¹ MITCHELL 09 reports $(1.98 \pm 0.09 \pm 0.30) \times 10^{-2}$ from a measurement of $[\Gamma(J/\psi(1S) \rightarrow \gamma\eta_c(1S))/\Gamma_{total}] \times [B(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-)]$ assuming $B(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) = (35.04 \pm 0.07 \pm 0.77) \times 10^{-2}$, which we rescale to our best value $B(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) = (34.68 \pm 0.30) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
² Calculated by the authors using an average of $B(J/\psi \rightarrow \gamma\eta_c) \times B(\eta_c \rightarrow K\bar{K}\pi)$ from BALTRUSAITIS 86, BISELLO 91, BAI 04 and $B(\eta_c \rightarrow K\bar{K}\pi) = (8.5 \pm 1.8)\%$ from AUBERT 06E.

$2.2 \pm 0.4 \pm 0.4$	264	ABLIKIM	05R BES2	$J/\psi \rightarrow \gamma\pi^+ \pi^- \eta'$

¹ From a fit of the measured $\pi^+ \pi^- \eta'$ lineshape that accounts for the abrupt distortion observed at the $p\bar{p}$ threshold with a Flatté formula in addition to known backgrounds and contributors, as well as an *ad hoc* Breit-Wigner ($M \approx 1919$ MeV; $\Gamma \approx 51$ MeV) that is required for a good fit. Another explanation for the distortion provided by ABLIKIM 16j is that a second resonance near 1870 MeV interferes with the $X(1835)$; fits to this possibility yield product branching fraction values compatible with that shown within the respective systematic uncertainties.

² From a fit of the $\pi^+ \pi^- \eta'$ mass distribution to a combination of $\gamma f_1(1510)$, $\gamma X(1835)$, and two unconfirmed states $\gamma X(2120)$, and $\gamma X(2370)$, for $M(p\bar{p}) < 2.8$ GeV, and accounting for backgrounds from non- η' events and $J/\psi \rightarrow \pi^0 \pi^+ \pi^- \eta'$.

Meson Particle Listings

Branching Ratios of ψ 's and χ 's, $\chi_{c0}(1P)$

the required branching ratios. However, the values are frequently taken from the *Review of Particle Physics* (RPP), which in turn uses the branching ratio reported by the experiment in the following edition, giving rise either to correlations or to plain vicious circles, as discussed in more detail in earlier editions of this review [1,2].

The way to avoid these dependencies and correlations is to extract the branching ratios through a fit that uses the truly measured combinations of branching fractions and partial widths. This fit, in fact, should involve decays from the four concerned particles, $\psi(2S)$, χ_{c0} , χ_{c1} , and χ_{c2} , and occasionally some combinations of branching ratios of more than one of them. This is what is done since the 2002 edition [3].

The PDG policy is to quote the results of the collaborations in a manner as close as possible to what appears in their original publications. However, in order to avoid the problems mentioned above, we had in some cases to work out the values originally measured, using the number of events and detection efficiencies given by the collaborations, or rescaling back the published results. The information was sometimes spread over several articles, and some articles referred to papers still unpublished, which in turn contained the relevant numbers in footnotes.

Even though the experimental collaborations are entitled to extract whatever branching ratios they consider appropriate by using other published results, we would like to encourage them to also quote explicitly in their articles the actual quantities measured, so that they can be used directly in averages and fits of different experimental determinations.

To inform the reader how we computed some of the values used in this edition of RPP, we use footnotes to indicate the branching ratios actually given by the experiments and the quantities they use to derive them from the true combination of branching ratios actually measured.

None of the branching ratios of the $\chi_{c0,1,2}$ are measured independently of the $\psi(2S)$ radiative decays. We tried to identify those branching ratios which can be correlated in a non-trivial way, and although we cannot preclude the existence of other cases, we are confident that the most relevant correlations have already been removed. Nevertheless, correlations in the errors of different quantities measured by the same experiment have not been taken into account.

Fit information

This is an overall fit to 4 total widths, 1 partial width, 26 combinations of partial widths, 24 branching ratios, and 108 combinations of branching ratios. Of the latter 62 involve decays of more than one particle.

The overall fit uses 248 measurements to determine 49 parameters and has a χ^2 of 378.1 for 199 degrees of freedom.

The relatively high χ^2 of the fit, 1.9 per d.o.f., can be traced back to a few specific discrepancies in the data. No scaling factors to fit uncertainties have been applied.

In the listing we provide the inter-particle correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the corresponding parameter x_i .

¹ From a fit of the $\phi\phi$ invariant mass with the width of $\chi_{c0}(1P)$ fixed to the PDG 16 value.
² From a fit of the J/ψ recoil mass spectrum. Supersedes ABE,K 02 and ABE 04G.
³ Using mass of $\psi(2S) = 3686.0$ MeV.
⁴ Recalculated by ANDREOTTI 05A, using the value of $\psi(2S)$ mass from AULCHENKO 03.
⁵ Mass value shifted by us by amount appropriate for $\psi(2S)$ mass = 3686 MeV and $J/\psi(1S)$ mass = 3097 MeV.

CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a $\chi^2 = 378.1$ for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{total}$.

CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a $\chi^2 = 378.1$ for 199 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{total}$.

10.24 ± 0.17 ± 0.23 3.7k 3 ADAM 05A CLEO Repl. by MENDEZ 08

¹ From a fit to the J/ψ recoil mass spectra.

² The value for $B(\psi(2S) \rightarrow \gamma \chi_{c1}) \times B(\chi_{c1} \rightarrow \gamma J/\psi(1S))$ quoted in HIMEL 80 is derived using $B(\psi(2S) \rightarrow J/\psi(1S) \pi^+ \pi^-) = (33 \pm 3)\%$ and $B(J/\psi(1S) \rightarrow \ell^+ \ell^-) = 0.138 \pm 0.018$. Calculated by us using $B(J/\psi(1S) \rightarrow \ell^+ \ell^-) = 0.1181 \pm 0.0020$.

³ Not independent from other values reported by ADAM 05A.

$\Gamma(\chi_{c1}(1P) \rightarrow \bar{K}^0 K^+ \pi^- + \text{c.c.})/\Gamma_{\text{total}} \times \Gamma(\psi(2S) \rightarrow \gamma \chi_{c1}(1P))/\Gamma_{\text{total}}$		$\Gamma_{17}/\Gamma \times \Gamma_{154}^{\psi(2S)}/\Gamma_{11}^{\psi(2S)}$

46 ± 12 ± 7 168 3 ROSNER 05 CLEO $\psi(2S) \rightarrow \pi^0 \eta_c \gamma$

1 Average of DOBBS 08A and ROSNER 05. DOBBS 08A reports $[\Gamma(h_c(1P) \rightarrow \gamma \eta_c(1S))/\Gamma_{total}] \times [B(\psi(2S) \rightarrow \pi^0 h_c(1P))] = (4.16 \pm 0.30 \pm 0.37) \times 10^{-4}$ which we divide by our best value $B(\psi(2S) \rightarrow \pi^0 h_c(1P)) = (8.6 \pm 1.3) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

2 DOBBS 08A reports $[\Gamma(h_c(1P) \rightarrow \gamma \eta_c(1S))/\Gamma_{total}] \times [B(\psi(2S) \rightarrow \pi^0 h_c(1P))] = (4.19 \pm 0.32 \pm 0.45) \times 10^{-4}$ which we divide by our best value $B(\psi(2S) \rightarrow \pi^0 h_c(1P)) = (8.6 \pm 1.3) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

3 ROSNER 05 reports $[\Gamma(h_c(1P) \rightarrow \gamma \eta_c(1S))/\Gamma_{total}] \times [B(\psi(2S) \rightarrow \pi^0 h_c(1P))] = (4.0 \pm 0.8 \pm 0.7) \times 10^{-4}$ which we divide by our best value $B(\psi(2S) \rightarrow \pi^0 h_c(1P)) = (8.6 \pm 1.3) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 25 combinations of partial widths obtained from integrated cross section, and 84 branching ratios uses 248 measurements to determine 49 parameters. The overall fit has a $\chi^2 = 378.1$ for 199 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$.

• • • We do not use the following data for averages, fits, limits, etc. • • •

- AAIJ 17AD report $m_{\psi(2S)} - m_{\eta_c(2S)} = 52.5 \pm 1.7 \pm 0.6$ MeV. We use the current value $m_{\psi(2S)} = 3686.097 \pm 0.025$ MeV to obtain the quoted mass.
- From a fit of the $\phi\phi$ invariant mass with the width of $\eta_c(2S)$ fixed to the PDG 16 value.
- Ignoring possible interference with continuum.
- With a width fixed to 11.3 MeV.
- With a width fixed to 11.3 MeV. Using both $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+\pi^-\pi^0$ decays.
- From a simultaneous fit to $K_S^0 K^\pm \pi^\mp$ and $K^+K^-\pi^0$ decay modes.
- Accounts for interference with non-resonant continuum.
- From a fit of the J/ψ recoil mass spectrum. Supersedes ABE, K 02 and ABE 04c.
- From the fit of the kaon momentum spectrum. Systematic errors not evaluated.
- Superseded by DEL-AMO-SANCHEZ 11M.
- Superseded by VINOKUROVA 11.
- Assuming mass of $\psi(2S) = 3686$ MeV.

