 fb^{-1} . The result is for $m_t = 175 \text{ GeV}$. $7.9 \pm 2.3 \text{ pb}$ is found for $m_t = 170 \text{ GeV}$. ABAZOV 10I uses a likelihood discriminant to separate signal from background, where the background model was created from lower jet-multiplicity data.

18 Based on 1 fb^{-1} . The result is for $m_t = 170 \text{ GeV}$. For $m_t = 175 \text{ GeV}$, the result is $6.3^{+1.2}_{-1.1}(\text{stat}) \pm 0.7(\text{syst}) \pm 0.4(\text{lumi}) \text{ pb}$. Cross section of $t\bar{t}$ production has been measured in the $t\bar{t} \rightarrow \tau_h + \text{jets}$ topology, where τ_h denotes hadronically decaying τ leptons. The result for the cross section times the branching ratio is $\sigma(t\bar{t} \rightarrow \tau_h + \text{jets}) = 0.60^{+0.23+0.15}_{-0.22-0.14} \pm 0.04 \text{ pb}$ for $m_t = 170 \text{ GeV}$.

19 Based on 1.1 fb^{-1} . The result is for $B(W \rightarrow \ell\nu) = 10.8\%$ and $m_t = 175 \text{ GeV}$; the mean value is 9.8 for $m_t = 172.5 \text{ GeV}$ and 10.1 for $m_t = 170 \text{ GeV}$. AALTONEN 09AD used high p_T e or μ with an isolated track to select $t\bar{t}$ decays into dileptons including $\ell = \tau$. The result is based on the candidate event samples with and without vertex b -tag.

20 Based on 2 fb^{-1} . The result is for $m_t = 175 \text{ GeV}$; the mean value is 3% higher for $m_t = 170 \text{ GeV}$ and 4% lower for $m_t = 180 \text{ GeV}$.

21 Result is based on 1 fb^{-1} of data. The result is for $m_t = 170 \text{ GeV}$, and the mean value decreases with increasing m_t ; see their Fig. 2. The result is obtained after combining $\ell + \text{jets}$, $\ell\ell$, and $\ell\tau$ final states, and the ratios of the extracted cross sections are $R^{\ell\ell/\ell j} = 0.86^{+0.19}_{-0.17}$ and $R^{\ell\tau/\ell\ell-\ell j} = 0.97^{+0.32}_{-0.29}$, consistent with the SM expectation of $R = 1$. This leads to the upper bound of $B(t \rightarrow bH^+)$ as a function of m_{H^+} . Results are shown in their Fig. 1 for $B(H^+ \rightarrow \tau\nu) = 1$ and $B(H^+ \rightarrow c\bar{s}) = 1$ cases. Comparison of the m_t dependence of the extracted cross section and a partial NNLO prediction gives $m_t = 169.1^{+5.9}_{-5.2} \text{ GeV}$.

22 Result is based on 1 fb^{-1} of data. The result is for $m_t = 170 \text{ GeV}$, and the mean value changes by $-0.07 [m_t(\text{GeV}) - 170] \text{ pb}$ near the reference m_t value. Comparison of the m_t dependence of the extracted cross section and a partial NNLO QCD prediction gives $m_t = 171.5^{+9.9}_{-8.8} \text{ GeV}$. The $\ell\tau$ channel alone gives $7.6^{+4.9+3.5+1.4}_{-4.3-3.4-0.9} \text{ pb}$ and the $\ell\ell$ channel gives $7.5^{+1.2+0.7+0.7}_{-1.1-0.6-0.5} \text{ pb}$.

23 Result is based on 0.9 fb^{-1} of data. The first error is from stat + syst, while the latter error is from luminosity. The result is for $m_t = 175 \text{ GeV}$, and the mean value changes by $-0.09 \text{ pb} \cdot [m_t(\text{GeV}) - 175]$.

24 Result is based on 0.9 fb^{-1} of data. The cross section is obtained from the $\ell + \geq 3\text{jet}$ event rates with 1 or 2 b-tag, and also from the kinematical likelihood analysis of the $\ell + 3, 4\text{jet}$ events. The result is for $m_t = 172.6 \text{ GeV}$, and its m_t dependence shown in Fig. 3 leads to the constraint $m_t = 170 \pm 7 \text{ GeV}$ when compared to the SM prediction.

25 Result is based on 360 pb^{-1} of data. Events with high p_T oppositely charged dileptons $\ell^+ \ell^-$ ($\ell = e, \mu$) are used to obtain cross sections for $t\bar{t}$, W^+W^- , and $Z \rightarrow \tau^+\tau^-$ production processes simultaneously. The other cross sections are given in Table IV.

26 Based on 1.02 fb^{-1} of data. Result is for $m_t = 175 \text{ GeV}$. Secondary vertex b-tag and neural network selections are used to achieve a signal-to-background ratio of about 1/2.

27 Based on 425 pb^{-1} of data. Result is for $m_t = 175 \text{ GeV}$. For $m_t = 170.9 \text{ GeV}$, $7.8 \pm 1.8(\text{stat} + \text{syst}) \text{ pb}$ is obtained.

28 Based on $405 \pm 25 \text{ pb}^{-1}$ of data. Result is for $m_t = 175 \text{ GeV}$. The last error is for luminosity. Secondary vertex b-tag and neural network are used to separate the signal events from the background.

29 Based on 425 pb^{-1} of data. Assumes $m_t = 175 \text{ GeV}$.

30 Based on $\sim 425 \text{ pb}^{-1}$. Assuming $m_t = 175 \text{ GeV}$. The first error is combined statistical and systematic, the second one is luminosity.

31 Based on $\sim 318 \text{ pb}^{-1}$. Assuming $m_t = 178 \text{ GeV}$. The cross section changes by $\pm 0.08 \text{ pb}$ for each $\mp \text{ GeV}$ change in the assumed m_t . Result is for at least one b-tag. For at least two b-tagged jets, $t\bar{t}$ signal of significance greater than 5σ is found, and the cross section is $10.1^{+1.6+2.0}_{-1.4-1.3} \text{ pb}$ for $m_t = 178 \text{ GeV}$.

32 Based on $\sim 311 \text{ pb}^{-1}$. Assuming $m_t = 178 \text{ GeV}$. For $m_t = 175 \text{ GeV}$, the result is $6.0 \pm 1.2^{+0.9}_{-0.7}$. This is the first CDF measurement without lepton identification, and hence it has sensitivity to the $W \rightarrow \tau\nu$ mode.

33 ABULENCIA,A 06E measures the $t\bar{t}$ production cross section in the all hadronic decay mode by selecting events with 6 to 8 jets and at least one b-jet. $S/B = 1/5$ has been achieved. Based on 311 pb^{-1} . Assuming $m_t = 178 \text{ GeV}$.

34 Based on $\sim 318 \text{ pb}^{-1}$. Assuming $m_t = 178 \text{ GeV}$. Result is for at least one b-tag. For at least two b-tagged jets, the cross section is $11.1^{+2.3+2.5}_{-1.9-1.9} \text{ pb}$.

35 ABAZOV 05Q measures the top-quark pair production cross section with $\sim 230 \text{ pb}^{-1}$ of data, based on the analysis of W plus n-jet events where W decays into e or μ plus neutrino, and at least one of the jets is b-jet like. The first error is statistical and systematic, and the second accounts for the luminosity uncertainty. The result assumes

Quark Particle Listings

 t

$m_t = 175$ GeV; the mean value changes by $(175 - m_t(\text{GeV})) \times 0.06$ pb in the mass range 160 to 190 GeV.

- ³⁶ABAZOV 05R measures the top-quark pair production cross section with 224–243 pb⁻¹ of data, based on the analysis of events with two charged leptons in the final state. The result assumes $m_t = 175$ GeV; the mean value changes by $(175 - m_t(\text{GeV})) \times 0.08$ pb in the mass range 160 to 190 GeV.
- ³⁷Based on 230 pb⁻¹. Assuming $m_t = 175$ GeV.
- ³⁸Based on 194 pb⁻¹. Assuming $m_t = 175$ GeV.
- ³⁹Based on 194 ± 11 pb⁻¹. Assuming $m_t = 175$ GeV.
- ⁴⁰Based on 162 ± 10 pb⁻¹. Assuming $m_t = 175$ GeV.
- ⁴¹ACOSTA 05V measures the top-quark pair production cross section with ~ 162 pb⁻¹ data, based on the analysis of W plus n -jet events where W decays into e or μ plus neutrino, and at least one of the jets is b -jet like. Assumes $m_t = 175$ GeV.
- ⁴²ACOSTA 04I measures the top-quark pair production cross section with 197 ± 12 pb⁻¹ data, based on the analysis of events with two charged leptons in the final state. Assumes $m_t = 175$ GeV.

Ratio of the Production Cross Sections of $t\bar{t}\gamma$ to $t\bar{t}$ at $\sqrt{s} = 1.96$ TeV

VALUE	DOCUMENT ID	TECN	COMMENT
0.024 ± 0.009	¹ AALTONEN	11z CDF	$E_T(\gamma) > 10$ GeV, $ \eta(\gamma) < 1.0$

- ¹Based on 6.0 fb⁻¹ of data. The error is statistical and systematic combined. Events with lepton + $\cancel{E}_T + \geq 3$ jets ($\geq 1b$) with and without central, high E_T photon are measured. The result is consistent with the SM prediction of 0.024 ± 0.005. The absolute production cross section is measured to be 0.18 ± 0.08 fb. The statistical significance is 3.0 standard deviations.

 $t\bar{t}$ Production Cross Section in pp Collisions at $\sqrt{s} = 7$ TeV

VALUE (pb)	CL%	DOCUMENT ID	TECN	COMMENT
< 1.7	95	¹ AAD	12BE ATLS	$\ell^+\ell^+ + \cancel{E}_T + \geq 2j + HT$

- ¹Based on 1.04 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. The upper bounds are the same for LL, LR and RR chiral components of the two top quarks.

 $t\bar{t}$ Production Cross Section in pp Collisions at $\sqrt{s} = 5.02$ TeV

Unless otherwise noted the first quoted error is from statistics, the second from systematic uncertainties, and the third from luminosity. If only two errors are quoted the luminosity is included in the systematic uncertainties.

VALUE (pb)	DOCUMENT ID	TECN	COMMENT

- ¹KHACHATRYAN 17B based on 5.0 fb⁻¹ of data, using a binned likelihood fit of templates to the data. Also the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.43 \pm 0.04 \pm 0.07 \pm 0.05$ is reported. The results are in agreement with NNLO SM predictions.
- ²KHACHATRYAN 16AW based on 5.0 fb⁻¹ of data, using a binned likelihood fit to differential distributions of b -tagged and non- b -tagged jets. The result is in good agreement with NNLO SM predictions.
- ³Based on 4.6 fb⁻¹ of data. Uses a template fit to distributions of \cancel{E}_T and jet multiplicities to measure simultaneously $t\bar{t}$, WW , and $Z/\gamma^* \rightarrow \tau\tau$ cross sections, assuming $m_t = 172.5$ GeV.

- ⁴AAD 15CC based on 4.6 fb⁻¹ of data. The event selection criteria are optimized for the $\ell\tau_h + \text{jets}$ channel. Using only this channel 183 ± 9 ± 23 ± 3 pb is derived for the cross section.
- ⁵AAIJ 15R, based on 1.0 fb⁻¹ of data, reports 0.239 ± 0.053 ± 0.033 ± 0.024 pb cross section for the forward fiducial region $p_T(\mu) > 25$ GeV, $2.0 < \eta(\mu) < 4.5$, $50 \text{ GeV} < p_T(b) < 100$ GeV, $2.2 < \eta(b) < 4.2$, $\Delta R(\mu, b) > 0.5$, and $p_T(\mu+b) > 20$ GeV. The three errors are from statistics, systematics, and theory. The result agrees with the SM NLO prediction.
- ⁶AAD 14AY reports 182.9 ± 3.1 ± 4.2 ± 3.6 ± 3.3 pb value based on 4.6 fb⁻¹ of data. The four errors are from statistics, systematic, luminosity, and the 0.66% beam energy uncertainty. We have combined the systematic uncertainties in quadrature. The result is for $m_t = 172.5$ GeV; for other m_t , $\sigma(m_t) = \sigma(172.5 \text{ GeV}) \times [1 - 0.0028 \times (m_t - 172.5 \text{ GeV})]$. The result is consistent with the SM prediction at NNLO.
- ⁷Based on 1.67 fb⁻¹ of data. The result uses the acceptance for $m_t = 172.5$ GeV.
- ⁸Based on 3.54 fb⁻¹ of data.
- ⁹Based on 2.3 fb⁻¹ of data.
- ¹⁰Based on 3.9 fb⁻¹ of data.
- ¹¹Based on 35 pb⁻¹ of data for an assumed top quark mass of $m_t = 172.5$ GeV.
- ¹²Based on 0.70 fb⁻¹ of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5$ GeV.
- ¹³Based on 35 pb⁻¹ of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5$ GeV and 173 ± 17⁺¹⁸₋₁₆ ± 6 pb is found without the b -tag.
- ¹⁴Based on 2.05 fb⁻¹ of data. The hadronic τ candidates are selected using a BDT technique. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5$ GeV.
- ¹⁵Based on 2.0 fb⁻¹ and 2.2 fb⁻¹ of data for $\ell = e$ and $\ell = \mu$, respectively. The 3 errors are from statistics, systematics, and luminosity. The result uses the acceptance for $m_t = 172.5$ GeV.
- ¹⁶Based on 2.3 fb⁻¹ of data. The 3 errors are from statistics, systematics, and luminosity. The result uses the profile likelihood-ratio (PLB) method and an assumed m_t of 172.5 GeV.
- ¹⁷Based on 2.9 pb⁻¹ of data. The result for single lepton channels is 142 ± 34⁺⁵⁰₋₃₁ pb, while for the dilepton channels is 151 ± 78⁺³⁷₋₆₂ ± 24 pb.
- ¹⁸Result is based on 36 pb⁻¹ of data. The first uncertainty corresponds to the statistical and systematic uncertainties, and the second corresponds to the luminosity.
- ¹⁹Based on 36 pb⁻¹ of data. The ratio of $t\bar{t}$ and Z/γ^* cross sections is measured as $\sigma(pp \rightarrow t\bar{t})/\sigma(pp \rightarrow Z/\gamma^* \rightarrow e^+e^-/\mu^+\mu^-) = 0.175 \pm 0.018(\text{stat}) \pm 0.015(\text{sys})$ for $60 < m_{\ell\ell} < 120$ GeV, for which they use an NNLO prediction for the denominator cross section of 972 ± 42 pb.
- ²⁰Result is based on 36 pb⁻¹ of data. The first error is from statistical and systematic uncertainties, and the second from luminosity. This is a combination of a measurement in the dilepton channel (CHATRCHYAN 11F) and the measurement in the ℓ + jets channel (CHATRCHYAN 11Z) which yields 150 ± 9 ± 17 ± 6 pb.
- ²¹Result is based on 3.1 ± 0.3 pb⁻¹ of data.

 $t\bar{t}$ Production Cross Section in pp Collisions at $\sqrt{s} = 8$ TeV

Unless otherwise noted the first quoted error is from statistics, the second from systematic uncertainties, and the third from luminosity. If only two errors are quoted the luminosity is included in the systematic uncertainties.

- ¹AABOUD 18BH based on 20.2 fb⁻¹ of data. The result is for $m_t = 172.5$ GeV. To reduce effects of uncertainties in the jet energy scale and b -tagging efficiency, they are included as nuisance parameters in the fit of discriminant distributions, after separating selected events into three regions. Furthermore the W +jets background distribution is modelled using Z +jets event data.
- ²AABOUD 17Z based on 20.2 fb⁻¹ of data, using the mode $t\bar{t} \rightarrow \tau\nu q'\bar{q}b\bar{b}$ with τ decaying hadronically. Single prong and 3 prong decays of τ are separately analyzed. The result is consistent with the SM. The third quoted uncertainty is due to luminosity.
- ³KHACHATRYAN 17B based on 19.6 fb⁻¹ of data, using a binned likelihood fit of templates to the data. Also the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.43 \pm 0.04 \pm 0.07 \pm 0.05$ is reported. The results are in agreement with NNLO SM predictions.
- ⁴AAD 16BK is an update of the value from AAD 14AY using the improved luminosity calibration. The value 242.9 ± 1.7 ± 5.5 ± 5.1 ± 4.2 pb is reported, where we have combined the systematic uncertainties in quadrature. Also the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.328 \pm 0.024 \pm 0.015 \pm 0.038 \pm 0.001$ has been updated. The former result is consistent with the SM predictions at NNLO, while the latter result is 2.1 σ below the expectation.
- ⁵KHACHATRYAN 16AW based on 19.7 fb⁻¹ of data, using a binned likelihood fit to differential distributions of b -tagged and non- b -tagged jets. The result is in good agreement with NNLO SM predictions.
- ⁶KHACHATRYAN 16BC based on 18.4 fb⁻¹ of data. The last uncertainty is due to luminosity. Cuts on kinematical fit probability and $\Delta R(b, b)$ are imposed. The major QCD background is determined from the data. The result is for $m_t = 172.5$ GeV and in agreement with the SM prediction. The top quark p_T spectra, also measured, are significantly softer than theoretical predictions.
- ⁷AAD 15BP based on 20.3 fb⁻¹ of data. The result is for $m_t = 172.5$ GeV and in agreement with the SM prediction 253⁺¹³₋₁₅ pb at NNLO+NNLL. Superseded by AABOUD 18BH.

- ⁸ AAIJ 15R, based on 2.0 fb^{-1} of data, reports $0.289 \pm 0.043 \pm 0.040 \pm 0.029 \text{ pb}$ cross section for the forward fiducial region $p_T(\mu) > 25 \text{ GeV}$, $2.0 < \eta(\mu) < 4.5$, $50 \text{ GeV} < p_T(b) < 100 \text{ GeV}$, $2.2 < \eta(b) < 4.2$, $\Delta R(\mu, b) > 0.5$, and $p_T(\mu+b) > 20 \text{ GeV}$. The three errors are from statistics, systematics, and theory. The result agrees with the SM NLO prediction.
- ⁹ AAD 14AY reports $242.4 \pm 1.7 \pm 5.5 \pm 7.5 \pm 4.2 \text{ pb}$ value based on 20.3 fb^{-1} of data. The four errors are from statistics, systematic, luminosity, and the 0.66% beam energy uncertainty. We have combined the systematic uncertainties in quadrature. The result is for $m_t = 172.5 \text{ GeV}$; for other m_t , $\sigma(m_t) = \sigma(172.5 \text{ GeV}) \times [1 - 0.0028 \times (m_t - 172.5 \text{ GeV})]$. Also measured is the ratio $\sigma(t\bar{t}; 8 \text{ TeV})/\sigma(t\bar{t}; 7 \text{ TeV}) = 1.326 \pm 0.024 \pm 0.015 \pm 0.049 \pm 0.001$. The results are consistent with the SM predictions at NNLO.
- ¹⁰ Based on 5.3 fb^{-1} of data. The result is for $m_t = 172.5 \text{ GeV}$, and a parametrization is given in eq.(6.1) for the mean value at other m_t values. The result is in agreement with the SM prediction $252.9^{+6.4}_{-8.6} \text{ pb}$ at NNLO.
- ¹¹ Based on 19.6 fb^{-1} of data. The measurement is in the channel $t\bar{t} \rightarrow (b\ell\nu)(b\tau\nu)$, where τ decays into hadrons (τ_h). The result is for $m_t = 172.5 \text{ GeV}$. For $m_t = 173.3 \text{ GeV}$, the cross section is lower by 3.1 pb.

t \bar{t} Production Cross Section in pp Collisions at $\sqrt{s} = 13 \text{ TeV}$

t **Fraction of $t\bar{t}$ + multi-jet Events in pp Collisions at $\sqrt{s} = 7$ TeV**

VALUE	DOCUMENT ID	TECN	COMMENT
0.332 ± 0.090	¹ AAD 15D ATLS	$\ell + \cancel{E}_T + n_j$ ($n=3$ to 8)	
0.436 ± 0.098	² CHATRCHYAN14AE CMS	$t\bar{t}(\ell\ell) + 0$ jet ($E_T > 30$ GeV)	
0.232 ± 0.125	² CHATRCHYAN14AE CMS	$t\bar{t}(\ell\ell) + 1$ jet ($E_T > 30$ GeV)	
	² CHATRCHYAN14AE CMS	$t\bar{t}(\ell\ell) + \geq 2$ jet ($E_T > 30$ GeV)	

¹ Based on 4.6 fb⁻¹ of data. Fiducial $t\bar{t}$ production cross section is presented as a function of the jet multiplicity for up to eight jets with the jet p_T threshold of 25, 40, 60, and 80 GeV, and as a function of jet p_T up to the 5th jet. MC models can be discriminated by using data for high jet multiplicity and by p_T distributions of the leading and 5th jet.

² Based on 5.0 fb⁻¹ of data. Events with two oppositely charged leptons, large \cancel{E}_T and jets with at least 1 b -tag are used to measure the fraction of $t\bar{t}$ plus additional jets. The gap fraction ($n=0$ jet rate) as a function of the jet p_T and that of H_T , the scalar sum of the p_T 's of additional jets, is shown in Fig. 8.

 $t\bar{t}$ Charge Asymmetry (A_C) in pp Collisions at $\sqrt{s} = 7$ TeV

$A_C = (N(\Delta|y| > 0) - N(\Delta|y| < 0)) / (N(\Delta|y| > 0) + N(\Delta|y| < 0))$ where $\Delta|y| = |y_t| - |y_{\bar{t}}|$ is the difference between the absolute values of the top and antitop rapidities and N is the number of events with $\Delta|y|$ positive or negative.

0.10 ± 0.68 ± 0.37	⁷ KHACHATRYAN16T CMS	$\ell + \cancel{E}_T + \geq 4j$ ($\geq 1b$)	

¹ ATLAS and CMS combination based on the data of AAD 16AZ and KHACHATRYAN 16AH. It takes into account the correlations of the measurements and systematic errors. A combination of the differential measurements of the charge asymmetry is also presented. The results are in agreement with the SM prediction (NNLO QCD + NLO EW).

² AAD 16AE is based on 20.3 fb⁻¹ of data. After kinematic reconstruction, the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. The lepton charge asymmetry is measured as $A_C^\ell = 0.008 \pm 0.006$. All the measurements are consistent with the SM predictions.

³ AAD 16AZ based on 20.3 fb⁻¹ of data. All the differential and inclusive measurements are statistically limited and consistent with the SM predictions.

⁴ AAD 16T based on 20.3 fb⁻¹ of data. Uses reconstruction techniques for the decay topology of highly boosted top quarks. The observed asymmetry is transformed by unfolding to a parton-level result in the shown fiducial region. The result is consistent with the NLO SM prediction.

⁵ KHACHATRYAN 16AD based on 19.5 fb⁻¹ of data. The lepton charge asymmetry is measured as $A_C^\ell = 0.003 \pm 0.006 \pm 0.003$. All the measurements are consistent with the SM predictions.

⁶ KHACHATRYAN 16AH based on 19.6 fb⁻¹ of data. The same data set as in KHACHATRYAN 16T is used. A template technique is used, which is sensitive to the charge anti-symmetric component of the $t\bar{t}$ rapidity distributions and statistically advantageous. The result is consistent with the SM predictions.

⁷ KHACHATRYAN 16T based on 19.7 fb⁻¹ of data. The same data set as in KHACHATRYAN 16AH is used. After kinematic reconstruction the top quark momenta are corrected for detector resolution and acceptance effects by unfolding, using parton level information of the MC generators. All the measurements are consistent with the SM predictions.

 t -quark Polarization in $t\bar{t}$ Events in pp Collisions at $\sqrt{s} = 1.96$ TeV

¹ ABAZOV 17 based on 9.7 fb⁻¹ of data. The value is top quark polarization times spin analyzing power in the beam basis. Combination with the result of ABAZOV 15K yields 0.081 ± 0.048 . This result together with the helicity polarization is shown in a 2-dimensional plot in Fig. 4. These results are consistent with the SM prediction.

² ABAZOV 17 based on 9.7 fb⁻¹ of data. The value is top quark polarization times spin analyzing power in the helicity basis. The result is consistent with the SM prediction. This result together with the beam polarization is shown in a 2-dimensional plot in Fig. 4.

³ ABAZOV 17 based on 9.7 fb⁻¹ of data. The value is top quark polarization times spin analyzing power in the transverse basis. The result is consistent with the SM prediction.

⁴ ABAZOV 15K based on 9.7 fb⁻¹ of data. The value is top quark polarization times spin analyzing power in the beam basis. The result is consistent with the SM prediction of -0.0019 ± 0.0005 .

 t -quark Polarization in $t\bar{t}$ Events in pp Collisions at $\sqrt{s} = 7$ TeV

The double differential distribution in polar angles, θ_1 (θ_2) of the decay particle of the top (anti-top) decay products, is parametrized as $(1/\sigma)d\sigma/(d\cos\theta_1 d\cos\theta_2) = (1/4)(1 + A_t \cos\theta_1 + A_{\bar{t}} \cos\theta_2 - C \cos\theta_1 \cos\theta_2)$. The charged lepton is used to tag t or \bar{t} . The coefficient A_t and $A_{\bar{t}}$ measure the average helicity of t and \bar{t} , respectively. $A_{CP} = A_t = A_{\bar{t}}$ assumes CP conservation, whereas $A_{CPV} = A_t = -A_{\bar{t}}$ corresponds to maximal CP violation.

¹ AABOUD 17G based on 20.2 fb⁻¹ of pp data, using events with two leptons and two or more jets with at least one b -tag. Determined from measurements of 15 top quark spin observables. The second error corresponds to a variation of m_t about 172.5 GeV by 0.7 GeV. The values are consistent with the NLO SM predictions.

² KHACHATRYAN 16AI based on 19.5 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV, using events with two leptons and two or more jets with at least one b -tag. Determined from the lepton angular distributions as a function of the $t\bar{t}$ -system kinematical variables.

 t -quark Polarization in Single Top Events in pp Collisions at $\sqrt{s} = 8$ TeV

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
>0.72	95	¹ AABOUD 17Bb ATLS	$\alpha_\ell P$; t-channel

¹ AABOUD 17Bb based on 20.2 fb⁻¹ of pp data. Triple-differential decay rate of top quark is used to simultaneously determine five generalized Wtb couplings as well as the top polarization. α_ℓ denotes the spin analyzing power of charged lepton, and the spin axis of the top polarization P is taken along the spectator-quark momentum in the top rest frame. The value is compatible with the SM prediction of about 0.9.

² AABOUD 17i based on 20.2 fb⁻¹ of pp data. A cut-based analysis is used to discriminate between signal and backgrounds. α_ℓ denotes the spin analyzing power of charged lepton, and the spin axis of the top polarization P is taken along the spectator-quark momentum in the top rest frame. See this paper for a number of other asymmetries and measurements that are not included here.

³ AABOUD 17i based on 20.2 fb⁻¹ of pp data. A cut-based analysis is used to discriminate between signal and backgrounds. F_\pm denotes W helicity fraction, and the spin axis of the top polarization P is taken along the spectator-quark momentum in the top rest frame. See this paper for a number of other asymmetries and measurements that are not included here.

⁴ KHACHATRYAN 16Bb based on 19.7 fb⁻¹ of data. A high-purity sample with a muon is selected by a multivariate analysis. The value is the top spin asymmetry, given by one half of the spin analyzing power α_μ ($=1$ at LO of SM) times the top polarization, P , where the spin axis is defined as the direction of the untagged jet in the top rest frame. The value is compatible with the SM prediction of 0.44 with a 2.0 σ deviation.

 $gg \rightarrow t\bar{t}$ Fraction in $p\bar{p}$ Collisions at $\sqrt{s} = 1.96$ TeV

VALUE	CL%	DOCUMENT ID	TECN	COMMENT
<0.33	68	¹ AALTONEN 09F CDF	$t\bar{t}$ correlations	
0.07 ± 0.14 ± 0.07		² AALTONEN 08Ag CDF	low p_T number of tracks	

¹ Based on 955 pb⁻¹. AALTONEN 09F used differences in the $t\bar{t}$ production angular distribution and polarization correlation to discriminate between $gg \rightarrow t\bar{t}$ and $q\bar{q} \rightarrow t\bar{t}$ subprocesses. The combination with the result of AALTONEN 08Ag yields $0.07^{+0.15}_{-0.07}$.

See key on page 999

Quark Particle Listings

t

2 Result is based on 0.96 fb^-1 of data. The contribution of the subprocesses gg -> t-tbar and q-qbar -> t-tbar is distinguished by using the difference between quark and gluon initiated jets in the number of small p_T (0.3 GeV < p_T < 3 GeV) charged particles in the central region (|eta| < 1.1).

A_FB of t-tbar in pp Collisions at sqrt(s) = 1.96 TeV

Table with columns: VALUE (%), DOCUMENT ID, TECN, COMMENT. Lists experimental results for the forward-backward asymmetry of top-antitop quark pairs in pp collisions at 1.96 TeV.

1 AALTONEN 18 based on 9-10 fb^-1 of pp data at sqrt(s) = 1.96 TeV. The value is the asymmetry in the number of reconstructed t-tbar events with rapidity yt > ytbar > ytbar > yt. The combined fits to CDF and D0 single lepton and ll asymmetries give A_FB^ell = 0.073 +/- 0.016 +/- 0.012 and A_FB^ell = 0.108 +/- 0.043 +/- 0.016, respectively. The results are consistent with the SM predictions.
2 ABAZOV 15k based on 9.7 fb^-1 of data. The result is consistent with the SM predictions. By combining with the previous D0 measurement in the l + jet channel ABABOV 14H, A_FB^ell = 0.118 +/- 0.025 +/- 0.013 is obtained.
3 AALTONEN 14F based on 9.1 fb^-1 of data. A_FB^ell and A_FB^ell denote, respectively, the asymmetries (N(x>0) - N(x<0)) / N_tot for x = q_e q_e-bar (q_e is the charge of l) and x = eta_l + eta_l-bar. Both results are consistent with the SM predictions. By combining with the previous CDF measurement in the l+jet channel AALTONEN 13x, A_FB^ell = 0.098 +/- 0.028 +/- 0.028 is obtained. The combined result is about two sigma larger than the SM prediction of A_FB^ell = 0.038 +/- 0.003.
4 Based on 9.7 fb^-1 of pp data at sqrt(s) = 1.96 TeV. The asymmetry is corrected for the production level for events with |y_l| < 1.5. Asymmetry as functions of E_T(l) and |y_l| are given in Figs. 7 and 8, respectively. Combination with the asymmetry measured in the dilepton channel [ABABOV 13P] gives A_FB^ell = 4.2 +/- 2.0 +/- 1.4 %, in agreement with the SM prediction of 2.0%.
5 Based on 9.7 fb^-1 of data of pp data at sqrt(s)=1.96 TeV. The measured asymmetry is in agreement with the SM predictions of 8.8 +/- 0.9 % [BERNREUTHER 12], which includes the EW effects. The dependences of the asymmetry on |y(t) - y(t-bar)| and m_t-tbar are shown in Figs. 9 and 10, respectively.
6 Based on 9.4 fb^-1 of data. Reported A_FB^ell values come from the determination of a_i coefficients of d sigma / d cos(theta_l) = sum_i a_i p_i cos(theta_l) measurement. The result of a_1/a_0 = (40 +/- 12)% seems higher than the NLO SM prediction of (15 +/- 3)%.
7 Based on 9.4 fb^-1 of data. The quoted result is the asymmetry at the parton level.
8 Based on 9.4 fb^-1 of data. The observed asymmetry is to be compared with the SM prediction of A_FB^ell = 0.038 +/- 0.003.
9 Based on 5.4 fb^-1 of data. ABABOV 13A studied the dilepton channel of the t-tbar events and measured the leptonic forward-backward asymmetry to be A_FB^ell = 5.8 +/- 5.1 +/- 1.3%, which is consistent with the SM (QCD+EW) prediction of 4.7 +/- 0.1%. The result is obtained after combining the measurement (15.2 +/- 4.0%) in the l + jets channel ABABOV 11AH. The top quark helicity is measured by using the neutrino weighting method to be consistent with zero in both dilepton and l + jets channels.
10 Based on 5.3 fb^-1 of data. The error is statistical and systematic combined. Events with lepton + E_T + >= 4jets (>= 1b) are used. AALTONEN 11F also measures the asymmetry as a function of the rapidity difference |y_t - y_t-bar|. The NLO QCD predictions [MCFM] are (4.0 +/- 0.6)% and (8.8 +/- 1.3)% for m_t-tbar < 450 and > 450 GeV, respectively.
11 Based on 5.4 fb^-1 of data. The error is statistical and systematic combined. The quoted asymmetry is obtained after unfolding to be compared with the MC@NLO prediction of (5.0 +/- 0.1)%. No significant difference between the m_t-tbar < 450 and > 450 GeV data samples is found. A corrected asymmetry based on the lepton from a top quark decay of (15.2 +/- 4.0)% is measured to be compared to the MC@NLO prediction of (2.1 +/- 0.1)%.
12 Result is based on 1.9 fb^-1 of data. The FB asymmetry in the t-tbar events has been measured in the l + jets mode, where the lepton charge is used as the flavor tag. The asymmetry in the pp frame is defined in terms of cos(theta) of hadronically decaying t-quark momentum, whereas that in the t-tbar frame is defined in terms of the t and t-bar rapidity difference. The results are consistent (<= 2 sigma) with the SM predictions.
13 Result is based on 0.9 fb^-1 of data. The asymmetry in the number of t-tbar events with y_t > y_t-bar and those with y_t < y_t-bar has been measured in the lepton + jets final state. The observed value is consistent with the SM prediction of 0.8% by MC@NLO, and an upper bound on the Z' -> t-tbar contribution for the SM Z-like couplings is given in Fig. 2 for 350 GeV < m_Z' < 1 TeV.

t-Quark Electric Charge

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Lists experimental results for the electric charge of the top quark.

1 AAD 13AY result is based on 2.05 fb^-1 of pp data at sqrt(s) = 7 TeV, the result is obtained by reconstructing t-tbar events in the lepton + jets final state, where b-jet charges are tagged by the jet-charge algorithm. This measurement excludes the charge -4/3 assignment to the top quark at more than 8 standard deviations.
2 ABABOV 14D result is based on 5.3 fb^-1 of pp data at sqrt(s)=1.96 TeV. The electric charge of b-W system in t-tbar candidate events is measured from the charges of the leptons from W decay and in b jets. Under the assumption that the b+W system consists of the sum of the top quark and the charge -4/3 quark b'(-4/3) of the same mass, the top quark fraction is found to be f = 0.88 +/- 0.13 (stat) +/- 0.11 (syst), or the upper bound for the b'(-4/3) contamination of 1 - f < 0.46 (95% CL).
3 AALTONEN 13J excludes the charge -4/3 assignment to the top quark at 99% CL, using 5.6 fb^-1 of data in pp collisions at sqrt(s) = 1.96 TeV. Result is obtained by reconstructing t-tbar events in the lepton + jets final state, where b-jet charges are tagged by the jet-charge algorithm.
4 AALTONEN 10s excludes the charge -4/3 assignment for the top quark [CHANG 99] at 95%CL, using 2.7 fb^-1 of data in pp collisions at sqrt(s) = 1.96 TeV. Result is obtained by reconstructing t-tbar events in the lepton + jets final state, where b-jet charges are tagged by the SLT (soft lepton tag) algorithm.
5 ABABOV 07c reports an upper limit rho < 0.80 (90% CL) on the fraction rho of exotic quark pairs Q-Q-bar with electric charge |q| = 4e/3 in t-tbar candidate events with high p_T lepton, missing E_T and >= 4 jets. The result is obtained by measuring the fraction of events in which the quark pair decays into W- + b and W+ + b-bar, where b and D-bar jets are discriminated by using the charge and momenta of tracks within the jet cones. The maximum CL at which the model of CHANG 99 can be excluded is 92%. Based on 370 pb^-1 of data at sqrt(s) = 1.96 TeV.

b' (4th Generation) Quark, Searches for

b'(-1/3)-quark/hadron mass limits in p-pbar and pp collisions

Table with columns: VALUE (GeV), CL%, DOCUMENT ID, TECN, COMMENT. Lists mass limits for b' quark searches across various experiments like SIRUNYAN, AABOUD, KHACHATRYAN, etc.

- 1 SIRUNYAN 19AQ based on 35.9 fb^-1 of pp data at sqrt(s) = 13 TeV. Pair production of vector-like b' is searched for with one b' decaying into Zb and the other b' decaying into Wt, Zb, hb. Events with an opposite-sign lepton pair consistent with coming from Z and jets are used. Mass limits are obtained for a variety of branching ratios of b'.
- 2 SIRUNYAN 19BW based on 35.9 fb^-1 of pp data at sqrt(s) = 13 TeV. The limit is for the pair-produced vector-like b' using all-hadronic final state. The analysis is made for the Zb, Wt, hb modes and mass limits are obtained for a variety of branching ratios.
- 3 AABOUD 18AW based on 36.1 fb^-1 of pp data at sqrt(s) = 13 TeV. The limit is for the pair-produced vector-like b' using lepton-plus-jets final state. The search is also sensitive to the decays into Zb and Hb final states.
- 4 AABOUD 18CE based on 36.1 fb^-1 of proton-proton data taken at sqrt(s) = 13 TeV. Events including a same-sign lepton pair are used. The limit is for a singlet model, assuming the branching ratios of b' into Zb, Wt and Hb as predicted by the model.
- 5 AABOUD 18CL, AABOUD 18CP based on 36.1 fb^-1 of pp data at sqrt(s) = 13 TeV. The limit is for the pair-produced vector-like b' using all-hadronic final state. The analysis is particularly powerful for the b' -> hb mode. Assuming the pure decay only in this mode sets a limit mb' > 1010 GeV.
- 6 AABOUD 18CP based on 36.1 fb^-1 of pp data at sqrt(s) = 13 TeV. Pair and single production of vector-like b' are searched for with at least one b' decaying into Zb. In the case of B(b' -> Zb) = 1, the limit is mb' > 1220 GeV.
- 7 The limit is for the singlet model, assuming that the branching ratios into Wt, Zb, hb add up to one.
- 8 The limit is for the doublet model, assuming that the branching ratios into Wt, Zb, hb add up to one.
- 9 AABOUD 18CR based on 36.1 fb^-1 of pp data at sqrt(s) = 13 TeV. A combination of searches for the pair-produced vector-like b' in various decay channels (b' -> Wt, Zb, hb). Also a model-independent limit is obtained as mb' > 1.03 TeV, assuming that the branching ratios into Zb, Wt, and hb add up to one.
- 10 The limit is for the singlet b'.
- 11 The limit is for b' in a weak isospin doublet (t', b') and |V'tb| << |V'tb|. For a b' in a doublet with a charge -4/3 vector-like quark, the limit mb' > 1.14 TeV is obtained.
- 12 SIRUNYAN 18BM based on 35.9 fb^-1 of pp data at sqrt(s) = 13 TeV. The limit is for the pair-produced vector-like b'. Three channels (single lepton, same-charge 2 leptons, or at least 3 leptons) are considered for various branching fraction combinations. Assuming B(tW) = 1, the limit is 1240 GeV and for B(bZ) = 1 it is 960 GeV.
- 13 SIRUNYAN 18Q based on 19.7 fb^-1 of pp data at sqrt(s) = 8 TeV. The limit is for the pair-produced vector-like b' that couple only to light quarks. Upper cross section limits on the single production of a b' and constraints for other decay channels (Zq and Hq) are also given in the paper.
- 14 SIRUNYAN 17AU based on 2.3-2.6 fb^-1 of pp data at sqrt(s) = 13 TeV. Limit on pair-produced singlet vector-like b' using one lepton and several jets. The mass bound is given for a b' transforming as a singlet under the electroweak symmetry group, assumed to decay through W, Z or Higgs boson (which decays to jets) and to a third generation quark.
- 15 KHACHATRYAN 16AN based on 19.7 fb^-1 of pp data at sqrt(s) = 8 TeV. Limit on pair-produced vector-like b' using 1, 2, and >2 leptons as well as fully hadronic final states. Other limits depending on the branching fractions to tW, bZ, and bH are given in Table IX.
- 16 AAD 15BY based on 20.3 fb^-1 of pp data at sqrt(s) = 8 TeV. Limit on pair-produced vector-like b' assuming the branching fractions to W, Z, and h modes of the singlet model. Used events containing >= 2l + ET + >= 2j (>= 1 b) and including a same-sign lepton pair.
- 17 AAD 15BY based on 20.3 fb^-1 of pp data at sqrt(s) = 8 TeV. Limit on pair-produced chiral b'-quark. Used events containing >= 2l + ET + >= 2j (>= 1 b) and including a same-sign lepton pair.
- 18 AAD 15Z based on 20.3 fb^-1 of pp data at sqrt(s) = 8 TeV. Used events with l + ET + >= 6j (>= 1 b) and at least one pair of jets from weak boson decay, primarily designed to select the signature b' b' -> WW tT -> WW WW bT. This is a limit on pair-produced vector-like b'. The lower mass limit is 640 GeV for a vector-like singlet b'.
- 19 Based on 20.3 fb^-1 of pp data at sqrt(s) = 8 TeV. No significant excess over SM expectation is found in the search for pair production or single production of b' in the events with dilepton from a high pT Z and additional jets (>= 1 b-tag). If instead of B(b' -> Wt) = 1 an electroweak singlet with B(b' -> Wt) ~ 0.45 is assumed, the limit reduces to 685 GeV.
- 20 Based on 5.0 fb^-1 of pp data at sqrt(s) = 7 TeV. CHATRCHYAN 13I looked for events with one isolated electron or muon, large ET, and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.
- 21 Result is based on 1.1 fb^-1 of data. No signal is found for the search of long-lived particles which decay into final states with two electrons or photons, and upper bound on the cross section times branching fraction is obtained for 2 < cr < 7000 nm; see Fig. 3. 95% CL excluded region of b' lifetime and mass is shown in Fig. 4.

••• We do not use the following data for averages, fits, limits, etc. •••

Quark Particle Listings

 b' (Fourth Generation) Quark

- ²² ACOSTA 03 looked for long-lived fourth generation quarks in the data sample of 90 pb^{-1} of $\sqrt{s}=1.8 \text{ TeV}$ $p\bar{p}$ collisions by using the muon-like penetration and anomalously high ionization energy loss signature. The corresponding lower mass bound for the charge $(2/3)e$ quark (t') is 220 GeV . The t' bound is higher than the b' bound because t' is more likely to produce charged hadrons than b' . The 95% CL upper bounds for the production cross sections are given in their Fig. 3.
- ²³ AAD 15AR based on 20.3 fb^{-1} of pp data at $\sqrt{s}=8 \text{ TeV}$. Used lepton-plus-jets final state. See Fig. 24 for mass limits in the plane of $B(b' \rightarrow Wt)$ vs. $B(b' \rightarrow Hb)$ from $b'\bar{b}' \rightarrow Hb + X$ searches.
- ²⁴ AAD 15CN based on 20.3 fb^{-1} of pp data at $\sqrt{s}=8 \text{ TeV}$. Limit on pair-production of chiral b' -quark. Used events with $\ell + E_T + \geq 4j$ (non- b -tagged). Limits on a heavy vector-like quark, which decays into Wq , Zq , hq , are presented in the plane $B(Q \rightarrow Wq)$ vs. $B(Q \rightarrow hq)$ in Fig. 12.
- ²⁵ Based on 1.04 fb^{-1} of pp data at $\sqrt{s}=7 \text{ TeV}$. No signal is found for the search of heavy quark pair production that decay into W and a t quark in the events with a high p_T isolated lepton, large E_T , and at least 6 jets in which one, two or more dijets are from W .
- ²⁶ Based on 2.0 fb^{-1} of pp data at $\sqrt{s}=7 \text{ TeV}$. No $b' \rightarrow Zb$ invariant mass peak is found in the search of heavy quark pair production that decay into Z and a b quark in events with $Z \rightarrow e^+e^-$ and at least one b -jet. The lower mass limit is 358 GeV for a vector-like singlet b' mixing solely with the third SM generation.
- ²⁷ Based on 1.04 fb^{-1} of pp data at $\sqrt{s}=7 \text{ TeV}$. No signal is found for the search of heavy quark pair production that decay into W and a quark in the events with dileptons, large E_T , and ≥ 2 jets.
- ²⁸ Based on 1.04 fb^{-1} of pp data at $\sqrt{s}=7 \text{ TeV}$. AAD 12BE looked for events with two isolated like-sign leptons and at least 2 jets, large E_T and $H_T > 350 \text{ GeV}$.
- ²⁹ Based on 5 fb^{-1} of pp data at $\sqrt{s}=7 \text{ TeV}$. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4th generation quarks that decay to bW or tW . Absence of signal in events with one lepton, same-sign dileptons or tripletons gives the bound. With a mass difference of $25 \text{ GeV}/c^2$ between $m_{t'}$ and $m_{b'}$, the corresponding limit shifts by about $\pm 20 \text{ GeV}/c^2$.
- ³⁰ Based on 4.9 fb^{-1} of pp data at $\sqrt{s}=7 \text{ TeV}$. CHATRCHYAN 12X looked for events with tripletons or same-sign dileptons and at least one b jet.
- ³¹ Based on 4.8 fb^{-1} of data in $p\bar{p}$ collisions at 1.96 TeV . AALTONEN 11J looked for events with $\ell + E_T + \geq 5j$ ($\geq 1 b$ or c). No signal is observed and the bound $\sigma(b'\bar{b}') < 30 \text{ fb}$ for $m_{b'} > 375 \text{ GeV}$ is found for $B(b' \rightarrow Wt) = 1$.
- ³² Based on 34 pb^{-1} of data in pp collisions at 7 TeV . CHATRCHYAN 11L looked for multi-jet events with tripletons or same-sign dileptons. No excess above the SM background excludes $m_{b'}$ between 255 and 361 GeV at 95% CL for $B(b' \rightarrow Wt) = 1$.
- ³³ Based on 2.7 fb^{-1} of data in $p\bar{p}$ collisions at $\sqrt{s}=1.96 \text{ TeV}$. AALTONEN 10H looked for pair production of heavy quarks which decay into tW^- or tW^+ , in events with same sign dileptons (e or μ), several jets and large missing E_T . The result is obtained for b' which decays into tW^- . For the charge $5/3$ quark ($T_{5/3}$) which decays into tW^+ , $m_{T_{5/3}} > 365 \text{ GeV}$ (95% CL) is found when it has the charge $-1/3$ partner B of the same mass.
- ³⁴ FLACCO 10 result is obtained from AALTONEN 10H result of $m_{b'} > 338 \text{ GeV}$, by relaxing the condition $B(b' \rightarrow Wt) = 100\%$ when $m_{b'} > m_{t'}$.
- ³⁵ Result is based on 1.06 fb^{-1} of data. No excess from the SM Z +jet events is found when Z decays into e or $\mu\mu$. The $m_{b'}$ bound is found by comparing the resulting upper bound on $\sigma(b'\bar{b}') [1-(1-B(b' \rightarrow Zb))^2]$ and the LO estimate of the b' pair production cross section shown in Fig. 38 of the article.
- ³⁶ HUANG 08 reexamined the b' mass lower bound of 268 GeV obtained in AALTONEN 07c that assumes $B(b' \rightarrow Zb) = 1$, which does not hold for $m_{b'} > 255 \text{ GeV}$. The lower mass bound is given in the plane of $\sin^2(\theta_{tb'})$ and $m_{b'}$.
- ³⁷ AFFOLDER 00 looked for b' that decays into $b+Z$. The signal searched for is $bbZZ$ events where one Z decays into e^+e^- or $\mu^+\mu^-$ and the other Z decays hadronically. The bound assumes $B(b' \rightarrow Zb) = 100\%$. Between 100 GeV and 199 GeV , the 95%CL upper bound on $\sigma(b' \rightarrow \bar{b}') \times B^2(b' \rightarrow Zb)$ is also given (see their Fig. 2).
- ³⁸ ABE 98n looked for $Z \rightarrow e^+e^-$ decays with displaced vertices. Quoted limit assumes $B(b' \rightarrow Zb) = 1$ and $c\tau_{b'} = 1 \text{ cm}$. The limit is lower than m_{Z+m_b} ($\sim 96 \text{ GeV}$) if $c\tau > 22 \text{ cm}$ or $c\tau < 0.009 \text{ cm}$. See their Fig. 4.
- ³⁹ ABACHI 97D searched for b' that decays mainly via FCNC. They obtained 95%CL upper bounds on $B(b'\bar{b}' \rightarrow \gamma + 3 \text{ jets})$ and $B(b'\bar{b}' \rightarrow 2\gamma + 2 \text{ jets})$, which can be interpreted as the lower mass bound $m_{b'} > m_{Z+m_b}$.
- ⁴⁰ ABACHI 95F bound on the top-quark also applies to b' and t' quarks that decay predominantly into W . See FROGGATT 97.
- ⁴¹ MUKHOPADHYAYA 93 analyze CDF dilepton data of ABE 92g in terms of a new quark decaying via flavor-changing neutral current. The above limit assumes $B(b' \rightarrow b\ell^+\ell^-) = 1\%$. For an exotic quark decaying only via virtual Z [$B(b\ell^+\ell^-) = 3\%$], the limit is 85 GeV .
- ⁴² ABE 92 dilepton analysis limit of $>85 \text{ GeV}$ at $\text{CL}=95\%$ also applies to b' quarks, as discussed in ABE 90b.
- ⁴³ ABE 90b exclude the region $28-72 \text{ GeV}$.
- ⁴⁴ AKESSON 90 searched for events having an electron with $p_T > 12 \text{ GeV}$, missing momentum $> 15 \text{ GeV}$, and a jet with $E_T > 10 \text{ GeV}$, $|\eta| < 2.2$, and excluded $m_{b'}$ between 30 and 69 GeV .
- ⁴⁵ For the reduction of the limit due to non-charged-current decay modes, see Fig. 19 of ALBAJAR 90b.
- ⁴⁶ ALBAJAR 88 study events at $E_{\text{cm}} = 546$ and 630 GeV with a muon or isolated electron, accompanied by one or more jets and find agreement with Monte Carlo predictions for the production of charm and bottom, without the need for a new quark. The lower mass limit is obtained by using a conservative estimate for the $b'\bar{b}'$ production cross section and by assuming that it cannot be produced in W decays. The value quoted here is revised using the full $O(\alpha_s^3)$ cross section of ALTARELLI 88.

 $b'(-1/3)$ mass limits from single production in $p\bar{p}$ and pp collisions

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>1500	95	¹ AAD	16AH ATLS	$g b \rightarrow b' \rightarrow tW, B(b' \rightarrow tW)=1$

• • • We do not use the following data for averages, fits, limits, etc. • • •
⁶ SIRUNYAN 19A1 CMS $bZ/tW \rightarrow b' \rightarrow tW$

- ¹ AAD 16AH based on 20.3 fb^{-1} of data in pp collisions at 8 TeV . No significant excess over SM expectation is found in the search for a vector-like b' in the single-lepton and dilepton channels (ℓ or $\ell\ell$) + $1,2,3 j$ ($\geq 1 b$). The model assumes that the b' has the excited quark couplings.
- ² Based on 19.7 fb^{-1} of data in pp collisions at 8 TeV . Limit on left-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.
- ³ Based on 19.7 fb^{-1} of data in pp collisions at 8 TeV . Limit on right-handed b' assuming 100% decay to tW and using all-hadronic, lepton + jets, and dilepton final states.
- ⁴ Based on 19.7 fb^{-1} of data in pp collisions at 8 TeV . Limit on vector-like b' assuming 100% decay to tW and using all-hadronic, lepton+jets, and dilepton final states.
- ⁵ Based on 5.4 fb^{-1} of data in $ppbar$ collisions at 1.96 TeV . ABAZOV 11F looked for single production of b' via the W or Z coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes $p\bar{p} \rightarrow b'q \rightarrow Wuq$, and $p\bar{p} \rightarrow b'q \rightarrow Zdq$ are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.
- ⁶ SIRUNYAN 19A1 based on 35.9 fb^{-1} of pp data at $\sqrt{s}=13 \text{ TeV}$. Exclusion limits are set on the product of the production cross section and branching fraction for the $b'(-1/3) + b$ and $b'(-1/3) + t$ modes as a function of the vector-like quark mass in Figs. 7 and 8 and in Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.

MASS LIMITS for b' (4th Generation) Quark or Hadron in e^+e^- Collisions

Search for hadrons containing a fourth-generation $-1/3$ quark denoted b' .

The last column specifies the assumption for the decay mode (CC denotes the conventional charged-current decay) and the event signature which is looked for.

- ¹ DECAMP 90F looked for isolated charged particles, for isolated photons, and for four-jet final states. The modes $b' \rightarrow bg$ for $B(b' \rightarrow bg) > 65\%$ or $b' \rightarrow b\gamma$ for $B(b' \rightarrow b\gamma) > 5\%$ are excluded. Charged Higgs decay were not discussed.
- ² ABDALLAH 07 searched for b' pair production at $E_{\text{cm}}=196-209 \text{ GeV}$, with 420 pb^{-1} . No signal leads to the 95% CL upper limits on $B(b' \rightarrow bZ)$ and $B(b' \rightarrow cW)$ for $m_{b'} = 96$ to 103 GeV .
- ³ ADRIANI 93g search for vector quarkonium states near Z and give limit on quarkonium- Z mixing parameter $\delta m^2 < (10-30) \text{ GeV}^2$ (95%CL) for the mass $88-94.5 \text{ GeV}$. Using

See key on page 999

Quark Particle Listings

b' (Fourth Generation) Quark, *t'* (Fourth Generation) Quark

- Richardson potential, a $1S(b'\bar{b}')$ state is excluded for the mass range 87.7–94.7 GeV. This range depends on the potential choice.
- ⁴ ABREU 90d assumed $m_{H^-} < m_{b'} - 3 \text{ GeV}$.
 - ⁵ Superseded by ABREU 91f.
 - ⁶ AKRAWY 90b search was restricted to data near the Z peak at $E_{\text{cm}} = 91.26 \text{ GeV}$ at LEP. The excluded region is between 23.6 and 41.4 GeV if no H^\pm decays exist. For charged Higgs decays the excluded regions are between $(m_{H^+} + 1.5 \text{ GeV})$ and 45.5 GeV.
 - ⁷ AKRAWY 90j search for isolated photons in hadronic Z decay and derive $B(Z \rightarrow b'\bar{b}') \cdot B(b' \rightarrow \gamma X) / B(Z \rightarrow \text{hadrons}) < 2.2 \times 10^{-3}$. Mass limit assumes $B(b' \rightarrow \gamma X) > 10\%$.
 - ⁸ ABE 89e search at $E_{\text{cm}} = 56\text{--}57 \text{ GeV}$ at TRISTAN for multihadron events with a spherical shape (using thrust and acoplanarity) or containing isolated leptons.
 - ⁹ ABE 89c search was at $E_{\text{cm}} = 55\text{--}60.8 \text{ GeV}$ at TRISTAN.
 - ¹⁰ If the photonic decay mode is large $(B(b' \rightarrow b\gamma) > 25\%)$, the ABRAMS 89c limit is 45.4 GeV. The limit for Higgs decay $(b' \rightarrow cH^-, H^- \rightarrow \bar{\nu}_s)$ is 45.2 GeV.
 - ¹¹ ADACHI 89c search was at $E_{\text{cm}} = 56.5\text{--}60.8 \text{ GeV}$ at TRISTAN using multi-hadron events accompanying muons.
 - ¹² ADACHI 89c also gives limits for any mixture of CC and bg decays.
 - ¹³ ENO 89 search at $E_{\text{cm}} = 50\text{--}60.8 \text{ GeV}$ at TRISTAN.
 - ¹⁴ ENO 89 considers arbitrary mixture of the charged current, bg , and $b\gamma$ decays.
 - ¹⁵ IGARASHI 88 searches for leptons in low-thrust events and gives $\Delta R(b') < 0.26$ (95% CL) assuming charged current decay, which translates to $m_{b'} > 24.4 \text{ GeV}$.
 - ¹⁶ SAGAWA 88 set limit $\sigma(\text{top}) < 6.1 \text{ pb}$ at $\text{CL}=95\%$ for top-flavored hadron production from event shape analyses at $E_{\text{cm}} = 52 \text{ GeV}$. By using the quark parton model cross-section formula near threshold, the above limit leads to lower mass bounds of 23.8 GeV for charge $-1/3$ quarks.
 - ¹⁷ ADEVA 86 give 95%CL upper bound on an excess of the normalized cross section, ΔR , as a function of the minimum c.m. energy (see their figure 3). Production of a pair of $1/3$ charge quarks is excluded up to $E_{\text{cm}} = 45.4 \text{ GeV}$.
 - ¹⁸ ALTHOFF 84c narrow state search sets limit $\Gamma(e^+e^-B(\text{hadrons})) < 2.4 \text{ keV}$ CL = 95% and heavy charge $1/3$ quark pair production $m > 21 \text{ GeV}$, CL = 95%.
 - ¹⁹ ALTHOFF 84i exclude heavy quark pair production for $7 < m < 19 \text{ GeV}$ ($1/3$ charge) using aplanarity distributions (CL = 95%).

- ¹ SIRUNYAN 19AQ based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. Pair production of vector-like t' is searched for with one t' decaying into Zt and the other t' decaying into Wb, Zt, ht . Events with an opposite-sign lepton pair consistent with coming from Z and jets are used. Mass limits are obtained for a variety of branching ratios of t' .
 - ² SIRUNYAN 19BW based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. The limit is for the pair-produced vector-like t' using all-hadronic final state. The analysis is made for the Wb, Zt, ht modes and mass limits are obtained for a variety of branching ratios.
 - ³ AABOUD 18CE based on 36.1 fb^{-1} of proton-proton data taken at $\sqrt{s} = 13 \text{ TeV}$. Events including a same-sign lepton pair are used. The limit is for a singlet model, assuming the branching ratios of t' into Zt, Wb and ht as predicted by the model.
 - ⁴ AABOUD 18CL based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. The limit is for the pair-produced vector-like t' using all-hadronic final state. The analysis is also made for the Wb, Zt, ht modes and mass limits are obtained for a variety of branching ratios.
 - ⁵ AABOUD 18CP based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. Pair and single production of vector-like t' are searched for with at least one t' decaying into Zt . In the case of $B(t' \rightarrow Zt) = 1$, the limit is $m_{t'} > 1340 \text{ GeV}$.
 - ⁶ The limit is for the singlet model, assuming that the branching ratios into Zt, Wb , and ht add up to one.
 - ⁷ The limit is for the doublet model, assuming that the branching ratios into Zt, Wb , and ht add up to one.
 - ⁸ AABOUD 18CR based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. A combination of searches for the pair-produced vector-like t' in various decay channels ($t' \rightarrow Wb, Zt, ht$). Also a model-independent limit is obtained as $m_{t'} > 1.31 \text{ TeV}$, assuming that the branching ratios into Zt, Wb and ht add up to one.
 - ⁹ The limit is for the singlet t' .
 - ¹⁰ The limit is for t' in a weak isospin doublet (t', b') and $|V_{tb'}| \ll |V_{t'b}|$.
 - ¹¹ SIRUNYAN 18BM based on 35.9 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. The limit is for the pair-produced vector-like t' . Three channels (single lepton, same-charge 2 leptons, or at least 3 leptons) are considered for various branching fraction combinations. Assuming $B(tH) = 1$, the limit is 1270 GeV and for $B(tZ) = 1$ it is 1300 GeV.
 - ¹² SIRUNYAN 18Q based on 19.7 fb^{-1} of pp data at $\sqrt{s} = 8 \text{ TeV}$. The limit is for the pair-produced vector-like t' that couple only to light quarks. Constraints for other decay channels (Zq and Hq) are also given in the paper.
 - ¹³ SIRUNYAN 18W based on 35.8 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. The limit is for the vector-like t' pair-produced by strong interaction using lepton-plus-jets mode and assuming that $B(t' \rightarrow Wb)$ is 100product of the production cross section and branching fraction to Wb for any new pair-produced heavy quark decaying to this channel as a narrow resonance.
 - ¹⁴ AABOUD 17L based on 36.1 fb^{-1} of pp data at $\sqrt{s} = 13 \text{ TeV}$. No signal is found in the search for heavy quark pair production that decay into Zt followed by $Z \rightarrow \nu\nu$ in

Quark Particle Listings

t' (Fourth Generation) Quark

- the events with one lepton, large E_T , and ≥ 4 jets. The lower mass limit 0.87 (1.05) TeV is obtained for the singlet (doublet) model with other possible decay modes.
- SIRUNYAN 17AU based on 2.3–2.6 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Limit on pair-produced singlet vector-like t' using one lepton and several jets. The mass bound is given for a t' transforming as a singlet under the electroweak symmetry group, assumed to decay through W , Z or Higgs boson (which decays to jets) and to a third generation quark. For a doublet, the limit is >830 GeV. Other limits are also given in the paper.
 - AAD 15AR based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used lepton-plus-jets final state. See Fig. 20 for mass limits in the plane of $B(t' \rightarrow Ht)$ vs. $B(t' \rightarrow Wb)$ from a combination of $t'\bar{t}' \rightarrow Wb + X$ and $t'\bar{t}' \rightarrow Ht + X$ searches. Any branching ratio scenario is excluded for mass below 715 GeV.
 - AAD 15BY based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on pair-produced vector-like t' assuming the branching fractions to W , Z , and h modes of the singlet model. Used events containing $\geq 2\ell + \cancel{E}_T + \geq 2j$ (≥ 1 b) and including a same-sign lepton pair.
 - KHACHATRYAN 15AI based on 19.7 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The search exploits all-hadronic final states by tagging boosted Higgs boson using jet substructure and b -tagging.
 - Based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. No significant excess over SM expectation is found in the search for pair production or single production of t' in the events with dilepton from a high p_T Z and additional jets (≥ 1 b -tag). If instead of $B(b' \rightarrow Wt)$ is 1 an electroweak singlet with $B(b' \rightarrow Wt) \sim 0.45$ is assumed, the limit reduces to 685 GeV.
 - Based on 19.5 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. The t' quark is pair produced and is assumed to decay into three different final states of bW , tZ , and th . The search is carried out using events with at least one isolated lepton.
 - Based on 1.04 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a quark in the events with dileptons, large E_T , and ≥ 2 jets.
 - Based on 1.04 fb⁻¹ of data in pp collisions at 7 TeV. AAD 12C looked for $t'\bar{t}'$ production followed by t' decaying into a top quark and X , an invisible particle, in a final state with an isolated high- p_T lepton, four or more jets, and a large missing transverse energy. No excess over the SM $t\bar{t}$ production gives the upper limit on $t'\bar{t}'$ production cross section as a function of $m_{t'}$ and m_X . The result is obtained for $B(t' \rightarrow Wt) = 1$.
 - Based on 5 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12BH searched for QCD and EW production of single and pair of degenerate 4th generation quarks that decay to Wb or Wt . Absence of signal in events with one lepton, same-sign dileptons or triplets gives the bound. With a mass difference of 25 GeV/ c^2 between $m_{t'}$ and $m_{b'}$, the corresponding limit shifts by about ± 20 GeV/ c^2 .
 - Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12P looked for $t'\bar{t}'$ production events with two isolated high p_T leptons, large E_T , and 2 high p_T jets with b -tag. The absence of signal above the SM background gives the limit for $B(t' \rightarrow Wb) = 1$.
 - Based on 4.7 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found for the search of heavy quark pair production that decay into W and a b quark in the events with a high p_T isolated lepton, large E_T , and at least 3 jets (≥ 1 b -tag). Vector-like quark of charge 2/3 with $400 < m_{t'} < 550$ GeV and $B(t' \rightarrow Wb) > 0.63$ is excluded at 95% CL.
 - Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 13I looked for events with one isolated electron or muon, large E_T , and at least four jets with large transverse momenta, where one jet is likely to originate from the decay of a bottom quark.
 - Based on 1.04 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. No signal is found in the search for pair produced heavy quarks that decay into W boson and a b quark in the events with a high p_T isolated lepton, large E_T and at least 3 jets (≥ 1 b -tag).
 - Based on 5.0 fb⁻¹ of pp data at $\sqrt{s} = 7$ TeV. CHATRCHYAN 12Bc looked for $t'\bar{t}'$ production events with a single isolated high p_T lepton, large E_T and at least 4 high p_T jets with a b -tag. The absence of signal above the SM background gives the limit for $B(t' \rightarrow Wb) = 1$.
 - Based on 5.7 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11AH looked for $t'\bar{t}'$ production followed by t' decaying into a top quark and X , an invisible particle, in the all hadronic decay mode of $t\bar{t}$. No excess over the SM $t\bar{t}$ production gives the upper limit on $t'\bar{t}'$ production cross section as a function of $m_{t'}$ and m_X . The result is obtained for $B(t' \rightarrow Xt) = 1$.
 - Based on 5.6 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11AL looked for $\ell + \geq 4j$ events and set upper limits on $\sigma(t'\bar{t}')$ as functions of $m_{t'}$.
 - Based on 4.8 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. AALTONEN 11I looked for $t'\bar{t}'$ production signal when t' decays into a top quark and X , an invisible particle, in $\ell + \cancel{E}_T +$ jets channel. No excess over the SM $t\bar{t}$ production gives the upper limit on $t'\bar{t}'$ production cross section as a function of $m_{t'}$ and m_X . The result is obtained for $B(t' \rightarrow Xt) = 1$.
 - Based on 5.3 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. ABZOV 11Q looked for $\ell + \cancel{E}_T + \geq 4j$ events and set upper limits on $\sigma(t'\bar{t}')$ as functions of $m_{t'}$.
 - Searches for pair production of a new heavy top-like quark t' decaying to a W boson and another quark by fitting the observed spectrum of total transverse energy and reconstructed t' mass in the lepton + jets events.
 - HUANG 08 reexamined the t' mass lower bound of 256 GeV obtained in AALTONEN 08H that assumes $B(b' \rightarrow qZ) = 1$ for $q = u, c$ which does not hold when $m_{b'} < m_{t'} - m_W$ or the mixing $\sin^2(\theta_{bt'})$ is so tiny that the decay occurs outside of the vertex detector. Fig. 1 gives that lower bound on $m_{t'}$ in the plane of $\sin^2(\theta_{bt'})$ and $m_{b'}$.

$t'(5/3)$ -quark/hadron mass limits in $p\bar{p}$ and pp collisions

> 800	95	7 CHATRCHYAN	14T CMS	$t'(5/3) \rightarrow tW^+$

- SIRUNYAN 19T based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Signals are searched in the final states of t' pair production, with same-sign leptons (which come from a t' decay) or a single lepton (which comes from a W out of 4Ws), along with jets, and no excess over the SM expectation is found.
- AABOUD 18AW based on 36.1 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Limit on $t'(5/3)$ in pair production assuming its coupling to Wt is equal to one. Lepton-plus-jets final state is used, characterized by $\ell + \cancel{E}_T +$ jets (≥ 1 b -tagged).
- AABOUD 18CE based on 36.1 fb⁻¹ of proton-proton data taken at $\sqrt{s} = 13$ TeV. Events including a same-sign lepton pair are used. The limit is for the pair-produced vector-like t' . With single t' production included, assuming $t'tW$ coupling of one, the limit is $m_{t'} > 1.6$ TeV.
- SIRUNYAN 17J based on 2.3 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Signals are searched in the final states of t' pair production, with same-sign leptons (which come from a t' decay) or a single lepton (which comes from a W out of 4Ws), along with jets, and no excess over the SM expectation is found.
- AAD 15BY based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Limit on $t'(5/3)$ in pair and single production assuming its coupling to Wt is equal to one. Used events containing $\geq 2\ell + \cancel{E}_T + \geq 2j$ (≥ 1 b) and including a same-sign lepton pair.
- AAD 15Z based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Used events with $\ell + \cancel{E}_T + \geq 6j$ (≥ 1 b) and at least one pair of jets from weak boson decay, sensitive to the final state $b\bar{b}W^+W^-W^+W^-$.
- CHATRCHYAN 14T based on 19.5 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. Non-observation of anomaly in H_T distribution in the same-sign dilepton events leads to the limit when pair produced $t'(5/3)$ quark decays exclusively into t and W^+ , resulting in the final state with $b\bar{b}W^+W^-W^+W^-$.

$t'(2/3)$ mass limits from single production in $p\bar{p}$ and pp collisions

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>950	95	1 AAD	16AV ATLS	$qg \rightarrow q't'b, B(t' \rightarrow Wb)=0.5$
>403	95	2 ABZOV	11F D0	$qd \rightarrow q't' \rightarrow q'(Wd)$ $\bar{\kappa}_{dt'}=1, B(t' \rightarrow Wd)=1$
>551	95	2 ABZOV	11F D0	$qu \rightarrow q't' \rightarrow q(Zu)$ $\bar{\kappa}_{ut'}=\sqrt{2}, B(t' \rightarrow Zu)=1$

- AAD 16AV based on 20.3 fb⁻¹ of pp data at $\sqrt{s} = 8$ TeV. No significant excess over SM expectation is found in the search for a fully reconstructed vector-like t' in the mode $\ell + \cancel{E}_T + \geq 2j$ (≥ 1 b). A veto on massive large-radius jets is used to reject the $t\bar{t}$ background.
- Based on 5.4 fb⁻¹ of data in $p\bar{p}$ collisions at 1.96 TeV. ABZOV 11F looked for single production of t' via the Z or E coupling to the first generation up or down quarks, respectively. Model independent cross section limits for the single production processes $p\bar{p} \rightarrow t'q \rightarrow (Wd)q$, and $p\bar{p} \rightarrow t'q \rightarrow (Zd)q$ are given in Figs. 3 and 4, respectively, and the mass limits are obtained for the model of ATRE 09 with degenerate bi-doublets of vector-like quarks.

$t'(5/3)$ mass limits from single production in $p\bar{p}$ and pp collisions

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
•••	1 SIRUNYAN	19AI CMS	$tW \rightarrow t'(5/3) \rightarrow tW$

- SIRUNYAN 19AI based on 35.9 fb⁻¹ of pp data at $\sqrt{s} = 13$ TeV. Exclusion limits are set on the product of the production cross section and branching fraction for the $b'(-1/3) + t$ and $t'(5/3) + t$ modes as a function of the vector-like quark mass in Fig. 8 and Tab. 2 for relative vector-like quark widths between 1 and 30% for left- and right-handed vector-like quark couplings. No significant deviation from the SM prediction is observed.

Free Quark Searches

FREE QUARK SEARCHES

The basis for much of the theory of particle scattering and hadron spectroscopy is the construction of the hadrons from a set of fractionally charged constituents (quarks). A central element of Quantum Chromodynamics is that quarks cannot be observed as free particles but are confined to mesons and baryons. Experiments have produced no evidence for free quarks.

This compilation is only a guide to the literature, since the quoted experimental limits are often only indicative. Reviews can be found in Refs. 1-4.

Quark Flux — Accelerator Searches

The definition of FLUX depends on the experiment

- (a) is the ratio of measured free quarks to predicted free quarks if there is no "confinement."
- (b) is the probability of fractional charge on nuclear fragments. Energy is in GeV/nucleon.
- (c) is the 90%CL upper limit on fractionally-charged particles produced per interaction.
- (d) is quarks per collision.
- (e) is inclusive quark-production cross-section ratio to $\sigma(e^+e^- \rightarrow \mu^+\mu^-)$.
- (f) is quark flux per charged particle.
- (g) is the flux per ν -event.
- (h) is quark yield per π^- yield.
- (i) is 2-body exclusive quark-production cross-section ratio to $\sigma(e^+e^- \rightarrow \mu^+\mu^-)$.

1 HUENTRUP 96 quote 95% CL limits for production of fragments with charge differing by as much as ±1/3 (in units of e) for charge 6 ≤ Z ≤ 10.
 2 BUSKULIC 93c limits for inclusive quark production are more conservative if the ALEPH hadronic fragmentation function is assumed.
 3 CECCHINI 93 limit at 90%CL for 23/3 ≤ Z ≤ 40/3, for 16A GeV O, 14.5A Si, and 200A S incident on Cu target. Other limits are 2.3 × 10⁻⁴ for 17/3 ≤ Z ≤ 20/3 and 1.2 × 10⁻⁴ for 20/3 ≤ Z ≤ 23/3.
 4 GHOSH 92 reports measurement of spallation fragment charge based on ionization in emulsion. Out of 650 measured tracks, 2 were consistent with charge 5e/3, and 4 with 7e/3.
 5 Hadronic quark.
 6 Leptonic quark.
 7 HE 91 limits are for charges of the form N±1/3 from 23/3 to 38/3, and correspond to cross-section limits of 380μb (Pb) and 320μb (Cu).
 8 The limits apply to projectile fragment charges of 17, 19, 20, 22, 23 in units of e/3.
 9 The limits apply to projectile fragment charges of 16, 17, 19, 20, 22, 23 in units of e/3.
 10 Flux limits and mass range depend on charge.
 11 Bound to nuclei.
 12 Quark lifetimes > 1 × 10⁻⁸ s.
 13 One candidate m < 0.17 GeV.

1 See AGNESE 15 Fig.6 for limits on vertical density as function of charge extending to |q|/e < 1/10.
 2 AMBROSIO 00c limit is below 11 × 10⁻¹⁵ for 0.25 < q/e < 0.5, and is changing rapidly near q/e=2/3, where it is 2 × 10⁻¹⁴.
 3 Distribution in celestial sphere was described as anisotropic.
 4 With telescope axis at zenith angle 40° to the south.
 5 Leptonic quarks.
 6 Lifetime > 10⁻⁸ s; charge ±0.70, 0.68, 0.42; and mass >4.4, 4.8, and 20 GeV, respectively.
 7 Time delayed air shower search.
 8 Prompt air shower search.
 9 Also e/4 and e/6 charges.
 10 No events in subsequent experiments.

Quark Flux — Cosmic Ray Searches

Shielding values followed with an asterisk indicate altitude in km. Shielding values not followed with an asterisk indicate sea level in kg/cm².

1 95% CL limit for fractional charge particles with 0.18e ≤ |Q_{residual}| ≤ 0.82e in total of 70.1 mg of silicone oil.

See key on page 999

Quark Particle Listings

Free Quark Searches

² 95% CL limit for particles with fractional charge $|Q_{residual}| > 0.16e$ in total of 17.4 mg of silicone oil.
³ Also set limits for $Q = \pm e/6$.
⁴ Note that in PHILLIPS 88 these authors report a subtle magnetic effect which could account for the apparent fractional charges.
⁵ Limit inferred by JONES 77b.

LIGHT UNFLAVORED MESONS (S = C = B = 0)

For $I = 1$ (π, b, ρ, a): $u\bar{d}, (u\bar{u}-d\bar{d})/\sqrt{2}, d\bar{u}$;
for $I = 0$ ($\eta, \eta', h, h', \omega, \phi, f, f'$): $c_1(u\bar{u} + d\bar{d}) + c_2(s\bar{s})$

π^\pm

$$J^G(J^P) = 1^-(0^-)$$

We have omitted some results that have been superseded by later experiments. The omitted results may be found in our 1988 edition Physics Letters **B204** 1 (1988).

π^\pm MASS

The most accurate charged pion mass measurements are based upon x-ray wavelength measurements for transitions in π^- -mesonic atoms. The observed line is the blend of three components, corresponding to different K-shell occupancies. JECKELMANN 94 revisits the occupancy question, with the conclusion that two sets of occupancy ratios, resulting in two different pion masses (Solutions A and B), are equally probable. We choose the higher Solution B since only this solution is consistent with a positive mass-squared for the muon neutrino, given the precise muon momentum measurements now available (DAUM 91, ASSAMAGAN 94, and ASSAMAGAN 96) for the decay of pions at rest. Earlier mass determinations with π^- -mesonic atoms may have used incorrect K-shell screening corrections.

Measurements with an error of > 0.005 MeV have been omitted from this Listing.

¹ DAUM 19 value is based on their previous (1991+1996) measurements of the μ^+ momentum of 29.79200 ± 0.00011 MeV for π^+ decay at rest. It also uses $m_\mu = 105.6583745 \pm 0.0000024$ MeV, and assumes conservatively $m_{\nu_\mu} = 2.0 \pm 2.0$ MeV. It is the most precise charged pion mass determination.

² TRASSINELLI 16 use the muonic oxygen line for online energy calibration of the pionic line.

³ LENZ 98 result does not suffer K-electron configuration uncertainties as does JECKELMANN 94.

⁴ JECKELMANN 94 Solution B (dominant 2-electron K-shell occupancy), chosen for consistency with positive $m_{\nu_\mu}^2$.

⁵ ASSAMAGAN 96 measures the μ^+ momentum p_μ in $\pi^+ \rightarrow \mu^+ \nu_\mu$ decay at rest to be 29.79200 ± 0.00011 MeV/c. Combined with the μ^+ mass and the assumption $m_{\nu_\mu} = 0$, this gives the π^+ mass above; if $m_{\nu_\mu} > 0$, m_{π^+} given above is a lower limit. Combined instead with m_μ and (assuming CPT) the π^- mass of JECKELMANN 94, p_μ gives an upper limit on m_{ν_μ} (see the ν_μ).

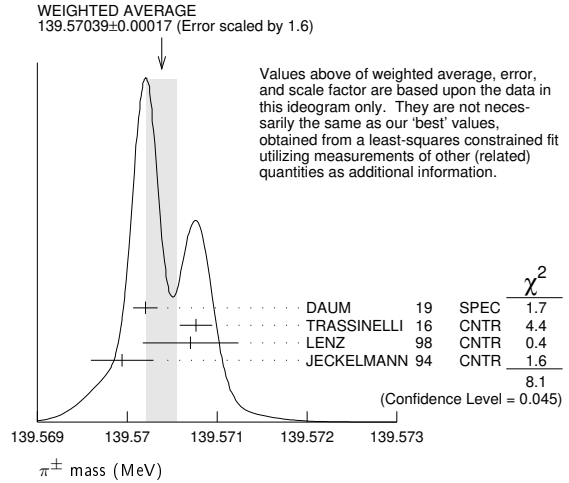

⁶ JECKELMANN 94 Solution A (small 2-electron K-shell occupancy) in combination with either the DAUM 91 or ASSAMAGAN 94 pion decay muon momentum measurement yields a significantly negative $m_{\nu_\mu}^2$. It is accordingly not used in our fits.