1.3 ± 0.6	21	ASNER	04 CLEO	$\gamma\gamma \rightarrow \eta_c \rightarrow K_S^0 K^\pm \pi^\mp$

²⁰ Assuming that the branching fraction into $\eta' \pi^+ \pi^-$ is the same as for $\eta_c(1S)$.
²¹ They measure $\Gamma(\eta_c(2S) \gamma\gamma) B(\eta_c(2S) \rightarrow K \bar{K} \pi) = (0.18 \pm 0.05 \pm 0.02) \Gamma(\eta_c(1S) \gamma\gamma) B(\eta_c(1S) \rightarrow K \bar{K} \pi)$. The value for $\Gamma(\eta_c(2S) \rightarrow \gamma\gamma)$ is derived assuming that the branching fractions for $\eta_c(2S)$ and $\eta_c(1S)$ decays to $K_S K \pi$ are equal and using $\Gamma(\eta_c(1S) \rightarrow \gamma\gamma) = 7.4 \pm 0.4 \pm 2.3$ keV.

3685.98 ± 0.09 ± 0.04		³ ARMSTRONG 93B	E760	$\bar{p}p \rightarrow e^+e^-$
3686.114 ± 0.007 ^{+0.011} _{-0.016}		⁴ ANASHIN 12	KEDR	$e^+e^- \rightarrow$ hadrons
3686.111 ± 0.025 ± 0.009		AULCHENKO 03	KEDR	$e^+e^- \rightarrow$ hadrons
3686.00 ± 0.10	413	⁵ ZHOLENTZ 80	OLYA	e^+e^-

¹ Supersedes AULCHENKO 03 and ANASHIN 12.
² Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).
³ Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the $J/\psi(1S)$ mass from AULCHENKO 03.
⁴ From the scans in 2004 and 2006. ANASHIN 12 reports the value $3686.114 \pm 0.007 \pm 0.011 \pm 0.002$ MeV, where the third uncertainty is due to assumptions on the interference between the resonance and hadronic continuum. We combined the two systematic uncertainties.
⁵ Superseded by ARTAMONOV 00.

¹ From a simultaneous fit to the hadronic and $\mu^+ \mu^-$ cross section, assuming $\Gamma = \Gamma_h + \Gamma_e + \Gamma_\mu + \Gamma_\tau$ and lepton universality. Does not include vacuum polarization correction.
² The initial-state radiation correction reevaluated by ANDREOTTI 07 in its Ref. [4].

$\psi(2S) \Gamma(i)\Gamma(e^+e^-)/\Gamma(\text{total})$

This combination of a partial width with the partial width into e^+e^- and with the total width is obtained from the integrated cross section into channel(i) in the e^+e^- annihilation. We list only data that have not been used to determine the partial width $\Gamma(i)$ or the branching ratio $\Gamma(i)/\Gamma(\text{total})$.

Meson Particle Listings

 $\psi(3770)$ 25.8 ± 1.3 4 SHAMOV 17 RVUE $e^+e^- \rightarrow D\bar{D}$, hadrons¹ Taking into account interference between the resonant and non-resonant $D\bar{D}$ production.² Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = 0^\circ$.³ Interference between the resonant and non-resonant $D\bar{D}$ production not taken into account.⁴ From the joint analysis of the data on the $D\bar{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR. **$\psi(3770)$ DECAY MODES**

In addition to the dominant decay mode to $D\bar{D}$, $\psi(3770)$ was found to decay into the final states containing the J/ψ (BAI 05, ADAM 06). ADAMS 06 and HUANG 06A searched for various decay modes with light hadrons and found a statistically significant signal for the decay to $\phi\eta$ only (ADAMS 06).

CONSTRAINED FIT INFORMATION

An overall fit to the total width, a partial width, and 3 branching ratios uses 23 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 20.1$ for 19 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

1 Solution I of the two solutions.
 2 Taking into account interference between the resonant and non-resonant $D\bar{D}$ production.
 3 Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = 0^\circ$.
 4 Interference between the resonant and non-resonant $D\bar{D}$ production not taken into account.
 5 BESSON 06 (as corrected in BESSON 10) measure $\sigma(e^+e^- \rightarrow \psi(3770) \rightarrow$ hadrons) = $6.36 \pm 0.08 + 0.41 - 0.30$ nb at $\sqrt{s} = 3773 \pm 1$ MeV, and obtain Γ_{ee} from the Born-level cross section calculated using $\psi(3770)$ mass and width from our 2004 edition, PDG 04.
 6 From the joint analysis of the data on the $D\bar{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR.
 7 Solution II of the two solutions.
 8 See also $\Gamma(e^+e^-)/\Gamma_{total}$ below.

1 Neglecting interference.
 2 Obtained by comparing a measurement of the total cross section (corrected in BESSON 10) with that of $D\bar{D}$ reported by CLEO in DOBBS 07.
 3 From the joint analysis of the data on the $D\bar{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR.
 4 Using $\sigma_{obs} = 7.07 \pm 0.58$ nb and neglecting interference.
 5 Not independent of ABLIKIM 08B.
 6 From a measurement of $\sigma(e^+e^- \rightarrow D\bar{D})$ at $\sqrt{s} = 3773$ MeV, using the $\psi(3770)$ resonance parameters measured by ABLIKIM 06L.

$\psi_2(3823)$

$I^G(J^{PC}) = 0^-(2^{--})$
I, J, P need confirmation.

was $\psi(3823)$, $X(3823)$
Seen by BHARDWAJ 13 in $B \rightarrow \chi_{c1} \gamma K$ and ABLIKIM 15S in $e^+ e^- \rightarrow \pi^+ \pi^- \gamma \chi_{c1}$ decays as a narrow peak in the invariant mass distribution of the $\chi_{c1} \gamma$ system. Properties consistent with the $\psi_2(1^3D_2) c\bar{c}$ state.

$\psi_2(3823)$ MASS

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT

$\chi_{c0}(3860) \quad I^G(J^{PC}) = 0^+(0^{++})$

OMITTED FROM SUMMARY TABLE

The assignment $J^P = 0^+$ is preferred over 2^+ by 2.5 sigma.

Observed by CHILIKIN 17 using full amplitude analysis of the process $e^+ e^- \rightarrow J/\psi D\bar{D}$, where $D = D^0, D^+$.

$\chi_{c1}(3872) \quad I^G(J^{PC}) = 0^+(1^{++})$

also known as $X(3872)$

This state shows properties different from a conventional $q\bar{q}$ state. A candidate for an exotic structure. See the review on non- $q\bar{q}$ states.

First observed by CHOI 03 in $B \rightarrow K\pi^+\pi^- J/\psi(1S)$ decays as a narrow peak in the invariant mass distribution of the $\pi^+\pi^- J/\psi(1S)$ final state. Isovector hypothesis excluded by AUBERT 05B and CHOI 11.

AAIJ 13Q perform a full five-dimensional amplitude analysis of the angular correlations between the decay products in $B^+ \rightarrow \chi_{c1}(3872) K^+$ decays, where $\chi_{c1}(3872) \rightarrow J/\psi\pi^+\pi^-$ and $J/\psi \rightarrow \mu^+\mu^-$, which unambiguously gives the $J^{PC} = 1^{++}$ assignment under the assumption that the $\pi^+\pi^-$ and J/ψ are in an S-wave. AAIJ 15AO extend this analysis with more data to limit D-wave contributions to $< 4\%$ at 95% CL.

See the review on "Spectroscopy of Mesons Containing Two Heavy Quarks."

- The mass difference for the $\chi_{c1}(3872)$ produced in B^+ and B^0 decays is $(-0.71 \pm 0.96 \pm 0.19)$ MeV.
- Width consistent with detector resolution.
- A possible equal mixture of two states with a mass difference greater than 3.6 MeV/c² is excluded at 95% CL.
- Calculated from the corresponding $m_{\chi_{c1}(3872)} - m_{J/\psi}$ using $m_{J/\psi} = 3096.916$ MeV.
- Fit with fixed width and including two resonances, X(3915) and X(3960).
- Could be a different state.
- Calculated from the corresponding $m_{\chi_{c1}(3872)} - m_{\psi(2S)}$ using $m_{\psi(2S)} = 3686.093$ MeV. Superseded by AUBERT 08Y.
- Calculated from the corresponding $m_{\chi_{c1}(3872)} - m_{\psi(2S)}$ using $m_{\psi(2S)} = 3685.96$ MeV. Superseded by AUBERT 06.
- Superseded by AALTONEN 09AU.
- Superseded by CHOI 11.
- A lower mass value can be due to an incorrect momentum scale for soft pions.

$Z_c(3900)$

$I^G(J^{PC}) = 1^+(1^+ -)$

was X(3900)

Properties incompatible with a $q\bar{q}$ structure (exotic state). See the review on non- $q\bar{q}$ states.

Charged $Z_c(3900)$ seen as a peak in the invariant mass distribution of the $J/\psi \pi^\pm$ system by BES III (ABLIKIM 13T) in $e^+ e^- \rightarrow \pi^+ \pi^- J/\psi$ at c.m. energy of 4.26 GeV and by radiative return from $e^+ e^-$ collisions at \sqrt{s} from 9.46 to 10.86 GeV at Belle (LIU 13B). Partial wave analysis of ABLIKIM 17J determines $J^P = 1^+$ with more than 7 σ significance. Neutral $Z_c(3900)$ seen in the $J/\psi \pi^0$ invariant mass distribution in $e^+ e^- \rightarrow \pi^0 \pi^0 J/\psi$ at c.m. energies of 4.23, 4.26, and 4.36 GeV by BES III (ABLIKIM 15U) and at 4.17 GeV by XIAO 13A. Peaks in $(D\bar{D}^*)^{0,\pm}$ reported by BES III (ABLIKIM 14A, ABLIKIM 15AB) are assumed to be related.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- 3881.2 ± 4.2 ± 52.7 6k 5 ABLIKIM 17J BES3 ± e⁺e⁻ → π⁺π⁻J/ψ
- ¹ Measured in weak decays of b-flavored hadrons (nonprompt).
- ² The signal of the Z_c(3900) is correlated with a parent J/ψπ⁺π⁻ system in the invariant mass range 4.2–4.7 GeV.
- ³ Neglecting interference between the Z_c(3900) and non-resonant continuum.
- ⁴ For M²(π⁺π⁻) < 0.65 GeV². Obtained by analyzing CLEO-c data but not authored by the CLEO Collaboration.
- ⁵ Pole mass obtained from a fit to a Flatte-like formula.

¹ Measured in prompt hadroproduction.

X(3915) $J^G(J^{PC}) = 0^+(0 \text{ or } 2^{++})$
 was χ_{c0}(3915)
 The experimental analysis prefers J^{PC} = 0⁺⁺. However, a re-analysis presented in ZHOU 15C shows that if helicity-2 dominance assumption is abandoned and a sizable helicity-0 component is allowed, a J^{PC} = 2⁺⁺ assignment is possible.

Meson Particle Listings

$X(4020)^\pm, \psi(4040)$

$X(4020)^\pm$

$$I^G(J^{PC}) = 1^+(?^{?}-)$$

Properties incompatible with a $q\bar{q}$ structure (exotic state). See the review on non- $q\bar{q}$ states.

Charged $X(4020)$ seen by ABLIKIM 13X from $e^+e^- \rightarrow \pi^+\pi^-h_c(1P)$ at c.m. energy from 3.90 to 4.42 GeV as a peak in the invariant mass distribution of the $\pi^\pm h_c(1P)$ system, and by ABLIKIM 14B from $e^+e^- \rightarrow (D^*\bar{D}^*)^\pm\pi^\mp$ events in $(D^*\bar{D}^*)^\pm$ mass. A neutral $X(4020)$ seen by ABLIKIM 14P at three c.m. energies in the same range in $e^+e^- \rightarrow \pi^0\pi^0 h_c(1P)$ as a peak in the larger of the two masses recoiling against a π^0 . ABLIKIM 15AA observes a 5.9σ signal in $(D^*\bar{D}^*)^0$ in $e^+e^- \rightarrow (D^*\bar{D}^*)^0\pi^0$ events using collisions at two c.m. energies. Production rates and mass values support grouping neutral and charged $X(4020)$ together as manifestations of a single $l = 1$ particle.

Meson Particle Listings

$\psi(4040)$

$\psi(4040)$ DECAY MODES

Due to the complexity of the $c\bar{c}$ threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle’s central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

$\psi(4160)$ DECAY MODES

Due to the complexity of the $c\bar{c}$ threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle’s central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

OMITTED FROM SUMMARY TABLE

was $X(4200)^\pm$

This state shows properties different from a conventional $q\bar{q}$ state. A candidate for an exotic structure. See the review on non- $q\bar{q}$ states.

Reported by CHILIKIN 14 in $J/\psi\pi^+$ at a significance of 6.2σ . Assignments of $0^-, 1^-, 2^-$, and 2^+ excluded at $6.1\sigma, 7.4\sigma, 4.4\sigma$, and 7.0σ level, respectively. Needs confirmation.

 $\psi(4230)$

$$I^G(J^{PC}) = 0^-(1^- -)$$

also known as $Y(4230)$; was $X(4230)$

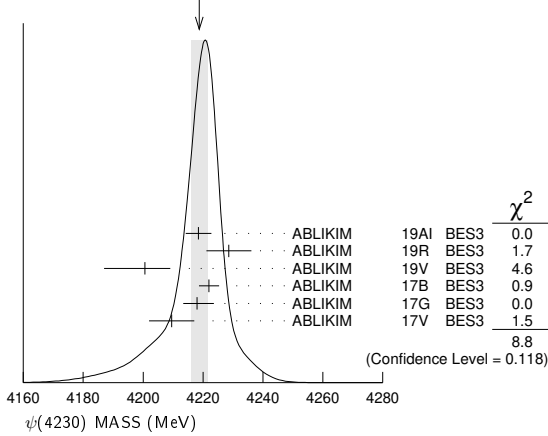

The recent measurement of $e^+e^- \rightarrow J/\psi\pi\pi$ (ABLIKIM 17B) led to a downward shift in the mass of the $\psi(4260)$, also known as $Y(4260)$, such that a distinction between the $\psi(4260)$ and $\psi(4230)$ no longer appears justified. Therefore, starting from this edition, we include the data of ABLIKIM 17B in this node and have listed the $\psi(4230)$ in the summary tables instead of the $\psi(4260)$.

 $\psi(4260)$

$$I^G(J^{PC}) = 0^-(1^{- -})$$

OMITTED FROM SUMMARY TABLE
also known as $Y(4260)$; was $X(4260)$

The state $\psi(4260)$ received its mass label from a Breit-Wigner (BW) fit to the $J/\psi\pi\pi$ data listed below. The symmetric BW placed the mass unavoidably into the center of the distribution. The most recent measurement in the 4260 MeV mass range in the same channel (ABLIKIM 17B), however, revealed that the distribution is asymmetric and that the state has a much lower mass consistent with the entry for particle $\psi(4230)$. Thus, in this edition we merged the measurement of ABLIKIM 17B with the $\psi(4230)$ node and labeled the older measurements of this node as not used. For details see the review on "Spectroscopy of mesons containing two heavy quarks."

$\psi(4390)$

$I^G(J^{PC}) = 0^-(1^{--})$
 I needs confirmation.

OMITTED FROM SUMMARY TABLE
 was X(4390)

This state shows properties different from a conventional $q\bar{q}$ state. A candidate for an exotic structure. See the review on non- $q\bar{q}$ states.

⁸ Systematic uncertainties not estimated.

⁹ From a fit to Crystal Ball (OSTERHELD 86) data.

¹⁰ From a fit to BES (BAI 02c) data.

$\psi(4415)$ DECAY MODES

Due to the complexity of the $c\bar{c}$ threshold region, in this listing, “seen” (“not seen”) means that a cross section for the mode in question has been measured at effective \sqrt{s} near this particle’s central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in \sqrt{s} or absence thereof. See mode listing(s) for details and references.

² From a four-dimensional amplitude analysis. Measured a product of branching fractions $B(B^0 \rightarrow Z_c(4430)^- K^+) \times B(Z_c(4430)^- \rightarrow \psi(2S) \pi^-) = (6.0^{+1.7+2.5}_{-2.0-1.4}) \times 10^{-5}$.
³ AUBERT 09AA quotes $B(B^+ \rightarrow \bar{K}^0 Z_c(4430)^+) \times B(Z_c(4430)^+ \rightarrow \pi^+ \psi(2S)) < 4.7 \times 10^{-5}$ and $B(\bar{B}^0 \rightarrow K^- Z_c(4430)^+) \times B(Z_c(4430)^+ \rightarrow \pi^+ \psi(2S)) < 3.1 \times 10^{-5}$ at 95% CL.
⁴ Measured a product of branching fractions $B(\bar{B}^0 \rightarrow K^- Z_c(4430)^+) \times B(Z_c(4430)^+ \rightarrow \pi^+ \psi(2S)) = (3.2^{+1.8+5.3}_{-0.9-1.6}) \times 10^{-5}$. Superseded by CHILIKIN 13.

$\Gamma(\pi^+ J/\psi) / \Gamma_{total}$ Γ_2 / Γ

VALUE	DOCUMENT ID	TECN	COMMENT
seen	1,2 CHILIKIN 14	BELL	$\bar{B}^0 \rightarrow K^- \pi^+ J/\psi$
not seen	3 AUBERT 09AA	BABR	$B \rightarrow K \pi^+ J/\psi$

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹ CHILIKIN 14 reports $B(\bar{B}^0 \rightarrow Z_c(4430)^+ K^-) \times B(Z_c(4430)^+ \rightarrow J/\psi \pi^+) = (5.4^{+4.0+1.1}_{-1.0-0.9}) \times 10^{-6}$.
² A broad enhancement seen by AAIJ 19R in the decays $B^0 \rightarrow J/\psi \pi^+ K^-$ at 4600 MeV can be due to an interplay of $Z_c(4430), Z_c(4200)$ and the fitting polynomials.
³ AUBERT 09AA quotes $B(B^+ \rightarrow \bar{K}^0 Z_c(4430)^+) \times B(Z_c(4430)^+ \rightarrow \pi^+ J/\psi) < 1.5 \times 10^{-5}$ and $B(\bar{B}^0 \rightarrow K^- Z_c(4430)^+) \times B(Z_c(4430)^+ \rightarrow \pi^+ J/\psi) < 0.4 \times 10^{-5}$ at 95% CL.