⁷ The DAUM 91 value includes the ABELA 84 result. The value is based on a measurement of the μ^+ momentum for π^+ decay at rest, $p_\mu = 29.79179 \pm 0.00053$ MeV, uses $m_\mu = 105.658389 \pm 0.000034$ MeV, and assumes that $m_{\nu_\mu} = 0$. The last assumption means that in fact the value is a lower limit.

⁸ JECKELMANN 86B gives $m_\pi/m_e = 273.12677(71)$. We use $m_e = 0.51099906(15)$ MeV from COHEN 87. The authors note that two solutions for the probability distribution of K-shell occupancy fit equally well, and use other data to choose the lower of the two possible π^\pm masses.

⁹ These values are scaled with a new wavelength-energy conversion factor $V\lambda = 1.23984244(37) \times 10^{-6}$ eV m from COHEN 87. The LU 80 screening correction relies upon a theoretical calculation of inner-shell refilling rates.

¹⁰ This MARUSHENKO 76 value used at the authors' request to use the accepted set of calibration γ energies. Error increased from 0.0017 MeV to include QED calculation error of 0.0017 MeV (12 ppm).

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

Lepton Family number (LF) or Lepton number (L) violating modes

Γ_8 $\mu^+ \bar{\nu}_e$	L	[c] < 1.5	× 10 ⁻³	90%
Γ_9 $\mu^+ \nu_e$	LF	[c] < 8.0	× 10 ⁻³	90%
Γ_{10} $\mu^- e^+ e^+ \nu$	LF	< 1.6	× 10 ⁻⁶	90%

[a] Measurements of $\Gamma(e^+ \nu_e)/\Gamma(\mu^+ \nu_\mu)$ always include decays with γ 's, and measurements of $\Gamma(e^+ \nu_e \gamma)$ and $\Gamma(\mu^+ \nu_\mu \gamma)$ never include low-energy γ 's. Therefore, since no clean separation is possible, we consider the modes with γ 's to be subreactions of the modes without them, and let $[\Gamma(e^+ \nu_e) + \Gamma(\mu^+ \nu_\mu)]/\Gamma_{\text{total}} = 100\%$.

[b] See the Particle Listings below for the energy limits used in this measurement; low-energy γ 's are not included.

[c] Derived from an analysis of neutrino-oscillation experiments.

 π^\pm CHARGE RADIUS

The charge radius of the pion $\sqrt{\langle r_\pi^2 \rangle}$ is defined in relation to the form factor of the pion electromagnetic vertex, called vector form factor VFF, F_V . The VFF is a function of the squared four-momentum transfer t , or of the squared c.m. energy s , depending on the channel in which the photon exchange takes place. In both cases, it is related to the slope of the VFF at zero, namely

$$\langle r_\pi^2 \rangle = 6 \frac{dF_V(q^2)}{dq^2} (q=0) \text{ where } q = t, s.$$

The quantity cannot be measured directly. It can be extracted from the cross sections of three processes: pion electroproduction, $eN \rightarrow eN\pi$, and pion electron scattering $e\pi \rightarrow e\pi$, for the t channel, and positron electron annihilation into two charged pions, $e^+e^- \rightarrow \pi^+\pi^-$, for the s channel. We encode all measurements, but we do not use electroproduction data in averaging because the extraction of the pion radius involves, in this case, theoretical uncertainties that cannot be controlled at the needed level of accuracy. In case of analyses based on the same data set, as ANANTHANARAYAN 17 and COLANGELO 19, which cannot be averaged, we combine the results into a common value, with the uncertainty range chosen to cover both analyses. Note that for consistency the form factor needs to be defined in both channels with the vacuum polarisation removed. For details see COLANGELO 19 or Appendix B of ANANTHANARAYAN 16a.

¹ This value combines the measurements of ANANTHANARAYAN 17 and COLANGELO 19 which are based on the same data set. The uncertainty range is chosen to cover both results.

² COLANGELO 19 fit existing F_V data, using an extended Omnes dispersive representation. This analysis is based on the same data set of ANANTHANARAYAN 17. Accordingly, they cannot be averaged. We combine the results into a common value, with the uncertainty range chosen to cover the uncertainty ranges of both analyses.

³ ANANTHANARAYAN 17 fit existing F_V data, using a mixed phase-modulus dispersive representation. This analysis is based on the same data set of COLANGELO 19. Accordingly, they cannot be averaged. We combine the results into a common value, with the uncertainty range chosen to cover the uncertainty ranges of both analyses.

⁴ According to the authors the uncertainty could be underestimated. The value quoted omits the BaBar data AUBERT 09.

⁵ The extractions could contain an additional theoretical uncertainty which cannot be sufficiently quantified.

⁶ BIJNENS 98 fits existing data.

⁷ The extraction is based on a parametrization that does not have correct analytic properties.

π^0 MEAN LIFE

Most experiments measure the π^0 width which we convert to a lifetime. ATHERTON 85 is the only direct measurement of the π^0 lifetime. Our average based only on indirect measurement yields $(8.30 \pm 0.19) \times 10^{-17}$ s. The two Primakoff measurements from 1970 have been excluded from our average because they suffered model-related systematics unknown at the time. More information on the π^0 lifetime can be found in BERNSTEIN 13.

VALUE (10^{-17} s)	EVTS	DOCUMENT ID	TECN	COMMENT

9 ± 0.68		KRYSHKIN 70	CNTR	Primakoff effect
7.3 ± 1.1		BELLETTINI 65B	CNTR	Primakoff effect
¹ LARIN 11 reported $\Gamma(\pi^0 \rightarrow \gamma\gamma) = 7.82 \pm 0.14 \pm 0.17$ eV which we converted to mean life $\tau = \hbar/\Gamma(\text{total})$.				
² BYCHKOV 09 obtains this using the conserved-vector-current relation between the vector form factor F_V and the π^0 lifetime.				
³ WILLIAMS 88 gives $\Gamma(\gamma\gamma) = 7.7 \pm 0.5 \pm 0.5$ eV. We give here $\tau = \hbar/\Gamma(\text{total})$.				
⁴ BROWMAN 74 gives a π^0 width $\Gamma = 8.02 \pm 0.42$ eV. The mean life is \hbar/Γ .				

π^0 DECAY MODES

For decay limits to particles which are not established, see the appropriate Search sections (A^0 (axion) and Other Light Boson (X^0) Searches, etc.).

[a] Astrophysical and cosmological arguments give limits of order 10^{-13} .

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 4.6$ for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

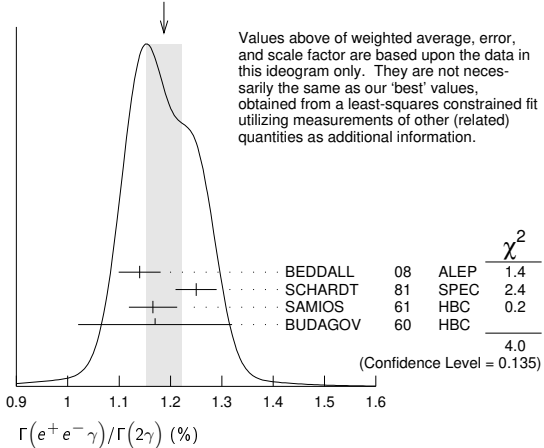

x_2	-100	
x_4	0	-1

••• We do not use the following data for averages, fits, limits, etc. •••
6.09 ± 0.40 ± 0.24 275 4 ALAVI-HARATI 99c SPEC 0 Repl. by ABOUZAID 07

1 ABOUZAID 07 result is for $m_{e^+e^-}/m_{\pi^0} > 0.95$. With radiative corrections the result becomes $(7.48 ± 0.29 ± 0.25) × 10^{-8}$.

2 The DESHPANDE 93 result with bremsstrahlung radiative corrections is $(8.0 ± 2.6 ± 0.6) × 10^{-8}$.

3 The MCFARLAND 93 result is for $B[\pi^0 → e^+e^-, (m_{e^+e^-}/m_{\pi^0})^2 > 0.95]$. With radiative corrections it becomes $(8.8_{-3.2}^{+4.5} ± 0.6) × 10^{-8}$.

4 ALAVI-HARATI 99c quote result for $B[\pi^0 → e^+e^-, (m_{e^+e^-}/m_{\pi^0})^2 > 0.95]$ to minimize radiative contributions from $\pi^0 → e^+e^-\gamma$. After radiative corrections they obtain $(7.04 ± 0.46 ± 0.28) × 10^{-8}$.

$\Gamma(e^+e^-)/\Gamma(2\gamma)$ Γ_5/Γ_1

Table with columns: VALUE (units 10^-7), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Rows include NIEBUHR 89, ZEPHAT 87, FRANK 83, MISCHKE 82, FISCHER 78B.

$\Gamma(4\gamma)/\Gamma_{total}$ Γ_6/Γ

Table with columns: VALUE (units 10^-8), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Rows include MCDONOUGH 88, BOLOTOV 86c, AUERBACH 80.

$\Gamma(\nu\bar{\nu})/\Gamma_{total}$ Γ_7/Γ

The astrophysical and cosmological limits are many orders of magnitude lower, but we use the best laboratory limit for the Summary Tables.

Table with columns: VALUE (units 10^-6), CL%, DOCUMENT ID, TECN, COMMENT. Rows include ARTAMONOV 05A, ATIYA 91, LAM 91, NATALE 91, DORENBOS... 88, HERCZEG 81.

1 This limit applies to all possible $\nu\nu'$ states as well as to other massless, weakly interacting states.

2 LAM 91 considers the production of right-handed neutrinos produced from the cosmic thermal background at the temperature of about the pion mass through the reaction $\gamma\gamma → \pi^0 → \nu\bar{\nu}$.

3 NATALE 91 considers the excess energy-loss rate from SN1987A if the process $\gamma\gamma → \pi^0 → \nu\bar{\nu}$ occurs, permitted if the neutrinos have a right-handed component. As pointed out in LAM 91 (and confirmed by Natale), there is a factor 4 error in the NATALE 91 published result $(0.8 × 10^{-7})$.

$\Gamma(\nu_e\bar{\nu}_e)/\Gamma_{total}$ Γ_8/Γ

Table with columns: VALUE (units 10^-6), CL%, DOCUMENT ID, TECN, COMMENT. Rows include DORENBOS... 88, HOFFMAN 88.

1 HOFFMAN 88 analyzes data from a 400-GeV BEBC beam-dump experiment.

$\Gamma(\nu_\mu\bar{\nu}_\mu)/\Gamma_{total}$ Γ_9/Γ

1 HOFFMAN 88 analyzes data from a 400-GeV BEBC beam-dump experiment.

$\Gamma(\gamma\nu\bar{\nu})/\Gamma_{total}$ Γ_{11}/Γ

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Rows include CORTINA-GIL 19, ATIYA 92.

$\Gamma(3\gamma)/\Gamma_{total}$ Γ_{12}/Γ

Forbidden by C invariance.

Table with columns: VALUE (units 10^-8), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Rows include MCDONOUGH 88, HIGHLAND 80, AUERBACH 78, DUCLOS 65, KUTIN 65.

1 These experiments give $B(3\gamma/2\gamma) < 5.0 × 10^{-6}$.

$\Gamma(\mu^+e^-)/\Gamma_{total}$ Γ_{13}/Γ

Forbidden by lepton family number conservation.

Table with columns: VALUE (units 10^-3), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Rows include APPEL 00, LEE 90, CAMPAGNARI 88.

$\Gamma(\mu^-e^+)/\Gamma_{total}$ Γ_{14}/Γ

Forbidden by lepton family number conservation.

Table with columns: VALUE (units 10^-3), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Rows include APPEL 00B, B865.

$[\Gamma(\mu^+e^-) + \Gamma(\mu^-e^+)]/\Gamma_{total}$ Γ_{15}/Γ

Forbidden by lepton family number conservation.

Table with columns: VALUE (units 10^-3), CL%, DOCUMENT ID, TECN, COMMENT. Rows include ABOUZAID 08c, KROLAK 94, HERCZEG 84, THEO 84, BRYMAN 82.

π^0 ELECTROMAGNETIC FORM FACTOR

The amplitude for the process $\pi^0 → e^+e^-\gamma$ contains a form factor F(x) at the $\pi^0\gamma\gamma$ vertex, where $x = [m_{e^+e^-}/m_{\pi^0}]^2$. The parameter a in the linear expansion F(x) = 1 + ax is listed below.

All the measurements except that of BEHREND 91 are in the time-like region of momentum transfer.

LINEAR COEFFICIENT OF π^0 ELECTROMAGNETIC FORM FACTOR

Table with columns: VALUE (units 10^-2), EVTS, DOCUMENT ID, TECN, COMMENT. Rows include LAZZERONI 17, FARZANPAY 92, MEIJERDREES 92B, BEHREND 91, FONVIEILLE 89, TUPPER 83, FISCHER 78, DEVONS 69, KOBRACK 61, SAMIOS 61.

1 BEHREND 91 estimates that their systematic error is of the same order of magnitude as their statistical error, and so we have included a systematic error of this magnitude. The value of a is obtained by extrapolation from the region of large space-like momentum transfer assuming vector dominance.

2 TUPPER 83 is a theoretical analysis of FISCHER 78 including 2-photon exchange in the corrections.

3 The FISCHER 78 error is statistical only. The result without radiation corrections is +0.05 ± 0.03.

η

$$I^G(J^{PC}) = 0^+(0^{-+})$$

We have omitted some results that have been superseded by later experiments. The omitted results may be found in our 1988 edition Physics Letters **B204** (1988).

η MASS

Recent measurements resolve the obvious inconsistency in previous η mass measurements in favor of the higher value first reported by NA48 (LA1 02). We use only precise measurements consistent with this higher mass value for our η mass average.

[a] Forbidden by angular momentum conservation.

[b] C parity forbids this to occur as a single-photon process.

CONSTRAINED FIT INFORMATION

An overall fit to 2 decay rate and 19 branching ratios uses 50 measurements and one constraint to determine 9 parameters. The overall fit has a $\chi^2 = 43.8$ for 42 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

x_3	24								
x_4	4	1

Meson Particle Listings

η

Table with 3 columns: Γ_{12} , Γ_{16} , and values for $\mu^+\mu^-\gamma$ and $\pi^+\pi^-e^+e^-(\gamma)$.

η DECAY RATES

$\Gamma(2\gamma)$ See the table immediately above giving the fitted decay rates. Following the advice of NEFKENS 02, we have removed the Primakoff-effect measurement from the average. See also the "Note on the Decay Width $\Gamma(\eta \rightarrow \gamma\gamma)$," in our 1994 edition, Phys. Rev. D50, 1 August 1994, Part I, p. 1451, for a discussion of the various measurements.

Table with 5 columns: VALUE (keV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

1 RODRIGUES 08 uses a more sophisticated calculation for the inelastic background due to incoherent photoproduction to reanalyze the η photoproduction data on Be and Cu at 9 GeV from BROWMAN 74B. This brings the value of $\Gamma(\eta \rightarrow 2\gamma)$ in line with direct measurements of the width. The error here is only statistical.
2 BEMPORAD 67 gives $\Gamma(2\gamma) = 1.21 \pm 0.26$ keV assuming $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.314$. Bemporad private communication gives $\Gamma(2\gamma)^2/\Gamma(\text{total}) = 0.380 \pm 0.083$. We evaluate this using $\Gamma(2\gamma)/\Gamma(\text{total}) = 0.38 \pm 0.01$. Not included in average because the uncertainty resulting from the separation of the coulomb and nuclear amplitudes has apparently been underestimated.

$\Gamma(\pi^0 2\gamma)$ Table with 5 columns: VALUE (eV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

η BRANCHING RATIOS

Neutral modes

$\Gamma(\text{neutral modes})/\Gamma_{\text{total}}$ Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

$\Gamma(2\gamma)/\Gamma_{\text{total}}$ Table with 5 columns: VALUE (units 10^{-2}), EVTS, DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

1 Not independent of other results listed for LOPEZ 07. Assuming decays of $\eta \rightarrow \gamma\gamma$, $3\pi^0$, $\pi^+\pi^-\pi^0$, $\pi^+\pi^-\gamma$, and $e^+e^-\gamma$ account for all η decays within a contribution of 0.3% to the systematic error.

$\Gamma(2\gamma)/\Gamma(\text{neutral modes})$ Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

1 This result from combining cross sections from two different experiments.

$\Gamma(3\pi^0)/\Gamma_{\text{total}}$ Table with 5 columns: VALUE (units 10^{-2}), EVTS, DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

1 Not independent of other results listed for LOPEZ 07. Assuming decays of $\eta \rightarrow \gamma\gamma$, $3\pi^0$, $\pi^+\pi^-\pi^0$, $\pi^+\pi^-\gamma$, and $e^+e^-\gamma$ account for all η decays within a contribution of 0.3% to the systematic error.

$\Gamma(3\pi^0)/\Gamma(\text{neutral modes})$ Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

$\Gamma(3\pi^0)/\Gamma(2\gamma)$ Table with 5 columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

$\Gamma(\pi^0 2\gamma)/\Gamma_{\text{total}}$ Table with 5 columns: VALUE (units 10^{-4}), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

1 PRAKHOV 08 is a reanalysis of the data of PRAKHOV 05, using for the first time the invariant-mass spectrum of the two photons.
2 Normalized using $\Gamma(\eta \rightarrow 2\gamma)/\Gamma = 0.3943 \pm 0.0026$.
3 This measurement and the independent analysis of the same data by KNECHT 04 both imply a lower value of $\Gamma(\pi^0 2\gamma)$ than the one obtained by ALDE 84 from $\Gamma(\pi^0 2\gamma)/\Gamma(2\gamma)$.

$\Gamma(\pi^0 2\gamma)/\Gamma(2\gamma)$ Table with 5 columns: VALUE (units 10^{-3}), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes OUR FIT and OUR AVERAGE values.

$\Gamma(\pi^0 2\gamma)/\Gamma(3\pi^0)$ Table with 5 columns: VALUE (units 10^{-4}), DOCUMENT ID, TECN, COMMENT. Includes OUR FIT and OUR AVERAGE values.

3.20±1.26 53 ¹ BASTIEN 62 HBC
2.5 ±1.0 10 ¹ PICKUP 62 HBC

¹ These experiments are not used in the averages as they do not separate clearly $\eta \rightarrow \pi^+\pi^-\pi^0$ and $\eta \rightarrow \pi^+\pi^-\gamma$ from each other. The reported values thus probably contain some unknown fraction of $\eta \rightarrow \pi^+\pi^-\gamma$.

$\Gamma(2\gamma)/[\Gamma(\pi^+\pi^-\pi^0) + \Gamma(\pi^+\pi^-\gamma) + \Gamma(e^+e^-\gamma)]$ $\Gamma_2/(\Gamma_9+\Gamma_{10}+\Gamma_{11})$

••• We do not use the following data for averages, fits, limits, etc. •••			
0.12 \pm 0.06		¹ THALER	72 ASPK

¹The authors don't believe this indicates D -wave because the dependence of β on the γ energy is inconsistent with the theoretical prediction. A $\cos^2\theta$ dependence can also come from P - and F -wave interference.

η CP-NONCONSERVING DECAY PARAMETER

$\pi^+\pi^-e^+e^-$ DECAY-PLANE ASYMMETRY PARAMETER A_ϕ

In the η rest frame, the total momentum of the e^+e^- pair is equal and opposite to that of the $\pi^+\pi^-$ pair. Let \hat{z} be the unit vector along the momentum of the e^+e^- pair; let \hat{n}_{ee} and $\hat{n}_{\pi\pi}$ be the unit vectors normal to the e^+e^- and $\pi^+\pi^-$ planes; and let ϕ be the angle between the two normals. Then

$$\sin\phi \cos\phi = [(\hat{n}_{ee} \times \hat{n}_{\pi\pi}) \cdot \hat{z}] (\hat{n}_{ee} \cdot \hat{n}_{\pi\pi}),$$

and

$$A_\phi \equiv \frac{N_{\sin\phi \cos\phi > 0} - N_{\sin\phi \cos\phi < 0}}{N_{\sin\phi \cos\phi > 0} + N_{\sin\phi \cos\phi < 0}}.$$

Meson Particle Listings

$\eta, f_0(500)$

Table listing meson particles with columns for name, code, year, and reference. Includes entries like LOPEZ, MILLER, ABLIKIM, etc.

Table listing meson particles with columns for name, code, year, and reference. Includes entries like FLATTE, LITCHFIELD, PRICE, etc.

$f_0(500)$

$I(G^{JPC}) = 0^+(0^{++})$

also known as σ ; was $f_0(600)$
See the related review(s):
Scalar Mesons below 2 GeV

$f_0(500)$ T-MATRIX POLE \sqrt{s}

Note that $\Gamma \approx 2 \text{Im}(\sqrt{s_{\text{pole}}})$.

Table with columns: VALUE (MeV), DOCUMENT ID, TECN, COMMENT. Contains data for various meson decays and fits.

1 S-matrix pole; 8595 events.
2 Applying the chiral unitary approach at NLO to the K_{e4} data of BATLEY 10 and $\pi N \rightarrow \pi \pi N$ data of HYAMS 73, GRAYER 74, and PROTOPESCU 73.

Meson Particle Listings

 $f_0(500)$

- ³ Uses the K_{e4} data of BATLEY 10c and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73, GRAYER 74, and PROTOPOESCU 73.
- ⁴ Analytic continuation using Roy equations.
- ⁵ Analytic continuation using GKPY equations.
- ⁶ Using Roy equations.
- ⁷ Average of three variants of the analytic K-matrix model. Uses the K_{e4} data of BATLEY 08a and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73 and GRAYER 74.
- ⁸ Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08a, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82b.
- ⁹ From the K_{e4} data of BATLEY 08a and $\pi N \rightarrow \pi\pi N$ data of HYAMS 73.
- ¹⁰ From the K_{e4} data of BATLEY 08a and $\pi N \rightarrow \pi\pi N$ data of PROTOPOESCU 73, GRAYER 74, and ESTABROOKS 74.
- ¹¹ From a mean of three different $f_0(500)$ parameterizations. Uses 40k events.
- ¹² From an isobar model using 2.6k events.
- ¹³ Reanalysis of ABLIKIM 04a, PISLAK 01, and HYAMS 73 data.
- ¹⁴ Using the N/D method.
- ¹⁵ From the solution of the Roy equation (ROY 71) for the isoscalar S-wave and using a phase-shift analysis of HYAMS 73 and PROTOPOESCU 73 data.
- ¹⁶ Reanalysis of the data from PROTOPOESCU 73, ESTABROOKS 74, GRAYER 74, ROSSELET 77, PISLAK 03, and AKHMETSHIN 04.
- ¹⁷ From a mean of six different analyses and $f_0(500)$ parameterizations.
- ¹⁸ Using data on $\psi(2S) \rightarrow J/\psi\pi\pi$ from BAI 00E and on $\Upsilon(nS) \rightarrow \Upsilon(mS)\pi\pi$ from BUTLER 94b and ALEXANDER 98.
- ¹⁹ Reanalysis of data from PROTOPOESCU 73, ESTABROOKS 74, GRAYER 74, and COHEN 80 in the unitarized ChPT model.
- ²⁰ From a combined analysis of HYAMS 73, AUGUSTIN 89, AITALA 01b, and PISLAK 01.
- ²¹ A similar analysis (KOMADA 01) finds $(580^{+79}_{-30}) - i(190^{+107}_{-49})$ MeV.
- ²² Coupled channel reanalysis of BATON 70, BENSINGER 71, BAILLON 72, HYAMS 73, HYAMS 75, ROSSELET 77, COHEN 80, and ETKIN 82b using the uniformizing variable.
- ²³ Using the inverse amplitude method and data of ESTABROOKS 73, GRAYER 74, and PROTOPOESCU 73.
- ²⁴ Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
- ²⁵ Average and spread of 4 variants ("up" and "down") of KAMINSKI 97b 3-channel model.
- ²⁶ Uses data from BEIER 72b, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CASON 83, ASTON 88, and ARMSTRONG 91b. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.
- ²⁷ Demonstrates explicitly that $f_0(500)$ and $f_0(1370)$ are two different poles.
- ²⁸ Analysis of data from FALVARD 88.
- ²⁹ Analysis of data from OCHS 73, ESTABROOKS 75, ROSSELET 77, and MUKHIN 80.
- ³⁰ Analysis of data from OCHS 73, GRAYER 74, and ROSSELET 77.
- ³¹ Coupled-channel analysis using data from PROTOPOESCU 73, HYAMS 73, HYAMS 75, GRAYER 74, ESTABROOKS 74, ESTABROOKS 75, FROGGATT 77, CORDEN 79, BISWAS 81.
- ³² Analysis of data from APEL 72c, GRAYER 74, CASON 76, PAWLICKI 77. Includes spread and errors of 4 solutions.
- ³³ Analysis of data from BATON 70, BENSINGER 71, COLTON 71, BAILLON 72, PROTOPOESCU 73, and WALKER 67.

- ⁵⁶ Using dispersive analysis with phases from GARCIA-MARTIN 11a and BUETTNER 04 as input.
- ⁵⁷ Using Roy-Steiner equations with $\pi\pi$ phase shifts from an update of COLANGELO 01 and from GARCIA-MARTIN 11a.
- ⁵⁸ Using an analytic K-matrix model.
- ⁵⁹ Using dispersion integral with phase input from Roy equations and data from MARSISKE 90, BOYER 90, BEHREND 92, UEHARA 08a, and MORI 07.
- ⁶⁰ Used dispersion theory. The value quoted used the $f_0(500)$ pole position of $457 - i276$ MeV.
- ⁶¹ Using p, n polarizabilities from PDG 06 and fitting to $\pi\pi$ phase motion from GARCIA-MARTIN 07 and σ -poles from GARCIA-MARTIN 07 and CAPRINI 06.
- ⁶² Using twice-subtracted dispersion integrals.
- ⁶³ Supersedes OLLER 08.
- ⁶⁴ Solution A (preferred solution based on χ^2 -analysis).

- 65 Dispersion theory based amplitude analysis of BOYER 90, MARSISKE 90, BEHREND 92, and MORI 07.
- 66 Solution B (worse than solution A; still acceptable when systematic uncertainties are included).
- 67 Using unitarity and the σ pole position from CAPRINI 06.
- 68 This width could equally well be assigned to the $f_0(1370)$. The authors analyse data from BOYER 90 and MARSISKE 90 and report strong correlation with $\gamma\gamma$ width of $f_2(1270)$.
- 69 Supersedes MORGAN 90.

$\rho(770)$

$$I^G(J^{PC}) = 1^+(1^--)$$

THE $\rho(770)$

Updated September 2019 by S. Eidelman (Novosibirsk) and G. Venanzoni (Pisa).

The determination of the parameters of the $\rho(770)$ is beset with many difficulties because of its large width. In physical region fits, the line shape does not correspond to a relativistic Breit-Wigner function with a P -wave width, but requires some additional shape parameter. This dependence on parameterization was demonstrated long ago [1]. Bose-Einstein correlations are another source of shifts in the $\rho(770)$ line shape, particularly in multiparticle final-state systems [2].

The same model dependence afflicts any other source of resonance parameters, such as the energy dependence of the phase shift δ_1^+ , or the pole position. It is, therefore, not surprising that a study of $\rho(770)$ dominance in the decays of the η and η' reveals the need for specific dynamical effects, in addition to the $\rho(770)$ pole [3,4].

The cleanest determination of the $\rho(770)$ mass and width comes from e^+e^- annihilation and τ -lepton decays. Analysis of ALEPH [5] showed that the charged $\rho(770)$ parameters measured from τ -lepton decays are consistent with those of the neutral one determined from e^+e^- data [6]. This conclusion is qualitatively supported by the later studies of CLEO [7] and Belle [8]. However, comparison of the two-pion mass spectrum in τ decays from OPAL [9], CLEO [7], and ALEPH [10,11], and the $e^+e^- \rightarrow \pi^+\pi^-$ cross section from CMD-2 [12,13], showed significant discrepancies between the two shapes which can be as high as 10% above the ρ meson [14,15]. This discrepancy remains after measurements of the two-pion cross section in e^+e^- annihilation at KLOE [16,17,18,19], SND [20,21], BaBar [22] and, more recently BESIII [23]. The effect is not accounted for by isospin breaking [24,25,26,27], but the accuracy of its calculation may be overestimated [28,29].

This problem seems to be solved after a recent analysis in [30] which showed that after correcting the τ data for the missing $\rho - \gamma$ mixing contribution, besides the other known isospin symmetry violating corrections, the $\pi\pi$ I=1 part of the hadronic vacuum polarization contribution to the muon $g - 2$ is fully compatible between τ based and e^+e^- based evaluations. The global fit of the whole set of the ρ , ω , and ϕ decays, taking into account mixing effects in the hidden local symmetry model, also showed consistency of the data on τ decays to two pions and e^+e^- annihilation [31,32]. However, because

Meson Particle Listings

 $\rho(770)$

of the progress in e^+e^- data, the τ input is now less precise and less reliable due to additional theoretical uncertainties [33] decreasing importance of τ versus e^+e^- comparison for the determination of $\rho(770)$ parameters and other applications, like, e.g., calculations of hadronic vacuum polarization.

- ¹ Without limitations on masses and widths.

$\rho(770)$ RANGE PARAMETER

The range parameter R enters an energy-dependent correction to the width, of the form $(1 + q_r^2 R^2) / (1 + q^2 R^2)$, where q is the momentum of one of the pions in the $\pi\pi$ rest system. At resonance, $q = q_r$.

$\Gamma_7 \pi^+ \pi^- \gamma$	(9.9 ± 1.6) × 10 ⁻³	S=1.4
$\Gamma_8 \pi^0 \gamma$	(4.7 ± 0.6) × 10 ⁻⁴	
$\Gamma_9 \eta \gamma$	(3.00 ± 0.21) × 10 ⁻⁴	
$\Gamma_{10} \pi^0 \pi^0 \gamma$	(4.5 ± 0.8) × 10 ⁻⁵	
$\Gamma_{11} \mu^+ \mu^-$	[a] (4.55 ± 0.28) × 10 ⁻⁵	
$\Gamma_{12} e^+ e^-$	[a] (4.72 ± 0.05) × 10 ⁻⁵	
$\Gamma_{13} \pi^+ \pi^- \pi^0$	(1.01 ^{+0.54} _{-0.36} ± 0.34) × 10 ⁻⁴	
$\Gamma_{14} \pi^+ \pi^- \pi^+ \pi^-$	(1.8 ± 0.9) × 10 ⁻⁵	
$\Gamma_{15} \pi^+ \pi^- \pi^0 \pi^0$	(1.6 ± 0.8) × 10 ⁻⁵	
$\Gamma_{16} \pi^0 e^+ e^-$	< 1.2	× 10 ⁻⁵ CL=90%
$\Gamma_{17} \eta e^+ e^-$		

[a] The $\omega\rho$ interference is then due to $\omega\rho$ mixing only, and is expected to be small. If $e\mu$ universality holds, $\Gamma(\rho^0 \rightarrow \mu^+ \mu^-) = \Gamma(\rho^0 \rightarrow e^+ e^-) \times 0.99785$.

CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 10 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 10.7$ for 8 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

9.7 ^{+3.1} _{-3.3}	^{3,4} HYAMS 67	OSPK	11 $\pi^- \text{Li, H}$

¹Possibly large $\rho\text{-}\omega$ interference leads us to increase the minus error.
²Result contains 11 ± 11% correction using SU(3) for central value. The error on the correction takes account of possible $\rho\text{-}\omega$ interference and the upper limit agrees with the upper limit of $\omega \rightarrow \mu^+\mu^-$ from this experiment.
³But he even enlarges his error to take residual ω contamination into account. Since his value is high, seems the other experiments also can't have too many ω 's. But maybe Hyams has additional μ 's from $\rho \rightarrow \pi\pi$, decaying π 's.
⁴HYAMS 67's mass resolution is 20 MeV. The ω region was excluded.

- Update of AKHMETSHIN 00c.
- From the combined fit of ANTONELLI 92, ACHASOV 01e, ACHASOV 02e, and ACHASOV 03d data on the $\pi^+\pi^-\pi^0$ and ANTONELLI 92 on the $\omega\pi^+\pi^-$ final states. Supersedes ACHASOV 99e and ACHASOV 02e.
- From the $\eta \rightarrow \gamma\gamma$ decay.
- From the $\eta \rightarrow 3\pi^0$ decay.
- Observed by threshold-crossing technique. Mass resolution = 4.8 MeV FWHM.
- From the $\rho-\omega$ interference in the $\pi^+\pi^-$ mass spectrum using the Breit-Wigner for the ω and leaving its mass and width as free parameters of the fit.
- Systematic uncertainties underestimated.
- From best-resolution sample of COYNE 71.
- From ω - ρ interference in the $\pi^+\pi^-$ mass spectrum assuming ω width 12.6 MeV.

CONSTRAINED FIT INFORMATION

An overall fit to 15 branching ratios uses 55 measurements and one constraint to determine 10 parameters. The overall fit has a $\chi^2 = 57.0$ for 46 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

1 Dispersive analysis. Value extracted from average of data from AUBERT 09As, AKHMETSHIN 07, ACHASOV 06, AMBROSINO 11A, BABUSCI 13D, ABLIKIM 16b normalised by PDG evaluation for $\Gamma(\omega \rightarrow e^+e^-)$.

2 A combined fit of AKHMETSHIN 07, AULCHENKO 06, and AULCHENKO 05.

3 Update of AKHMETSHIN 02.

4 From the $m_{\pi^+\pi^-}$ spectrum taking into account the interference of the $\rho\pi$ and $\omega\pi$ amplitudes.

5 From a fit to $\pi^+\pi^-$ mass using $\rho(770)$ (parametrized with the Gounaris-Sakurai approach), $\omega(782)$, and box anomaly components.

6 ABLIKIM 18c reports $[\Gamma(\omega(782) \rightarrow \pi^+\pi^-)/\Gamma_{\text{total}}] \times [B(\eta'(958) \rightarrow \omega\gamma)] = (3.25 \pm 0.21 \pm 0.52) \times 10^{-4}$ which we divide by our best value $B(\eta'(958) \rightarrow \omega\gamma) = (2.52 \pm 0.07) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

7 From a fit to $\pi^+\pi^-$ mass using $\rho(770)$ (parametrized with the Gounaris-Sakurai approach), $\omega(782)$, and $\rho(1450)$ components.

8 ABLIKIM 18c reports $[\Gamma(\omega(782) \rightarrow \pi^+\pi^-)/\Gamma_{\text{total}}] \times [B(\eta'(958) \rightarrow \omega\gamma)] = (3.22 \pm 0.21 \pm 0.52) \times 10^{-4}$ which we divide by our best value $B(\eta'(958) \rightarrow \omega\gamma) = (2.52 \pm 0.07) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

9 Using $\Gamma(\omega \rightarrow e^+e^-)$ from the 2004 Edition of this Review (PDG 04).

10 Using the data of AKHMETSHIN 02 in the hidden local symmetry model.

11 Using the data of BARKOV 85.

12 Using the data of BARKOV 85 in the hidden local symmetry model.

13 From a model-dependent analysis assuming complete coherence.

14 Re-evaluated under $\Gamma(\pi^+\pi^-)/\Gamma(\pi^+\pi^-\pi^0)$ by BEHREND 71 using more accurate $\omega \rightarrow \rho$ photoproduction cross-section ratio.

$\Gamma(\pi^+\pi^-)/\Gamma(\pi^+\pi^-\pi^0)$ Γ_3/Γ_1

PARAMETER Λ IN $\omega \rightarrow \pi^0\ell^+\ell^-$ DECAY

In the pole approximation the electromagnetic transition form factor for a resonance of mass M is given by the expression:

$$|F|^2 = (1 - M^2/\Lambda^2)^{-2}$$

where for the parameter Λ vector dominance predicts $\Lambda = M_p \approx 0.770$ GeV. The ARNALDI 09 measurement is in obvious conflict with this expectation. Note that for $\eta \rightarrow \gamma\mu^+\mu^-$ decay ARNALDI 09 and DZHELYADIN 80 obtain the value of Λ consistent with vector dominance.

PARAMETER Λ IN $\omega \rightarrow \pi^0\mu^+\mu^-$ DECAY

[a] C parity forbids this to occur as a single-photon process.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, 2 combinations of partial widths obtained from integrated cross section, and 19 branching ratios uses 51 measurements and one constraint to determine 9 parameters. The overall fit has a $\chi^2 = 69.4$ for 43 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

 $\eta'(958) \Gamma(i)\Gamma(\gamma\gamma)/\Gamma(\text{total})$

This combination of a partial width with the partial width into $\gamma\gamma$ and with the total width is obtained from the integrated cross section into channel(i) in the $\gamma\gamma$ annihilation.

$\eta'(958) \rightarrow \eta\pi\pi$ DECAY PARAMETERS

$|M^2| = |1 + \alpha Y|^2 + CX + DX^2$

X and Y are Dalitz variables; α is complex and C , and D are real-valued. Parameters C and D are not necessarily equal to c and d , respectively, in the generalized parameterization following this one. May be different for $\eta'(958) \rightarrow \eta\pi^+\pi^-$ and $\eta'(958) \rightarrow \eta\pi^0\pi^0$ decays. Because of different initial assumptions and strong correlations of the parameters we do not average the parameters in the section below.

6 ± 6				

- Analytic continuation using Roy equations. Uses the K_{e4} data of BATLEY 10c and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73, GRAYER 74, and PROTOPESCU 73.
- Quoted number refers to twice imaginary part of pole position.
- Analytic continuation using GKPY equations. Uses the K_{e4} data of BATLEY 10c and the $\pi N \rightarrow \pi\pi N$ data of HYAMS 73, GRAYER 74, and PROTOPESCU 73.
- Pole position. Used Roy equations.
- Average of the analyses of three data sets in the K-matrix model. Uses the data of BATLEY 08A, HYAMS 73, and GRAYER 74, partially of COHEN 80 or ETKIN 82B.
- On sheet II in a 2-pole solution. The other pole is found on sheet III at (850–100i) MeV
- Using a relativistic Breit-Wigner function and taking into account the finite D_S mass.
- Breit-Wigner $\pi\pi$ width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio $g_{f_0} K K / g_{f_0} \pi\pi = 0$.
- Systematic errors not estimated.