$b\bar{b}$ MESONS (including possibly non- $q\bar{q}$ states)

The level scheme of meson states containing a minimal quark content of $b\bar{b}$. The name of a state is determined by its quantum numbers $I^G J^{PC}$ (see the review “Naming Scheme for Hadrons”). States included in the Summary Tables are shown with solid lines; those requiring confirmation are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including $\Upsilon(nS) \rightarrow \gamma\eta_b(mS)$, $\Upsilon(nS) \rightarrow \gamma\chi_{bJ}(mP)$, and $\chi_{bJ}(nP) \rightarrow \gamma\Upsilon(mS)$, are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open bottom mesons is indicated in the figure.

WIDTH DETERMINATIONS OF THE Υ STATES

As is the case for the $J/\psi(1S)$ and $\psi(2S)$, the full widths of the $b\bar{b}$ states $\Upsilon(1S)$, $\Upsilon(2S)$, and $\Upsilon(3S)$ are not directly measurable, since they are much narrower than the energy resolution of the e^+e^- storage rings where these states are produced. The common indirect method to determine Γ starts from

$$\Gamma = \Gamma_{\ell\ell}/B_{\ell\ell}, \quad (1)$$

where $\Gamma_{\ell\ell}$ is one leptonic partial width and $B_{\ell\ell}$ is the corresponding branching fraction ($\ell = e, \mu, \text{ or } \tau$). One then assumes $e-\mu-\tau$ universality and uses

$$\begin{aligned} \Gamma_{\ell\ell} &= \Gamma_{ee} \\ B_{\ell\ell} &= \text{average of } B_{ee}, B_{\mu\mu}, \text{ and } B_{\tau\tau}. \end{aligned} \quad (2)$$

The electronic partial width Γ_{ee} is also not directly measurable at e^+e^- storage rings, only in the combination $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$, where Γ_{had} is the hadronic partial width and

$$\Gamma_{\text{had}} + 3\Gamma_{ee} = \Gamma. \quad (3)$$

This combination is obtained experimentally from the energy-integrated hadronic cross section

$$\begin{aligned} \int_{\text{resonance}} \sigma(e^+e^- \rightarrow \Upsilon \rightarrow \text{hadrons})dE \\ = \frac{6\pi^2 \Gamma_{ee}\Gamma_{\text{had}}}{M^2 \Gamma} C_r = \frac{6\pi^2 \Gamma_{ee}^{(0)}\Gamma_{\text{had}}}{M^2 \Gamma} C_r^{(0)}, \end{aligned} \quad (4)$$

where M is the Υ mass, and C_r and $C_r^{(0)}$ are radiative correction factors. C_r is used for obtaining Γ_{ee} as defined in Eq. (1), and contains corrections from all orders of QED for describing $(b\bar{b}) \rightarrow e^+e^-$. The lowest order QED value $\Gamma_{ee}^{(0)}$, relevant for comparison with potential-model calculations, is defined by the lowest order QED graph (Born term) alone, and is about 7% lower than Γ_{ee} .

The Listings give experimental results on B_{ee} , $B_{\mu\mu}$, $B_{\tau\tau}$, and $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$. The entries of the last quantity have been re-evaluated consistently using the correction procedure of KURAEV 85 [1]. The partial width Γ_{ee} is obtained from the average values for $\Gamma_{ee}\Gamma_{\text{had}}/\Gamma$ and $B_{\ell\ell}$ using

$$\Gamma_{ee} = \frac{\Gamma_{ee}\Gamma_{\text{had}}}{\Gamma(1-3B_{\ell\ell})}. \quad (5)$$

See key on page 999

Meson Particle Listings

Bottomonium, $\eta_b(1S)$

The total width Γ is then obtained from Eq. (1). We do not list Γ_{ee} and Γ values of individual experiments. The Γ_{ee} values in the Meson Summary Table are also those defined in Eq. (1).

• • • We do not use the following data for averages, fits, limits, etc. • • •
¹ With floating width. Not independent of the corresponding mass measurement.
² Assuming $\Gamma_{\eta_b(1S)} = 10$ MeV. Not independent of the corresponding γ energy or mass measurements.
³ Obtained by analyzing CLEO III data but not authored by the CLEO Collaboration.

$\chi_{b0}(1P)$ $I^G(J^{PC}) = 0^+(0^+)$
J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\chi_{b1}(1P)$

$$J^G(JPC) = 0^+(1^{++})$$

J needs confirmation.

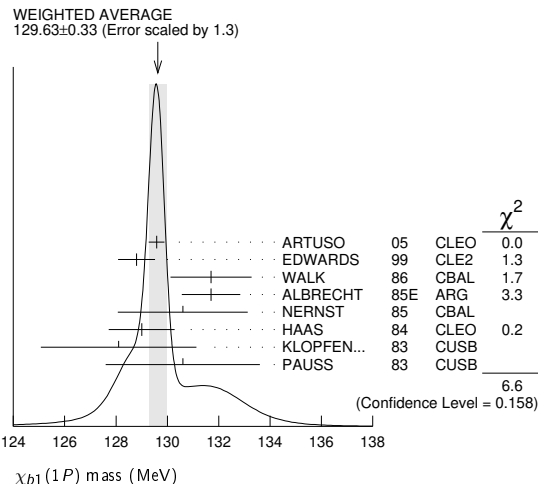

Observed in radiative decay of the $T(2S)$, therefore $C = +$. Branching ratio requires E1 transition. M1 is strongly disfavored, therefore $P = +$. $J = 1$ from SKWARNICKI 87.

$\chi_{b2}(1P)$

$$I^G(J^{PC}) = 0^+(2^{++})$$

J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$. $J = 2$ from SKWARNICKI 87.

CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 13 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 11.8$ for 11 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$$\Upsilon_2(1D) \quad I^G(J^{PC}) = 0^-(2^{--})$$

was $\Upsilon(1D)$
 First observed by BONVICINI 04 in the decay $\gamma\gamma \Upsilon(1S)$ and confirmed by DEL-AMO-SANCHEZ 10R in the decay $\pi^+ \pi^- \Upsilon(1S)$. Data consistent with $J^P = 2^-$. The states with $J = 1$ and 3 also possibly seen, but need confirmation.

$\chi_{b0}(2P)$

$$I^G(J^{PC}) = 0^+(0^{++})$$

J needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\chi_{b1}(2P)$ $J^PC = 0^+(1^+)$
 J needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\chi_{b2}(2P)$

$$J^G(J^{PC}) = 0^+(2^{++})$$

J needs confirmation.

Observed in radiative decay of the $T(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\Upsilon(4S)$ BRANCHING RATIOS

$B\bar{B}$ DECAYS

The ratio of branching fraction to charged and neutral B mesons is often derived assuming isospin invariance in the decays, and relies on the knowledge of the B^+/B^0 lifetime ratio. "OUR EVALUATION" is obtained based on averages of rescaled data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account the common dependence of the measurement on the value of the lifetime ratio.

$Z_b(10610)$

$$I^G(J^{PC}) = 1^+(1^+ -)$$

was $X(10610)$

Properties incompatible with a $q\bar{q}$ structure (exotic state). See the review on non- $q\bar{q}$ states.

Observed by BONDAR 12 in $\Upsilon(5S)$ decays to $\Upsilon(nS)\pi^+\pi^-$ ($n = 1, 2, 3$) and $h_b(mP)\pi^+\pi^-$ ($m = 1, 2$). $J^P = 1^+$ is favored from angular analyses.

Meson Particle Listings

 $Z_b(10650)$ $Z_b(10650)$ was $X(10650)^\pm$

Properties incompatible with a $q\bar{q}$ structure (exotic state). See the review on non- $q\bar{q}$ states.

Observed by BONDAR 12 in $\Upsilon(5S)$ decays to $\Upsilon(nS)\pi^+\pi^-$ ($n = 1, 2, 3$) and $h_b(mP)\pi^+\pi^-$ ($m = 1, 2$). $J^P = 1^+$ is favored from angular analyses.

$$I^G(J^{PC}) = 1^+(1^+-)$$

I, G, C need confirmation.

¹ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 28 energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV, including the initial-state radiation at $\Upsilon(10860)$.
² From a simultaneous fit to the $h_b(nP)\pi^+\pi^-$, $n = 1, 2$ cross sections at 22 energy points within $\sqrt{s} = 10.77\text{--}11.02$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single relative phase, a single relative amplitude, and two overall normalization factors, one for each n). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.
³ From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s} = 10.82\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).
⁴ Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.
⁵ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 25energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relative phase, and three decoherence coefficients, one for each n). Continuum contributions were measured (and therefore fixed) to be zero.
⁶ Superseded by MIZUK 19.
⁷ In a model where a flat non-resonant $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.
⁸ The parameters of the $\Upsilon(11020)$ are fixed to those in AUBERT 09E.
⁹ In a model where a flat nonresonant $\Upsilon(1S, 2S, 3S)\pi^+\pi^-$ continuum interferes with a single Breit-Wigner resonance.
¹⁰ In a model where a non-resonant $b\bar{b}$ -continuum represented by a threshold function at $\sqrt{s} = 2m_B$ is incoherently added to a flat component interfering with two Breit-Wigner resonances. Not independent of other AUBERT 09E results. Systematic uncertainties not estimated.
¹¹ Assuming four Gaussians with radiative tails and a single step in R .
¹² In a coupled-channel model with three resonances and a smooth step in R .

$40.6^{+12.7+1.1}_{-8.0-19.1}$	² MIZUK	16	BELL $e^+e^- \rightarrow h_b(1P, 2P)\pi^+\pi^-$

••• We do not use the following data for averages, fits, limits, etc. •••
¹ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 28 energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV, including the initial-state radiation at $\Upsilon(10860)$.
² From a simultaneous fit to the $h_b(nP)\pi^+\pi^-$, $n = 1, 2$ cross sections at 22 energy points within $\sqrt{s} = 10.77\text{--}11.02$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single relative phase, a single relative amplitude, and two overall normalization factors, one for each n). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.
³ From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s} = 10.82\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).
⁴ Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.
⁵ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 25energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relative phase, and three decoherence coefficients, one for each n). Continuum contributions were measured (and therefore fixed) to be zero.
⁶ Superseded by MIZUK 19.
⁷ In a model where a flat non-resonant $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.
⁸ The parameters of the $\Upsilon(11020)$ are fixed to those in AUBERT 09E.

Meson Particle Listings

 $\Upsilon(10860)$

⁹In a model where a flat nonresonant $\Upsilon(1S, 2S, 3S)\pi^+\pi^-$ continuum interferes with a single Breit-Wigner resonance.

¹⁰In a model where a non-resonant $b\bar{b}$ -continuum represented by a threshold function at $\sqrt{s}=2m_B$ is incoherently added to a flat component interfering with two Breit-Wigner resonances. Not independent of other AUBERT 09E results. Systematic uncertainties not estimated.

¹¹Assuming four Gaussians with radiative tails and a single step in R .

¹²In a coupled-channel model with three resonances and a smooth step in R .

11020 ± 30	LOVELOCK	85	CUSB $e^+e^- \rightarrow \text{hadrons}$

¹ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 28 energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV, including the initial-state radiation at $\Upsilon(10860)$.

² From a simultaneous fit to the $h_b(nP)\pi^+\pi^-$, $n = 1, 2$ cross sections at 22 energy points within $\sqrt{s} = 10.77\text{--}11.02$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single relative phase, a single relative amplitude, and two overall normalization factors, one for each n). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

³ From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s} = 10.82\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).

⁴ Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.

⁵ From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 25 energy points within $\sqrt{s} = 10.6\text{--}11.05$ GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with fourteen resonance parameters (a mass, width, and three amplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relative phase, and three decoherence coefficients, one for each n). Continuum contributions were measured (and therefore fixed) to be zero.

⁶ Superseded by MIZUK 19.

⁷ In a model where a flat non-resonant $b\bar{b}$ -continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

¹ The statistical and systematic errors are 15 and 29 in the last two places of the value. The value disagrees with the MOHR 16 value by over 3 standard deviations.

p MASS (MeV)

The mass is known much more precisely in u (atomic mass units) than in MeV. The conversion from u to MeV, $1 u = 931.494 0054(57) \text{ MeV}/c^2$ (MOHR 16, the 2014 CODATA value), involves the relatively poorly known electronic charge.

¹ HORI 01, HORI 03, HORI 06, and HORI 11 use the more-precisely-known constraint on the \bar{p} charge-to-mass ratio of GABRIELSE 99 (see above) to get their results. Their results are not independent of the HORI 01, HORI 03, HORI 06, and HORI 11 values for $|m_p - m_{\bar{p}}|/m_p$, above.

² TORII 99 uses the more-precisely-known constraint on the \bar{p} charge-to-mass ratio of GABRIELSE 95 (see above) to get this result. This is not independent of the TORII 99 value for $|m_p - m_{\bar{p}}|/m_p$, above.

³ HUGHES 92 uses recent measurements of Rydberg-energy and cyclotron-frequency ratios.

|q_p + q_e|/e

See BRESSI 11 for a summary of experiments on the neutrality of matter. See also "n CHARGE" in the neutron Listings.

VALUE	DOCUMENT ID	COMMENT
<1 × 10⁻²¹	¹ BRESSI	11 Neutrality of SF ₆
• • • We do not use the following data for averages, fits, limits, etc. • • •		
<3.2 × 10 ⁻²⁰	² SENGUPTA	00 binary pulsar
<0.8 × 10 ⁻²¹	MARINELLI	84 Magnetic levitation
<1.0 × 10 ⁻²¹	¹ DYLLA	73 Neutrality of SF ₆

¹ BRESSI 11 uses the method of DYLLA 73 but finds serious errors in that experiment that greatly reduce its accuracy. The BRESSI 11 limit assumes that $n \rightarrow p e^- \nu_e$ conserves charge. Thus the limit applies equally to the charge of the neutron.

² SENGUPTA 00 uses the difference between the observed rate of rotational energy loss by the binary pulsar PSR B1913+16 and the rate predicted by general relativity to set this limit. See the paper for assumptions.

 ρ ELECTRIC DIPOLE MOMENTA nonzero value is forbidden by both T invariance and P invariance.

VALUE (10^{-23} e cm)	DOCUMENT ID	TECN	COMMENT
< 0.021	1 SAHOO 17		Theory plus ^{199}Hg atom EDM

• • • We do not use the following data for averages, fits, limits, etc. • • •

< 0.54	1 DMITRIEV 03		Theory plus ^{199}Hg atom EDM
- 3.7 ± 6.3	CHO 89	NMR	TI F molecules
< 400	DZUBA 85	THEO	Uses ^{129}Xe moment
130 ± 200	2 WILKENING 84		
900 ± 1400	3 WILKENING 84		
700 ± 900	HARRISON 69	MBR	Molecular beam

1 SAHOO 17 and DMITRIEV 03 are not direct measurements of the proton electric dipole moment. They use theory to calculate this limit from the limit on the electric dipole moment of the ^{199}Hg atom.

2 This WILKENING 84 value includes a finite-size effect and a magnetic effect.

3 This WILKENING 84 value is more cautious than the other and excludes the finite-size effect, which relies on uncertain nuclear integrals.

 ρ ELECTRIC POLARIZABILITY α_p

For a very complete review of the "polarizability of the nucleon and Compton scattering," see SCHUMACHER 05. His recommended values for the proton are $\alpha_p = (12.0 \pm 0.6) \times 10^{-4} \text{ fm}^3$ and $\beta_p = (1.9 \pm 0.6) \times 10^{-4} \text{ fm}^3$, almost exactly our averages.

VALUE (10^{-4} fm^3)	DOCUMENT ID	TECN	COMMENT
11.2 ± 0.4 OUR AVERAGE			
10.65 ± 0.35 ± 0.36	MCGOVERN 13	RVUE	$\chi\text{EFT} + \text{Compton scattering}$

11.82 ± 0.98 ± 0.52 - 0.98	2 BLANPIED 01	LEGS	$\rho(\vec{\gamma}, \gamma), \rho(\vec{\gamma}, \pi^0), \rho(\vec{\gamma}, \pi^+)$
11.9 ± 0.5 ± 1.3	3 OLMOSDEL... 01	CNTR	γp Compton scattering
12.1 ± 0.8 ± 0.5	4 MACGIBBON 95	RVUE	global average

• • • We do not use the following data for averages, fits, limits, etc. • • •

11.7 ± 0.8 ± 0.7	5 BARANOV 01	RVUE	Global average
12.5 ± 0.6 ± 0.9	MACGIBBON 95	CNTR	γp Compton scattering
9.8 ± 0.4 ± 1.1	HALLIN 93	CNTR	γp Compton scattering
10.62 ± 1.25 ± 1.07 - 1.19 - 1.03	ZIEGER 92	CNTR	γp Compton scattering
10.9 ± 2.2 ± 1.3	6 FEDERSPIEL 91	CNTR	γp Compton scattering

1 BEANE 03 uses effective field theory and low-energy γp and γd Compton-scattering data. It also gets for the isoscalar polarizabilities (see the erratum) $\alpha_N = (13.0 \pm 1.9 \pm 3.9) \times 10^{-4} \text{ fm}^3$ and $\beta_N = (-1.8 \pm 1.9 \pm 2.1) \times 10^{-4} \text{ fm}^3$.

2 BLANPIED 01 gives $\alpha_p + \beta_p$ and $\alpha_p - \beta_p$. The separate α_p and β_p are provided to us by A. Sandorfi. The first error above is statistics plus systematics; the second is from the model.

3 This OLMOSDELEON 01 result uses the TAPS data alone, and does not use the (re-evaluated) sum-rule constraint that $\alpha + \beta = (13.8 \pm 0.4) \times 10^{-4} \text{ fm}^3$. See the paper for a discussion.

4 MACGIBBON 95 combine the results of ZIEGER 92, FEDERSPIEL 91, and their own experiment to get a "global average" in which model errors and systematic errors are treated in a consistent way. See MACGIBBON 95 for a discussion.

5 BARANOV 01 combines the results of 10 experiments from 1958 through 1995 to get a global average that takes into account both systematic and model errors and does not use the theoretical constraint on the sum $\alpha_p + \beta_p$.

6 FEDERSPIEL 91 obtains for the (static) electric polarizability α_p , defined in terms of the induced electric dipole moment by $\mathbf{D} = 4\pi\epsilon_0\alpha_p\mathbf{E}$, the value $(7.0 \pm 2.2 \pm 1.3) \times 10^{-4} \text{ fm}^3$.

 ρ MAGNETIC POLARIZABILITY β_p

The electric and magnetic polarizabilities are subject to a dispersion sum-rule constraint $\bar{\alpha} + \bar{\beta} = (14.2 \pm 0.5) \times 10^{-4} \text{ fm}^3$. Errors here are anticorrelated with those on $\bar{\alpha}_p$ due to this constraint.