See key on page 999

Meson Particle Listings
f_0(980)

- 10 Breit-Wigner pi-pi width. Using finite width corrections according to FLATTE 76 and ACHASOV 05, and the ratio g_f0 K K / g_f0 pi pi = 4.21 +/- 0.25 +/- 0.21 from ABLIKIM 05.
11 Breit-Wigner, solution 1, PWA ambiguous.
12 K-matrix pole from combined analysis of pi-pi -> pi^0 pi^0 n, pi-pi -> K Kbar n, pi+ pi- -> pi+ pi-, p-bar p -> pi^0 pi^0 pi^0, pi^0 eta, pi^0 pi^0 eta, pi+ pi- pi^0, K+ K- pi^0, K_S^0 K_S^0 pi^0, K+ K_S^0 pi- at rest, p-bar n -> pi- pi- pi+, K_S^0 K- pi^0, K_S^0 K_S^0 pi- at rest.
13 Using the data of AKHMETSHIN 99c, ACHASOV 00H, and ALOISIO 02D.
14 Breit-Wigner width.
15 Supersedes ACHASOV 98i. Using the model of ACHASOV 89.
16 Supersedes ACHASOV 98i.
17 In the "narrow resonance" approximation.
18 From the combined fit of the photon spectra in the reactions e+ e- -> pi+ pi- gamma, pi^0 pi^0 gamma.
19 Supersedes BARBERIS 99 and BARBERIS 99b
20 T-matrix pole.
21 On sheet II in a 2 pole solution. The other pole is found on sheet III at (1039-93i) MeV.
22 From invariant mass fit.
23 On sheet II in a 2 pole solution. The other pole is found on sheet III at (963-29i) MeV.
24 Reanalysis of data from HYAMS 73, GRAYER 74, SRINIVASAN 75, and ROSSELET 77 using the interfering amplitude method.
25 At high |t|.
26 At low |t|.
27 On sheet II in a 4-pole solution, the other poles are found on sheet III at (953-55i) MeV and on sheet IV at (938-35i) MeV.
28 Combined fit of ALDE 95B, ANISOVICH 94,
29 On sheet II in a 2 pole solution. The other pole is found on sheet III at (996-103i) MeV.
30 From sheet II pole position.
31 On sheet II in a 2 pole solution. The other pole is found on sheet III at (797-185i) MeV and can be interpreted as a shadow pole.
32 On sheet II in a 2 pole solution. The other pole is found on sheet III at (978-28i) MeV.
33 From coupled channel analysis.
34 Coupled channel analysis with finite width corrections.
35 From coupled channel fit to the HYAMS 73 and PROTOPODESCU 73 data. With a simultaneous fit to the pi-pi phase-shifts, inelasticity and to the K_S^0 K_S^0 invariant mass.
36 Included in AGUILAR-BENITEZ 78 fit.

f_0(980) DECAY MODES

Table with 3 columns: Mode, Fraction (Gamma_i / Gamma), and observation status. Rows include pi pi, K Kbar, gamma gamma, and e+ e-.

f_0(980) PARTIAL WIDTHS

Table with 5 columns: Gamma (gamma), Value (keV), Document ID, TECN, and Comment. Includes 'OUR AVERAGE' and various experimental data points with footnotes 1-13.

Gamma(e+ e-) table with columns: Value (eV), CL%, Document ID, TECN, and Comment. Shows a value of <8.4 at 90% CL.

f_0(980) BRANCHING RATIOS

Gamma(pi pi) / [Gamma(pi pi) + Gamma(K Kbar)] table with columns: Value, EVTS, Document ID, TECN, and Comment. Includes a note: 'We do not use the following data for averages, fits, limits, etc.' and lists data from AUBERT, ABLIKIM, ANISOVICH, LOVERRE, CASON, and WETZEL.

¹ The prediction taking into account phase-space difference, radiative corrections, isospin breaking, and the Sommerfeld-Gamow-Sakharov factor gives 0.630.
² Theoretical analysis of BRAMON 00 taking into account phase-space difference, electromagnetic radiative corrections, as well as isospin breaking, predicts 0.62. FLOREZ-BAEZ 08 predicts 0.63 considering also structure-dependent radiative corrections. FISCHBACH 02 calculates additional corrections caused by the close threshold and predicts 0.68. See also BENAYOUN 01 and DUBYNSKIY 07. BENAYOUN 12 obtains 0.71 ± 0.01 in the HLS model.

- Statistical error negligible.
- From the pole position. Using an amplitude analysis based on approximate three-body unitary of τ data from SCHAEEL 05c.
- Reanalysis of CLEO data using Breit-Wigner parameterization.
- Superseded by AGHASYAN 2018B.
- The $\rho^\pm \pi^\mp$ state can be also due to the $\pi(1300)$.
- Using the Breit-Wigner parameterization; strong correlation between mass and width.
- Using the data of BARATE 98R.
- From a fit to the 3π mass spectrum including the $K\bar{K}^*(892)$ threshold.
- Uses the model of KUHN 90.
- Uses the model of ISGUR 89.
- Includes the effect of a possible a_1' state.
- Uses the model of FEINDT 90.
- Supersedes AKERS 95P.
- Average and spread of values using 2 variants of the model of BOWLER 75.
- Reanalysis of RUCKSTUHL 86.
- Reanalysis of SCHMIDKE 86.
- Reanalysis of ALBRECHT 86B.
- From a combined reanalysis of ALBRECHT 86B, SCHMIDKE 86, and RUCKSTUHL 86.
- From a combined reanalysis of ALBRECHT 86B and DAUM 81B.
- Uses the model of BOWLER 75.
- Produced in K^- backward scattering.

-0.062±0.020 (Error scaled by 2.3)

D-wave/S-wave AMPLITUDE RATIO IN DECAY OF $a_1(1260) \rightarrow \rho \pi$

- 1 Deck-type background not subtracted.
- 2 Uses the model of ISGUR 89.
- 3 Supersedes AKERS 95P.

- 1 Statistical error negligible.
- 2 From the pole position. Using an amplitude analysis based on approximate three-body unitary of τ data from SCHAEEL 05c.
- 3 Superseded by AGHASYAN 2018B.
- 4 The $\rho^\pm \pi^\mp$ state can be also due to the $\pi(1300)$.
- 5 Using the Breit-Wigner parameterization; strong correlation between mass and width.
- 6 Using the data of BARATE 98R.
- 7 From a fit of the $K^- K^*0$ distribution assuming $m_{a_1} = 1230$ MeV and purely resonant production of the $K^- K^*0$ system.
- 8 From a fit to the 3π mass spectrum including the $K \bar{K}^*(892)$ threshold.
- 9 Using the $a_1(1260)$ mass of 1230 MeV.
- 10 From AKHMETSHIN 99E and ASNER 00 data using the $a_1(1260)$ mass of 1230 MeV.
- 11 Uses the model of KUHN 90.
- 12 Uses the model of ISGUR 89.
- 13 Includes the effect of a possible a_1' state.
- 14 Uses the model of FEINDT 90.
- 15 Supersedes AKERS 95P.
- 16 Average and spread of values using 2 variants of the model of BOWLER 75.
- 17 Reanalysis of RUCKSTUHL 86.
- 18 Reanalysis of SCHMIDKE 86.
- 19 Reanalysis of ALBRECHT 86B.
- 20 From a combined reanalysis of ALBRECHT 86B, SCHMIDKE 86, and RUCKSTUHL 86.
- 21 From a combined reanalysis of ALBRECHT 86B and DAUM 81B.
- 22 Uses the model of BOWLER 75.
- 23 Produced in K^- backward scattering.

- From a fit to the Dalitz plot.
- Assuming for $\rho(1450)$ mass and width of 1370 and 386 MeV respectively.
- Assuming for $f_0(500)$ (σ) mass and width of 860 and 880 MeV respectively.
- Uses multichannel Aitchison-Bowler model (BOWLER 75). Uses data from GAVILLET 77, DAUM 80, and DANKOWYCH 81.
- Assuming for $f_0(1370)$ mass and width of 1186 and 350 MeV respectively.
- Assuming for $f_2(1270)$ mass and width of 1275 and 185 MeV respectively.
- Inconsistent with observations of $\sigma\pi$, $f_0(1370)\pi$, and $f_2(1270)\pi$ decay modes.
- Using structure functions from KUHN 92 and DECKER 93A and B ($\tau^- \rightarrow K^- \pi^- K^+ \nu_\tau$) = (0.155 \pm 0.006 \pm 0.009)% from BRIERE 03.
- From a comparison to ALAM 94 assuming purely resonant production of the $K^- K^+ 0$ system.
- From a fit to the 3π mass spectrum including the $K \bar{K}^*(892)$ threshold.
- Assuming $a_1(1260)$ dominance and taking B($\tau \rightarrow a_1(1260)\nu_\tau$) from BUSKULIC 96.

- Averaged over six nuclear targets, no statistically significant dependence on target nucleus observed.
- Breit-Wigner mass.
- T-matrix pole.
- Mass errors enlarged by us to Γ/\sqrt{N} ; see the note with the $K^*(892)$ mass.
- From a partial-wave analysis of data using a K-matrix formalism with 5 poles.
- From an energy-independent partial-wave analysis.
- From an amplitude analysis of the reaction $\pi^+\pi^- \rightarrow 2\pi^0$.
- From an amplitude analysis of $\pi^+\pi^- \rightarrow \pi^+\pi^-$ scattering data.
- Using CLEO-c data but not authored by the CLEO Collaboration.
- From a fit to a Breit-Wigner line shape with fixed $\Gamma = 185$ MeV.
- 4-poles, 5-channel K matrix fit.
- From analysis of L3 data at 91 and 183-209 GeV.
- Systematic uncertainties not estimated.
- JOHNSON 68 includes BONDAR 63, LEE 64, DERADO 65, EISNER 67.

- 1 Averaged over six nuclear targets, no statistically significant dependence on target nucleus observed.
- 2 Breit-Wigner width
- 3 T-matrix pole.
- 4 Width errors enlarged by us to $4\Gamma/\sqrt{N}$; see the note with the $K^*(892)$ mass.
- 5 From a partial-wave analysis of data using a K-matrix formalism with 5 poles.
- 6 From an energy-independent partial-wave analysis.
- 7 From an amplitude analysis of the reaction $\pi^+\pi^- \rightarrow 2\pi^0$.
- 8 From an amplitude analysis of $\pi^+\pi^- \rightarrow \pi^+\pi^-$ scattering data.
- 9 JOHNSON 68 includes BONDAR 63, LEE 64, DERADO 65, EISNER 67.
- 10 4-poles, 5-channel K matrix fit.
- 11 From analysis of L3 data at 91 and 183-209 GeV.
- 12 Systematic uncertainties not estimated.

WEIGHTED AVERAGE
185.9±2.8-2.1 (Error scaled by 1.6)

Values above of weighted average, error, and scale factor are based upon the data in this ideogram only. They are not necessarily the same as our 'best' values, obtained from a least-squares constrained fit utilizing measurements of other (related) quantities as additional information.

$f_2(1270)$ DECAY MODES

Mode	Fraction (Γ_i/Γ)	Scale factor/Confidence level
Γ_1 $\pi\pi$	(84.2 \pm 2.9 / -0.9) %	S=1.1
Γ_2 $\pi^+\pi^-2\pi^0$	(7.7 \pm 1.1 / -3.2) %	S=1.2

Γ_9 $K^0 K^- \pi^+ + c.c.$	< 3.4 $\times 10^{-3}$	CL=95%
Γ_{10} $e^+ e^-$	< 6 $\times 10^{-10}$	CL=90%

CONSTRAINED FIT INFORMATION

An overall fit to the total width, 4 partial widths, a combination of partial widths obtained from integrated cross sections, and 6 branching ratios uses 45 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 83.0$ for 38 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

The value of this width depends on the theoretical model used. Unitary approaches with scalars typically (with exception of PENNINGTON 08) give values clustering around 2.6 keV; without an S-wave contribution, values are systematically higher (typically around 3 keV).

<1.7	90	VOROBYEV	88	ND $e^+e^- \rightarrow \pi^0\pi^0$	

- From a partial-wave analysis of data using a K-matrix formalism with 5 poles.
- From analysis of L3 data at 91 and 183–209 GeV and using SU(3) relations.
- Based on a K-matrix analysis of BELLE data from MORI 07, UEHARA 08a, UEHARA 09 and UEHARA 13. The width is derived for the pole on the third sheet which is closest to the physical axis. Supersedes PENNINGTON 08.
- Solution A (preferred solution based on χ^2 -analysis).
- Dispersion theory based amplitude analysis of BOYER 90, MARSISKE 90, BEHREND 92, and MORI 07.
- Solution B (worse than solution A; still acceptable when systematic uncertainties are included).
- With a narrow scalar state around 1220 MeV.
- Using a unitarized model with a 300–500 keV wide scalar at 1100 MeV.
- Using the unitarized model of LYTH 85.
- Error includes spread of different solutions. Data of MARK2 and CRYSTAL BALL used in the analysis. Authors report strong correlations with $\gamma\gamma$ width of $f_0(1370)$: $\Gamma(f_2) + 1/4 \Gamma(f_0) = 3.6 \pm 0.3$ KeV.
- Radiative corrections modify the partial widths; for instance the COURAU 84 value becomes 2.66 ± 0.21 in the calculation of LANDRO 86.
- Using the MENNESSIER 83 model.
- Superseded by BOYER 90.
- If helicity = 2 assumption is not made.
- Using mass, width and $B(f_2(1270) \rightarrow 2\pi)$ from PDG 78.

CONSTRAINED FIT INFORMATION

An overall fit to 6 branching ratios uses 18 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 24.0$ for 14 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$a_2(1320)$

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 18 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 9.3$ for 15 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

- Another pole is found at $(1510 \pm 130) - i(800⁺¹⁰⁰₋₁₅₀)$ MeV.
- Coupled channel analysis of $\pi^+ \pi^- \pi^0, K^+ K^- \pi^0,$ and $K^\pm K_S^0 \pi^\mp$.
- Average between $\pi^+ \pi^- 2\pi^0$ and $2(\pi^+ \pi^-)$.
- T-matrix pole on sheet ---.
- Supersedes ANISOVICH 94.
- Coupled-channel analysis of $\bar{p}p \rightarrow 3\pi^0, \pi^0 \eta \eta,$ and $\pi^0 \pi^0 \eta$ on sheet IV. Demonstrates explicitly that $f_0(500)$ and $f_0(1370)$ are two different poles.
- Analysis of data from FALVARD 88.
- The pole is on Sheet III. Demonstrates explicitly that $f_0(500)$ and $f_0(1370)$ are two different poles.
- Uses data from BEIER 72b, OCHS 73, HYAMS 73, GRAYER 74, ROSSELET 77, CASON 83, ASTON 88, and ARMSTRONG 91b. Coupled channel analysis with flavor symmetry and all light two-pseudoscalars systems.
- Reanalysis of ANISOVICH 94 data.
- T-matrix pole on sheet III.
- Analysis of data from OCHS 73, GRAYER 74, BECKER 79, and CASON 83.

Footnotes for branching ratios: 1 Constructive interference between X(1835) and $\eta(1405)/\eta(1475)$ decays to $\gamma\phi$ is assumed. 2 Destructive interference between X(1835) and $\eta(1405)/\eta(1475)$ decays to $\gamma\phi$ is assumed. 3 Calculated by us from B($J/\psi \rightarrow \eta(1405)\gamma \rightarrow \phi\gamma\gamma$) < 0.82×10^{-4} and B($J/\psi \rightarrow \eta(1405)\gamma \rightarrow \rho^0\gamma\gamma$) = $(1.07 \pm 0.17 \pm 0.11) \times 10^{-4}$.

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹ From a fit with a width fixed at 55 MeV.
² This result supersedes ARMSTRONG 84, ARMSTRONG 89.
³ From fit to the $K^*(892) K 1^+ +$ partial wave.
⁴ Mass error increased to account for $a_0(980)$ mass cut uncertainties.
⁵ No systematic error given.

f₁(1420) WIDTH

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes sub-sections for Γ(ππ)/Γ(KK̄π) and Γ(ηππ)/Γ(KK̄π). Contains data for various experiments like ABDALLAH, NICHITIU, ADAMS, BARBERIS, BERTIN, ARMSTRONG, AUGUSTIN, BAI, BEHREND, BECKER, AIHARA, CHAUVAT, BROMBERG, DIONISI, DAHL, SOSA, PROKOSHKIN, BITYUKOV.

6 This result supersedes ARMSTRONG 84, ARMSTRONG 89.
7 From fit to the K*(892) K 1++ partial wave.
8 No systematic error given.

f₁(1420) DECAY MODES

Table with columns: Mode, Fraction (Γ_i/Γ). Lists decay modes like K K̄ π, K K̄*(892) + c.c., η π π, a₀(980) π, π π ρ, 4 π, ρ⁰ γ, φ γ.

f₁(1420) Γ(i)Γ(γγ)/Γ(total)

Table with columns: VALUE (keV), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Includes sub-sections for Γ(KK̄π) × Γ(γγ*)/Γ_{total} and Γ(φγ)/Γ(KK̄π).

9 From a fit with a width fixed at 55 MeV.
10 The form factor parameter from the fit is 926 ± 78 MeV.
11 Assume a ρ-pole form factor.
12 A φ - pole form factor gives considerably smaller widths.
13 Published value divided by 2.

f₁(1420) BRANCHING RATIOS

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Includes sub-sections for Γ(KK̄*(892) + c.c.)/Γ(KK̄π) and Γ₂/Γ₁.

Γ(ππ)/Γ(KK̄π)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for CORDEN, DAHL.

Γ(ηππ)/Γ(KK̄π)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for ARMSTRONG, KOPKE, GIDAL, CORDEN, DEFOIX.

Γ(a₀(980)π)/Γ(ηππ)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for PROKOSHKIN, ANDO, CORDEN, DEFOIX.

Γ(4π)/Γ(KK̄*(892) + c.c.)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for DIONISI.

Γ(KK̄π)/[Γ(KK̄*(892) + c.c.) + Γ(a₀(980)π)]

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Includes data for DIONISI.

Γ(a₀(980)π)/Γ(KK̄*(892) + c.c.)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for BARBERIS, ARMSTRONG.

Γ(4π)/Γ(KK̄π)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for ARMSTRONG.

Γ(ρ⁰γ)/Γ_{total}

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for ARMSTRONG.

Γ(ρ⁰γ)/Γ(KK̄π)

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data for BARBERIS.

Γ(φγ)/Γ(KK̄π)

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Includes data for BARBERIS.

 $\rho(1450)$

$$I^G(J^{PC}) = 1^+(1^-)$$

THE $\rho(1450)$ AND THE $\rho(1700)$

Updated September 2019 by S. Eidelman (Novosibirsk), C. Hanhart (Juelich) and G. Venanzoni (Pisa).

In our 1988 edition, we replaced the $\rho(1600)$ entry with two new ones, the $\rho(1450)$ and the $\rho(1700)$, because there was emerging evidence that the 1600-MeV region actually contains two ρ -like resonances. Erkal [1] had pointed out this possibility with a theoretical analysis on the consistency of 2π and 4π electromagnetic form factors and the $\pi\pi$ scattering length. Donnachie [2], with a full analysis of data on the 2π and 4π final states in e^+e^- annihilation and photoproduction reactions, had also argued that in order to obtain a consistent picture, two resonances were necessary. The existence of $\rho(1450)$ was supported by the analysis of $\eta\rho^0$ mass spectra obtained in photoproduction and e^+e^- annihilation [3], as well as that of $e^+e^- \rightarrow \omega\pi$ [4].

The analysis of [2] was further extended by [5,6] to include new data on 4π -systems produced in e^+e^- annihilation, and in τ -decays (τ decays to 4π , and e^+e^- annihilation to 4π can be related by the Conserved Vector Current assumption). These systems were successfully analyzed using interfering contributions from two ρ -like states, and from the tail of the $\rho(770)$ decaying into two-body states. While specific conclusions on $\rho(1450) \rightarrow 4\pi$ were obtained, little could be said about the $\rho(1700)$.

Independent evidence for two 1^- states is provided by [7] in 4π electroproduction at $\langle Q^2 \rangle = 1$ (GeV/c)², and by [8] in a high-statistics sample of the $\eta\pi\pi$ system in π^-p charge exchange.

This scenario with two overlapping resonances is supported by other data. Bisello [9] measured the pion form factor in the interval 1.35–2.4 GeV, and observed a deep minimum around 1.6 GeV. The best fit was obtained with the hypothesis of ρ -like resonances at 1420 and 1770 MeV, with widths of about 250 MeV. Antonelli [10] found that the $e^+e^- \rightarrow \eta\pi^+\pi^-$ cross section is better fitted with two fully interfering Breit-Wigners, with parameters in fair agreement with those of [2] and [9]. These results can be considered as a confirmation of the $\rho(1450)$.

Decisive evidence for the $\pi\pi$ decay mode of both $\rho(1450)$ and $\rho(1700)$ comes from $\bar{p}p$ annihilation at rest [11]. It has been shown that these resonances also possess a $K\bar{K}$ decay mode [12–14]. High-statistics studies of the decays $\tau \rightarrow \pi\pi\nu_\tau$ [15,16], and $\tau \rightarrow 4\pi\nu_\tau$ [17] also require the $\rho(1450)$, but are not sensitive to the $\rho(1700)$, because it is too close to the τ mass. A recent very-high-statistics study of the $\tau \rightarrow \pi\pi\nu_\tau$ decay performed at Belle [18] reports the first observation of both $\rho(1450)$ and $\rho(1700)$ in τ decays. A clear picture of the two $\pi^+\pi^-$ resonances interfering with the $\rho(770)$ in e^+e^- annihilation was also reported by BaBar using the ISR method [19].

The structure of these ρ states is not yet completely clear. Barnes [20] and Close [21] claim that $\rho(1450)$ has a mass

consistent with radial $2S$, but its decays show characteristics of hybrids, and suggest that this state may be a $2S$ -hybrid mixture. Donnachie [22] argues that hybrid states could have a 4π decay mode dominated by the $a_1\pi$. Such behavior has been observed by [23] in $e^+e^- \rightarrow 4\pi$ in the energy range 1.05–1.38 GeV, and by [17] in $\tau \rightarrow 4\pi$ decays. CLEO [24] and Belle [25] observe the $\rho(1450) \rightarrow \omega\pi$ decay mode in B -meson decays, however, do not find $\rho(1700) \rightarrow \omega\pi^0$. A similar conclusion is made by [26,27], who studied the process $e^+e^- \rightarrow \omega\pi^0$ and do not observe a statistically significant signal of the $\rho(1700)$. Various decay modes of the $\rho(1450)$ and $\rho(1700)$ are observed in $\bar{p}n$ and $\bar{p}p$ annihilation [28,29], but no definite conclusions can be drawn. More data should be collected to clarify the nature of the ρ states, particularly in the energy range above 1.6 GeV.

We now list under a separate entry the $\rho(1570)$, the $\phi\pi$ state with $J^{PC} = 1^{--}$ earlier observed by [30] (referred to as $C(1480)$) and recently confirmed by [31]. While [32] shows that it may be a threshold effect, [5] and [33] suggest two independent vector states with this decay mode. The $C(1480)$ has not been seen in the $\bar{p}p$ [34] and e^+e^- [35,36] experiments. However, the sensitivity of the two latter is an order of magnitude lower than that of [31]. Note that [31] can not exclude that their observation is due to an OZI-suppressed decay mode of the $\rho(1700)$.

Several observations on the $\omega\pi$ system in the 1200-MeV region [37–43] may be interpreted in terms of either $J^P = 1^-$ $\rho(770) \rightarrow \omega\pi$ production [44], or $J^P = 1^+$ $b_1(1235)$ production [42,43]. We argue that no special entry for a $\rho(1250)$ is needed. The LASS amplitude analysis [45] showing evidence for $\rho(1270)$ is preliminary and needs confirmation. For completeness, the relevant observations are listed under the $\rho(1450)$.

Recently [46] reported a very broad 1^{--} resonance-like K^+K^- state in $J/\psi \rightarrow K^+K^-\pi^0$ decays. Its pole position corresponds to mass of 1576 MeV and width of 818 MeV. [47–49] suggest its exotic structure (molecular or multiquark), while [50] and [51] explain it by the interference between the $\rho(1450)$ and $\rho(1700)$. The latter statement is qualitatively supported by BaBar [52] and SND [53]. We quote [46] as $X(1575)$ in the section “Further States.”

Evidence for ρ -like mesons decaying into 6π states was first noted by [54] in the analysis of 6π mass spectra from e^+e^- annihilation [55,56] and diffractive photoproduction [57]. Clegg [54] argued that two states at about 2.1 and 1.8 GeV exist: while the former is a candidate for the $\rho(2150)$, the latter could be a manifestation of the $\rho(1700)$ distorted by threshold effects. BaBar reported observations of the new decay modes of the $\rho(2150)$ in the channels $\eta'(958)\pi^+\pi^-$ and $f_1(1285)\pi^+\pi^-$ [58]. The relativistic quark model [59] predicts the 2^3D_1 state with $J^{PC} = 1^{--}$ at 2.15 GeV which can be identified with the $\rho(2150)$.

We no longer list under a separate particle $\rho(1900)$ various observations of irregular behavior of the cross sections near the $N\bar{N}$ threshold. Dips of various width around 1.9

GeV were reported by the E687 Collaboration (a narrow one in the $3\pi^+3\pi^-$ diffractive photoproduction [60,61]), by the FENICE experiment (a narrow structure in the R value [62]), by BaBar in ISR (a narrow structure in the $e^+e^- \rightarrow \phi\pi$ final state [63], but much broader in $e^+e^- \rightarrow 3\pi^+3\pi^-$ and $e^+e^- \rightarrow 2(\pi^+\pi^-\pi^0)$ [64]), by CMD-3 (also a rather broad dip in $e^+e^- \rightarrow 3\pi^+3\pi^-$ [65]). A dedicated scan of the $N\bar{N}$ -threshold region by CMD-3 confirms this effect in the $e^+e^- \rightarrow 3\pi^+3\pi^-$ and $e^+e^- \rightarrow K^+K^-\pi^+\pi^-$ final states, but does not see it in the cross section of $e^+e^- \rightarrow 2\pi^+2\pi^-$ [66]. Most probably, these structures emerge as a threshold effect due to the opening of the $N\bar{N}$ channel [67,68,69].

¹ From the combined fit of AULCHENKO 15 and ACHASOV 18 in the model with the interfering $\rho(1450)$, $\rho(1700)$ and $\rho(2150)$ with the parameters of the $\rho(1450)$ and $\rho(1700)$ floating and the mass and width of the $\rho(2150)$ fixed at 2155 MeV and 320 MeV, respectively. The phases of the resonances are π , 0 and π , respectively.

² From a fit to the $e^+ e^- \rightarrow \eta \pi^+ \pi^-$ cross section with vector meson dominance model including $\rho(770)$, $\rho(1450)$, and $\rho(1700)$ decaying exclusively via $\eta \rho(770)$. Masses and widths of vector states are fixed to PDG 14. Coupling constants are assumed to be real.

CONSTRAINED FIT INFORMATION

An overall fit to 6 branching ratios uses 10 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 5.6$ for 6 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, 2 partial widths, a combination of partial widths obtained from integrated cross sections, and 3 branching ratios uses 17 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 18.2$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

- 11 T-matrix pole.
- 12 On sheet II in a two-pole solution.
- 13 Supersedes the $\omega\omega$ state of BELADIDZE 92b earlier assigned to the $f_2(1640)$.
- 14 Breit-Wigner width.
- 15 T-matrix pole, large coupling to $\rho\rho$ and $\omega\omega$, could be $f_2(1640)$.
- 16 Coupled-channel analysis of AMSLER 95b, AMSLER 95c, and AMSLER 94d.
- 17 From a simultaneous analysis of the annihilations $\bar{p}p \rightarrow 3\pi^0, \pi^0 \eta \eta$ including AKER 91 data.
- 18 Supersedes ADAMO 92.
- 19 J^P not determined, could be partly $f_0(1500)$.
- 20 J^P not determined.
- 21 Superseded by AMSLER 95b.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 6 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 1.9$ for 3 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

¹ From a fit with coherent interference of the $\phi(1680)$ with a non-resonant contribution.
² Assuming the $K\bar{K}^*(892) + c.c.$ dynamics. Systematic uncertainties not estimated.
³ Using a vector meson dominance model with contribution from $\phi(1020)$, $\phi(1680)$, and higher mass excitations of $\rho(770)$ and $\omega(782)$.
⁴ Using events with $\pi\pi$ invariant mass less than 0.85 GeV.
⁵ From a fit with two incoherent Breit-Wigners.
⁶ From the simultaneous fit to the $K\bar{K}^*(892) + c.c.$ and $\phi\eta$ data from AUBERT 08s using the results of AUBERT 07AK.
⁷ From the combined fit of AKHMETSHIN 03 and MANE 81 also including ρ, ω , and ϕ . Neither isospin nor flavor structure known.
⁸ Using data from IVANOV 81, BARKOV 87, BISELLO 88b, DOLINSKY 91, and ANTONELLI 92.
⁹ Using the data from BISELLO 91c.
¹⁰ Using BISELLO 88b and MANE 82 data.
¹¹ From global fit including ρ, ω, ϕ and $\rho(1700)$ assume mass 1570 MeV and width 510 MeV for ρ radial excitation.
¹² From global fit of ρ, ω, ϕ and their radial excitations to channels $\omega\pi^+\pi^-, K^+K^-, K_S^0 K_L^0, K_S^0 K^\pm\pi^\mp$. Assume mass 1570 MeV and width 510 MeV for ρ radial excitations, mass 1570 and width 500 MeV for ω radial excitation.
¹³ Fit to one channel only, neglecting interference with $\omega, \rho(1700)$.

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 10 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 14.7$ for 7 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

 $\rho(1700)$

$$J^G(J^{PC}) = 1^+(1^{--})$$

THE $\rho(1450)$ AND THE $\rho(1700)$

Updated September 2019 by S. Eidelman (Novosibirsk), C. Hanhart (Juelich) and G. Venanzoni (Pisa).

In our 1988 edition, we replaced the $\rho(1600)$ entry with two new ones, the $\rho(1450)$ and the $\rho(1700)$, because there was emerging evidence that the 1600-MeV region actually contains two ρ -like resonances. Erkal [1] had pointed out this possibility with a theoretical analysis on the consistency of 2π and 4π electromagnetic form factors and the $\pi\pi$ scattering length. Donnachie [2], with a full analysis of data on the 2π and 4π final states in e^+e^- annihilation and photoproduction reactions, had also argued that in order to obtain a consistent picture, two resonances were necessary. The existence of $\rho(1450)$ was supported by the analysis of $\eta\rho^0$ mass spectra obtained in photoproduction and e^+e^- annihilation [3], as well as that of $e^+e^- \rightarrow \omega\pi$ [4].

The analysis of [2] was further extended by [5,6] to include new data on 4π -systems produced in e^+e^- annihilation, and in τ -decays (τ decays to 4π , and e^+e^- annihilation to 4π can be related by the Conserved Vector Current assumption). These systems were successfully analyzed using interfering contributions from two ρ -like states, and from the tail of the $\rho(770)$ decaying into two-body states. While specific conclusions on $\rho(1450) \rightarrow 4\pi$ were obtained, little could be said about the $\rho(1700)$.

Independent evidence for two 1^- states is provided by [7] in 4π electroproduction at $\langle Q^2 \rangle = 1$ (GeV/c)², and by [8] in a high-statistics sample of the $\eta\pi\pi$ system in π^-p charge exchange.

This scenario with two overlapping resonances is supported by other data. Bisello [9] measured the pion form factor in the interval 1.35–2.4 GeV, and observed a deep minimum around 1.6 GeV. The best fit was obtained with the hypothesis of ρ -like resonances at 1420 and 1770 MeV, with widths of about 250 MeV. Antonelli [10] found that the $e^+e^- \rightarrow \eta\pi^+\pi^-$ cross section is better fitted with two fully interfering Breit-Wigners, with parameters in fair agreement with those of [2] and [9]. These results can be considered as a confirmation of the $\rho(1450)$.

Decisive evidence for the $\pi\pi$ decay mode of both $\rho(1450)$ and $\rho(1700)$ comes from $\bar{p}p$ annihilation at rest [11]. It has been shown that these resonances also possess a $K\bar{K}$ decay mode [12–14]. High-statistics studies of the decays $\tau \rightarrow \pi\pi\nu_\tau$ [15,16], and $\tau \rightarrow 4\pi\nu_\tau$ [17] also require the $\rho(1450)$, but are not sensitive to the $\rho(1700)$, because it is too close to the τ mass. A recent very-high-statistics study of the $\tau \rightarrow \pi\pi\nu_\tau$ decay performed at Belle [18] reports the first observation of both $\rho(1450)$ and $\rho(1700)$ in τ decays. A clear picture of the two $\pi^+\pi^-$ resonances interfering with the $\rho(770)$ in e^+e^- annihilation was also reported by BaBar using the ISR method [19].

The structure of these ρ states is not yet completely clear. Barnes [20] and Close [21] claim that $\rho(1450)$ has a mass consistent with radial $2S$, but its decays show characteristics of hybrids, and suggest that this state may be a $2S$ -hybrid mixture. Donnachie [22] argues that hybrid states could have a 4π decay mode dominated by the $a_1\pi$. Such behavior has been observed by [23] in $e^+e^- \rightarrow 4\pi$ in the energy range 1.05–1.38 GeV, and by [17] in $\tau \rightarrow 4\pi$ decays. CLEO [24] and Belle [25] observe the $\rho(1450) \rightarrow \omega\pi$ decay mode in B -meson decays, however, do not find $\rho(1700) \rightarrow \omega\pi^0$. A similar conclusion is made by [26,27], who studied the process $e^+e^- \rightarrow \omega\pi^0$ and do not observe a statistically significant signal of the $\rho(1700)$. Various decay modes of the $\rho(1450)$ and $\rho(1700)$ are observed in $\bar{p}n$ and $\bar{p}p$ annihilation [28,29], but no definite conclusions can be drawn. More data should be collected to clarify the nature of the ρ states, particularly in the energy range above 1.6 GeV.

We now list under a separate entry the $\rho(1570)$, the $\phi\pi$ state with $J^{PC} = 1^{--}$ earlier observed by [30] (referred to as $C(1480)$) and recently confirmed by [31]. While [32] shows that it may be a threshold effect, [5] and [33] suggest two independent vector states with this decay mode. The $C(1480)$ has not been seen in the $\bar{p}p$ [34] and e^+e^- [35,36] experiments. However, the sensitivity of the two latter is an order of magnitude lower than that of [31]. Note that [31] can not exclude that their observation is due to an OZI-suppressed decay mode of the $\rho(1700)$.

Several observations on the $\omega\pi$ system in the 1200-MeV region [37–43] may be interpreted in terms of either $J^P = 1^- \rho(770) \rightarrow \omega\pi$ production [44], or $J^P = 1^+ b_1(1235)$ production [42,43]. We argue that no special entry for a $\rho(1250)$ is needed. The LASS amplitude analysis [45] showing evidence for $\rho(1270)$ is preliminary and needs confirmation.

For completeness, the relevant observations are listed under the $\rho(1450)$.

Recently [46] reported a very broad 1^{--} resonance-like K^+K^- state in $J/\psi \rightarrow K^+K^-\pi^0$ decays. Its pole position corresponds to mass of 1576 MeV and width of 818 MeV. [47–49] suggest its exotic structure (molecular or multiquark), while [50] and [51] explain it by the interference between the $\rho(1450)$ and $\rho(1700)$. The latter statement is qualitatively supported by BaBar [52] and SND [53]. We quote [46] as $X(1575)$ in the section “Further States.”

Evidence for ρ -like mesons decaying into 6π states was first noted by [54] in the analysis of 6π mass spectra from e^+e^- annihilation [55,56] and diffractive photoproduction [57]. Clegg [54] argued that two states at about 2.1 and 1.8 GeV exist: while the former is a candidate for the $\rho(2150)$, the latter could be a manifestation of the $\rho(1700)$ distorted by threshold effects. BaBar reported observations of the new decay modes of the $\rho(2150)$ in the channels $\eta'(958)\pi^+\pi^-$ and $f_1(1285)\pi^+\pi^-$ [58]. The relativistic quark model [59] predicts the 2^3D_1 state with $J^{PC} = 1^{--}$ at 2.15 GeV which can be identified with the $\rho(2150)$.

We no longer list under a separate particle $\rho(1900)$ various observations of irregular behavior of the cross sections near the $N\bar{N}$ threshold. Dips of various width around 1.9 GeV were reported by the E687 Collaboration (a narrow one in the $3\pi^+3\pi^-$ diffractive photoproduction [60,61]), by the FENICE experiment (a narrow structure in the R value [62]), by BaBar in ISR (a narrow structure in $e^+e^- \rightarrow \phi\pi$ final state [63], but much broader in $e^+e^- \rightarrow 3\pi^+3\pi^-$ and $e^+e^- \rightarrow 2(\pi^+\pi^-\pi^0)$ [64]), by CMD-3 (also a rather broad dip in $e^+e^- \rightarrow 3\pi^+3\pi^-$ [65]). A dedicated scan of the $N\bar{N}$ -threshold region by CMD-3 confirms this effect in the $e^+e^- \rightarrow 3\pi^+3\pi^-$ and $e^+e^- \rightarrow K^+K^-\pi^+\pi^-$ final states, but does not see it in the cross section of $e^+e^- \rightarrow 2\pi^+2\pi^-$ [66]. Most probably, these structures emerge as a threshold effect due to the opening of the $N\bar{N}$ channel [67,68,69].

$\Gamma(\eta\rho) \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ $\Gamma_{14}\Gamma_{17}/\Gamma$
 VALUE (keV) DOCUMENT ID TECN COMMENT

••• We do not use the following data for averages, fits, limits, etc. •••
 $84 \pm 26 \pm 4$ ¹ LEES 18 BABR $e^+e^- \rightarrow \eta\pi^+\pi^-$
 7 ± 3 ANTONELLI 88 DM2 $e^+e^- \rightarrow \eta\pi^+\pi^-$
¹ Includes non-resonant contribution. The selected fit model includes three ρ excited states. Model uncertainty is 80%.

$\Gamma(K\bar{K}) \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ $\Gamma_{16}\Gamma_{17}/\Gamma$
 VALUE (keV) DOCUMENT ID TECN COMMENT

••• We do not use the following data for averages, fits, limits, etc. •••
 0.035 ± 0.029 ¹ BIZOT 80 DM1 e^+e^-
¹ Model dependent.

$\Gamma(\rho\pi\pi) \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ $\Gamma_3\Gamma_{17}/\Gamma$
 VALUE (keV) DOCUMENT ID TECN COMMENT

••• We do not use the following data for averages, fits, limits, etc. •••
 3.510 ± 0.090 ¹ BIZOT 80 DM1 e^+e^-
¹ Model dependent.

 $\rho(1700) \Gamma(i)/\Gamma(\text{total}) \times \Gamma(e^+e^-)/\Gamma(\text{total})$

$\Gamma(\pi^0\omega)/\Gamma_{\text{total}} \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ $\Gamma_{18}/\Gamma \times \Gamma_{17}/\Gamma$
 VALUE (units 10^{-8}) EVTS DOCUMENT ID TECN COMMENT

••• We do not use the following data for averages, fits, limits, etc. •••
 0.09 ± 0.05 $10.2k$ ¹ ACHASOV 16D SND $1.05-2.00 e^+e^- \rightarrow \pi^0\pi^0\gamma$
 1.7 ± 0.4 7815 ² ACHASOV 13 SND $1.05-2.00 e^+e^- \rightarrow \pi^0\pi^0\gamma$
¹ From a phenomenological model based on vector meson dominance with interfering $\rho(700)$, $\rho(1450)$, and $\rho(1700)$. The $\rho(1700)$ mass and width are fixed at 1720 MeV and 250 MeV, respectively. Systematic uncertainty not estimated. Supersedes ACHASOV 13.
² From a phenomenological model based on vector meson dominance with the interfering $\rho(1450)$ and $\rho(1700)$ and their widths fixed at 400 and 250 MeV, respectively. Systematic uncertainty not estimated.

$\Gamma(\eta\rho)/\Gamma_{\text{total}} \times \Gamma(e^+e^-)/\Gamma_{\text{total}}$ $\Gamma_{14}/\Gamma \times \Gamma_{17}/\Gamma$
 VALUE (units 10^{-8}) EVTS DOCUMENT ID TECN COMMENT

••• We do not use the following data for averages, fits, limits, etc. •••
 $8.3^{+3.8}_{-3.1}$ $7.4k$ ¹ ACHASOV 18 SND $1.22-2.00 e^+e^- \rightarrow \eta\pi^+\pi^-$
¹ From the combined fit of AULCHENKO 15 and ACHASOV 18 in the model with the interfering $\rho(1450)$, $\rho(1700)$ and $\rho(2150)$ with the parameters of the $\rho(1450)$ and $\rho(1700)$ floating and the mass and width of the $\rho(2150)$ fixed at 2155 MeV and 320 MeV, respectively. The phases of the resonances are π , 0 and π , respectively.

Meson Particle Listings

$\rho(1700), a_2(1700)$

$\Gamma(K\bar{K})/\Gamma(2\pi^+\pi^-)$ Γ_{16}/Γ_2

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, CHG, COMMENT. Contains data for DELCOURT 81B DM1 and BINGHAM 72B HBC.

$\Gamma(K\bar{K})/\Gamma(K\bar{K}^*(892)+c.c.)$ Γ_{16}/Γ_{13}

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Contains data for BUON 82 DM1.

$\Gamma(\pi^0\omega)/\Gamma_{total}$ Γ_{18}/Γ

Table with columns: VALUE, EVTS, DOCUMENT ID, TECN, COMMENT. Contains data for MATVIENKO 15 BELL and ACHASOV 12 SND.

$\Gamma(\pi^0\gamma)/\Gamma_{total}$ Γ_{19}/Γ

Table with columns: VALUE, DOCUMENT ID, TECN, COMMENT. Contains data for ACHASOV 10D SND.

$\rho(1700)$ REFERENCES

Large reference table listing authors, document IDs, and technical details for various experiments and publications related to the rho(1700) meson.

$a_2(1700)$

$J^{PC} = 1^-(2^+ +)$

$a_2(1700)$ MASS

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes 'OUR AVERAGE' and data from RODAS, AMSLER, AGHASYAN, JACKURA, ABLIKIM, etc.

1 The coupled-channel analysis of both the $\eta\pi$ and $\eta'\pi$ systems using ADOLPH 15data. The mass is extracted from the T-matrix pole. 2 T-matrix pole. 3 Statistical error negligible. 4 Breit-Wigner mass. 5 Superseded by RODAS 19. 6 From analysis of L3 data at 183-209 GeV. 7 Statistical error only. 8 Spin 2 dominant, isospin not determined, could also be $I=1$. 9 Possibly two $J^P = 2^+$ resonances with isospins 0 and 1.

$a_2(1700)$ WIDTH

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes 'OUR AVERAGE' and data from RODAS, AMSLER, AGHASYAN, JACKURA, ABLIKIM, etc.

1 The coupled-channel analysis of both the $\eta\pi$ and $\eta'\pi$ systems using ADOLPH 15data. The width is extracted from the T-matrix pole. 2 T-matrix pole. 3 Statistical error negligible. 4 Breit-Wigner width. 5 Superseded by RODAS 19. 6 From analysis of L3 data at 183-209 GeV. 7 Statistical error only. 8 Spin 2 dominant, isospin not determined, could also be $I=1$.

$a_2(1700)$ DECAY MODES

Table with columns: Mode, Fraction (Γ_i/Γ). Lists decay channels like $\eta\pi$, $\gamma\gamma$, $\rho\pi$, $f_2(1270)\pi$, $K\bar{K}$, $\omega\pi^-\pi^0$, and $\omega\rho$.

$a_2(1700)$ PARTIAL WIDTHS

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Contains data for SCHEGELSKY 06A RVUE.

¹ From partial wave analysis including all possible combinations of 0^{++} , 2^{++} , and 4^{++} resonances.

² Spin 0 favored over spin 2.

³ In the SU(3) based model with a specific interference pattern of the $f_2(1270)$, $a_2^0(1320)$, and $f_2'(1525)$ mesons incoherently added to the $f_0(1710)$ and non-resonant background.

⁴ Breit-Wigner mass.

⁵ $J^P = 0^+$, supersedes by ARMSTRONG 89D.

⁶ Using CLEO-c data but not authored by the CLEO Collaboration.

⁷ From a fit to a Breit-Wigner line shape with fixed $\Gamma = 135$ MeV.

⁸ Systematic errors not estimated.

⁹ This state may be different from $f_0(1710)$, see CLOSE 05.

¹⁰ K-matrix pole, assuming $J^P = 0^+$, from combined analysis of $\pi^- p \rightarrow \pi^0 \pi^0 n$, $\pi^- p \rightarrow K\bar{K}n$, $\pi^+\pi^- \rightarrow \pi^+\pi^-$, $\bar{p}p \rightarrow \pi^0 \pi^0 \pi^0$, $\pi^0 \eta\eta$, $\pi^0 \pi^0 \eta$, $\pi^+\pi^-\pi^0$, $K^+K^-\pi^0$, $K_S^0 K_S^0 \pi^0$, $K^+ K_S^0 \pi^-$ at rest, $\bar{p}n \rightarrow \pi^-\pi^-\pi^+$, $K_S^0 K^- \pi^0$, $K_S^0 K_S^0 \pi^-$ at rest.

¹¹ Decaying to $f_0(1370)\pi\pi$.

¹² T-matrix pole.

¹³ Not seen by AMSLER 02.

¹⁴ Supersedes BARBERIS 99 and BARBERIS 99B.

¹⁵ T-matrix pole, assuming $J^P = 0^+$

¹⁶ No J^{PC} determination.

¹⁷ No J^{PC} determination, width not determined.

¹⁸ $J^P = 2^+$.

¹⁹ From a fit to the 0^+ partial wave.

²⁰ No J^{PC} determination.

²¹ ALDE 92D combines all the GAMS-2000 data.

²² $J^P = 2^+$, superseded by FRENCH 99.

²³ From an analysis ignoring interference with $f_2'(1525)$.

²⁴ From an analysis including interference with $f_2'(1525)$.

²⁵ Superseded by ALDE 92D.

²⁶ Uses MRK3 data. From a partial-wave analysis of data using a K-matrix formalism with 5 poles, but assuming spin 2. Fit with constrained inelasticity.

²⁷ $J^P = 2^+$ preferred.

²⁸ From fit neglecting nearby $f_2'(1525)$. Replaced by BLOOM 83.

$f_0(1710)$

$$I^G(J^{PC}) = 0^+(0^{++})$$

See the review on "Non- $q\bar{q}$ Mesons."

- From partial wave analysis including all possible combinations of 0^{++} , 2^{++} , and 4^{++} resonances.
- Spin 0 favored over spin 2.
- In the SU(3) based model with a specific interference pattern of the $f_2(1270)$, $\phi_2^0(1320)$, and $f_2'(1525)$ mesons incoherently added to the $f_0(1710)$ and non-resonant background.
- Breit-Wigner width.
- $J^P = 0^+$, superseded by ARMSTRONG 89D.
- Systematic errors not estimated.
- This state may be different from $f_0(1710)$, see CLOSE 05.
- (Solution I)
- K-matrix pole, assuming $J^P = 0^+$, from combined analysis of $\pi^-\pi^0 \rightarrow \pi^0\pi^0 n$, $\pi^-\pi^0 \rightarrow K\bar{K}n$, $\pi^+\pi^-\pi^0 \rightarrow \pi^+\pi^-\pi^0$, $\bar{p}p \rightarrow \pi^0\pi^0\pi^0$, $\pi^0\eta\eta$, $\pi^0\pi^0\eta$, $\pi^+\pi^-\pi^0$, $K^+K^-\pi^0$, $K_S^0 K_S^0 \pi^0$, $K^+K_S^0 \pi^-$ at rest, $\bar{p}n \rightarrow \pi^-\pi^-\pi^+$, $K_S^0 K^-\pi^0$, $K_S^0 K_S^0 \pi^-$ at rest.
- (Solution I)
- Decaying to $f_0(1370)\pi\pi$.
- T-matrix pole.
- $J^P = 0^+$.
- Not seen by AMSLER 02.
- Supersedes BARBERIS 99 and BARBERIS 99B.
- T-matrix pole, assuming $J^P = 0^+$
- No J^{PC} determination.
- $J^P = 2^+$.
- From a fit to the 0^+ partial wave.
- No J^{PC} determination.
- ALDE 92D combines all the GAMS-2000 data.
- $J^P = 2^+$, (0^+ excluded).
- From an analysis ignoring interference with $f_2'(1525)$.
- From an analysis including interference with $f_2'(1525)$.
- Uses MRK3 data. From a partial-wave analysis of data using a K-matrix formalism with 5 poles, but assuming spin 2. Fit with constrained inelasticity.
- No J^{PC} determination.
- $J^P = 2^+$ preferred.
- From fit neglecting nearby $f_2'(1525)$. Replaced by BLOOM 83.
- From an amplitude analysis of the $K_S^0 K_S^0$ system, superseded by LONGACRE 86.

1859 ⁺³ ₋₁₀		8 BAI	03F BES2	$J/\psi \rightarrow \gamma p\bar{p}$

- From a fit of the measured $\pi^+\pi^-\eta'$ lineshape that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold through interference with a second previously unseen narrow resonance near 1870 MeV. The fit uses Breit-Wigner functions for the signal shapes and includes known backgrounds and contributors.
- From a fit to $\gamma\phi$ invariant mass. Angular analysis consistent with $J^{PC} = 0^{-+}$. Other J^{PC} not excluded.
- Pole mass from a fit of the measured $\pi^+\pi^-\eta'$ lineshape to a Flatte formula that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold; the fit also includes known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner function ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit.
- From the fit including final state interaction effects in isospin 0 S-wave according to SIBIRTSSEV 05A. Supersedes ABLIKIM 10G.
- From a fit of the $\pi^+\pi^-\eta'$ mass distribution to a combination of $\gamma f_1(1510)$, $\gamma X(1835)$, and two unconfirmed states $\gamma X(2120)$, and $\gamma X(2370)$, for $M(p\bar{p}) < 2.8$ GeV, and accounting for backgrounds from non- η' events and $J/\psi \rightarrow \pi^0\pi^+\pi^-\eta'$.
- The selected process is $J/\psi \rightarrow \omega a_0(980)\pi$. This state may be due also to $\eta_2(1870)$ or to a combination of $X(1835)$ and $\eta_2(1870)$.
- From a fit of the $p\bar{p}$ mass distribution to a combination of $\gamma X(1835)$, γR with $M(R) = 2100$ MeV and $\Gamma(R) = 160$ MeV, and $\gamma p\bar{p}$ phase space, for $M(p\bar{p}) < 2.85$ GeV.
- Evidence for a threshold enhancement in the $p\bar{p}$ mass spectrum was also reported by ABE 02k, AUBERT,B 05L, and WANG 05A in $B^+ \rightarrow p\bar{p}K^+$, WANG 05A in $B^0 \rightarrow p\bar{p}K_S^0$, ABE 02w in $\bar{B}^0 \rightarrow p\bar{p}D^0$, DEL-AMO-SANCHEZ 12 in $B \rightarrow D(D^*)p\bar{p}(\pi)$, and WEI 08 in $B^+ \rightarrow p\bar{p}\pi^+$ decays. Not seen by ATHAR 06 in $\Upsilon(1S) \rightarrow p\bar{p}\gamma$.
- From the fit including final state interaction effects in isospin 0 S-wave according to SIBIRTSSEV 05A. Systematic errors not estimated.

VALUE	DOCUMENT ID TECN COMMENT
seen	¹ ABLIKIM 16j BES3 $J/\psi \rightarrow \gamma\pi^+\pi^-\eta'$

- ABLIKIM 16j quotes $B(J/\psi \rightarrow \gamma X(1835)) \times B(X(1835) \rightarrow \pi^+\pi^-\eta') = (3.93 \pm 0.38^{+0.31}_{-0.84}) \times 10^{-4}$ from a fit of the measured $\pi^+\pi^-\eta'$ lineshape that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold with a Flatté formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16j is that a second resonance near 1870 MeV interferes with the $X(1835)$; fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.

- 1 From the first PWA solution.
- 2 From a partial-wave analysis of the data.
- 3 From an amplitude analysis of the reaction $\pi^+ \pi^- \rightarrow 2 \pi^0$.
- 4 K matrix pole.
- 5 Taking into account the $f_2(1950)$. Helicity-2 production favored.
- 6 Energy-dependent analysis.
- 7 Single energy analysis.
- 8 From solution A of amplitude analysis of data on $\bar{p} p \rightarrow \pi \pi$. See however KLOET 96 who fit $\pi^+ \pi^-$ only and find waves only up to $J = 3$ to be important but not significantly resonant.
- 9 From solution B of amplitude analysis of data on $\bar{p} p \rightarrow \pi \pi$. See however KLOET 96 who fit $\pi^+ \pi^-$ only and find waves only up to $J = 3$ to be important but not significantly resonant.
- 10 $I(J^{PC}) = 0(4^+)$ from amplitude analysis assuming one-pion exchange.
- 11 Width errors enlarged by us to $4\Gamma/\sqrt{N}$; see the note with the $K^*(892)$ mass.

~2150	⁷ MARTIN	80C RVUE	
~2150	⁸ DULUDE	78B OSPK	$1-2 \bar{p}p \rightarrow \pi^0\pi^0$
⁵ OAKDEN 94 makes an amplitude analysis of LEAR data on $\bar{p}p \rightarrow \pi\pi$ using a method based on Barrelet zeros. This is solution A. The amplitude analysis of HASAN 94 includes earlier data as well, and assume that the data can be parametrized in terms of towers of nearly degenerate resonances on the leading Regge trajectory. See also KLOET 96 and MARTIN 97 who make related analyses.			
⁶ From solution B of amplitude analysis of data on $\bar{p}p \rightarrow \pi\pi$.			

⁷ $I(J^P) = 0(2^+)$ from simultaneous analysis of $p\bar{p} \rightarrow \pi^-\pi^+$ and $\pi^0\pi^0$.
⁸ $I^G(J^P) = 0^+(2^+)$ from partial-wave amplitude analysis.

• • • We do not use the following data for averages, fits, limits, etc. • • •

- From the fit to the BABAR data of LEES 13Q assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution. The resonance significance is 3.5 σ .
- From the fit to the BABAR data of LEES 13Q and BESIII data of ABLIKIM 19L assuming a coherent sum of a single Breit-Wigner resonance and a nonresonant contribution.
- Could also be another state. Seen in J/ψ decay with branching ratio $J/\psi \rightarrow X\pi^0 \rightarrow K^+ K^- \pi^0 = (6.7 \pm 1.1 \pm 2.2 \pm 1.8) \times 10^{-6}$.
- The observed structure can be due to both the $\phi(2170)$ and $\rho(2150)$.
- Using the GOUNARIS 68 parametrization of the pion form factor leaving the masses and widths of the $\rho(1450)$, $\rho(1700)$, and $\rho(2150)$ resonances as free parameters of the fit.
- Includes ATKINSON 85.

58 ± 16 ± 20	201	^{3,6} AUBERT, BE 06D	BABR	$10.6 e^+e^- \rightarrow K^+K^-\pi\pi\gamma$

¹The observed structure can be due to both the $\phi(2170)$ and $\rho(2150)$.

²Fit includes interference with the $\phi(1680)$.

³From the $\phi f_0(980)$ component.

⁴From a fit with two incoherent Breit-Wigners.

⁵From the $K^+K^-f_0(980)$ component.

⁶Superseded by LEES 12F.

CHARGED KAON MASS

Revised 1994 by T.G. Trippe (LBNL).

The average of the six charged kaon mass measurements which we use in the Particle Listings is

$$m_{K^\pm} = 493.677 \pm 0.013 \text{ MeV } (S = 2.4), \quad (1)$$

where the error has been increased by the scale factor S . The large scale factor indicates a serious disagreement between different input data. The average before scaling the error is

$$m_{K^\pm} = 493.677 \pm 0.005 \text{ MeV }, \quad (2)$$

$$\chi^2 = 22.9 \text{ for } 5 \text{ D.F.}, \text{ Prob. } = 0.04\%,$$

where the high χ^2 and correspondingly low χ^2 probability further quantify the disagreement.

The main disagreement is between the two most recent and precise results,

$$m_{K^\pm} = 493.696 \pm 0.007 \text{ MeV} \quad \text{DENISOV 91}$$

$$m_{K^\pm} = 493.636 \pm 0.011 \text{ MeV } (S = 1.5) \quad \text{GALL 88}$$

$$\text{Average} = 493.679 \pm 0.006 \text{ MeV}$$

$$\chi^2 = 21.2 \text{ for } 1 \text{ D.F.}, \text{ Prob. } = 0.0004\%, \quad (3)$$

both of which are measurements of x-ray energies from kaonic atoms. Comparing the average in Eq. (3) with the overall average in Eq. (2), it is clear that DENISOV 91 and GALL 88 dominate the overall average, and that their disagreement is responsible for most of the high χ^2 .

The GALL 88 measurement was made using four different kaonic atom transitions, $K^- \text{Pb } (9 \rightarrow 8)$, $K^- \text{Pb } (11 \rightarrow 10)$, $K^- \text{W } (9 \rightarrow 8)$, and $K^- \text{W } (11 \rightarrow 10)$. The m_{K^\pm} values they obtain from each of these transitions is shown in the Particle Listings and in Fig. 1. Their $K^- \text{Pb } (9 \rightarrow 8)$ m_{K^\pm} is below and somewhat inconsistent with their other three transitions. The average of their four measurements is

$$m_{K^\pm} = 493.636 \pm 0.007,$$

$$\chi^2 = 7.0 \text{ for } 3 \text{ D.F.}, \text{ Prob. } = 7.2\%. \quad (4)$$

This is a low but acceptable χ^2 probability so, to be conservative, GALL 88 scaled up the error on their average by $S=1.5$ to obtain their published error ± 0.011 shown in Eq. (3) above and used in the Particle Listings average.

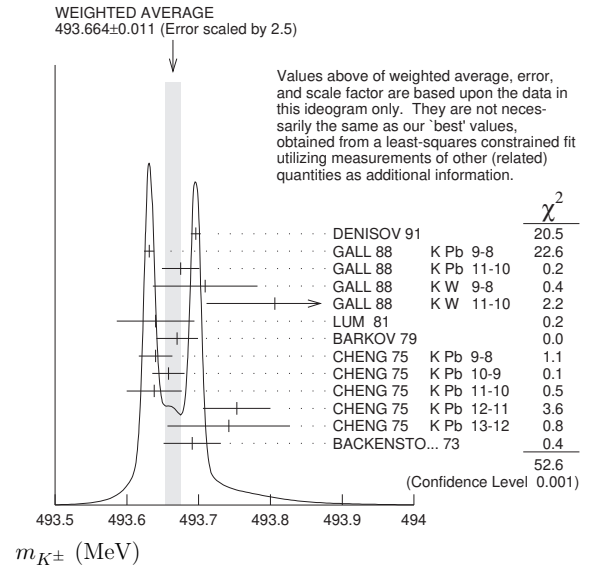

Figure 1: Ideogram of m_{K^\pm} mass measurements. GALL 88 and CHENG 75 measurements are shown separately for each transition they measured.

The ideogram in Fig. 1 shows that the DENISOV 91 measurement and the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ measurement yield two well-separated peaks. One might suspect the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ measurement since it is responsible both for the internal inconsistency in the GALL 88 measurements and the disagreement with DENISOV 91.

To see if the disagreement could result from a systematic problem with the $K^- \text{Pb } (9 \rightarrow 8)$ transition, we have separated the CHENG 75 data, which also used $K^- \text{Pb}$, into its separate transitions. Figure 1 shows that the CHENG 75 and GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ values are consistent, suggesting the possibility of a common effect such as contaminant nuclear γ rays near the $K^- \text{Pb } (9 \rightarrow 8)$ transition energy, although the CHENG 75 errors are too large to make a strong conclusion. The average of all 13 measurements has a χ^2 of 52.6 as shown in Fig. 1 and the first line of Table 1, yielding an unacceptable χ^2 probability of 0.00005%. The second line of Table 1 excludes both the GALL 88 and CHENG 75 measurements of the $K^- \text{Pb } (9 \rightarrow 8)$ transition and yields a χ^2 probability of 43%. The third [fourth] line of Table 1 excludes only the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ [DENISOV 91] measurement and yields a χ^2 probability of 20% [8.6%]. Table 1 shows that removing both measurements of the $K^- \text{Pb } (9 \rightarrow 8)$ transition produces the most consistent set of data, but that excluding only the GALL 88 $K^- \text{Pb } (9 \rightarrow 8)$ transition or DENISOV 91 also produces acceptable probabilities.

Meson Particle Listings

 K^\pm **Table 1:** m_{K^\pm} averages for some combinations of Fig. 1 data.

m_{K^\pm} (MeV)	χ^2	D.F.	Prob. (%)	Measurements used
493.664 ± 0.004	52.6	12	0.00005	all 13 measurements
493.690 ± 0.006	10.1	10	43	no K^- Pb(9→8)
493.687 ± 0.006	14.6	11	20	no GALL 88 K^- Pb(9→8)
493.642 ± 0.006	17.8	11	8.6	no DENISOV 91

Yu.M. Ivanov, representing DENISOV 91, has estimated corrections needed for the older experiments because of improved ^{192}Ir and ^{198}Au calibration γ -ray energies. He estimates that CHENG 75 and BACKENSTOSS 73 m_{K^\pm} values could be raised by about 15 keV and 22 keV, respectively. With these estimated corrections, Table 1 becomes Table 2. The last line of Table 2 shows that if such corrections are assumed, then GALL 88 K^- Pb (9 → 8) is inconsistent with the rest of the data even when DENISOV 91 is excluded. Yu.M. Ivanov warns that these are rough estimates. Accordingly, we do not use Table 2 to reject the GALL 88 K^- Pb (9 → 8) transition, but we note that a future reanalysis of the CHENG 75 data could be useful because it might provide supporting evidence for such a rejection.

Table 2: m_{K^\pm} averages for some combinations of Fig. 1 data after raising CHENG 75 and BACKENSTOSS 73 values by 0.015 and 0.022 MeV respectively.

m_{K^\pm} (MeV)	χ^2	D.F.	Prob. (%)	Measurements used
493.666 ± 0.004	53.9	12	0.00003	all 13 measurements
493.693 ± 0.006	9.0	10	53	no K^- Pb(9→8)
493.690 ± 0.006	11.5	11	40	no GALL 88 K^- Pb(9→8)
493.645 ± 0.006	23.0	11	1.8	no DENISOV 91

The GALL 88 measurement uses a Ge semiconductor spectrometer which has a resolution of about 1 keV, so they run the risk of some contaminant nuclear γ rays. Studies of γ rays following stopped π^- and Σ^- absorption in nuclei (unpublished) do not show any evidence for contaminants according to GALL 88 spokesperson, B.L. Roberts. The DENISOV 91 measurement uses a crystal diffraction spectrometer with a resolution of 6.3 eV for radiation at 22.1 keV to measure the 4f-3d transition in K^- ^{12}C . The high resolution and the light nucleus reduce the probability for overlap by contaminant γ rays, compared with the measurement of GALL 88. The DENISOV 91 measurement is supported by their high-precision measurement of the 4d-2p transition energy in π^- ^{12}C , which is good agreement with the calculated energy.

While we suspect that the GALL 88 K^- Pb (9 → 8) measurements could be the problem, we are unable to find clear grounds for rejecting it. Therefore, we retain their measurement in the average and accept the large scale factor until further information can be obtained from new measurements and/or from reanalysis of GALL 88 and CHENG 75 data.

We thank B.L. Roberts (Boston Univ.) and Yu.M. Ivanov (Petersburg Nuclear Physics Inst.) for their extensive help in understanding this problem.

¹ Error increased from 0.0059 based on the error analysis in IVANOV 92.

² This value is the authors' combination of all of the separate transitions listed for this paper.

³ The CHENG 75 values for separate transitions were calculated from their Table 7 transition energies. The first error includes a 20% systematic error in the noncircular contaminant shift. The second error is due to a ± 5 eV uncertainty in the theoretical transition energies.

 $m_{K^+} - m_{K^-}$

Test of CPT.

- [a] See the Particle Listings below for the energy limits used in this measurement.
- [b] Most of this radiative mode, the low-momentum γ part, is also included in the parent mode listed without γ 's.
- [c] Structure-dependent part.
- [d] See the review on "Form Factors for Radiative Pion and Kaon Decays" for definitions and details.
- [e] Direct-emission branching fraction.
- [f] Derived from an analysis of neutrino-oscillation experiments.
- [g] Violates angular-momentum conservation.

CONSTRAINED FIT INFORMATION

An overall fit to the mean life, a decay rate, and 15 branching ratios uses 35 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 53.4$ for 28 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

¹BATLEY 12 uses data collected in 2003–2004. The result is inclusive of $K^\pm \rightarrow \pi^+ \pi^- e^\pm \nu_\gamma$ decays. Using PDG 12 value for $\Gamma(\pi^+ \pi^- \pi^+ \pi^-)/\Gamma = (5.59 \pm 0.04) \times 10^{-2}$. BATLEY 12 obtains $B(\pi^+ \pi^- e \nu) = (4.257 \pm 0.004 \pm 0.035) \times 10^{-5}$ where the syst. error is dominated by the error on the normalization mode.

²PISLAK 01 reports $\Gamma(\pi^+ \pi^- e^+ \nu_e)/\Gamma_{\text{total}} = (4.109 \pm 0.008 \pm 0.110) \times 10^{-5}$ using the PDG 00 value $\Gamma(\pi^+ \pi^+ \pi^-)/\Gamma_{\text{total}} = (5.59 \pm 0.05) \times 10^{-2}$. We divide by the PDG value and unfold its error from the systematic error. PISLAK 03 and PISLAK 10A give additional details on the branching ratio measurement and give improved errors on the S-wave $\pi\pi$ scattering length: $a_0^0 = 0.235 \pm 0.013$ and $a_0^2 = -0.0410 \pm 0.0027$.

Hadronic modes with photons

$\Gamma(\pi^+ \pi^0 \gamma(INT))/\Gamma_{\text{total}}$					Γ_{21}/Γ
The $K^+ \rightarrow \pi^+ \pi^0 \gamma$ differential decay rate can be described in terms of $T_{\pi^+ \pi^0}$, the charged pion kinetic energy, and $W^2 = (P_K \cdot P_\gamma)(P_{\pi^+} \cdot P_\gamma) / (m_K m_{\pi^+})^2$; then we can write $d^2\Gamma(K^+ \rightarrow \pi^+ \pi^0 \gamma) / (dT_{\pi^+ \pi^0} dW^2) = d^2\Gamma(K^+ \rightarrow \pi^+ \pi^0 \gamma)_{IB} / (dT_{\pi^+ \pi^0} dW^2) [1 + 2 \cos(\phi + \delta_1^+ - \delta_0^0) \frac{m_\pi^2 m_K^2 W^2 X_E + m_\pi^4 m_K^4 (X_E^2 + X_M^2) W^4}{m_\pi^2 m_K^2 W^2 X_E + m_\pi^4 m_K^4 (X_E^2 + X_M^2) W^4}]$. The IB differential and total branching ratios are expressed in terms of the non-radiative experimental width $\Gamma(K^+ \rightarrow \pi^+ \pi^0)$ by Low's theorem. Using PDG 10 $B(K^+ \rightarrow \pi^+ \pi^0) = 0.2066 \pm 0.0008$, one obtains respectively $B(K^+ \rightarrow \pi^+ \pi^0 \gamma)_{IB} (55 < T_{\pi^+ \pi^0} < 90 \text{ MeV}) = 2.55 \times 10^{-4}$ and $B(K^+ \rightarrow \pi^+ \pi^0 \gamma)_{IB} (0 < T_{\pi^+ \pi^0} < 80 \text{ MeV}) = 1.80 \times 10^{-4}$. Fitting respectively the piece proportional to W^2 and the piece proportional to W^4 , the interference contribution (INT), proportional to X_E , and the direct contribution (DE) proportional to $X_E^2 + X_M^2$ are extracted.

< 100 ± 600		CHEN	68	OSPK	+	$T_{\pi^-} 60\text{--}90 \text{ MeV}$

¹ LAZZERONI 14 combines NA62 and NA48/2 results. The result for the full kinematic range is extrapolated from the model-independent branching fraction $(9.65 \pm 0.61 \pm 0.14) \times 10^{-7}$ for $(m_{\gamma\gamma}/m_K)^2 > 0.2$. The measured ChPT parameter $\tilde{c} = 1.86 \pm 0.25$.

² KITCHING 97 is extrapolated from their model-independent branching fraction $(6.0 \pm 1.5 \pm 0.7) \times 10^{-7}$ for $100 \text{ MeV}/c < P_{\pi^+} < 180 \text{ MeV}/c$ using Chiral Perturbation Theory.

³ BATLEY 14 uses data collected in 2003 and 2004. Branching ratio is obtained by determining the parameter $\tilde{c} = 1.41 \pm 0.38 \pm 0.11$ and integrating the $O(p^6)$ chiral spectrum. A model independent value for the branching ratio is also obtained $(8.77 \pm 0.87 \pm 0.17) \times 10^{-7}$ for kinematic range $(m_{\gamma\gamma}/m_K)^2 > 0.2$.

⁴ ARTAMONOV 05 limit assumes ChPT with $\tilde{c} = 1.8$ with unitarity corrections. With $\tilde{c} = 1.6$ and no unitarity corrections they obtain $< 2.3 \times 10^{-8}$ at 90% CL. This partial branching ratio is predicted to be 6.10×10^{-9} and 0.49×10^{-9} for the cases with and without unitarity correction.

DALITZ PLOT PARAMETERS FOR $K \rightarrow 3\pi$ DECAYS

Revised 1999 by T.G. Trippe (LBNL).

The Dalitz plot distribution for $K^\pm \rightarrow \pi^\pm \pi^\pm \pi^\mp$, $K^\pm \rightarrow \pi^0 \pi^0 \pi^\pm$, and $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$ can be parameterized by a series expansion such as that introduced by Weinberg [1]. We use the form

$$\begin{aligned} |M|^2 \propto & 1 + g \frac{(s_3 - s_0)}{m_{\pi^+}^2} + h \left[\frac{s_3 - s_0}{m_{\pi^+}^2} \right]^2 \\ & + j \frac{(s_2 - s_1)}{m_{\pi^+}^2} + k \left[\frac{s_2 - s_1}{m_{\pi^+}^2} \right]^2 \\ & + f \frac{(s_2 - s_1)(s_3 - s_0)}{m_{\pi^+}^2 m_{\pi^+}^2} + \dots, \end{aligned} \quad (1)$$

where $m_{\pi^+}^2$ has been introduced to make the coefficients g , h , j , and k dimensionless, and

$$\begin{aligned} s_i &= (P_K - P_i)^2 = (m_K - m_i)^2 - 2m_K T_i, \quad i = 1, 2, 3, \\ s_0 &= \frac{1}{3} \sum_i s_i = \frac{1}{3} (m_K^2 + m_1^2 + m_2^2 + m_3^2). \end{aligned}$$

Here the P_i are four-vectors, m_i and T_i are the mass and kinetic energy of the i^{th} pion, and the index 3 is used for the odd pion.

The coefficient g is a measure of the slope in the variable s_3 (or T_3) of the Dalitz plot, while h and k measure the quadratic dependence on s_3 and $(s_2 - s_1)$, respectively. The coefficient j is related to the asymmetry of the plot and must be zero if CP invariance holds. Note also that if CP is good, g , h , and k must be the same for $K^+ \rightarrow \pi^+ \pi^+ \pi^-$ as for $K^- \rightarrow \pi^- \pi^- \pi^+$.

Since different experiments use different forms for $|M|^2$, in order to compare the experiments we have converted to g , h , j , and k whatever coefficients have been measured. Where such conversions have been done, the measured coefficient a_y , a_t , a_u , or a_v is given in the comment at the right. For definitions of

Meson Particle Listings

 K^\pm

these coefficients, details of this conversion, and discussion of the data, see the April 1982 version of this note [2].

- 1 BATLEY 07E includes data from BATLEY 06A. Uses quadratic parametrization and PDG 06 value $g = 0.626 \pm 0.007$ to obtain $g_+ - g_- = (2.2 \pm 2.1 \pm 0.7) \times 10^{-4}$. Neglects any possible charge asymmetries in higher order slope parameters h or k .
- 2 Asymmetry obtained assuming that $g_+ + g_- = 2 \times 0.652$ (PDG 02) and that asymmetries in h and k are zero.
- 3 Linear and quadratic slopes from PDG 04 are used. Any possible charge asymmetries in higher order slope parameters h or k are neglected.

ALTERNATIVE PARAMETRIZATIONS OF $K^\pm \rightarrow \pi^\pm \pi^0 \pi^0$ DALITZ PLOT

The following functional form for the matrix element suggested by $\pi\pi$ rescattering in $K^+ \rightarrow \pi^+ \pi^+ \pi^0 \rightarrow \pi^+ \pi^0 \pi^0$ is used for this fit (CABIBBO 04A, CABIBBO 05): Matrix element = $M_0 + M_1$ where $M_0 = 1 + (1/2)g_0 u + (1/2)h' u^2 + (1/2)k_0 v^2$ with $u = (s_3 - s_0) / (m_{\pi^+})^2$, $v = (s_2 - s_1) / (m_{\pi^+})^2$ and where M_1 takes into account the non-analytic piece due to $\pi\pi$ rescattering amplitudes a_0 and a_2 ; The parameters g_0 and h' are related to the parameters g and h of the matrix element squared given in the previous section by the approximations $g_0 \sim g^{PDG}$ and $h' \sim h^{PDG} - (g/2)^2$ and $k_0 \sim k^{PDG}$.

In addition, we also consider the effective field theory framework of COLANGELO 06A and BISSEGER 09 to extract g_{BB} and h'_{BB} .

 $K_{\ell 3}^\pm$ AND $K_{\ell 3}^0$ FORM FACTORS

Updated September 2013 by T.G. Trippe (LBNL) and C.-J. Lin (LBNL).

Assuming that only the vector current contributes to $K \rightarrow \pi \ell \nu$ decays, we write the matrix element as

$$M \propto f_+(t) [(P_K + P_\pi)_\mu \bar{\ell} \gamma_\mu (1 + \gamma_5) \nu] + f_-(t) [m_\ell \bar{\ell} (1 + \gamma_5) \nu], \quad (1)$$

where P_K and P_π are the four-momenta of the K and π mesons, m_ℓ is the lepton mass, and f_+ and f_- are dimensionless form factors which can depend only on $t = (P_K - P_\pi)^2$, the square of the four-momentum transfer to the leptons. If time-reversal invariance holds, f_+ and f_- are relatively real. $K_{\mu 3}$ experiments, discussed immediately below, measure f_+ and f_- , while $K_{e 3}$ experiments, discussed further below, are sensitive only to f_+ because the small electron mass makes the f_- term negligible.

$K_{\mu 3}$ Experiments. Analyses of $K_{\mu 3}$ data frequently assume a linear dependence of f_+ and f_- on t , *i.e.*,

$$f_\pm(t) = f_\pm(0) [1 + \lambda_\pm(t/m_{\pi^+}^2)]. \quad (2)$$

Most $K_{\mu 3}$ data are adequately described by Eq. (2) for f_+ and a constant f_- (*i.e.*, $\lambda_- = 0$).

Two commonly used equivalent parametrizations:

(1) λ_+ , $\xi(0)$ parametrization. Older analyses of $K_{\mu 3}$ data often introduce the ratio of the two form factors

$$\xi(t) = f_-(t)/f_+(t). \quad (3)$$

The $K_{\mu 3}$ decay distribution is then described by the two parameters λ_+ and $\xi(0)$ (assuming time reversal invariance and $\lambda_- = 0$).

(2) λ_+ , λ_0 parametrization. More recent $K_{\mu 3}$ analyses have parametrized in terms of the form factors f_+ and f_0 , which are associated with vector and scalar exchange, respectively, to the lepton pair. f_0 is related to f_+ and f_- by

$$f_0(t) = f_+(t) + [t/(m_K^2 - m_\pi^2)] f_-(t). \quad (4)$$

Here $f_0(0)$ must equal $f_+(0)$ unless $f_-(t)$ diverges at $t = 0$. The earlier assumption that f_+ is linear in t and f_- is constant leads to f_0 linear in t :

$$f_0(t) = f_0(0) [1 + \lambda_0(t/m_{\pi^+}^2)]. \quad (5)$$

With the assumption that $f_0(0) = f_+(0)$, the two parametrizations, $(\lambda_+, \xi(0))$ and (λ_+, λ_0) are equivalent as long as correlation information is retained. (λ_+, λ_0) correlations tend to be less strong than $(\lambda_+, \xi(0))$ correlations.

Since the 2006 edition of the *Review* [4], we no longer quote results in the $(\lambda_+, \xi(0))$ parametrization. We have removed many older low statistics results from the Listings. See the 2004 version of this note [5] for these older results, and the 1982 version [6] for additional discussion of the $K_{\mu 3}^0$ parameters, correlations, and conversion between parametrizations.

Quadratic Parametrization. More recent high-statistics experiments have included a quadratic term in the expansion of $f_+(t)$,

$$f_+(t) = f_+(0) \left[1 + \lambda'_+(t/m_{\pi^+}^2) + \frac{\lambda''_+}{2} (t/m_{\pi^+}^2)^2 \right]. \quad (6)$$

If there is a non-vanishing quadratic term, then λ_+ of Eq. (2) represents the average slope, which is then different from λ'_+ . Our convention is to include the factor $\frac{1}{2}$ in the quadratic term, and to use m_{π^+} even for $K_{e 3}^+$ and $K_{\mu 3}^+$ decays. We have converted other's parametrizations to match our conventions, as noted in the beginning of the " $K_{\ell 3}^\pm$ and $K_{\ell 3}^0$ Form Factors" sections of the Listings.

Pole Parametrization. The pole model describes the t -dependence of $f_+(t)$ and $f_0(t)$ in terms of the exchange of the lightest vector and scalar K^* mesons with masses M_v and M_s , respectively:

$$f_+(t) = f_+(0) \left[\frac{M_v^2}{M_v^2 - t} \right], \quad f_0(t) = f_0(0) \left[\frac{M_s^2}{M_s^2 - t} \right]. \quad (7)$$

Dispersive Parametrization. This approach [7,8] uses dispersive techniques and the known low-energy $K\pi$ phases to parametrize the vector and scalar form factors:

$$f_+(t) = f_+(0) \exp \left[\frac{t}{m_\pi^2} (\Lambda_+ + H(t)) \right]; \quad (8)$$

$$f_0(t) = f_+(0) \exp \left[\frac{t}{(m_K^2 - m_\pi^2)} (\ln[C] - G(t)) \right], \quad (9)$$

where Λ_+ is the slope of the vector form factor, and $\ln[C] = \ln[f_0(m_K^2 - m_\pi^2)]$ is the logarithm of the scalar form factor at

Meson Particle Listings

K^\pm

the Callan-Treiman point. The functions $H(t)$ and $G(t)$ are dispersive integrals.

K_{e3} Experiments. Analysis of K_{e3} data is simpler than that of $K_{\mu 3}$ because the second term of the matrix element assuming a pure vector current [Eq. (1) above] can be neglected. Here f_+ can be assumed to be linear in t , in which case the linear coefficient λ_+ of Eq. (2) is determined, or quadratic, in which case the linear coefficient λ'_+ and quadratic coefficient λ''_+ of Eq. (6) are determined.