VALUE (10^{-4} fm^3)	DOCUMENT ID	TECN	COMMENT

 ρ CHARGE RADIUSThis is the rms electric charge radius, $\sqrt{\langle r_E^2 \rangle}$.

There are three kinds of measurements of the proton radius: via transitions in atomic hydrogen; via electron scattering off hydrogen; and via muonic hydrogen Lamb shift. Most measurements of the radius of the proton involve electron-proton interactions, the most recent of which is the electron scattering measurement $r_p = 0.831(14) \text{ fm}$ (XIONG 19), and the atomic-hydrogen value, $r_p = 0.833(10) \text{ fm}$ (BEZGINOV 19). These agree well with another recent atomic-hydrogen value $r_p = 0.8335(95) \text{ fm}$ (BEYER 17), and with the best measurement using muonic hydrogen $r_p = 0.84087(39) \text{ fm}$ (ANTOGNINI 13), that is far more precise.

The MOHR 16 value (2014 CODATA), obtained from the electronic results available at the time, was $0.8751(61) \text{ fm}$. This differs by 5.6 standard deviations from the muonic hydrogen value, leading to the so-called proton charge radius puzzle. See our 2018 edition (Physical Review D98 030001 (2018)) for a further discussion of interpretations of this puzzle. However, reflecting the new electronic measurements, the 2018 CODATA recommended value is $0.8414(19) \text{ fm}$, and the puzzle appears to be resolved.

See our 2014 edition (Chinese Physics C38 070001 (2014)) for values published before 2003.

1 BEZGINOV 19 measures the $2S_{1/2}$ to $2P_{1/2}$ transition frequency in atomic hydrogen using the frequency-offset separated oscillatory field (FOSOF) technique. The result agrees well with the muonic hydrogen Lamb shift value.

2 The XIONG 19 value from $ep \rightarrow ep$ scattering and supports the muonic hydrogen Lamb shift value.

3 FLEURBAEY 18 measures the 1S-3S transition frequency in hydrogen and in combination with the 1S-2S transition frequency deduces the proton radius and the Rydberg constant.

4 The BEYER 17 result is 3.3 combined standard deviations below the MOHR 16 (2014 CODATA) value. The experiment measures the 2S-4P transition in hydrogen and gets the proton radius and the Rydberg constant.

5 Authors also provide values for combinations of all available data.

p MAGNETIC RADIUS

This is the rms magnetic radius, $\sqrt{\langle r_M^2 \rangle}$.

Table with columns: VALUE (fm), DOCUMENT ID, TECN, COMMENT. Includes data for LEE, EPSTEIN, ZHAN, BERNAUER, BORISYUK, BELUSHKIN.

• • • We do not use the following data for averages, fits, limits, etc. • • •

Table with columns: VALUE (fm), DOCUMENT ID, TECN, COMMENT. Includes data for EPSTEIN, ZHAN, BERNAUER, BORISYUK, BELUSHKIN.

¹In a consistent reanalysis LEE 2015 extract values separately for the Mainz 2010 data only (0.776+-0.034+-0.017) fm and for the world data without Mainz data (0.914+-0.035) fm. The quoted value is a simple combination of the two, which ignores possible discrepancies and unknown correlations and should be considered with caution.

p MEAN LIFE

A test of baryon conservation. See the "p Partial Mean Lives" section below for limits for identified final states. The limits here are to "anything" or are for "disappearance" modes of a bound proton (p) or (n). See also the 3ν modes in the "Partial Mean Lives" section. Table 1 of BACK 03 is a nice summary.

Table with columns: LIMIT (years), PARTICLE, CL%, DOCUMENT ID, TECN, COMMENT. Lists various decay modes and their limits.

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹AHMED 04 and ANDERSON 19A look for γ rays from the de-excitation of a residual ¹⁵O* or ¹⁵N* following the disappearance of a neutron or proton in ¹⁶O.

²ARAKI 06 looks for signs of de-excitation of the residual nucleus after disappearance of a neutron from the s shell of ¹²C.

³BACK 03 looks for decays of unstable nuclides left after N decays of parent ¹²C, ¹³C, ¹⁶O nuclei. These are "invisible channel" limits.

⁴ZDESENKO 03 gets this limit on proton disappearance in deuterium by analyzing SNO data in AHMAD 02.

⁵AHMAD 02 (see its footnote 7) looks for neutrons left behind after the disappearance of the proton in deuterons.

⁶BERNABEI 00b looks for the decay of a ¹²⁸₅₃I nucleus following the disappearance of a proton in the otherwise-stable ¹²⁹Xe nucleus.

⁷EVANS 77 looks for the daughter nuclide ¹²⁹Xe from possible ¹³⁰Te decays in ancient Te ore samples.

⁸This mean-life limit has been obtained from a half-life limit by dividing the latter by ln(2) = 0.693.

⁹FLEROV 58 looks for the spontaneous fission of a ²³²Th nucleus after the disappearance of one of its nucleons.

p̄ MEAN LIFE

Of the two astrophysical limits here, that of GEER 00d involves considerably more refinements in its modeling. The other limits come from direct observations of stored antiprotons. See also "p̄ Partial Mean Lives" after "p Partial Mean Lives," below, for exclusive-mode limits. The best (lifetime/branching fraction) limit there is 7 × 10⁵ years, for p̄ → e⁻γ. We advance only the exclusive-mode limits to our Summary Tables.

Table with columns: LIMIT (years), CL%, EVTS, DOCUMENT ID, TECN, COMMENT. Lists various decay modes and their limits.

• • • We do not use the following data for averages, fits, limits, etc. • • •

¹GEER 00d uses agreement between a model of galactic p̄ production and propagation and the observed p̄/p cosmic-ray spectrum to set this limit.

p DECAY MODES

See the "Note on Nucleon Decay" in our 1994 edition (Phys. Rev. D50, 1173) for a short review.

The "partial mean life" limits tabulated here are the limits on τ/B_j, where τ is the total mean life and B_j is the branching fraction for the mode in question. For N decays, p and n indicate proton and neutron partial lifetimes.

Table with columns: Mode, Partial mean life (10³⁰ years), Confidence level. Lists various decay modes and their partial mean lives and confidence levels.

p PARTIAL MEAN LIVES

The "partial mean life" limits tabulated here are the limits on τ/B_j , where τ is the total mean life for the proton and B_j is the branching fraction for the mode in question.

Decaying particle: p = proton, n = bound neutron. The same event may appear under more than one partial decay mode. Background estimates may be accurate to a factor of two.

¹ In estimating the background, this HIRATA 89c limit (as opposed to the later limits of WALL 00b and MCGREW 99) does not take into account present understanding that the flux of ν_μ originating in the upper atmosphere is depleted. Doing so would reduce the background and thus also would reduce the limit here.

² We have calculated 90% CL limit from 1 confined event.

³ We have converted 2 possible events to 90% CL limit.

⁴ We have converted half-life to 90% CL mean life.

>0.000012	90	5	9.7	BERGER	91B	FREJ τ per iron nucleus

1 ARAKI 06 looks for signs of de-excitation of the residual nucleus after disappearance of two neutrons from the s shell of ^{12}C .

2 ANDERSON 19A looks for γ rays from the de-excitation of a residual $^{14}\text{O}^*$ following the disappearance of nn in ^{16}O .

3 TRETYAK 04 uses data from an old Homestake-mine radiochemical experiment on limits for invisible decays of ^{39}K to ^{37}Ar .

4 BACK 03 looks for decays of unstable nuclides left after NN decays of parent ^{12}C , ^{13}C , ^{16}O nuclei. These are "invisible channel" limits.

5 BERNABEI 00b looks for the decay of a ^{127}Xe nucleus following the disappearance of an nn pair in the otherwise-stable ^{129}Xe nucleus. The limit here applies as well to $nn \rightarrow \nu_\mu \bar{\nu}_\mu$, $nn \rightarrow \nu_\tau \bar{\nu}_\tau$, or any "disappearance" mode.

$\tau(nn \rightarrow \nu_\mu \bar{\nu}_\mu)$ 778

See the preceding data block. "Invisible modes" would include any multi-neutrino mode.

n

$$I(J^P) = \frac{1}{2}(1^+)$$
 Status: ***

We have omitted some results that have been superseded by later experiments. See our earlier editions.

Anyone interested in the neutron should look at these two review articles: D. Dubbers and M.G. Schmidt, "The neutron and its role in cosmology and particle physics," *Reviews of Modern Physics* **83** 1111 (2011); and F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," *Reviews of Modern Physics* **83** 1173 (2011).

n MASS (atomic mass units u)

The mass is known much more precisely in u (atomic mass units) than in MeV. See the next data block.

VALUE (u)	DOCUMENT ID	TECN	COMMENT
$1.00866491588 \pm 0.0000000049$	MOHR 16	RVUE	2014 CODATA value
••• We do not use the following data for averages, fits, limits, etc. •••			
$1.008664916000 \pm 0.0000000043$	MOHR 12	RVUE	2010 CODATA value
$1.00866491597 \pm 0.0000000043$	MOHR 08	RVUE	2006 CODATA value
$1.00866491560 \pm 0.0000000055$	MOHR 05	RVUE	2002 CODATA value
$1.00866491578 \pm 0.0000000055$	MOHR 99	RVUE	1998 CODATA value
$1.008665904 \pm 0.000000014$	COHEN 87	RVUE	1986 CODATA value

n MASS (MeV)

The mass is known much more precisely in u (atomic mass units) than in MeV. The conversion from u to MeV, $1 u = 931.494 005 4(57) \text{ MeV}/c^2$ (MOHR 16, the 2014 CODATA value), involves the relatively poorly known electronic charge.