If we remove the assumption of a pure vector current, then the matrix element for the decay, in addition to the terms in Eq. (1), would contain

$$+2m_K f_S \bar{\ell}(1 + \gamma_5)\nu + (2f_T/m_K)(P_K)_\lambda(P_\pi)_\mu \bar{\ell}\sigma_{\lambda\mu}(1 + \gamma_5)\nu, \quad (10)$$

where f_S is the scalar form factor, and f_T is the tensor form factor. In the case of the K_{e3} decays where the f_- term can be neglected, experiments have yielded limits on $|f_S/f_+|$ and $|f_T/f_+|$.

Fits for K_{e3} Form Factors. For K_{e3} data, we determine best values for the three parametrizations: linear (λ_+), quadratic (λ'_+ , λ''_+) and pole (M_v). For $K_{\mu 3}$ data, we determine best values for the three parametrizations: linear (λ_+ , λ_0), quadratic (λ'_+ , λ''_+ , λ_0) and pole (M_v , M_s). We then assume $\mu - e$ universality so that we can combine K_{e3} and $K_{\mu 3}$ data, and again determine best values for the three parametrizations: linear (λ_+ , λ_0), quadratic (λ'_+ , λ''_+ , λ_0), and pole (M_v , M_s). When there is more than one parameter, fits are done including input correlations. Simple averages suffice in the two K_{e3} cases where there is only one parameter: linear (λ_+) and pole (M_v).

Both KTeV and KLOE see an improvement in the quality of their fits relative to linear fits when a quadratic term is introduced, as well as when the pole parametrization is used. The quadratic parametrization has the disadvantage that the quadratic parameter λ''_+ is highly correlated with the linear parameter λ'_+ , in the neighborhood of 95%, and that neither parameter is very well determined. The pole fit has the same number of parameters as the linear fit, but yields slightly better fit probabilities, so that it would be advisable for all experiments to include the pole parametrization as one of their choices [9].

The “Kaon Particle Listings” show the results with and without assuming $\mu - e$ universality. The “Meson Summary Tables” show all of the results assuming $\mu - e$ universality, but most results not assuming $\mu - e$ universality are given only in the Listings.

K_{e3}^\pm FORM FACTORS

In the form factor comments, the following symbols are used.

f_+ and f_- are form factors for the vector matrix element.

f_S and f_T refer to the scalar and tensor term.

$f_0 = f_+ + f_- t/(m_{K^+}^2 - m_{\pi^0}^2)$.

$t =$ momentum transfer to the π .

λ_+ and λ_0 are the linear expansion coefficients of f_+ and f_0 :

$f_+(t) = f_+(0) (1 + \lambda_+ t/m_{\pi^+}^2)$

For quadratic expansion

$f_+(t) = f_+(0) (1 + \lambda'_+ t/m_{\pi^+}^2 + \frac{\lambda''_+}{2} t^2/m_{\pi^+}^4)$

as used by KTeV. If there is a non-vanishing quadratic term, then λ_+ represents an average slope, which is then different from λ'_+ .

NA48/2 and OKA quadratic expansion coefficients are converted with $\lambda'_+{}^{PDG} = \lambda'_+{}^{NA48/2}$ and $\lambda''_+{}^{PDG} = 2 \lambda''_+{}^{NA48/2}$

$\lambda'_+{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda'_+{}^{OKA}$ and

$\lambda''_+{}^{PDG} = 2 (\frac{m_{\pi^+}}{m_{\pi^0}})^4 \lambda''_+{}^{OKA}$

OKA linear expansion coefficients are converted with $\lambda_+{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+{}^{OKA}$ and $\lambda_0{}^{PDG} = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_0{}^{OKA}$

The pole parametrization is

$f_+(t) = f_+(0) (\frac{M_V^2}{M_V^2 - t})$

$f_0(t) = f_0(0) (\frac{M_S^2}{M_S^2 - t})$

where M_V and M_S are the vector and scalar pole masses.

The following abbreviations are used:

DP = Dalitz plot analysis.

PI = π spectrum analysis.

MU = μ spectrum analysis.

POL = μ polarization analysis.

BR = $K_{\mu 3}^\pm/K_{e3}^\pm$ branching ratio analysis.

E = positron or electron spectrum analysis.

RC = radiative corrections.

For previous λ'_+ and λ''_+ parametrizations used by NA48 (e.g. LAI 07A) and ISTRA (e.g. YUSHCHENKO 04B) see PDG 18.

λ_+ (LINEAR ENERGY DEPENDENCE OF f_+ IN K_{e3}^\pm DECAY)

These results are for a linear expansion only. See the next section for fits including a quadratic term. $\ln(C)$ (DISPERSIVE SCALAR FORM FACTOR IN K_{e3}^\pm decays)

VALUE (units 10^{-3})	EVTS	DOCUMENT ID	TECN	CHG	
182.17 ± 6.31 ± 14.45	2.3M	¹ BATLEY	18	NA48	±

¹ Data collected in 2004 by NA48/2. Combined fit with dispersive vector form factor $A_+ = 25.36 \pm 0.58 \pm 0.72$. Correlation coefficient is 0.104. $\chi^2/NDF = 410.3/382$. BATLEY 18 also performed a combined K_{e3}^\pm and $K_{\mu 3}^\pm$ fit assuming $\mu-e$ universality and obtained $(183.65 \pm 5.92 \pm 14.25) \times 10^{-3}$.

 K_{24}^\pm FORM FACTORS

Based on the parametrizations of AMOROS 99, the K_{24}^\pm form factors can be expressed as

$$F_s = f_s + f'_s q^2 + f''_s q^4 + f'_e S_e / 4m_\pi^2$$

$$F_p = f_p$$

$$G_p = g_p + g'_p q^2$$

$$H_p = h_p$$

where $q^2 = (S_\pi / 4m_\pi^2) - 1$, S_π is the invariant mass squared of the dipion, and S_e is the invariant mass squared of the dilepton.

DECAY FORM FACTOR FOR $K^\pm \rightarrow \pi^0 \pi^\pm e^\pm \nu$
Given in BOLOTOV 86b, BARMIN 88b, and SHIMIZU 04.

$K^\pm \rightarrow \ell^\pm \nu \gamma$ FORM FACTORS

For definitions of the axial-vector F_A and vector F_V form factor, see the "Note on $\pi^\pm \rightarrow \ell^\pm \nu \gamma$ and $K^\pm \rightarrow \ell^\pm \nu \gamma$ Form Factors" in the π^\pm section. In the kaon literature, often different definitions $a_K = F_A/m_K$ and $v_K = F_V/m_K$ are used.

$F_A + F_V$, SUM OF AXIAL-VECTOR AND VECTOR FORM FACTOR FOR $K \rightarrow e\nu e\gamma$

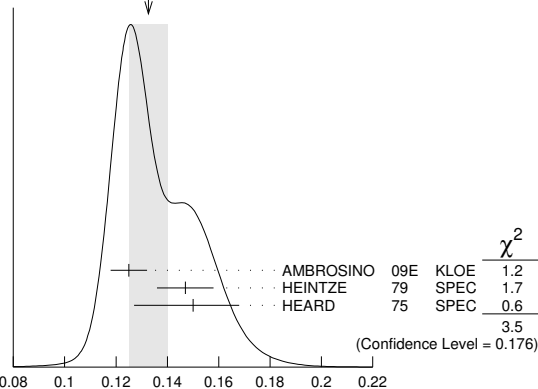

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
0.133 ± 0.008 OUR AVERAGE		Error includes scale factor of 1.3.	See the ideogram below.	
0.125 ± 0.007 ± 0.001	1.4K	¹ AMBROSINO 09E	KLOE	E_γ in 10–250 MeV, $p_e > 200$ MeV/c
0.147 ± 0.011	51	² HEINTZE 79	SPEC	
0.150 ± 0.018 -0.023	56	³ HEARD 75	SPEC	

¹ AMBROSINO 09E measures the absolute value $|F_A + F_V|$ which is parametrized as $|F_A + F_V| = F_V (1 + \lambda(1-x)) + F_A$, $x = 2E_\gamma/m_K$. ($F_A + F_V$) and λ are fit parameters. The fitted value of $\lambda = 0.38 \pm 0.20 \pm 0.02$ with a correlation of -0.93 between ($F_A + F_V$) and λ .

² HEINTZE 79 quotes absolute value of $|F_A + F_V| \sin\theta_c$. We use $\sin\theta_c = V_{us} = 0.2205$.

³ HEARD 75 quotes absolute value of $|F_A + F_V| \sin\theta_c$. We use $\sin\theta_c = V_{us} = 0.2205$.

T-VIOLATION PARAMETER IN K⁰-K⁰ MIXING

The asymmetry $A_T = \frac{\Gamma(\bar{K}^0 \rightarrow K^0) - \Gamma(K^0 \rightarrow \bar{K}^0)}{\Gamma(\bar{K}^0 \rightarrow K^0) + \Gamma(K^0 \rightarrow \bar{K}^0)}$ must vanish if T invariance holds.

ASYMMETRY A_T IN K⁰-K⁰ MIXING

VALUE (units 10 ⁻³)	EVTS	DOCUMENT ID	TECN
6.6 ± 1.3 ± 1.0	640k	¹ ANGELOPOULOS... 98E	CPLR

¹ ANGELOPOULOS 98E measures the asymmetry $A_T = [\Gamma(\bar{K}^0_{t=0} \rightarrow e^+\pi^-\nu_{t=\tau}) - \Gamma(K^0_{t=0} \rightarrow e^-\pi^+\bar{\nu}_{t=\tau})] / [\Gamma(\bar{K}^0_{t=0} \rightarrow e^+\pi^-\nu_{t=\tau}) + \Gamma(K^0_{t=0} \rightarrow e^-\pi^+\bar{\nu}_{t=\tau})]$ as a function of the neutral-kaon eigentime τ . The initial strangeness of the neutral kaon is tagged by the charge of the accompanying charged kaon in the reactions $p\bar{p} \rightarrow K^-\pi^+K^0$ and $p\bar{p} \rightarrow K^+\pi^-K^0$. The strangeness at the time of the decay is tagged by the lepton charge. The reported result is the average value of A_T over the interval $1\tau_S < \tau < 20\tau_S$. From this value of A_T ANGELOPOULOS 01B, assuming CP T invariance in the $e\pi\nu$ decay amplitude, determine the T -violating as $\Delta S = \Delta S$ conserving parameter (for its definition, see Review below) $4\text{Re}(\epsilon) = (6.2 \pm 1.4 \pm 1.0) \times 10^{-3}$.

See the related review(s):

[CPT Invariance Tests in Neutral Kaon Decay](#)

CP-VIOLATION PARAMETERS

Re(ε)

VALUE (units 10 ⁻³)	DOCUMENT ID	TECN
1.596 ± 0.013	¹ AMBROSINO 06H	KLOE
• • • We do not use the following data for averages, fits, limits, etc. • • •		
1.664 ± 0.010	² LAI 05A	NA48

¹ AMBROSINO 06H uses Bell-Steinberger relations with the following measurements: $B(K_L^0 \rightarrow \pi^+\pi^-)$ in AMBROSINO 06F, $B(K_S^0 \rightarrow \pi^0\pi^0\pi^0)$ in AMBROSINO 05B, the K_S^0 -semileptonic charge asymmetry in AMBROSINO 06E, and K^0 -semileptonic results in ANGELOPOULOS 98F.

² LAI 05A values are obtained through unitarity (Bell-Steinberger relations), improving determination of η_{000} and combining other data from PDG 04 and APOSTOLAKIS 99B.

CPT-VIOLATION PARAMETERS

In K^0 - \bar{K}^0 mixing, if CP -violating interactions include a T conserving part then

$$|K_S\rangle = [|K_1\rangle + (\epsilon + \delta)|K_2\rangle] / \sqrt{1 + |\epsilon + \delta|^2}$$

$$|K_L\rangle = [|K_2\rangle + (\epsilon - \delta)|K_1\rangle] / \sqrt{1 + |\epsilon - \delta|^2}$$

where

$$|K_1\rangle = [|K^0\rangle + |\bar{K}^0\rangle] / \sqrt{2}$$

$$|K_2\rangle = [|K^0\rangle - |\bar{K}^0\rangle] / \sqrt{2}$$

and

$$|\bar{K}^0\rangle = CP|K^0\rangle.$$

The parameter δ specifies the CP -violating part.

Estimates of δ are given below assuming the validity of the $\Delta S = \Delta Q$ rule. See also THOMSON 95 for a test of CP -symmetry conservation in K^0 decays using the Bell-Steinberger relation.

REAL PART OF δ

A nonzero value violates CP T invariance.

- ¹ The two ABOUZAID 11 values use the same full KTeV dataset from 1996, 1997, and 1999. The first enters the "assuming CP^T " fit and the second enters the "not assuming CP^T " fit.
- ² ABOUZAID 11 fit has Δm , τ_S , ϕ_e , $\text{Re}(\epsilon'/\epsilon)$, and $\text{Im}(\epsilon'/\epsilon)$ as free parameters. See $\text{Im}(\epsilon'/\epsilon)$ in the " K_L^0 CP violation" section for correlation information.
- ³ ABOUZAID 11 fit has Δm and τ_S free but constrains ϕ_e to the Superweak value, i.e. assumes CP^T . This τ_S value is correlated with their $\Delta m = m_{K_L^0} - m_{K_S^0}$ measurement in the K_L^0 listings. The correlation coefficient $\rho(\tau_S, \Delta m) = -0.670$.
- ⁴ Fit to the proper time distribution.
- ⁵ This ALAVI-HARATI 03 fit has Δm and τ_S free but constrains ϕ_{+-} to the Superweak value, i.e. assumes CPT . This τ_S value is correlated with their $\Delta m = m_{K_L^0} - m_{K_S^0}$ measurement in the K_L^0 listings. The correlation coefficient $\rho(\tau_S, \Delta m) = -0.396$. Superseded by ABOUZAID 11.
- ⁶ This ALAVI-HARATI 03 fit has Δm , ϕ_{+-} , and τ_{K_S} free. See ϕ_{+-} in the " K_L CP violation" section for correlation information. Superseded by ABOUZAID 11.
- ⁷ ARONSON 82 find that K_S^0 mean life may depend on the kaon energy.
- ⁸ CARITHERS 75 measures the Δm dependence of the total decay rate (inverse mean life) to be $\Gamma(K_S^0) = [(1.122 \pm 0.004) + 0.16(\Delta m - 0.5348)/\Delta m] 10^{10} \text{ s}^{-1}$, or, in terms of mean life, CARITHERS 75 measures $\tau_S = (0.8913 \pm 0.0032) - 0.238 [\Delta m - 0.5348] (10^{-10} \text{ s})$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{ s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- ⁹ HILL 68 has been changed by the authors from the published value (0.865 ± 0.009) because of a correction in the shift due to η_{+-} . SKJEGGESTAD 72 and HILL 68 give detailed discussions of systematics encountered in this type of experiment.
- ¹⁰ Pre-1971 experiments are excluded from the average because of disagreement with later more precise experiments.

[a] See the Particle Listings below for the energy limits used in this measurement.

[b] Most of this radiative mode, the low-momentum γ part, is also included in the parent mode listed without γ 's.

[c] The value is for the sum of the charge states or particle/antiparticle states indicated.

[d] Not a measurement. Calculated as $0.666 \cdot B(\pi^\pm e^\mp \nu_e)$.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 5 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 0.1$ for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

4.1 \pm 2.5	0.5	4 ADLER 96e	CPLR	Sup. by ADLER 97b
3.9 \pm 5.4	0.9	5 THOMSON 94	E621	Sup. by ZOU 96

1 BATLEY 05 is obtained by measuring the interference parameters in $K_S, K_L \rightarrow \pi^+ \pi^- \pi^0$. $\text{Re}(\lambda) = 0.038 \pm 0.008 \pm 0.006$ and $\text{Im}(\lambda) = -0.013 \pm 0.005 \pm 0.004$; the correlation coeff. between $\text{Re}(\lambda)$ and $\text{Im}(\lambda)$ is 0.66 (statistical only).

2 ADLER 97b find the CP-conserving parameters $\text{Re}(\lambda) = (28 \pm 7 \pm 3) \times 10^{-3}$, $\text{Im}(\lambda) = (-10 \pm 8 \pm 2) \times 10^{-3}$. They estimate $B(K_S^0 \rightarrow \pi^+ \pi^- \pi^0)$ from $\text{Re}(\lambda)$ and the K_L^0 decay parameters. See also ANGELOPOULOS 98c.

3 ZOU 96 is from the the measured quantities $|\rho_{+-0}| = 0.039 \pm_{-0.006}^{+0.009} \pm 0.005$ and $\phi_\rho = (-9 \pm 18)^\circ$.

4 ADLER 96e is from the measured quantities $\text{Re}(\lambda) = 0.036 \pm 0.010 \pm_{-0.005}^{+0.002}$ and $\text{Im}(\lambda)$ consistent with zero. Note that the quantity λ is the same as ρ_{+-0} used in other footnotes.

5 THOMSON 94 calculates this branching ratio from their measurements $|\rho_{+-0}| = 0.035 \pm_{-0.011}^{+0.019} \pm 0.004$ and $\phi_\rho = (-59 \pm 48)^\circ$ where $|\rho_{+-0}| e^{i\phi_\rho} = A(K_S^0 \rightarrow \pi^+ \pi^- \pi^0, I=2) / A(K_L^0 \rightarrow \pi^+ \pi^- \pi^0)$.

7.04 ± 0.08 OUR AVERAGE					
$7.046 \pm 0.18 \pm 0.16$			¹ BATLEY	07D NA48	$K^0(\overline{K}^0)(t) \rightarrow \pi e \nu$
$6.91 \pm 0.34 \pm 0.15$	624		² ALOISIO	02 KLOE	Tagged K_S^0 using $\phi \rightarrow K_L^0 K_S^0$
7.05 ± 0.09	13k		³ AMBROSINO	06E KLOE	Not fitted
7.2 ± 1.4	75		AKHMETSHIN	99 CMD2	Tagged K_S^0 using $\phi \rightarrow K_L^0 K_S^0$

¹ Reconstructed from $K^0(\overline{K}^0)(t) \rightarrow \pi e \nu$ distributions using PDG values of $B(K_L^0 \rightarrow \pi e \nu) = 0.4053 \pm 0.0015$, $\tau_L = (5.114 \pm 0.021) \times 10^{-8}$ s and $\tau_S = (0.8958 \pm 0.0005) \times 10^{-10}$ s.
² Uses the PDG 00 value for $B(K_S^0 \rightarrow \pi^+ \pi^-)$.
³ Obtained by imposing $\sum_i B(K_S^0 \rightarrow i) = 1$, where i runs over all the four branching ratios $\pi^+ \pi^-$, $\pi^0 \pi^0$, $\pi e \nu$, and $\pi \mu \nu$. Input value of $B(K_S^0 \rightarrow \pi^+ \pi^-) / B(K_S^0 \rightarrow \pi^0 \pi^0)$ from AMBROSINO 06c is used. To derive $\Gamma(K_S^0 \rightarrow \pi^+ \mu \nu) / \Gamma(K_S^0 \rightarrow \pi^+ e \nu)$, lepton universality is assumed, radiative corrections from ANDRE 07 are used, and phase space integrals are taken from KTeV, ALEXOPOULOS 04A. This branching fraction enters our fit via their $\Gamma(\pi^\pm e^\mp \nu_e) / \Gamma(\pi^+ \pi^-)$ branching ratio measurement.

$\Gamma(\pi^\pm \mu^\mp \nu_\mu)/\Gamma_{\text{total}}$					Γ_9/Γ
---	--	--	--	--	-------------------

The PDG 06 value below has not been measured but is computed to be 0.666 times the $K_S \rightarrow \pi^\pm e^\mp \nu_e$ branching fraction. It is included in the fit that constrains the four branching ratios $\pi^+ \pi^-$, $\pi^0 \pi^0$, $\pi e \nu$, and $\pi \mu \nu$ to sum to 1. This treatment, used by AMBROSINO 06E, is preferable to our previous practice of constraining the $\pi^+ \pi^-$ and $\pi^0 \pi^0$ modes to sum to 1. The 0.666 factor is obtained from AMBROSINO 06E and assumes lepton universality, radiative corrections from ANDRE 07, and phase space integrals from KTeV, ALEXOPOULOS 04A.

VALUE (units 10^{-4})	DOCUMENT ID	COMMENT
--------------------------	-------------	---------

4.69 ± 0.06 OUR FIT
 $4.691 \pm 0.001 \pm 0.056$ ¹ PDG 06 calculated from $\pi^\pm e^\mp \nu_e$
¹ The PDG 06 value is computed to be $B_{\text{PDG06}}(\pi \mu \nu) = 0.666 B_{\text{FIT}}(\pi e \nu)$. The first error specifies the arbitrarily small error, 0.001×10^{-4} , on $B_{\text{PDG06}}(\pi \mu \nu)$ for fixed $B_{\text{FIT}}(\pi e \nu)$. The second error is that due to the uncertainty in $B_{\text{FIT}}(\pi e \nu)$.

¹ BABUSCI 13c uses 1.7 fb^{-1} of data of $\phi \rightarrow K_L^0 K_S^0$ decays with K_L^0 interaction in the calorimeter, collected from 2004 to 2005. No candidate events were found in the data with an expected background of $0.04^{+0.15}_{-0.03}$ events. Upper limit is obtained by normalizing to $K_S^0 \rightarrow 2\pi^0$ decays.

² LAI 05A value is obtained from their bound on $|\eta_{000}|$ (not assuming CPT) and $B(K_L^0 \rightarrow 3\pi^0) = 0.211 \pm 0.003$, and PDG 04 values for K_L^0 and K_S^0 lifetimes. If CPT is assumed then $B(K_S^0 \rightarrow 3\pi^0)_{CPT} < 2.3 \times 10^{-7}$ at 90% CL

³ ANGELOPOULOS 98B is from $\text{Im}(\eta_{000}) = -0.05 \pm 0.12 \pm 0.05$, assuming $\text{Re}(\eta_{000}) = \text{Re}(\epsilon) = 1.635 \times 10^{-3}$ and using the value $B(K_L^0 \rightarrow \pi^0 \pi^0 \pi^0) = 0.2112 \pm 0.0027$.

K_S^0 FORM FACTORS

For discussion, see note on $K_{\ell 3}$ form factors in the K^\pm section of the Particle Listings above. Because the semileptonic branching fraction is smaller in K_S^0 than K_L^0 by the ratio of the mean lives, the K_S^0 semileptonic form factor has so far been measured only in the K_{e3} mode using the linear expansion $f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$, which gives the vector form factor $f_+(t)$ relative to its value at $t = 0$.

CP VIOLATION IN $K_S \rightarrow 3\pi$

Written 1996 by T. Nakada (Paul Scherrer Institute) and L. Wolfenstein (Carnegie-Mellon University).

The possible final states for the decay $K^0 \rightarrow \pi^+\pi^-\pi^0$ have isospin $I = 0, 1, 2$, and 3 . The $I = 0$ and $I = 2$ states have $CP = +1$ and K_S can decay into them without violating CP symmetry, but they are expected to be strongly suppressed by centrifugal barrier effects. The $I = 1$ and $I = 3$ states, which have no centrifugal barrier, have $CP = -1$ so that the K_S decay to these requires CP violation.

In order to see CP violation in $K_S \rightarrow \pi^+\pi^-\pi^0$, it is necessary to observe the interference between K_S and K_L decay, which determines the amplitude ratio

$$\eta_{+-0} = \frac{A(K_S \rightarrow \pi^+\pi^-\pi^0)}{A(K_L \rightarrow \pi^+\pi^-\pi^0)} \quad (1)$$

If η_{+-0} is obtained from an integration over the whole Dalitz plot, there is no contribution from the $I = 0$ and $I = 2$ final states and a nonzero value of η_{+-0} is entirely due to CP violation.

Only $I = 1$ and $I = 3$ states, which are $CP = -1$, are allowed for $K^0 \rightarrow \pi^0\pi^0\pi^0$ decays and the decay of K_S into $3\pi^0$ is an unambiguous sign of CP violation. Similarly to η_{+-0} , η_{000} is defined as

$$\eta_{000} = \frac{A(K_S \rightarrow \pi^0\pi^0\pi^0)}{A(K_L \rightarrow \pi^0\pi^0\pi^0)} \quad (2)$$

If one assumes that CPT invariance holds and that there are no transitions to $I = 3$ (or to nonsymmetric $I = 1$ states), it can be shown that

$$\eta_{+-0} = \eta_{000} = \epsilon + i \frac{\text{Im } a_1}{\text{Re } a_1} \quad (3)$$

With the Wu-Yang phase convention, a_1 is the weak decay amplitude for K^0 into $I = 1$ final states; ϵ is determined from CP violation in $K_L \rightarrow 2\pi$ decays. The real parts of η_{+-0} and η_{000} are equal to $\text{Re}(\epsilon)$. Since currently-known upper limits on $|\eta_{+-0}|$ and $|\eta_{000}|$ are much larger than $|\epsilon|$, they can be interpreted as upper limits on $\text{Im}(\eta_{+-0})$ and $\text{Im}(\eta_{000})$ and so as limits on the CP -violating phase of the decay amplitude a_1 .

CP-VIOLATION PARAMETERS IN K_S^0 DECAY

$$A_S = [\Gamma(K_S^0 \rightarrow \pi^- e^+ \nu_e) - \Gamma(K_S^0 \rightarrow \pi^+ e^- \bar{\nu}_e)] / \text{SUM}$$

Such asymmetry violates CP . If CPT is assumed then $A_S = 2 \text{Re}(\epsilon)$.

K_L^0

$$I(J^P) = \frac{1}{2}(0^-)$$

$$m_{K_L^0} - m_{K_S^0}$$

For earlier measurements, beginning with GOOD 61 and FITCH 61, see our 1986 edition, Physics Letters **170B** 132 (1986).

OUR FIT is described in the note on "CP violation in K_L decays" in the K^0 Particle Listings. The result labeled "OUR FIT Assuming CPT" ["OUR FIT Not assuming CPT"] includes all measurements except those with the comment "Not assuming CPT" ["Assuming CPT"]. Measurements with neither comment do not assume CPT and enter both fits.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- 1 The two ABOUZAIID 11 values use the same data. The first enters the "assuming CPT" fit and the second enters the "not assuming CPT" fit.
- 2 ABOUZAIID 11 fit has Δm , τ_S , ϕ_c , $\text{Re}(e'/\epsilon)$, and $\text{Im}(e'/\epsilon)$ as free parameters. See $\text{Im}(e'/\epsilon)$ in the " K_L^0 CP violation" section for correlation information.
- 3 ABOUZAIID 11 fit has Δm and τ_S free but constrains ϕ_c to the Superweak value, i.e. assumes CPT. See " K_S^0 Mean Life" section for correlation information.
- 4 Fits Δm and ϕ_{+-} simultaneously. GIBBONS 93c systematic error is from B. Winstein via private communication. 20-160 GeV K beams.
- 5 GIBBONS 93 value assume $\phi_{+-} = \phi_{00} = \phi_{SW} = (43.7 \pm 0.2)^\circ$, i.e. assumes CPT. 20-160 GeV K beams.
- 6 These two experiments have a common systematic error due to the uncertainty in the momentum scale, as pointed out in WAHL 89.
- 7 GJESDAL 74 uses charge asymmetry in K_{e3}^0 decays.
- 8 ALAVI-HARATI 03 fit Δm and $\tau_{K_S^0}$ simultaneously. ϕ_{+-} is constrained to the Superweak value, i.e. CPT is assumed. See " K_S^0 Mean Life" section for correlation information. Superseded by ABOUZAIID 11.
- 9 ALAVI-HARATI 03 fit Δm , ϕ_{+-} , and $\tau_{K_S^0}$ simultaneously. See ϕ_{+-} in the " K_L CP violation" section for correlation information. Superseded by ABOUZAIID 11.
- 10 ANGELOPOULOS 01 uses strong interactions strangeness tagging at two different times.
- 11 Uses K_{e3}^0 and K_{e3}^0 strangeness tagging at production and decay. Assumes CPT conservation on $\Delta S = -\Delta Q$ transitions.
- 12 ADLER 96c is the result of a fit which includes nearly the same data as entered into the "OUR FIT" value above.
- 13 ARONSON 82 find that Δm may depend on the kaon energy.
- 14 ARONSON 70 and CARNEGIE 71 use K_S^0 mean life = $(0.862 \pm 0.006) \times 10^{-10} \text{ s}$. We have not attempted to adjust these values for the subsequent change in the K_S^0 mean life or in η_{+-} .

K_L^0 MEAN LIFE

VALUE (10^{-8} s)	EVTS	DOCUMENT ID	TECN	COMMENT	
5.116 ± 0.021 OUR FIT	Error includes scale factor of 1.1.				
5.099 ± 0.021 OUR AVERAGE					
5.072 ± 0.011 ± 0.035	13M	1 AMBROSINO 06	KLOE	$\sum_i B_i = 1$	
5.092 ± 0.017 ± 0.025	15M	AMBROSINO 05c	KLOE		
5.154 ± 0.044	0.4M	VOSBURGH 72	CNTR		
• • • We do not use the following data for averages, fits, limits, etc. • • •					
5.15 ± 0.14		DEVLIN 67	CNTR		
1 AMBROSINO 06 uses $\phi \rightarrow K_L K_S$ with K_L tagged by $K_S \rightarrow \pi^+ \pi^-$. The four major K_L BR's are measured, the small remainder ($\pi^+ \pi^-, \pi^0 \pi^0, \gamma \gamma$) is taken from PDG 04. This KLOE K_L lifetime is obtained by imposing $\sum_i B_i = 1$. The correlation matrix among the four measured K_L BR's and this K_L lifetime is					
	K_{e3}	$K_{\mu 3}$	$3\pi^0$	$\pi^+ \pi^- \pi^0$	τ_{K_L}
	K_{e3}	1	-0.25	-0.56	-0.07
	$K_{\mu 3}$	1	-0.43	-0.20	0.33
	$3\pi^0$		1	-0.39	-0.21
	$\pi^+ \pi^- \pi^0$			1	-0.39
	τ_{K_L}				1

These correlations are taken into account in our fit. The average of this KLOE mean life measurement and the independent KLOE measurement in AMBROSINO 05c is $(5.084 \pm 0.023) \times 10^{-8} \text{ s}$.

- [a] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [b] This mode includes gammas from inner bremsstrahlung but not the direct emission mode $K_L^0 \rightarrow \pi^+ \pi^- \gamma$ (DE).
- [c] See the Particle Listings below for the energy limits used in this measurement.
- [d] Most of this radiative mode, the low-momentum γ part, is also included in the parent mode listed without γ 's.
- [e] Allowed by higher-order electroweak interactions.
- [f] Violates CP in leading order. Test of direct CP violation since the indirect CP-violating and CP-conserving contributions are expected to be suppressed.

CONSTRAINED FIT INFORMATION

An overall fit to the mean life and 15 branching ratios uses 27 measurements and one constraint to determine 11 parameters. The overall fit has a $\chi^2 = 37.4$ for 17 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

¹ABOUZAID 07D includes 1997 (ALAVI-HARATI 01E) and 1999 data. It measures the ratio of $B(K_L^0 \rightarrow \pi^0 \gamma e^+ e^-) / B(K_L^0 \rightarrow \pi^0 \pi^0)$, where π_D^0 is the Dalitz decaying π^0 , and uses PDG 06 values $B(K_L^0 \rightarrow \pi^0 \pi^0) = (8.69 \pm 0.04) \times 10^{-4}$, and $B(\pi_D^0 \rightarrow e^+ e^- \gamma) = (1.198 \pm 0.032) \times 10^{-2}$. Supersedes ALAVI-HARATI 01E result.

- Quadratic dependence required by some experiments. (See sections on "QUADRATIC COEFFICIENT h " and "QUADRATIC COEFFICIENT k " below.) Correlations prevent us from averaging results of fits not including $g, h,$ and k terms.
- BISI 74 value comes from quadratic fit with quad. term consistent with zero. g error is thus larger than if linear fit were used.
- BUCHANAN 70 result revised by BUCHANAN 75 to include radiative correlations and to use more reliable K_L^0 momentum spectrum of second experiment (had same beam).

-6.1 ± 0.9 ± 0.5	14.7M	² LAI 01B	NA48
-3.3 ± 1.1 ± 0.7	5M	^{2,3} SOMALWAR 92	E731

- Result obtained using C13pl model of CABIBBO 05 to include $\pi\pi$ rescattering effects. The systematic error includes an external error of 1.06×10^{-3} from the parametrization input of $(a_0 - a_2) m_{\pi^+} = 0.268 \pm 0.017$ from BATLEY 06B.
- LAI 01B and SOMALWAR 92 results do not include $\pi\pi$ final state rescattering effects.
- SOMALWAR 92 chose m_{π^+} as normalization to make it compatible with the Particle Data Group $K_L^0 \rightarrow \pi^+ \pi^- \pi^0$ definitions.

K_L^0 FORM FACTORS

For discussion, see note on form factors in the K^\pm section of the Particle Listings above.

In the form factor comments, the following symbols are used.

f_+ and f_- are form factors for the vector matrix element.

f_S and f_T refer to the scalar and tensor term.

$$f_0(t) = f_+(t) + f_-(t) t / (m_{K^0}^2 - m_{\pi^+}^2).$$

t = momentum transfer to the π .

λ_+ and λ_0 are the linear expansion coefficients of f_+ and f_0 :

$$f_+(t) = f_+(0) (1 + \lambda_+ t / m_{\pi^+}^2)$$

For quadratic expansion

$$f_+(t) = f_+(0) (1 + \lambda'_+ t / m_{\pi^+}^2 + \frac{\lambda''_+}{2} t^2 / m_{\pi^+}^4)$$

as used by KTeV. If there is a non-vanishing quadratic term, then λ_+ represents an average slope, which is then different from λ'_+ .

NA48 (K_{e3}) and ISTRA quadratic expansion coefficients are converted with

$$\lambda'_+ PDG = \lambda_+ NA48 \text{ and } \lambda''_+ PDG = 2 \lambda'_+ NA48$$

$$\lambda'_+ PDG = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+ ISTRA \text{ and}$$

$$\lambda''_+ PDG = 2 (\frac{m_{\pi^+}}{m_{\pi^0}})^4 \lambda'_+ ISTRA$$

ISTRA linear expansion coefficients are converted with

$$\lambda_+ PDG = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_+ ISTRA \text{ and } \lambda_0 PDG = (\frac{m_{\pi^+}}{m_{\pi^0}})^2 \lambda_0 ISTRA$$

The pole parametrization is

$$f_+(t) = f_+(0) (\frac{M_V^2}{M_V^2 - t})$$

$$f_0(t) = f_0(0) (\frac{M_S^2}{M_S^2 - t})$$

where M_V and M_S are the vector and scalar pole masses.

The dispersive parametrization is

$$f_+(t) = f_+(0) \exp[\frac{t}{m_\pi^2} (\Lambda_+ + H(t))];$$

$$f_0(t) = f_0(0) \exp[\frac{t}{m_K^2 - m_\pi^2} (\ln[C] - G(t))],$$

where Λ_+ is the slope parameter and $\ln[C] = \ln[f_0(m_K^2 - m_\pi^2)]$

is the logarithm of the scalar form factor at the Callan-Treiman point.

$H(t)$ and $G(t)$ are dispersive integrals.

The following abbreviations are used:

DP = Dalitz plot analysis.

PI = π spectrum analysis.

MU = μ spectrum analysis.

POL = μ polarization analysis.

BR = $K_{\mu 3}^0 / K_{e 3}^0$ branching ratio analysis.

E = positron or electron spectrum analysis.

RC = radiative corrections.

λ_+ (LINEAR ENERGY DEPENDENCE OF f_+ IN K_{e3}^0 DECAY)

For radiative correction of K_{e3}^0 DP, see GINSBERG 67, BECHERRAWY 70, CIRIGLIANO 02, CIRIGLIANO 04, and ANDRE 07. Results labeled OUR FIT are discussed in the review “ K_{e3}^\pm and K_{e3}^0 Form Factors” in the K^\pm Listings. For earlier, lower statistics results, see the 2004 edition of this review, Physics Letters **B592** 1 (2004).

α_{K^*} DECAY FORM FACTOR FOR $K_L \rightarrow \ell^+ \ell^- \gamma, K_L^0 \rightarrow \ell^+ \ell^- \ell^+ \ell^-$

Average of all α_{K^*} measurements (from each of three datablocks following this one) assuming lepton universality.

VALUE	DOCUMENT ID
-0.205 ± 0.022 OUR AVERAGE	Includes data from the 3 datablocks that follow this one. Error includes scale factor of 1.8. See the ideogram below.

α_{K^*} DECAY FORM FACTOR FOR $K_L \rightarrow \ell^+ \ell^- \gamma, K_L^0 \rightarrow \ell^+ \ell^- \ell^+ \ell^-$

α_{K^*} DECAY FORM FACTOR FOR $K_L \rightarrow e^+ e^- \gamma$

α_{K^*} is the constant in the model of BERGSTROM 83 which measures the relative strength of the vector-vector transition $K_L \rightarrow K^* \gamma$ with $K^* \rightarrow \rho, \omega, \phi \rightarrow \gamma^*$ and the pseudoscalar-pseudoscalar transition $K_L \rightarrow \pi, \eta, \eta' \rightarrow \gamma \gamma^*$.

VALUE	EVTS	DOCUMENT ID	TECN

$\alpha_{K^*}^{\text{eff}}$ DECAY FORM FACTOR FOR $K_L \rightarrow e^+ e^- e^+ e^-$

$\alpha_{K^*}^{\text{eff}}$ is the parameter describing the relative strength of an intermediate pseudoscalar decay amplitude and a vector meson decay amplitude in the model of BERGSTROM 83. It takes into account both the radiative effects and the form factor. Since there are two $e^+ e^-$ pairs here compared with one in $e^+ e^- \gamma$ decays, a factorized expression is used for the $e^+ e^- e^+ e^-$ decay form factor.

See the related review(s):
[CP Violation in \$K_L^0\$ Decays](#)

CP-VIOLATION PARAMETERS IN K_L^0 DECAYS

CHARGE ASYMMETRY IN K_S^0 DECAYS

Such asymmetry violates CP. It is related to $\text{Re}(\epsilon)$.

A_L = weighted average of $A_L(\mu)$ and $A_L(e)$

In previous editions and in the literature the symbol used for this asymmetry was δ_L^{\pm} or δ . We use A_L for consistency with B^0 asymmetry notation and with recent K_S^0 notation.

PARAMETERS FOR $K_L^0 \rightarrow 2\pi$ DECAY

$$\eta_{+-} = A(K_L^0 \rightarrow \pi^+ \pi^-) / A(K_S^0 \rightarrow \pi^+ \pi^-)$$

$$\eta_{00} = A(K_L^0 \rightarrow \pi^0 \pi^0) / A(K_S^0 \rightarrow \pi^0 \pi^0)$$

The fitted values of $|\eta_{+-}|$ and $|\eta_{00}|$ given below are the results of a fit to $|\eta_{+-}|$, $|\eta_{00}|$, $|\eta_{00}/\eta_{+-}|$, and $\text{Re}(\epsilon'/\epsilon)$. Independent information on $|\eta_{+-}|$ and $|\eta_{00}|$ can be obtained from the fitted values of the $K_L^0 \rightarrow \pi\pi$ and $K_S^0 \rightarrow \pi\pi$ branching ratios and the K_L^0 and K_S^0 lifetimes. This information is included as data in the $|\eta_{+-}|$ and $|\eta_{00}|$ sections with a Document ID "BRFIT." See the note "CP violation in K_L decays" above for details.