VALUE (MeV)	DOCUMENT ID	TECN	COMMENT
$939.5654133 \pm 0.0000058$	MOHR 16	RVUE	2014 CODATA value
••• We do not use the following data for averages, fits, limits, etc. •••			
939.565379 ± 0.000021	MOHR 12	RVUE	2010 CODATA value
939.565346 ± 0.000023	MOHR 08	RVUE	2006 CODATA value
939.565360 ± 0.000081	MOHR 05	RVUE	2002 CODATA value
939.565331 ± 0.000037	1 KESSLER	99	SPEC $np \rightarrow d \gamma$
939.565330 ± 0.000038	MOHR 99	RVUE	1998 CODATA value
939.56565 ± 0.00028	2,3 DIFILIPPO	94	TRAP Penning trap
939.56563 ± 0.00028	COHEN 87	RVUE	1986 CODATA value
939.56564 ± 0.00028	3,4 GREENE	86	SPEC $np \rightarrow d \gamma$
939.5731 ± 0.0027	3 COHEN	73	RVUE 1973 CODATA value

¹We use the 1998 CODATA u-to-MeV conversion factor (see the heading above) to get this mass in MeV from the much more precisely measured KESSLER 99 value of 1.00866491637 ± 0.0000000082 u.
²The mass is known much more precisely in u: $m = 1.0086649235 \pm 0.0000000023$ u. We use the 1986 CODATA conversion factor to get the mass in MeV.
³These determinations are not independent of the $m_n - m_p$ measurements below.
⁴The mass is known much more precisely in u: $m = 1.008664919 \pm 0.000000014$ u.

\bar{n} MASS

VALUE (MeV)	EVTS	DOCUMENT ID	TECN	COMMENT
939.485 ± 0.051	59	¹ CRESTI	86	HBC $\bar{p}p \rightarrow \bar{n}n$

¹This is a corrected result (see the erratum). The error is statistical. The maximum systematic error is 0.029 MeV.

$(m_n - m_{\bar{n}})/m_n$

A test of CPT invariance. Calculated from the *n* and \bar{n} masses, above.

¹The 2014 CODATA mass difference in u is $m_n - m_p = 1.00138844900(51) \times 10^{-3}u$.
²The 2010 CODATA mass difference in u is $m_n - m_p = 1.38844919(45) \times 10^{-3}u$.
³Calculated by us from the MOHR 08 ratio $m_n/m_p = 1.00137841918(46)$. In u, $m_n - m_p = 1.38844920(46) \times 10^{-3}u$.
⁴Calculated by us from the MOHR 05 ratio $m_n/m_p = 1.00137841870 \pm 0.00000000058$. In u, $m_n - m_p = (1.3884487 \pm 0.0000006) \times 10^{-3}u$.
⁵Calculated by us from the MOHR 99 ratio $m_n/m_p = 1.00137841887 \pm 0.00000000058$. In u, $m_n - m_p = (1.3884489 \pm 0.0000006) \times 10^{-3}u$.
⁶Calculated by us from the COHEN 87 ratio $m_n/m_p = 1.001378404 \pm 0.000000009$. In u, $m_n - m_p = 0.001388434 \pm 0.000000009u$.

***n* MEAN LIFE**

Limits on lifetimes for bound neutrons are given in the section "p PARTIAL MEAN LIVES."

We average seven of the best eight measurements, those made with ultracold neutrons (UCN's). If we include the one in-beam measurement with a comparable error (YUE 13), we get 879.6 ± 0.8 s, where the scale factor is now 2.0.

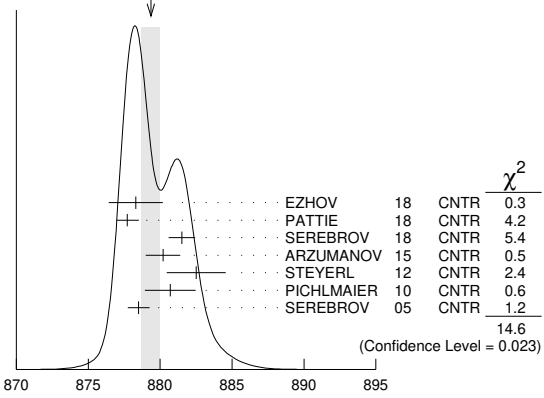

For a recent discussion of the long-standing disagreement between in-beam and UCN results, see CZARNECKI 18 (Physical Review Letters **120** 202002 (2018)). For a full review of all matters concerning the neutron lifetime until about 2010, see WIETFELDT 11, F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," Reviews of Modern Physics **83** 1173 (2011).

918 ± 14	CHRISTENSEN72	CNTR	

¹PATTIE 18 uses a new technique, with a semi-toroidal magneto-gravitational asymmetric trap and a novel in situ *n*-detector.
²ARZUMANOV 15 is a reanalysis of their 2008–2010 dataset, with improved systematic corrections of ARZUMANOV 00 and ARZUMANOV 12.
³STEYERL 12 is a detailed reanalysis of neutron storage loss corrections to the raw data of MAMPE 89, and it replaces that value.
⁴YUE 13 differs from NICO 05 in that a different and better method was used to measure the neutron density in the fiducial volume. This shifted the lifetime by +1.4 seconds and reduced the previously largest source of systematic uncertainty by a factor of five.
⁵ARZUMANOV 12 reanalyzes its systematic corrections in ARZUMANOV 00 and obtains this corrected value.
⁶IGNATOVICH 95 calls into question some of the corrections and averaging procedures used by MAMPE 93. The response, BONDARENKO 96, denies the validity of the criticisms.
⁷The NESVIZHEVSKII 92 measurement has been withdrawn by A. Serebrov.
⁸The BYRNE 80 measurement has been withdrawn (J. Byrne, private communication, 1990).

−1.91304277 ± 0.00000048	¹ GREENE 82	MRS	

¹GREENE 82 measures the moment to be $(1.04187564 \pm 0.00000026) \times 10^{-3}$ Bohr magnetons. The value above is obtained by multiplying this by $m_p/m_e = 1836.152701 \pm 0.000037$ (the 1986 CODATA value from COHEN 87).

***n* ELECTRIC DIPOLE MOMENT**

A nonzero value is forbidden by both *T* invariance and *P* invariance. A number of early results have been omitted. See RAMSEY 90, GOLUB 94, and LAMOREAUX 09 for reviews.

The results are upper limits on $|d_n|$.

- ABEL 20 reports $d = (0.0 \pm 1.1 \pm 0.2) \times 10^{-26}$ e cm value corresponding to the listed limit.
- SAHOO 17 develops theory to calculate this limit from the measured limit by GRANER 16 of the ¹⁹⁹Hg atom EDM.
- PENDLEBURY 15 reports $d = (-0.21 \pm 1.82) \times 10^{-26}$ e cm value corresponding to the listed limit.
- SEREBROV 14 includes the data of ALTAREV 96.
- LAMOREAUX 07 faults BAKER 06 for not including in the estimate of systematic error an effect due to the Earth's rotation. BAKER 07 replies (1) that the effect was included implicitly in the analysis and (2) that further analysis confirms that the BAKER 06 limit is correct as is. See also SILENKO 07.
- This HARRIS 99 result includes the result of SMITH 90. However, the averaging of the results of these two experiments has been criticized by LAMOREAUX 00.

n MEAN-SQUARE CHARGE RADIUS

The mean-square charge radius of the neutron, $\langle r_n^2 \rangle$, is related to the neutron-electron scattering length b_{ne} by $\langle r_n^2 \rangle = 3(m_e a_0 / m_n) b_{ne}$, where m_e and m_n are the masses of the electron and neutron, and a_0 is the Bohr radius. Numerically, $\langle r_n^2 \rangle = 86.34 b_{ne}$, if we use a_0 for a nucleus with infinite mass.

LIMIT ON $n\bar{n}$ OSCILLATIONS

Mean Time for $n\bar{n}$ Transition in Vacuum

A test of $\Delta B=2$ baryon number nonconservation. MOHAPATRA 80 and MOHAPATRA 89 discuss the theoretical motivations for looking for $n\bar{n}$ oscillations. DOVER 83 and DOVER 85 give phenomenological analyses. The best limits come from looking for the decay of neutrons bound in nuclei. However, these analyses require model-dependent corrections for nuclear effects. See KABIR 83, DOVER 89, ALBERICO 91, and GAL 00 for discussions. Direct searches for $n \rightarrow \bar{n}$ transitions using reactor neutrons are cleaner but give somewhat poorer limits. We include limits for both free and bound neutrons in the Summary Table. See MOHAPATRA 09 and PHILLIPS 16 for recent reviews.

LIMIT ON *nn'* OSCILLATIONS

Lee and Yang (LEE 56) proposed the existence of mirror world in an attempt to restore global parity symmetry. A possible candidate for dark matter. Limits depend on assumptions about fields *B* and *B'*. See the papers for details. See BEREZHIANI 18 for a recent discussion.