$|\eta_{00}| = |A(K_L^0 \rightarrow 2\pi^0) / A(K_S^0 \rightarrow 2\pi^0)|$

Meson Particle Listings

K_L^0

- ² These values are derived from $|\eta_{00}/\eta_{+-}|$ measurements. They enter the average in this section but enter the fit via the $|\eta_{00}/\eta_{+-}|$ only.
- ³ This is the combined results from BARR 93D and BURKHARDT 88, taking into account their common systematic uncertainty.
- ⁴ We use ABOUZAID 11 $\text{Re}(\epsilon'/\epsilon)$ value with *CPT* assumption in our fits for $|\eta_{+-}|$, $|\eta_{00}|$, and $\text{Re}(\epsilon'/\epsilon)$.
- ⁵ These values are derived from $|\eta_{00}/\eta_{+-}|$ measurements.

ϕ_{+-} , PHASE OF η_{+-}

The dependence of the phase on Δm and τ_S is given for each experiment in the comments below, where Δm is the $K_L^0 - K_S^0$ mass difference in units $10^{10} \text{h}\bar{s}^{-1}$ and τ_S is the K_S mean life in units 10^{-10}s . We also give the regeneration phase ϕ_f in the comments below.

OUR FIT is described in the note on “CP violation in K_L decays” in the K_L^0 Particle Listings. Most experiments in this section are included in both the “Not Assuming CPT” and “Assuming CPT” fits. In the latter fit, they have little direct influence on ϕ_{+-} because their errors are large compared to that assuming CPT, but they influence Δm and τ_S through their dependencies on these parameters, which are given in the footnotes.

- ¹ APOSTOLAKIS 99c measures $\phi_{+-} = (43.19 \pm 0.53 \pm 0.28) + 300 [\Delta m - 0.5301] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- ² SCHWINGENHEUER 95 measures $\phi_{+-} = (43.53 \pm 0.76) + 173 [\Delta m - 0.5282] - 275 [\tau_S - 0.8926] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- ³ These experiments measure $\phi_{+-} - \phi_f$ and calculate the regeneration phase from the power law momentum dependence of the regeneration amplitude using analyticity and dispersion relations. SCHWINGENHEUER 95 [GIBBONS 93] includes a systematic error of $0.35^\circ [0.5^\circ]$ for uncertainties in their modeling of the regeneration amplitude.
- ⁴ GIBBONS 93 measures $\phi_{+-} = (42.21 \pm 0.9) + 189 [\Delta m - 0.5257] - 460 [\tau_S - 0.8922] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values. This is actually reported in SCHWINGENHEUER 95, footnote 8. GIBBONS 93 reports $\phi_{+-} (42.2 \pm 1.4)^\circ$. They measure $\phi_{+-} - \phi_f$ and calculate the regeneration phase ϕ_f from the power law momentum dependence of the regeneration amplitude using analyticity. An error of 0.6° is included for possible uncertainties in the regeneration phase.
- ⁵ CAROSI 90 measures $\phi_{+-} = (46.9 \pm 1.4 \pm 0.7) + 579 [\Delta m - 0.5351] + 303 [\tau_S - 0.8922] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

- ⁶ GEWENIGER 74B measures $\phi_{+-} = (49.4 \pm 1.0) + 565 [\Delta m - 0.540] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- ⁷ Not independent of other phase parameters reported in ABOUZAID 11.
- ⁸ ALAVI-HARATI 03 ϕ_{+-} is correlated with their $\Delta m = m_{K_L^0} - m_{K_S^0}$ and τ_{K_S} measurements in the K_L^0 and K_S^0 sections respectively. The correlation coefficients are $\rho(\phi_{+-}, \Delta m) = +0.955$, $\rho(\phi_{+-}, \tau_S) = -0.871$, and $\rho(\tau_S, \Delta m) = -0.840$. CPT is not assumed. Uses scintillator Pb regenerator. Superseded by ABOUZAID 11.
- ⁹ ADLER 96C measures $\phi_{+-} = (43.82 \pm 0.41) + 339 [\Delta m - 0.5307] - 252 [\tau_S - 0.8922] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- ¹⁰ ADLER 96C is the result of a fit which includes nearly the same data as entered into the “OUR FIT” value in the 1996 edition of this Review (Physical Review **D54** 1 (1996)).
- ¹¹ ADLER 95B measures $\phi_{+-} = (42.7 \pm 0.9 \pm 0.6) + 316 [\Delta m - 0.5274] + 30 [\tau_S - 0.8926] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- ¹² ADLER 92B quote separately two systematic errors: ± 0.4 from their experiment and ± 1.0 degrees due to the uncertainty in the value of Δm .
- ¹³ KARLSSON 90 systematic error does not include regeneration phase uncertainty.
- ¹⁴ CARITHERS 75 measures $\phi_{+-} = (45.5 \pm 2.8) + 224 [\Delta m - 0.5348] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values. $\phi_f = -40.9 \pm 2.6^\circ$.

ϕ_{00} , PHASE OF η_{00}

See comment in ϕ_{+-} header above for treatment of Δm and τ_S dependence, as well as for the inclusion of data in both the “Assuming CPT” and “Not Assuming CPT” fits.

OUR FIT is described in the note on “CP violation in K_L decays” in the K_L^0 Particle Listings.

VALUE (°)	DOCUMENT ID	TECN	COMMENT
43.52 ± 0.05 OUR FIT			Error includes scale factor of 1.3. Assuming CPT
43.7 ± 0.6 OUR FIT			Error includes scale factor of 1.2. Not assuming CPT
44.5 ± 2.3 ± 0.5	¹ CAROSI 90	NA31

41.7 ± 5.9 ± 0.2	³ ANGELOPO... 98	CPLR	
50.8 ± 7.1 ± 1.7	⁴ ADLER 96B	CPLR	Sup. by ANGELOPOULOS 98
47.4 ± 1.4 ± 0.9	⁵ KARLSSON 90	E731	
¹ CAROSI 90 measures $\phi_{00} = (47.1 \pm 2.1 \pm 1.0) + 579 [\Delta m - 0.5351] + 252 [\tau_S - 0.8922] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.			
² Not independent of other phase parameters reported in ABOUZAID 11.			
³ ANGELOPOULOS 98 measures $\phi_{00} = (42.0 \pm 5.6 \pm 1.9) + 240 [\Delta m - 0.5307] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$. Our first error is their experiment's error and our second error is the systematic error from using our best values. The τ_S dependence is negligible.			
⁴ ADLER 96B identified initial neutral kaon individually as being a K^0 or a \bar{K}^0 . The systematic uncertainty is $\pm 1.5^\circ$ combined in quadrature with $\pm 0.8^\circ$ due to Δm .			
⁵ KARLSSON 90 systematic error does not include regeneration phase uncertainty.			

$\phi_\epsilon = (2\phi_{+-} + \phi_{00})/3$

This expression is a very good approximation, good to about 10^{-3} degrees because of the small measured values of $\phi_{00} - \phi_{+-}$ and $\text{Re}(\epsilon'/\epsilon)$, and small theoretical ambiguities.

VALUE (°)	DOCUMENT ID	TECN	COMMENT
43.52 ± 0.05 OUR FIT			Error includes scale factor of 1.2. Assuming CPT
43.5 ± 0.5 OUR FIT			Error includes scale factor of 1.3. Not assuming CPT
43.5164 ± 0.0002 ± 0.0518	¹ SUPERWEAK 16		Assuming CPT
43.86 ± 0.63	² ABOUZAID 11	KTEV	Not assuming CPT
¹ SUPERWEAK 16 is a fake measurement used to impose the CPT or Superweak constraint $\phi_{+-} = \phi_{\text{SW}} = \tan^{-1} [2 \frac{\Delta m}{\tau_L - \tau_S} (\frac{\tau_S \tau_L}{\tau_L - \tau_S})]$. This “measurement” is linearized using values near the PDG 04 edition values of Δm , τ_S and τ_L , and then adjusted to our current values as described in the following “measurement”. SUPERWEAK 16 measures $\phi_\epsilon = (43.50258 \pm 0.00021) + 54.1 [\Delta m - 0.5289] + 32.0 [\tau_S - 0.89564] (^\circ)$. We have adjusted the measurement to use our best values of $(\Delta m = 0.5293 \pm 0.0009) (10^{10} \text{h}\bar{s}^{-1})$, $(\tau_S = 0.8954 \pm 0.0004) (10^{-10} \text{s})$. Our first error is their experiment's error and our second error is the systematic error from using our best values.			
² ABOUZAID 11 uses the full KTeV dataset collected in 1996, 1997, and 1999. See $\text{Im}(\epsilon'/\epsilon)$ section for correlation information.			

$\text{Im}(\epsilon'/\epsilon) = -(\phi_{00} - \phi_{+-})/3$

For small $|\epsilon'/\epsilon|$, $\text{Im}(\epsilon'/\epsilon)$ is related to the phases of η_{00} and η_{+-} by the above expression.

VALUE (°)	DOCUMENT ID	TECN	COMMENT
-0.002 ± 0.005 OUR FIT			Error includes scale factor of 1.7. Assuming CPT
-0.11 ± 0.11 OUR FIT			Not assuming CPT
-0.0985 ± 0.1157	¹ ABOUZAID 11	KTEV	Not assuming CPT
¹ ABOUZAID 11 uses the full KTeV dataset collected in 1996, 1997, and 1999. The fit has Δm , τ_S , ϕ_ϵ , $\text{Re}(\epsilon'/\epsilon)$, and $\text{Im}(\epsilon'/\epsilon)$ as free parameters. The reported value of $\text{Im}(\epsilon'/\epsilon) = (-17.20 \pm 20.20) \times 10^{-4}$ rad. The correlation coefficients are $\rho(\phi_\epsilon, \Delta m) = 0.828$, $\rho(\phi_\epsilon, \tau_S) = -0.765$, $\rho(\Delta m, \tau_S) = -0.858$, $\rho(\text{Im}(\epsilon'/\epsilon), \phi_\epsilon) = -0.041$, $\rho(\text{Im}(\epsilon'/\epsilon), \Delta m) = 0.026$, $\rho(\text{Im}(\epsilon'/\epsilon), \tau_S) = -0.010$.

- 1 Extracted from Forward Dispersion Relations using sequences of Pade approximants .
- 2 Extracted from Breit-Wigner parameters.
- 3 Fit to scattering phase shifts using UChPT amplitudes with explicit resonances.
- 4 Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06c, AITALA 06, and LINK 09 using an s-dependent width with couplings to $K\pi$ and $K\eta'$, and the Adler zero near thresholds.
- 5 From a complex pole included in the fit. Using parameters from the model that fits data best.
- 6 Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06c using for the κ an s-dependent width with an Adler zero near threshold.
- 7 Using Roy-Steiner equations (ROY 71) consistent with unitarity, analyticity and crossing symmetry constraints.
- 8 From UChPT fitted to MERCER 71, BINGHAM 72 and ESTABROOKS 78. Amplitude shown to be consistent with data of ABLIKIM 06c.
- 9 Reanalysis of ASTON 88 data.
- 10 Reanalysis of data from LINGLIN 73, ESTABROOKS 78, and ASTON 88 using the Inverse Amplitude Method.
- 11 Reanalysis of ASTON 88 using interfering Breit-Wigner amplitudes. Extracted from Breit-Wigner parameters.
- 12 Unitarized Quark Model.

905^{+65}_{-30}		9 ISHIDA 97B	RVUE	11 $K^- \rho \rightarrow K^- \pi^+ n$

- 1 The Breit-Wigner parameters from a fit with seven intermediate resonances. The S-matrix pole position is $(764 \pm 63^{+71}_{-54}) - i (306 \pm 149^{+143}_{-85})$ MeV.
- 2 From a fit including ten additional resonances and energy-independent Breit-Wigner width.
- 3 A fit in the $K_0^{*0}(700) + K^*(892) + K^*(1410)$ model with mass and width of the $K_0^{*0}(700)$ from ABLIKIM 06c well describes the left slope of the $K_S^0 \pi^-$ invariant mass spectrum in $\tau^- \rightarrow K_S^0 \pi^- \nu_\tau$ decay studied by EPIFANOV 07. Averaged value from different parameterizations.

- 4 Not seen by KOPP 01 using 7070 events of $D^0 \rightarrow K^- \pi^+ \pi^0$. LINK 02e and LINK 05i show clear evidence for a constant non-resonant scalar amplitude rather than $K_0^{*0}(700)$ in their high statistics analysis of $D^+ \rightarrow K^- \pi^+ \mu^+ \nu_\mu$.
- 5 AUBERT 07r does not find evidence for the charged $K_0^{*0}(700)$ using 11k events of $D^0 \rightarrow K^- K^+ \pi^0$.
- 6 Using parameters from the model that fits data best.
- 7 A Breit-Wigner mass and width.
- 8 Breit-Wigner parameters. A significant S-wave can be also modeled as a non-resonant contribution.
- 9 Reanalysis of ASTON 88 using interfering Breit-Wigner amplitudes.

- Mass errors enlarged by us to Γ/\sqrt{N} . See note.
- Number of events in peak reevaluated by us.
- From a Dalitz plot analysis in an isobar model with charged and neutral $K^*(892)$ masses and widths floating.
- This value comes from a fit with χ^2 of 178/117.
- Systematic uncertainties not estimated.

WEIGHTED AVERAGE
895.55 ± 0.20 (Error scaled by 1.7)

$K^*(892)$ MASSES AND MASS DIFFERENCES

Unrealistically small errors have been reported by some experiments. We use simple “realistic” tests for the minimum errors on the determination of a mass and width from a sample of N events:

$$\delta_{\min}(m) = \frac{\Gamma}{\sqrt{N}}, \quad \delta_{\min}(\Gamma) = 4 \frac{\Gamma}{\sqrt{N}}. \quad (1)$$

We consistently increase unrealistic errors before averaging. For a detailed discussion, see the 1971 edition of this Note.

K*(892)

m_{K*(892)^0} - m_{K*(892)^±}

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes data for AGUILAR... and BARASH.

1 Number of events in peak reevaluated by us.

K*(892) RANGE PARAMETER

All from partial wave amplitude analyses.

Table with columns: VALUE (GeV^-1), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes data for DEL-AMO-SA... and LINK.

• • • We do not use the following data for averages, fits, limits, etc. • • •

1 Taking into account the K*(892)^0, S-wave and P-wave (K*(1410)^0).

2 Fit to K pi mass spectrum includes a non-resonant scalar component.

K*(892) WIDTH

CHARGED ONLY, HADROPRODUCED

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes data for BAUBILLIER, NAPIER, TOAFF, AJINENKO, AGUILAR..., COOPER, PALER, CLARK, CLARK, AGUILAR..., WOJCICKI.

• • • We do not use the following data for averages, fits, limits, etc. • • •

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, CHG, COMMENT. Includes data for ABLIKIM, LEES, AAIJ, ABELE, BIRD, BARTH, CLELAND, CLELAND, CLELAND, DELFOSSE, DELFOSSE.

- 1 Width errors enlarged by us to 4 x Gamma/sqrt(N); see note.
2 Inclusive reaction. Complicated background and phase-space effects.
3 Number of events in peak reevaluated by us.
4 From a Dalitz plot analysis in an isobar model with charged and neutral K*(892) masses and widths floating.
5 Average of fit results with different parametrizations for the K pi S-wave.
6 K-matrix pole.
7 From a partial wave amplitude analysis.

CHARGED ONLY, PRODUCED IN tau LEPTON DECAYS

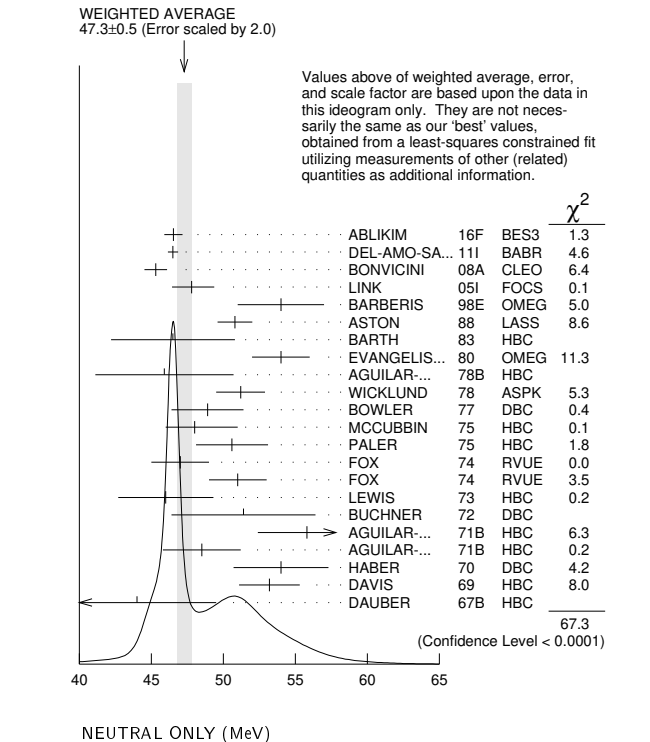

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for EPIFANOV, BOITO, BOITO, JAMIN, BARATE.

- 1 From a fit in the K_0^*(700) + K*(892) + K*(1410) model.
2 From the pole position of the K pi vector form factor using EPIFANOV 07 and constraints from K_1^0 decays in ANTONELLI 10.
3 From the pole position of the K pi vector form factor in the complex s-plane and using EPIFANOV 07 data.
4 Systematic uncertainties not estimated.
5 Reanalysis of EPIFANOV 07 using resonance chiral theory.
6 With mass and width of the K*(1410) fixed at 1412 MeV and 227 MeV, respectively.

NEUTRAL ONLY

Table with columns: VALUE (MeV), EVTS, DOCUMENT ID, TECN, COMMENT. Includes data for ABLIKIM, DEL-AMO-SA..., BONVICINI, LINK, BARBERIS, ASTON, BARTH, EVANGELIS..., AGUILAR..., WICKLUND, BOWLER, MCCUBBIN, PALER, FOX, LEWIS, BUCHNER, AGUILAR..., HABER, DAVIS, DAUBER.

- 1 Taking also into account the K_0^*(1430)^0 and K_2^*(1430)^0.
2 Taking into account the K*(892)^0, S-wave and P-wave (K*(1410)^0).
3 From the isobar model with a complex pole for the xi.
4 Fit to K pi mass spectrum includes a non-resonant scalar component.
5 Inclusive reaction. Complicated background and phase-space effects.
6 Width errors enlarged by us to 4 x Gamma/sqrt(N); see note.
7 Number of events in peak reevaluated by us.
8 From a Dalitz plot analysis in an isobar model with charged and neutral K*(892) masses and widths floating.
9 This value comes from a fit with chi^2 of 178/117.
10 Systematic uncertainties not estimated.

CONSTRAINED FIT INFORMATION

An overall fit to the total width and a partial width uses 13 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 7.8$ for 11 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

D-wave/S-wave RATIO FOR $K_1(1270) \rightarrow K^*(892)\pi$

VALUE	DOCUMENT ID	TECN	COMMENT	
1.0 ± 0.7	¹ DAUM	81c	CNTR	63 $K^- p \rightarrow K^- 2\pi p$

¹ Average from low and high t data.
² Assuming that decays are saturated by the $K\rho, K_0^*(1430)\pi, K^*(892)\pi, K\omega$ decay modes and neglecting interference between them. The values $B(\omega \rightarrow \pi^+\pi^-) = (1.53^{+0.11}_{-0.13})\%$ and $B(K_0^*(1430) \rightarrow K\pi) = (93 \pm 10)\%$ are used. Systematic uncertainties not estimated.

~1450.0	MARTIN	78	SPEC	10	$K^\pm p \rightarrow K_S^0 \pi p$

- Using both $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+\pi^-\pi^0$. From a likelihood scan in the presence of several interfering scalar-meson resonances with fixed width $\Gamma(K_0^*(1430)) = 210$ MeV.
- S-matrix pole. Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06c, AITALA 06, and LINK 09 using an s-dependent width with couplings to $K\pi$ and $K\eta'$, and the Adler zero near thresholds.
- From the isobar model with a complex pole for the κ .
- From a non-parametric analysis.
- A Breit-Wigner mass and width.
- S-matrix pole. Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06c including the κ with an s-dependent width and an Adler zero near threshold.
- S-matrix pole. Using ASTON 88 and assuming $K_0^*(700)$, $K_0^*(1950)$.
- Using ASTON 88 and assuming $K_0^*(700)$.
- T-matrix pole. Reanalysis of ASTON 88 data.
- Breit-Wigner fit. Using ASTON 88.
- Assuming a low-mass scalar $K\pi$ resonance, $\kappa(700)$.
- T-matrix pole. Using data from ESTABROOKS 78 and ASTON 88.
- J^P not determined, could be $K_2^*(1430)$.
- T-matrix pole.
- Uses a model for the background, without this background they get a mass 1340 MeV, where the phase shift passes 90°.
- Mass defined by pole position. From elastic $K\pi$ partial-wave analysis.

200 to 300		¹⁵ ESTABROOKS	78	ASPK $13 K^\pm p \rightarrow K^\pm \pi^\pm (n, \Delta)$

- Using both $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+\pi^-\pi^0$. From a likelihood scan in the presence of several interfering scalar-meson resonances with fixed mass $M(K_0^*(1430)) = 1435$ MeV.
- S-matrix pole. Supersedes BUGG 06. Combined analysis of ASTON 88, ABLIKIM 06c, AITALA 06, and LINK 09 using an s-dependent width with couplings to $K\pi$ and $K\eta'$, and the Adler zero near thresholds.
- From the isobar model with a complex pole for the κ .
- From a non-parametric analysis.
- A Breit-Wigner mass and width.
- S-matrix pole. Reanalysis of ASTON 88, AITALA 02, and ABLIKIM 06c including the κ with an s-dependent width and an Adler zero near threshold.
- S-matrix pole. Using ASTON 88 and assuming $K_0^*(700)$, $K_0^*(1950)$.
- Using ASTON 88 and assuming $K_0^*(700)$.
- T-matrix pole. Reanalysis of ASTON 88 data.
- Breit-Wigner fit. Using ASTON 88.
- Assuming a low-mass scalar $K\pi$ resonance, $\kappa(700)$.
- T-matrix pole. Using data from ESTABROOKS 78 and ASTON 88.
- J^P not determined, could be $K_2^*(1430)$.
- T-matrix pole.
- From elastic $K\pi$ partial-wave analysis.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 10 branching ratios uses 32 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 21.1$ for 25 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 4 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 2.9$ for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

x_2	-36
x_3	-39 -72

1 From energy-independent partial-wave analysis.
 2 From a fit to Y_6^2 moment. $J^P = 3^-$ found.
 3 Confirmed by phase shift analysis of ESTABROOKS 78, yields $J^P = 3^-$.
 4 From a partial wave amplitude analysis.
 5 From a fit to the Y_6^0 moment.

CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 4 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 0.0$ for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$K(3100)$

$I^G(J^PC) = ?^?(?^{??})$

OMITTED FROM SUMMARY TABLE

Narrow peak observed in several ($\Lambda \bar{p}$ + pions) and ($\bar{\Lambda} p$ + pions) states in Σ^- Be reactions by BOURQUIN 86 and in $n p$ and $n A$ reactions by ALEEV 93. Not seen by BOEHNLEIN 91. If due to strong decays, this state has exotic quantum numbers ($B=0, Q=+1, S=-1$ for $\Lambda \bar{p} \pi^+ \pi^+$ and $I \geq 3/2$ for $\Lambda \bar{p} \pi^-$). Needs confirmation.

¹BARLAG 90c estimates the systematic error to be negligible.

D^+ DECAY MODES

Most decay modes (other than the semileptonic modes) that involve a neutral K meson are now given as K_S^0 modes, not as \bar{K}^0 modes. Nearly always it is a K_S^0 that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K_S^0) = \Gamma(\bar{K}^0)$.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level
------	--------------------------------	-----------------------------------

Inclusive modes

Γ_1	e^+ semileptonic	(16.07 ± 0.30) %

Γ_{110}	$K^+ \bar{K}^*(892)^0$, $\bar{K}^*(892)^0 \rightarrow K^- \pi^+$	$(2.49 \pm_{-0.13}^{+0.08}) \times 10^{-3}$		Γ_{161}	$K^*(892)^- 2\mu^+$	L $< 8.5 \times 10^{-4}$	CL=90%
Γ_{111}	$K^+ \bar{K}_0^*(1430)^0$, $\bar{K}_0^*(1430)^0 \rightarrow K^- \pi^+$	$(1.82 \pm 0.35) \times 10^{-3}$		Γ_{162}	Unaccounted decay modes	$(63.3 \pm 0.4) \%$	S=1.3
Γ_{112}	$K^+ \bar{K}_2^*(1430)^0$, $\bar{K}_2^* \rightarrow K^- \pi^+$	$(1.6 \pm_{-0.8}^{+1.2}) \times 10^{-4}$		[a] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.			
Γ_{113}	$K^+ \bar{K}_0^*(700)$, $\bar{K}_0^* \rightarrow K^- \pi^+$	$(6.8 \pm_{-2.1}^{+3.5}) \times 10^{-4}$		[b] These subfractions of the $K^- 2\pi^+$ mode are uncertain: see the Particle Listings.			
Γ_{114}	$a_0(1450)^0 \pi^+$, $a_0^0 \rightarrow K^+ K^-$	$(4.5 \pm_{-1.8}^{+7.0}) \times 10^{-4}$		[c] Submodes of the $D^+ \rightarrow K^- 2\pi^+ \pi^0$ and $K_S^0 2\pi^+ \pi^-$ were studied by ANJOS 92C and COFFMAN 92B, but with at most 142 events for the first mode and 229 for the second – not enough for precise results. With nothing new for 18 years, we refer to our 2008 edition, Physics Letters B667 1 (2008), for those results.			
Γ_{115}	$\phi(1680) \pi^+$, $\phi \rightarrow K^+ K^-$	$(4.9 \pm_{-1.9}^{+4.0}) \times 10^{-5}$		[d] The unseen decay modes of the resonances are included.			
Γ_{116}	$K_S^0 K_S^0 \pi^+$	$(2.70 \pm 0.13) \times 10^{-3}$		[e] This is <i>not</i> a test for the $\Delta C=1$ weak neutral current, but leads to the $\pi^+ \ell^+ \ell^-$ final state.			
				[f] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.

$0.8323 \pm 0.0150 \pm 0.0008$	³ LINK	07B	FOCS	See LINK 09
--------------------------------	-------------------	-----	------	-------------

¹ This LINK 09 model-independent partial-wave analysis of the $K^- \pi^+$ S-wave slices the $K^- \pi^+$ mass range into 39 bins.
² The BONVICINI 08A QMIPWA (quasi-model-independent partial-wave analysis) of the $K^- \pi^+$ S-wave amplitude slices the $K^- \pi^+$ mass range into 26 bins but keeps the Breit-Wigner $\bar{K}_0^*(1430)^0$.
³ This LINK 07B fit uses a K matrix. The $K^- \pi^+$ S-wave fit fraction given above breaks down into (207.3 \pm 25.5 \pm 12.4)% isospin-1/2 and (40.5 \pm 9.6 \pm 3.2)% isospin-3/2 — with large interference between the two. The isospin-1/2 component includes the κ (or $\bar{K}_0^*(700)^0$) and $\bar{K}_0^*(1430)^0$.

$\Gamma(\bar{K}_0^*(700)^0 \pi^+, \bar{K}_0^*(700)^0 \rightarrow K^- \pi^+)/\Gamma(K^- 2\pi^+)$					Γ_{50}/Γ_{48}

D^\pm CP-VIOLATING DECAY-RATE ASYMMETRIES

This is the difference between D^+ and D^- partial widths for the decay to state f , divided by the sum of the widths:
 $A_{CP}(f) = [\Gamma(D^+ \rightarrow f) - \Gamma(D^- \rightarrow \overline{f})] / [\Gamma(D^+ \rightarrow f) + \Gamma(D^- \rightarrow \overline{f})]$.

$A_{CP}(\mu^\pm \nu)$ in $D^+ \rightarrow \mu^+ \nu_\mu$, $D^- \rightarrow \mu^- \overline{\nu}_\mu$

$D^\pm \chi^2$ TESTS OF CP -VIOLATION (CPV)

We list model-independent searches for local CP violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a χ^2 test comparing normalised yields N_i, \bar{N}_i in CP -conjugate bin pairs i : $\chi^2 = \sum_i (N_i - \alpha \bar{N}_i) / \sigma(N_i - \alpha \bar{N}_i)$. The factor $\alpha = (\sum_i N_i) / (\sum_i \bar{N}_i)$ removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured χ^2 or larger under the assumption of CP conservation [AUBERT 08AO, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14C]. Results can be combined using Fisher's method [MOSTELLER 48].

Local CPV in $D^\pm \rightarrow \pi^+ \pi^- \pi^\pm$

p-value (%)	EVTS	DOCUMENT ID	TECN	COMMENT
78.1	3.1M	¹ AAIJ	14C LHCb	χ^2

¹ AAIJ 14C uses binned and unbinned methods, and finds slightly better sensitivity with the former. We took the first value in the table of results for the binned method.

CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

$A_{Tviol}(K_S^0 K^\pm \pi^\pm \pi^\mp)$ in $D^\pm \rightarrow K_S^0 K^\pm \pi^\pm \pi^\mp$

$C_T \equiv \bar{p}_{K^+} \cdot (\bar{p}_{\pi^+} \times \bar{p}_{\pi^-})$ is a parity-odd correlation of the K^+ , π^+ , and π^- momenta for the D^+ . $\bar{C}_T \equiv \bar{p}_{K^-} \cdot (\bar{p}_{\pi^-} \times \bar{p}_{\pi^+})$ is the corresponding quantity for the D^- . Then $A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$, and $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$, and $A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$. C_T and \bar{C}_T are commonly referred to as T-odd moments, because they are odd under T reversal. However, the T-conjugate process $K_S^0 K^\pm \pi^\pm \pi^\mp \rightarrow D^\pm$ is not accessible, while the P-conjugate process is.

1865.30 ± 0.33 ± 0.23	0.1k	ANASHIN 10A	KEDR	e^+e^- at $\psi(3770)$
1864.847 ± 0.150 ± 0.095	0.3k	CAWLFIELD 07	CLEO	$D^0 \rightarrow K_S^0 \phi$

¹ Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration. The largest source of error in the TOMARADZE 14 value is from the uncertainties in the K^- and K_S^0 masses. The systematic error given above is the addition in quadrature of $\pm 0.022 \pm 0.053$ MeV, where the second error is from those mass uncertainties.

² The largest source of error in the LEES 13s value is from the uncertainty of the K^+ mass. The quoted systematic error is in fact $\pm 0.043 + 3 (m_{K^+} - 493.677)$, in MeV.

$m_{D^\pm} - m_{D^0}$

The fit includes $D^\pm, D^0, D_S^\pm, D^{*\pm}, D^{*0}, D_S^{*\pm}, D_1(2420)^0, D_2^*(2460)^0$, and $D_{S1}(2536)^\pm$ mass and mass difference measurements.

$D^0 - \bar{D}^0$ Mixing

$$|m_{D_1^0} - m_{D_2^0}| = x \Gamma$$

The D_1^0 and D_2^0 are the mass eigenstates of the D^0 meson, as described in the note on " $D^0 - \bar{D}^0$ Mixing," above. The experiments usually present $x \equiv \Delta m / \Gamma$. Then $\Delta m = x \Gamma = x \hbar / \tau$.

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group, see the note on " $D^0 - \bar{D}^0$ Mixing."

¹ AAIJ 19x D^0 come from D^{*+} and $\bar{B}^0 \rightarrow D^0 \mu^- X$ decays (and c.c.) in pp collisions at 7 and 8 TeV. Measurement allows for CP violation (none seen).

² The result was established with D^0 from prompt and secondary D^* . Based on 5 fb⁻¹ of data collected at $\sqrt{s} = 7, 8, 13$ TeV. Assumes no CP violation. Reported $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$ and $y' = (5.28 \pm 0.52) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y$.

³ Model-independent measurement of the charm mixing parameters in the decay $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ using 1.0 fb⁻¹ of LHCB data at $\sqrt{s} = 7$ TeV.

⁴ Time-dependent amplitude analysis of $D^0 \rightarrow \pi^+ \pi^- \pi^0$.

⁵ Based on 976 fb⁻¹ of data collected at $Y(nS)$ resonances. Assumes no CP violation. Reported $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$ and $y' = (4.6 \pm 3.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.

⁶ The time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation and is sensitive to the sign of Δm .

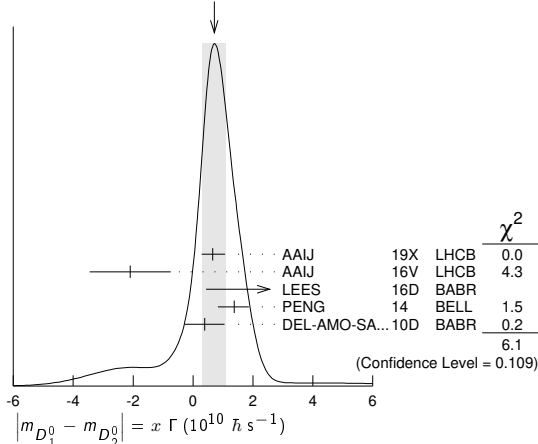

See key on page 999

Meson Particle Listings

D^0

- ⁷ Based on 9.6 fb^{-1} of data collected at the Tevatron. Assumes no CP violation. Reported $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$ and $y' = (4.3 \pm 4.3) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ⁸ DEL-AMO-SANCHEZ 10D uses $540,800 \pm 800 K_S^0 \pi^+ \pi^-$ and $79,900 \pm 300 K_S^0 K^+ K^-$ events in a time-dependent amplitude analysis of the D^0 and \bar{D}^0 Dalitz plots. No evidence was found for CP violation, and the values here assume no such violation.
- ⁹ The result was established with D^0 from prompt and secondary D^* . Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Assumes no CP violation. Reported $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$ and $y' = (5.23 \pm 0.84) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹⁰ Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Assumes no CP violation. Reported $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$ and $y' = (4.8 \pm 1.0) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹¹ Based on 1 fb^{-1} of data collected at $\sqrt{s} = 7 \text{ TeV}$ in 2011. Assumes no CP violation. Reported $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$ and $y' = (7.2 \pm 2.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹² The AUBERT 09AN values are inferred from the branching ratio $\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0) / \Gamma(D^0 \rightarrow K^+ \pi^- \pi^0)$ given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between $D^0 \rightarrow K^+ \pi^- \pi^0$ and $\bar{D}^0 \rightarrow K^+ \pi^- \pi^0$ is assumed to be small. The width difference here is y'' , which is not the same as y_{CP} in the note on D^0 - \bar{D}^0 mixing.
- ¹³ LOWREY 09 uses quantum correlations in $e^+ e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$. See below for coherence factors and average relative strong phases for both $D^0 \rightarrow K^+ \pi^- \pi^0$ and $D^0 \rightarrow K^+ \pi^- 2\pi^+$. A fit that includes external measurements of charm mixing parameters gets $\Delta m = (2.34 \pm 0.61) \times 10^{10} \text{ h s}^{-1}$.
- ¹⁴ The ASNER 05 and ZHANG 07b values are from the time-dependent Dalitz plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation and is sensitive to the sign of Δm .
- ¹⁵ The AUBERT 03Z, LI 05A, and ZHANG 06 limits are inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^-) / \Gamma(K^+ \pi^-)$ (via \bar{D}^0) / $\Gamma(K^+ \pi^-)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from D^0 - \bar{D}^0 mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. AUBERT 03Z assumes the strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ amplitudes is small; if an arbitrary phase is allowed, the limit degrades by 20%. The LI 05A and ZHANG 06 limits are valid for an arbitrary strong phase.
- ¹⁶ This LINK 05H limit is inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^-)$ (via \bar{D}^0) / $\Gamma(K^+ \pi^-)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from D^0 - \bar{D}^0 mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by 25%.
- ¹⁷ This GODANG 00 limit is inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^-)$ (via \bar{D}^0) / $\Gamma(K^+ \pi^-)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from D^0 - \bar{D}^0 mixing. The limit allows interference between the DCS and mixing ratios, and also allows CP violation. The strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ is assumed to be small. If an arbitrary relative strong phase is allowed, the limit degrades by a factor of two.
- ¹⁸ AITALA 98 allows interference between the doubly Cabibbo-suppressed and mixing amplitudes, and also allows CP violation in this term, but assumes that $A_D = A_R = 0$. See the note on " D^0 - \bar{D}^0 Mixing," above.
- ¹⁹ This limit is inferred from R_M for $f = K^+ \pi^-$ and $f = K^+ \pi^- \pi^+ \pi^-$. See the note on " D^0 - \bar{D}^0 Mixing," above. Decay-time information is used to distinguish doubly Cabibbo-suppressed decays from D^0 - \bar{D}^0 mixing.
- ²⁰ This limit is inferred from R_M for $f = K^+ \ell^- \bar{\nu}_\ell$. See the note on " D^0 - \bar{D}^0 Mixing," above.
- ²¹ ANJOS 88c assumes that $y = 0$. See the note on " D^0 - \bar{D}^0 Mixing," above. Without this assumption, the limit degrades by about a factor of two.

WEIGHTED AVERAGE
 0.7 ± 0.4 (Error scaled by 1.4)

$$(\Gamma_{D_1^0} - \Gamma_{D_2^0}) / \Gamma = 2y$$

The D_1^0 and D_2^0 are the mass eigenstates of the D^0 meson, as described in the note on " D^0 - \bar{D}^0 Mixing," above.

Due to the strong phase difference between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$, we exclude from the average those measurements of y' that are inferred from the D^0 - \bar{D}^0 mixing ratio $\Gamma(K^+ \pi^- \text{ via } \bar{D}^0) / \Gamma(K^+ \pi^-)$ given near the end of this D^0 Listings.

Some early results have been omitted. See our 2006 Review (Journal of Physics **G33** 1 (2006)).

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group, see the note on " D^0 - \bar{D}^0 Mixing."

- ¹ Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Measures the lifetime difference between $D^0 \rightarrow K^- K^+$ and $D^0 \rightarrow \pi^- \pi^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = (\Gamma_{CP+} - \Gamma_{CP-}) / (\Gamma_{CP+} + \Gamma_{CP-})$. The D^0 mesons are required to originate from semimuonic decays of B mesons. We list $2y_{CP} = \Delta \Gamma / \Gamma$.
- ² AAIJ 19X D^0 come from D^{*+} and $\bar{B}^0 \rightarrow D^0 \mu^- X$ decays (and c.c.) in pp collisions at 7 and 8 TeV. Measurement allows for CP violation (none seen).
- ³ The result was established with D^0 from prompt and secondary D^* . Based on 5 fb^{-1} of data collected at $\sqrt{s} = 7, 8, 13 \text{ TeV}$. Assumes no CP violation. Reported $x'^2 = (3.9 \pm 2.7) \times 10^{-5}$ and $y' = (5.28 \pm 0.52) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ⁴ Model-independent measurement of the charm mixing parameters in the decay $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ using 1.0 fb^{-1} of LHCb data at $\sqrt{s} = 7 \text{ TeV}$.
- ⁵ Time-dependent amplitude analysis of $D^0 \rightarrow \pi^+ \pi^- \pi^0$.
- ⁶ An improved measurement of $\bar{D}^0 - D^0$ mixing and a search for CP violation in D^0 decays to CP -even final states $K^+ K^-$ and $\pi^+ \pi^-$ using the final Belle data sample of 976 fb^{-1} .
- ⁷ ABLIKIM 15D uses quantum correlations in $e^+ e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$.
- ⁸ Based on 976 fb^{-1} of data collected at $Y(1S)$ resonances. Assumes no CP violation. Reported $x'^2 = (0.09 \pm 0.22) \times 10^{-3}$ and $y' = (4.6 \pm 3.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.

Meson Particle Listings

D^0

- ⁹The time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ is employed. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This value allows CP violation and is sensitive to the sign of Δm .
- ¹⁰Based on 9.6 fb^{-1} of data collected at the Tevatron. Assumes no CP violation. Reported $x'^2 = (0.08 \pm 0.18) \times 10^{-3}$ and $y' = (4.3 \pm 4.3) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹¹Obtained $y_{CP} = (0.72 \pm 0.18 \pm 0.12)\%$ based on three effective D^0 lifetimes measured in $K^+ \pi^-$, $K^- K^+$, and $\pi^- \pi^+$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- ¹²Compared the lifetimes of D^0 decay to the CP eigenstate $K^+ K^-$ with D^0 decay to $\pi^+ \pi^-$. The values here assume no CP violation.
- ¹³DEL-AMO-SANCHEZ 10b uses $540,800 \pm 800 K_S^0 \pi^+ \pi^-$ and $79,900 \pm 300 K_S^0 K^+ K^-$ events in a time-dependent amplitude analyses of the D^0 and \bar{D}^0 Dalitz plots. No evidence was found for CP violation, and the values here assume no such violation.
- ¹⁴ZUPANC 09 uses a method based on measuring the mean decay time of $D^0 \rightarrow K_S^0 K^+ K^-$ events for different $K^+ K^-$ mass intervals.
- ¹⁵LINK 00, AITALA 99E, and ABE 02i measure the lifetime difference between $D^0 \rightarrow K^- K^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)] / [\Gamma(CP+) + \Gamma(CP-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- ¹⁶CSORNA 02 measures the lifetime difference between $D^0 \rightarrow K^- K^+$ and $\pi^- \pi^+$ (CP even) decays and $D^0 \rightarrow K^- \pi^+$ (CP mixed) decays, or $y_{CP} = [\Gamma(CP+) - \Gamma(CP-)] / [\Gamma(CP+) + \Gamma(CP-)]$. We list $2y_{CP} = \Delta\Gamma/\Gamma$.
- ¹⁷The result was established with D^0 from prompt and secondary D^* . Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Assumes no CP violation. Reported $x'^2 = (3.6 \pm 4.3) \times 10^{-5}$ and $y' = (5.23 \pm 0.84) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹⁸Based on 3 fb^{-1} of data collected at $\sqrt{s} = 7, 8 \text{ TeV}$. Assumes no CP violation. Reported $x'^2 = (5.5 \pm 4.9) \times 10^{-4}$ and $y' = (4.8 \pm 1.0) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ¹⁹Based on 1 fb^{-1} of data collected at $\sqrt{s} = 7 \text{ TeV}$ in 2011. Assumes no CP violation. Reported $x'^2 = (-0.9 \pm 1.3) \times 10^{-4}$ and $y' = (7.2 \pm 2.4) \times 10^{-3}$, where $x' = x \cos(\delta) + y \sin(\delta)$, $y' = y \cos(\delta) - x \sin(\delta)$ and δ is the strong phase between the $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$.
- ²⁰This combines the $y_{CP} = (\tau_{K\pi} / \tau_{KK}) - 1$ using untagged $K^- \pi^+$ and $K^- K^+$ events of AUBERT 09A1 with the disjoint y_{CP} using tagged $K^- \pi^+$, $K^- K^+$, and $\pi^- \pi^+$ events of AUBERT 08U.
- ²¹The AUBERT 09AN values are inferred from the branching ratio $\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0)$ via $\bar{D}^0 / \Gamma(D^0 \rightarrow K^- \pi^+ \pi^0)$ given near the end of this Listings. Mixing is distinguished from DCS decays using decay-time information. Interference between mixing and DCS is allowed. The phase between $D^0 \rightarrow K^+ \pi^- \pi^0$ and $\bar{D}^0 \rightarrow K^+ \pi^- \pi^0$ is assumed to be small. The width difference here is y'' , which is not the same as y_{CP} in the note on $D^0 - \bar{D}^0$ mixing.
- ²²LOWREY 09 uses quantum correlations in $e^+ e^- \rightarrow D^0 \bar{D}^0$ at the $\psi(3770)$. See below for coherence factors and average relative strong phases for both $D^0 \rightarrow K^- \pi^+ \pi^0$ and $D^0 \rightarrow K^- \pi^- 2\pi^+$. A fit that includes external measurements of charm mixing parameters gets $2y = (1.62 \pm 0.32) \times 10^{-2}$.
- ²³The GODANG 00, AUBERT 03Z, LINK 05H, LI 05A, ZHANG 06, AUBERT 07w, and AALTONEN 08E limits are inferred from the $D^0 - \bar{D}^0$ mixing ratio $\Gamma(K^+ \pi^-)$ (via $\bar{D}^0) / \Gamma(K^- \pi^+)$ given near the end of this D^0 Listings. Decay-time information is used to distinguish DCS decays from $D^0 - \bar{D}^0$ mixing. The limits allow interference between the DCS and mixing ratios, and all except AUBERT 07w and AALTONEN 08E also allow CP violation. The phase between $D^0 \rightarrow K^+ \pi^-$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ is assumed to be small. This is a measurement of y' and is not the same as the y_{CP} of our note above on " $D^0 - \bar{D}^0$ Mixing."
- ²⁴This value combines the results of AUBERT 08U and AUBERT 03P.
- ²⁵STARIC 07 compares the lifetimes of D^0 decay to the CP eigenstates $K^+ K^-$ and $\pi^+ \pi^-$ with D^0 decay to $K^- \pi^+$.
- ²⁶The ASNER 05 and ZHANG 07B values are from the time-dependent Dalitz-plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$. Decay-time information and interference on the Dalitz plot are used to distinguish doubly Cabibbo-suppressed decays from mixing and to measure the relative phase between $D^0 \rightarrow K^{*+} \pi^-$ and $\bar{D}^0 \rightarrow K^{*+} \pi^-$. This limit allows CP violation.
- ²⁷The ranges of AUBERT 03Z, LINK 05H, LI 05A, and ZHANG 06 measurements are for 95% confidence level.
- ²⁸AUBERT 03P measures $Y \equiv 2\tau^0 / (\tau^+ + \tau^-) - 1$, where τ^0 is the $D^0 \rightarrow K^- \pi^+$ (and $\bar{D}^0 \rightarrow K^+ \pi^-$) lifetime, and τ^+ and τ^- are the D^0 and \bar{D}^0 lifetimes to CP -even states (here $K^- K^+$ and $\pi^- \pi^+$). In the limit of CP conservation, $Y = Y \equiv \Delta\Gamma / 2\Gamma$ (we list $2y = \Delta\Gamma/\Gamma$). AUBERT 03P also uses $\tau^+ - \tau^-$ to get $\Delta Y = -0.008 \pm 0.006 \pm 0.002$.

$|q/p|$

The mass eigenstates D_1^0 and D_2^0 are related to the $C = \pm 1$ states by $|D_{1,2}^0\rangle = p|D^0\rangle + q|\bar{D}^0\rangle$. See the note on " $D^0 - \bar{D}^0$ Mixing" above.

"OUR EVALUATION" comes from CPV allowing averages provided by the Heavy Flavor Averaging Group. This would include as-yet-unpublished results, see the note on " $D^0 - \bar{D}^0$ Mixing."

- 1 Measured using $D^0 \rightarrow K^+ K^-$ decays, combines measurements with D^0 either from partially reconstructed semileptonic B hadron decays or from $D^{*+} \rightarrow D^0 \pi^+$.
- 2 Measured using $D^0 \rightarrow \pi^+ \pi^-$ decays, combines measurements with D^0 either from partially reconstructed semileptonic B hadron decays or from $D^{*+} \rightarrow D^0 \pi^+$.
- 3 An improved measurement of $\bar{D}^0 - D^0$ mixing and a search for CP violation in D^0 decays to CP -even final states $K^+ K^-$ and $\pi^+ \pi^-$ using the final Belle data sample of 976 fb^{-1} .
- 4 Combined result from $D^0 \rightarrow K^+ K^-$ and $D^0 \rightarrow \pi^+ \pi^-$, with D^0 from $D^{*+} \rightarrow D^0 \pi^+$ (and cc).
- 5 Measured using $D^{*+} \rightarrow D^0 \pi^+$, $D^0 \rightarrow K^+ K^-$ decays (and cc).
- 6 Measured using $D^{*+} \rightarrow D^0 \pi^+$, $D^0 \rightarrow \pi^+ \pi^-$ decays (and cc).
- 7 Measured using $D^0 \rightarrow K^+ K^-$ decays, with D^0 from partially reconstructed semileptonic B hadron decays.
- 8 Measured using $D^0 \rightarrow \pi^+ \pi^-$ decays, with D^0 from partially reconstructed semileptonic B hadron decays.

$\phi_{K_S^0 \pi^+ \pi^-}$

Parametrizes CP violation in the interference between D^0 mixing and decay. The mass eigenstates D_1^0 and D_2^0 are related to the $C = \pm 1$ states by $|D_{1,2}^0\rangle = p|D^0\rangle + q|\bar{D}^0\rangle$. In the absence of CP violation in the decay, and using the usual phase convention where CP conservation implies q/p is real, $\phi_{K_S^0 \pi^+ \pi^-}$ is identical to the decay-mode-independent parameter $\phi = \arg(q/p)$.

- ¹ Uses quantum correlations in $e^+e^- \rightarrow D^0\bar{D}^0$ at the $\psi(3770)$ to measure the asymmetry of the branching fraction of $D^0 \rightarrow K^-\pi^+$ in CP -odd and CP -even eigenstates to be $(12.7 \pm 1.3 \pm 0.7)\%$. A fit that includes external measurements of charm mixing parameters finds the value quoted above.
- ² Uses quantum correlations in $e^+e^- \rightarrow D^0\bar{D}^0$ at the $\psi(3770)$, where decay rates of CP -tagged $K\pi$ final states depend on the strong phases between the decays of $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^+\pi^-$. The measurements obtained $\sin(\delta) = -0.01 \pm 0.41 \pm 0.04$ and $|\delta| = (10^{+28+13}_{-53-00})^\circ$ as well. A fit that includes external measurements of charm mixing parameters finds $\cos(\delta) = 1.15^{+0.19+0.00}_{-0.17-0.08}$, $\sin(\delta) = 0.56^{+0.32+0.21}_{-0.31-0.20}$, and $|\delta| = (18^{+11}_{-17})^\circ$.
- ³ ASNER 08 uses quantum correlations in $e^+e^- \rightarrow D^0\bar{D}^0$ at the $\psi(3770)$, where decay rates of CP -tagged $K\pi$ final states depend on $\cos \delta$ because of interfering amplitudes. The above measurement implies $|\delta| < 75^\circ$ with a confidence level of 95%. A fit that includes external measurements of charm mixing parameters finds $\cos \delta = 1.10 \pm 0.35 \pm 0.07$. See also the note on " $D^0-\bar{D}^0$ Mixing" p. 783 in our 2008 Review (PDG 08).

$D^0 \rightarrow K^-\pi^+\pi^0$ COHERENCE FACTOR $R_{K\pi\pi^0}$

See the note on ' $D^0-\bar{D}^0$ Mixing' for the definition. $R_{K\pi\pi^0}$ can have any value between 0 and 1. A value near 1 indicates the decay is dominated by a few intermediate states with limited interference.

D^0 DECAY MODES

Most decay modes (other than the semileptonic modes) that involve a neutral K meson are now given as K_S^0 modes, not as \bar{K}^0 modes. Nearly always it is a K_S^0 that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K_S^0) = \Gamma(\bar{K}^0)$.

4.3 ± 1.0	130	¹⁰ PERUZZI	77 LGW	e^+e^- 3.77 GeV

¹ ABLIKIM 18w measured the combined $K^{\mp} \pi^{\pm}$ branching fraction to be 3.898%. We have subtracted off the doubly Cabibbo-suppressed branching fraction $B(D^0 \rightarrow K^+ \pi^-) = (1.50 \pm 0.07) \times 10^{-4}$, even though it is less than one-third of the uncertainty of the combined measurement, in order to treat this as a measurement of $B(D^0 \rightarrow K^- \pi^+)$.
² This combines the CLEO results of ARTUSO 98, COAN 98, and AKERIB 93.
³ ABACHI 88, DECAMP 91J, AKERIB 93, ALBRECHT 94f, and BARATE 97c use $D^*(2010)^+ \rightarrow D^0 \pi^+$ decays. The π^+ is both slow and of low p_T with respect to the event thrust axis or nearest jet ($\approx D^{*+}$ direction). The excess number of such π^+ 's over background gives the number of $D^*(2010)^+ \rightarrow D^0 \pi^+$ events, and the fraction with $D^0 \rightarrow K^- \pi^+$ gives the $D^0 \rightarrow K^- \pi^+$ branching fraction.
⁴ DOBBS 07 and HE 05 use single- and double-tagged events in an overall fit. DOBBS 07 supersedes HE 05.
⁵ ARTUSO 98, following ALBRECHT 94, uses D^0 mesons from $\bar{B}^0 \rightarrow D^*(2010)^+ X \ell^- \bar{\nu}_\ell$ decays. Our average uses the CLEO average of this value with the values of COAN 98 and AKERIB 93.
⁶ COAN 98 assumes that $\Gamma(B \rightarrow \bar{D} X \ell^+ \nu)/\Gamma(B \rightarrow X \ell^+ \nu) = 1.0 - 3|V_{ub}/V_{cb}|^2 - 0.010 \pm 0.005$, the last term accounting for $\bar{B} \rightarrow D_s^+ K X \ell^- \bar{\nu}$. COAN 98 is included in the CLEO average in ARTUSO 98.
⁷ ALBRECHT 94 uses D^0 mesons from $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}_\ell$ decays. This is a different set of events than used by ALBRECHT 94f.
⁸ This AKERIB 93 value includes radiative corrections; without them, the value is $0.0391 \pm 0.0008 \pm 0.0017$. AKERIB 93 is included in the CLEO average in ARTUSO 98.
⁹ SCHINDLER 81 (MARK-2) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.24 ± 0.02 nb. We use the MARK-3 (ADLER 88c) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.
¹⁰ PERUZZI 77 (MARK-1) measures $\sigma(e^+e^- \rightarrow \psi(3770)) \times$ branching fraction to be 0.25 ± 0.05 nb. We use the MARK-3 (ADLER 88c) value of $\sigma = 5.8 \pm 0.5 \pm 0.6$ nb.

-----------	---------------------	-----	------	---------------------------

¹BARLAG 92c computes the branching fraction using topological normalization.

$\Gamma(K_S^0 \pi^+ \pi^- \pi^0) / \Gamma(K_S^0 \pi^+ \pi^-)$ $\Gamma_{81} / \Gamma_{38}$

Branching fractions for submodes of this mode with narrow resonances (the η, ω, η') are fairly well determined (see below). COFFMAN 92B gives fractions of K* and ρ submodes, but with only 140 ± 28 events above background could not determine them with much accuracy. We omit those measurements here; they are in our 2008 Review (Physics Letters **B667** 1 (2008)).

0.53 ± 0.11 ± 0.23	76k	¹ AAIJ 16N	LHCB	Dalitz plot fit
¹ AAIJ 16N gives results for two S-wave parameterisations. We take the values from the model with LASS parametrization, and the difference as a systematic uncertainty.				

$\Gamma(K^+ K^- \pi^0) / \Gamma(K^- \pi^+ \pi^0)$ Γ₂₀₈/Γ₅₃

VALUE (units 10 ⁻²)	EVTS	DOCUMENT ID	TECN	COMMENT
2.37 ± 0.03 ± 0.04	11k ± 122	AUBERT,B	06x BABR	$e^+ e^- \approx \Upsilon(4S)$
• • • We do not use the following data for averages, fits, limits, etc. • • •				
0.95 ± 0.26	151	ASNER	96b CLE2	$e^+ e^- \approx \Upsilon(4S)$

$\Gamma(K^*(892)^+ K^-, K^*(892)^+ \rightarrow K^+ \pi^0) / \Gamma(K^+ K^- \pi^0)$ Γ₂₀₉/Γ₂₀₈

This is the "fit fraction" from the Dalitz-plot analysis with interference.

VALUE (units 10 ⁻²)	DOCUMENT ID	TECN	COMMENT
44.4 ± 0.8 ± 0.6	AUBERT 07T	BABR	Dalitz fit II, 11k evts
• • • We do not use the following data for averages, fits, limits, etc. • • •			
46.1 ± 3.1	¹ CAWLFIELD 06A	CLEO	Dalitz fit, 627 ± 30 evts
¹ The error on this CAWLFIELD 06A result is statistical only.			

$\Gamma(K^*(892)^- K^+, K^*(892)^- \rightarrow K^- \pi^0) / \Gamma(K^+ K^- \pi^0)$ Γ₂₁₀/Γ₂₀₈

This is the "fit fraction" from the Dalitz-plot analysis with interference.

VALUE (units 10 ⁻²)	DOCUMENT ID	TECN	COMMENT
15.9 ± 0.7 ± 0.6	AUBERT 07T	BABR	Dalitz fit II, 11k evts
• • • We do not use the following data for averages, fits, limits, etc. • • •			
12.3 ± 2.2	¹ CAWLFIELD 06A	CLEO	Dalitz fit, 627 ± 30 evts
¹ The error on this CAWLFIELD 06A result is statistical only.			

$\Gamma((K^+ \pi^0)_{S\text{-wave}} K^-) / \Gamma(K^+ K^- \pi^0)$ Γ₂₁₁/Γ₂₀₈

This is the "fit fraction" from the Dalitz-plot analysis with interference.

VALUE (units 10 ⁻²)	DOCUMENT ID	TECN	COMMENT
71.1 ± 3.7 ± 1.9	¹ AUBERT 07T	BABR	Dalitz fit II, 11k evts
¹ The only major difference between fits I and II in the AUBERT 07T analysis is in this mode, where the fit-I fraction is (16.3 ± 3.4 ± 2.1)%.			

$\Gamma((K^- \pi^0)_{S\text{-wave}} K^+) / \Gamma(K^+ K^- \pi^0)$ Γ₂₁₂/Γ₂₀₈

This is the "fit fraction" from the Dalitz-plot analysis with interference.

VALUE (units 10 ⁻²)	DOCUMENT ID	TECN	COMMENT
3.9 ± 0.9 ± 1.0	AUBERT 07T	BABR	Dalitz fit II, 11k evts

$\Gamma(f_0(980) \pi^0, f_0 \rightarrow K^+ K^-) / \Gamma(K^+ K^- \pi^0)$ Γ₂₁₃/Γ₂₀₈

This is the "fit fraction" from the Dalitz-plot analysis with interference.

VALUE (units 10 ⁻²)	DOCUMENT ID	TECN	COMMENT
10.5 ± 1.1 ± 1.2	¹ AUBERT 07T	BABR	Dalitz fit II, 11k evts
¹ When AUBERT 07T replace the $f_0(980) \pi^0$ mode with $a_0(980) \pi^0$, the fit fraction is a negligibly different (11.0 ± 1.5 ± 1.2)%.			

$\Gamma(\phi \pi^0, \phi \rightarrow K^+ K^-) / \Gamma(K^+ K^- \pi^0)$ Γ₂₁₄/Γ₂₀₈

This is the "fit fraction" from the Dalitz-plot analysis with interference.

VALUE (units 10 ⁻²)	DOCUMENT ID	TECN	COMMENT
19.4 ± 0.6 ± 0.5	AUBERT 07T	BABR	Dalitz fit II, 11k evts
• • • We do not use the following data for averages, fits, limits, etc. • • •			
14.9 ± 1.6	¹ CAWLFIELD 06A	CLEO	Dalitz fit, 627 ± 30 evts
¹ The error on this CAWLFIELD 06A result is statistical only.			

$\Gamma(K^+ K^- \pi^0 \text{ nonresonant}) / \Gamma(K^+ K^- \pi^0)$ Γ₂₁₅/Γ₂₀₈

This is the "fit fraction" from the Dalitz-plot analysis with interference.

VALUE	DOCUMENT ID	TECN	COMMENT
0.360 ± 0.037	¹ CAWLFIELD 06A	CLEO	Dalitz fit, 627 ± 30 evts
¹ The error is statistical only. CAWLFIELD 06A also fits the Dalitz plot replacing this flat nonresonant background with broad S-wave $\kappa^\pm \rightarrow K^\pm \pi^0$ resonances. There is no significant improvement in the fit, and $K^{*+} K^{\mp} \pi^0$ and $\phi \pi^0$ results are not much changed.			

$\Gamma(2K_S^0 \pi^0) / \Gamma_{\text{total}}$ Γ₂₁₆/Γ

$\Gamma(K^+ \pi^-) / \Gamma(K^- \pi^+)$ $\Gamma_{256} / \Gamma_{35}$

This is R , the time-integrated wrong-sign rate compared to the right-sign rate. See the note on " D^0 - \bar{D}^0 Mixing," near the start of the D^0 Listings.

The experiments here use the charge of the pion in $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$ decay to tell whether a D^0 or a \bar{D}^0 was born. The $D^0 \rightarrow K^+ \pi^-$ decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by $D^0 \rightarrow \bar{D}^0$ mixing followed by $\bar{D}^0 \rightarrow K^+ \pi^-$ decay. Some of the experiments can use the decay-time information to disentangle the two mechanisms. Here, we list the experimental branching ratio, which if there is no mixing is the DCS ratio. See the next data block for values of the DCS ratio R_D , and the following data block for limits on the mixing ratio R_M . See the section on CP -violating asymmetries near the end of this D^0 Listing for values of A_D , and the note on " D^0 - \bar{D}^0 Mixing" for limits on x' and y' .

Some early limits have been omitted from this Listing; see our 1998 edition (The European Physical Journal **C3** 1 (1998)) and our 2006 edition (Journal of Physics **G33** 1 (2006)).

- This AUBERT,B 06N result assumes no mixing.

$\Gamma(K^+\pi^-\pi^0 \text{ via } \bar{D}^0)/\Gamma(K^-\pi^+\pi^0)$

Γ_{264}/Γ_{53}

This is R_M in the note on " D^0 - \bar{D}^0 Mixing" near the start of the D^0 Listings. The experiments here (1) use the charge of the pion in $D^*(2010)^\pm \rightarrow (D^0 \text{ or } \bar{D}^0) \pi^\pm$ decay to tell whether a D^0 or a \bar{D}^0 was born; and (2) use the decay-time distribution to disentangle doubly Cabibbo-suppressed decay and mixing. For the limits on $|m_1 - m_2|$ and $(\Gamma_1 - \Gamma_2)/\Gamma$ that come from the best mixing limit, see near the beginning of these D^0 Listings.

VALUE (units 10^{-3})	CL%	DOCUMENT ID	TECN	COMMENT
5.25 $^{+0.25}_{-0.31}$ ± 0.12		AUBERT	09AN BABR	e^+e^- at 10.58 GeV

- This AUBERT,B 06N limit assumes no CP violation. The measured value corresponding to the limit is $(2.3^{+1.8}_{-1.4} \pm 0.4) \times 10^{-4}$. If CP violation is allowed, this becomes $(1.0^{+2.2}_{-0.7} \pm 0.3) \times 10^{-4}$.

$\Gamma(K^+\pi^+2\pi^- \text{ via DCS})/\Gamma(K^-2\pi^+\pi^-)$ Γ_{265}/Γ_{70}

Table with columns: VALUE (units 10^-3), EVTS, DOCUMENT ID, TECN, COMMENT. Includes 'OUR AVERAGE' and data from AAIJ and EVANS.

1 This result uses external input on the mixing parameters x, y. Without this input, the result is (3.215 ± 0.136) × 10^-3.
2 A combined fit with a recent LHCb D^0 D^0 mixing results in AAIJ 16F is also reported to be (3.01 ± 0.07) × 10^-3.

$\Gamma(K^+\pi^+2\pi^-)/\Gamma(K^-2\pi^+\pi^-)$ Γ_{266}/Γ_{70}

The experiments here use the charge of the pion in D*(2010)± → (D^0 or D^0) π± decay to tell whether a D^0 or a D^0 was born. The D^0 → K^+π^-π^+π^- decay can occur directly by doubly Cabibbo-suppressed (DCS) decay, or indirectly by D^0 → D^0 mixing followed by D^0 → K^+π^-π^+π^- decay.

Some early limits have been omitted from this Listing; see our 1998 edition (EPJ C3 1).

Table with columns: VALUE (units 10^-3), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Includes 'OUR AVERAGE' and data from AAIJ, WHITE, DYTMAN, and AITALA.

Table with columns: VALUE (units 10^-3), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Includes data from TIAN, AMMAR, and ANJOS.

1 AAIJ 16F result comes from time-dependent analysis that uses external input on the mixing parameters x, y. Without this input, the result is (3.29 ± 0.08) × 10^-3.
2 AMMAR 91 cannot and DYTMAN 01, TIAN 05 do not distinguish between doubly Cabibbo-suppressed decay and D^0 D^0 mixing.
3 This AITALA 98 result assumes no D^0 D^0 mixing (RM in the note on "D^0 D^0 Mixing"). It becomes -0.0020 ± 0.0117 ± 0.0106 ± 0.0035 when mixing is allowed and decay-time information is used to distinguish doubly Cabibbo-suppressed decays from mixing.
4 ANJOS 88c uses decay-time information to distinguish doubly Cabibbo-suppressed (DCS) decays from D^0 D^0 mixing. However, the result assumes no interference between the DCS and mixing amplitudes (γ = 0 in the note on "D^0 D^0 Mixing" near the start of the D^0 Listings). When interference is allowed, the limit degrades to 0.033.

$\Gamma(K^+\pi^+2\pi^- \text{ via } \bar{D}^0)/\Gamma(K^-2\pi^+\pi^-)$ Γ_{267}/Γ_{70}

This is a D^0 D^0 mixing limit. The experiments here (1) use the charge of the pion in D*(2010)± → (D^0 or D^0) π± decay to tell whether a D^0 or a D^0 was born; and (2) use the decay-time distribution to disentangle doubly Cabibbo-suppressed decay and mixing. For the limits on |m_{D_1^0} - m_{D_2^0}| and (Γ_{D_1^0} - Γ_{D_2^0})/Γ_{D^0} that come from the best mixing limit, see near the beginning of these D^0 Listings.

Table with columns: VALUE (units 10^-5), CL%, DOCUMENT ID, TECN, COMMENT. Includes 'OUR AVERAGE' and data from AAIJ.

1 AAIJ 16F result comes from an unconstrained decay-time dependent fit to the wrong-sign to right-sign decay rates ratio as (x^2 + y^2)/2.
2 ANJOS 88c uses decay-time information to distinguish doubly Cabibbo-suppressed (DCS) decays from D^0 D^0 mixing. However, the result assumes no interference between the DCS and mixing amplitudes (γ = 0 in the note on "D^0 D^0 Mixing" near the start of the D^0 Listings). When interference is allowed, the limit degrades to 0.007.

$\Gamma(K^+\pi^- \text{ or } K^+\pi^+2\pi^- \text{ via } \bar{D}^0)/\Gamma(K^-\pi^+ \text{ or } K^-2\pi^+\pi^-)$ Γ_{268}/Γ_{0}

This is a D^0 D^0 mixing limit. For the limits on |m_{D_1^0} - m_{D_2^0}| and (Γ_{D_1^0} - Γ_{D_2^0})/Γ_{D^0} that come from the best mixing limit, see near the beginning of these D^0 Listings.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data from AITALA and ANJOS.

1 AITALA 98 uses decay-time information to distinguish doubly Cabibbo-suppressed decays from D^0 D^0 mixing. The fit allows interference between the two amplitudes, and also allows CP violation in this term. The central value obtained is 0.0039 ± 0.0036 ± 0.0016 - 0.0032 ± 0.0016. When interference is disallowed, the result becomes 0.0021 ± 0.0009 ± 0.0002.
2 This combines results of ANJOS 88c on K^+π^- and K^+π^-π^+π^- (via D^0) reported in the data block above (see footnotes there). It assumes no interference.

$\Gamma(\mu^- \text{ anything via } \bar{D}^0)/\Gamma(\mu^+ \text{ anything})$ Γ_{269}/Γ_6

This is a D^0 D^0 mixing limit. See the somewhat better limits above.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes 'OUR AVERAGE' and data from LOUIS.

1 AITALA 98 uses decay-time information to distinguish doubly Cabibbo-suppressed decays from D^0 D^0 mixing. The fit allows interference between the two amplitudes, and also allows CP violation in this term. The central value obtained is 0.0039 ± 0.0036 ± 0.0016 - 0.0032 ± 0.0016. When interference is disallowed, the result becomes 0.0021 ± 0.0009 ± 0.0002.
2 This combines results of ANJOS 88c on K^+π^- and K^+π^-π^+π^- (via D^0) reported in the data block above (see footnotes there). It assumes no interference.

Rare or forbidden modes

$\Gamma(\gamma\gamma)/\Gamma_{total}$ Γ_{270}/Γ

D^0 → γγ is a flavor-changing neutral-current decay, forbidden in the Standard Model at the tree level.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data from NISAR, ABLIKIM, LEES, and COAN.

$\Gamma(e^+e^-)/\Gamma_{total}$ Γ_{271}/Γ

A test for the ΔC = 1 weak neutral current. Allowed by first-order weak interaction combined with electromagnetic interaction.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data from PETRIC, LEES, AUBERT.B, PRIPSTEIN, AITALA, FREYBERGER, ADLER, ALBRECHT, and HAAS.

$\Gamma(\mu^+\mu^-)/\Gamma_{total}$ Γ_{272}/Γ

A test for the ΔC = 1 weak neutral current. Allowed by first-order weak interaction combined with electromagnetic interaction.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data from AAIJ, LEES, AALTONEN, PETRIC, ABT, AUBERT.B, ACOSTA, PRIPSTEIN, AITALA, ADAMOVIICH, ALEXOPOU..., FREYBERGER, ADAMOVIICH, KODAMA, MISHRA, ALBRECHT, LOUIS, and AUBERT.

1 LEES 12q gives a 2-sided range.
2 Here MISHRA 94 uses "the statistical approach advocated by the PDG." For an alternate approach, giving a limit of 9 × 10^-6 at 90% confidence level, see the paper.

$\Gamma(\pi^0 e^+ e^-)/\Gamma_{total}$ Γ_{273}/Γ

A test for the ΔC = 1 weak neutral current. Allowed by higher-order electroweak interactions.

Table with columns: VALUE, CL%, DOCUMENT ID, TECN, COMMENT. Includes data from ABLIKIM and FREYBERGER.

$\Gamma(\pi^0 \mu^+ \mu^-)/\Gamma_{total}$ Γ_{274}/Γ

¹ Based on 3 fb⁻¹ of data collected at $\sqrt{s} = 7, 8$ TeV. Allowing for CP violation, the direct CP-violation in mixing is reported for the $D^0 \rightarrow K^+\pi^-$ and $\bar{D}^0 \rightarrow K^-\pi^+$.

² The CPV is derived from $A_{CP} = (R_D^+ - R_D^-)/(R_D^+ + R_D^-)$.

³ This ZHANG 06 result allows mixing.

⁴ This LINK 05H result assumes no mixing. If mixing is allowed, it becomes $0.13^{+0.33}_{-0.25} \pm 0.10$.

⁵ This AUBERT 03Z limit assumes no mixing. If mixing is allowed, the 95% confidence-level interval is $(-2.8 < A_D < 4.9) \times 10^{-3}$.

⁶ This GODANG 00 result assumes no $D^0\text{-}\bar{D}^0$ mixing and becomes $-0.43 < A_{CP} < +0.34$ at 95% CL. If mixing is allowed $A_{CP} = -0.01 \pm 0.16 \pm 0.01$.

⁷ This LI 05A result allows mixing.

D^0 CP-EVEN FRACTIONS

The CP-even fraction F_{\pm} , defined for self-conjugate final states, like the coherence factor is used for measuring the unitary triangle angle γ in $B \rightarrow DK$ decays. A purely CP-even state has $F_{\pm} = 1$, a CP-odd one has $F_{\pm} = 0$. For details, see NAYAK 15.

D^0 CP-VIOLATING ASYMMETRY DIFFERENCES

$\Delta A_{CP} = A_{CP}(K^+ K^-) - A_{CP}(\pi^+ \pi^-)$

CP violation in these modes can come from the decay amplitudes (direct) and/or from mixing or interference of mixing and decay (indirect). The difference ΔA_{CP} is primarily sensitive to the direct component, and only retains a second-order dependence on the indirect component for measurements where the mean decay time of the $K^+ K^-$ and $\pi^+ \pi^-$ samples are not identical. The results below are averaged assuming the indirect component can be neglected.

D^0 TESTS OF LOCAL CP-VIOLATION (CPV)

We list model-independent searches for local CP violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a χ^2 test comparing normalised yields N_i, \bar{N}_i in CP-conjugate bin pairs i : $\chi^2 = \sum_i (N_i - \alpha \bar{N}_i) / \sigma(N_i - \alpha \bar{N}_i)$. The factor $\alpha = (\sum_i N_i) / (\sum_i \bar{N}_i)$ removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured χ^2 or larger under the assumption of CP conservation [AUBERT 08AO, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14c]. Results can be combined using Fisher's method [MOSTELLER 48].

CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

The CP-sensitive P-odd (T-odd) correlation in D^0, \bar{D}^0 decays. The D^0 and \bar{D}^0 are distinguished by the charge of the parent D^* : $D^{*+} \rightarrow D^0 \pi^+$ and $D^{*-} \rightarrow \bar{D}^0 \pi^-$.

$A_{Tviol}(K^+ K^- \pi^+ \pi^-)$ in $D^0, \bar{D}^0 \rightarrow K^+ K^- \pi^+ \pi^-$

$C_T \equiv \vec{p}_{K^+} \cdot (\vec{p}_{\pi^+} \times \vec{p}_{\pi^-})$ is a parity-odd correlation of the K^+, π^+ , and π^- momenta (evaluated in the D^0 rest frame) for the D^0 . $\bar{C}_T \equiv \vec{p}_{K^-} \cdot (\vec{p}_{\pi^-} \times \vec{p}_{\pi^+})$ is the corresponding quantity for the \bar{D}^0 . Then $A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$, and $\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$, and $A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$. C_T and \bar{C}_T are commonly referred to as T-odd moments, because they are odd under T reversal. However, the T-conjugate process $K^+ K^- \pi^+ \pi^- \rightarrow D^0$ is not accessible, while the P-conjugate process is.

D^0 CPT-VIOLATING DECAY-RATE ASYMMETRIES

$A_{CPT}(K^{\mp} \pi^{\pm})$ in $D^0 \rightarrow K^- \pi^+, \bar{D}^0 \rightarrow K^+ \pi^-$

$A_{CPT}(t)$ is defined in terms of the time-dependent decay probabilities $P(D^0 \rightarrow K^- \pi^+)$ and $P(\bar{D}^0 \rightarrow K^+ \pi^-)$ by $A_{CPT}(t) = (P - \bar{P}) / (P + \bar{P})$. For small mixing parameters $x \equiv \Delta m / \Gamma$ and $y \equiv \Delta \Gamma / 2\Gamma$ (as is the case), and times t , $A_{CPT}(t)$ reduces to $[y \operatorname{Re} \xi - x \operatorname{Im} \xi] \Gamma t$, where ξ is the CPT-violating parameter.

The following is actually $y \operatorname{Re} \xi - x \operatorname{Im} \xi$.

$\bar{D}^*(2007)^0$ modes are charge conjugates of modes below.

Mode	Fraction (Γ_i/Γ)
Γ_1 $D^0\pi^0$	(64.7 ± 0.9) %
Γ_2 $D^0\gamma$	(35.3 ± 0.9) %

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 5 measurements and one constraint to determine 2 parameters. The overall fit has a $\chi^2 = 2.5$ for 4 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$D_1(2420)^0$ POLARIZATION AMPLITUDE A_{D_1}

A polarization amplitude A_{D_1} is a parameter that depends on the initial polarization of the D_1 and is sensitive to a possible S-wave contribution to its decay. For D_1 decays the helicity angle, θ_h , distribution varies like $1 + A_{D_1} \cos^2 \theta_h$, where θ_h is the angle in the D^* rest frame between the two pions emitted by the $D_1 \rightarrow D^* \pi$ and the $D^* \rightarrow D \pi$.

Unpolarized D_1 decaying purely via D-wave is predicted to give $A_{D_1} = 3$.

 $D(2740)^0$ POLARIZATION AMPLITUDE A_{D_J}

A polarization amplitude A_{D_J} is a parameter that depends on the initial polarization of the D_J . For D_J decays the helicity angle, θ_H , distribution varies like $1 + A_{D_J} \cos^2(\theta_H)$, where θ_H is the angle in the D_J rest frame between the two pions emitted in the $D_J \rightarrow D^* \pi$ and $D^* \rightarrow D \pi$ decays.

Meson Particle Listings

D_s^\pm

CHARMED, STRANGE MESONS ($C = S = \pm 1$)

$$D_s^+ = c\bar{s}, D_s^- = \bar{c}s, \text{ similarly for } D_s^{*\pm}$$

D_s^\pm

$$J(P) = 0(0^-)$$

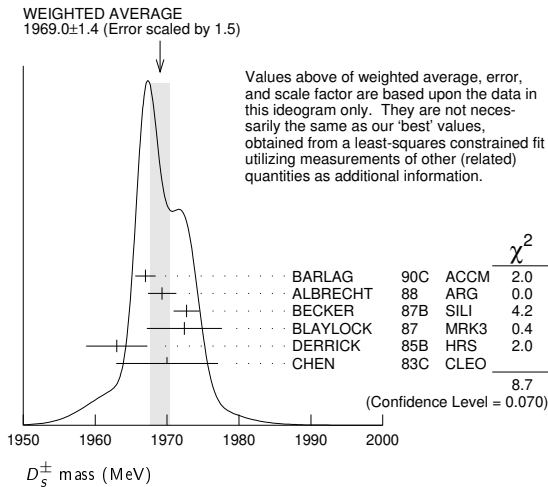

The angular distributions of the decays of the ϕ and $\bar{K}^*(892)^0$ in the $\phi\pi^+$ and $K^+\bar{K}^*(892)^0$ modes strongly indicate that the spin is zero. The parity given is that expected of a $c\bar{s}$ ground state.

D_s^\pm MASS

The fit includes $D_s^\pm, D^0, D_s^{*\pm}, D^{*0}, D_s^{*0}, D_1(2420)^0, D_2^*(2460)^0$, and $D_{s1}(2536)^\pm$ mass and mass difference measurements. Measurements of the D_s^\pm mass with an error greater than 10 MeV are omitted from the fit and average. A number of early measurements have been omitted altogether.