VALUE (s)	CL%	DOCUMENT ID	TECN	COMMENT
>448	90	SEREBROV	09A	CNTR Assumes <i>B'</i> < 100 nT
• • • We do not use the following data for averages, fits, limits, etc. • • •				
> 17	95	¹ BEREZHIANI	18	CNTR UCN, scan of <i>B</i> field
> 12	95	² ALTAREV	09A	CNTR UCN, scan 0 ≤ <i>B</i> ≤ 12.5 μT
>414	90	SEREBROV	08	CNTR UCN, <i>B</i> field on & off
>103	95	BAN	07	CNTR UCN, <i>B</i> field on & off

¹ The *B* field was set to (0.09, 0.12, 0.21) G. Limits on oscillation time are valid for any mirror field *B'* in (0.08-0.17) G, and for aligned fields *B* and *B'*. For larger values of *B'*, the limits are significantly reduced.

² Losses of neutrons due to oscillations to mirror neutrons would be maximal when the magnetic fields *B* and *B'* in the two worlds were equal. Hence the scan over *B* by ALTAREV 09A: the limit applies for any *B'* over the given range. At *B'* = 0, the limit is 141 s (95% CL).

- 7 MENDENHALL 13 gets $A = -0.11954 \pm 0.00055 \pm 0.00098$ and $\lambda = -1.2756 \pm 0.0030$. We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.
- 8 This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.
- 9 This is the combined result of ABELE 02 and ABELE 97d.
- 10 These experiments measure the absolute value of g_A/g_V only.
- 11 KROHN 75 includes events of CHRISTENSEN 70.
- 12 KROPP 74 reviews all data through 1972.

e^- ASYMMETRY PARAMETER A

This is the neutron-spin electron-momentum correlation coefficient. Unless otherwise noted, the values are corrected for radiative effects and weak magnetism. In the Standard Model, A is related to $\lambda \equiv g_A/g_V$ by $A = -2\lambda(\lambda+1)/(1+3\lambda^2)$; this assumes that g_A and g_V are real.

- 1 MAERKISCH 19 further derive a value for the CKM-element $|V_{ud}| = 0.97351 \pm 0.00060$, using $\tau_n = 879.7(8)$ sec and the relation from CZARNECKI 18.
- 2 BROWN 18 gets $A = -0.12054 \pm 0.00044 \pm 0.00068$ and $\lambda = -1.2783 \pm 0.0022$. We quote the combined values that include the earlier UCNA measurements (MENDENHALL 13).
- 3 This MUND 13 value includes earlier PERKEO II measurements (ABELE 02 and ABELE 97d), with a correction to those results.
- 4 YEROZOLIMSKY 97 makes a correction to the EROZOLIMSKII 91 value.
- 5 MENDENHALL 13 gets $A = -0.11954 \pm 0.00055 \pm 0.00098$ and $\lambda = -1.2756 \pm 0.0030$. We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.
- 6 This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.
- 7 This is the combined result of ABELE 02 and ABELE 97d.
- 8 MOSTOVOI 01 calculates this from its measurement of $\lambda = g_A/g_V$ above.
- 9 These results are not corrected for radiative effects and weak magnetism, but the corrections are small compared to the errors.

$\bar{\nu}_e$ ASYMMETRY PARAMETER B

This is the neutron-spin antineutrino-momentum correlation coefficient. In the Standard Model, B is related to $\lambda \equiv g_A/g_V$ by $B = 2\lambda(\lambda-1)/(1+3\lambda^2)$; this assumes that g_A and g_V are real.

0.9876 ± 0.0004	1 MOSTOVOI 01	CNTR	Inferred
1 MOSTOVOI 01 calculates this from its measurement of $\lambda = g_A/g_V$ above.			

PROTON ASYMMETRY PARAMETER C

Describes the correlation between the neutron spin and the proton momentum. In the Standard Model, C is related to $\lambda \equiv g_A/g_V$ by $C = -x_c(A+B) = x_c 4\lambda/(1+3\lambda^2)$, where $x_c = 0.27484$ is a kinematic factor; this assumes that g_A and g_V are real.

VALUE	DOCUMENT ID	TECN	COMMENT
-0.2377 ± 0.0010 ± 0.0024	SCHUMANN 08	CNTR	Cold <i>n</i> , polarized

$e^- \bar{\nu}_e$ ANGULAR CORRELATION COEFFICIENT a

For a review of past experiments and plans for future measurements of the *a* parameter, see WIETFELDT 05. In the Standard Model, *a* is related to $\lambda \equiv g_A/g_V$ by $a = (1 - \lambda^2)/(1 + 3\lambda^2)$; this assumes that g_A and g_V are real.

VALUE	DOCUMENT ID	TECN	COMMENT

-0.1045 ± 0.0014	2 MOSTOVOI 01	CNTR	Inferred
1 DARIUS 17 exploits a "wishbone" correlation, where the <i>p</i> time of flight is correlated with the momentum of the electron in delayed coincidence.			
2 MOSTOVOI 01 calculates this from its measurement of $\lambda = g_A/g_V$ above.			

ϕ_{AV} PHASE OF g_A RELATIVE TO g_V

Time reversal invariance requires this to be 0 or 180°. This is related to *D* given in the next data block and $\lambda \equiv g_A/g_V$ by $\sin(\phi_{AV}) \equiv D(1+3\lambda^2)/2|\lambda|$; this assumes that g_A and g_V are real.

- 1 EROZOLIMSKII 78 says asymmetric proton losses and nonuniform beam polarization may give a systematic error up to 30×10^{-4} , thus increasing the EROZOLIMSKII 74 error to 50×10^{-4} . STEINBERG 74 and STEINBERG 76 estimate these systematic errors to be insignificant in their experiment.

TRIPLE CORRELATION COEFFICIENT R

Another test of time-reversal invariance. *R* measures the polarization of the electron in the direction perpendicular to the plane defined by the neutron spin and the electron momentum. *R* = 0 for *T* invariance.

 $N(1520)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_i/Γ)
Γ_1 $N\pi$	55–65 %
Γ_2 $N\eta$	0.07–0.09 %
Γ_3 $N\pi\pi$	25–35 %
Γ_4 $\Delta(1232)\pi$	22–34 %
Γ_5 $\Delta(1232)\pi$, S-wave	15–23 %
Γ_6 $\Delta(1232)\pi$, D-wave	7–11 %

Γ_7 $N\sigma$	< 2 %
Γ_8 $p\gamma$	0.31–0.52 %
Γ_9 $p\gamma$, helicity=1/2	0.01–0.02 %
Γ_{10} $p\gamma$, helicity=3/2	0.30–0.50 %
Γ_{11} $n\gamma$	0.30–0.53 %
Γ_{12} $n\gamma$, helicity=1/2	0.04–0.10 %
Γ_{13} $n\gamma$, helicity=3/2	0.25–0.45 %

 $N(1675)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_i/Γ)
Γ_1 $N\pi$	38-42 %
Γ_2 $N\eta$	< 1 %
Γ_3 ΛK	
Γ_4 $N\pi\pi$	25-45 %
Γ_5 $\Delta(1232)\pi$	
Γ_6 $\Delta(1232)\pi, D\text{-wave}$	23-37 %
Γ_7 $N\rho$	
Γ_8 $N\rho, S=1/2$	
Γ_9 $N\rho, S=3/2, D\text{-wave}$	
Γ_{10} $N\sigma$	3-7 %
Γ_{11} $p\gamma$	0-0.02 %
Γ_{12} $p\gamma, \text{helicity}=1/2$	0-0.01 %
Γ_{13} $p\gamma, \text{helicity}=3/2$	0-0.01 %
Γ_{14} $n\gamma$	0-0.15 %
Γ_{15} $n\gamma, \text{helicity}=1/2$	0-0.05 %
Γ_{16} $n\gamma, \text{helicity}=3/2$	0-0.10 %

 $N(1680)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_i/Γ)
Γ_1 $N\pi$	60-70 %
Γ_2 $N\eta$	<1 %
Γ_3 ΛK	
Γ_4 $N\pi\pi$	20-40 %
Γ_5 $\Delta(1232)\pi$	11-23 %
Γ_6 $\Delta(1232)\pi, P$ -wave	4-10 %
Γ_7 $\Delta(1232)\pi, F$ -wave	1-13 %
Γ_8 $N\rho$	
Γ_9 $N\rho, S=3/2, P$ -wave	
Γ_{10} $N\rho, S=3/2, F$ -wave	
Γ_{11} $N\sigma$	9-19 %
Γ_{12} $p\gamma$	0.21-0.32 %
Γ_{13} $p\gamma, \text{ helicity}=1/2$	0.001-0.011 %
Γ_{14} $p\gamma, \text{ helicity}=3/2$	0.20-0.32 %
Γ_{15} $n\gamma$	0.021-0.046 %
Γ_{16} $n\gamma, \text{ helicity}=1/2$	0.004-0.029 %
Γ_{17} $n\gamma, \text{ helicity}=3/2$	0.01-0.024 %

$N(1720)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_j/Γ)
Γ_1 $N\pi$	8–14 %
Γ_2 $N\eta$	1–5 %
Γ_3 $N\omega$	12–40 %
Γ_4 ΛK	4–5 %
Γ_5 $N\pi\pi$	50–90 %
Γ_6 $\Delta(1232)\pi$	47–89 %
Γ_7 $\Delta(1232)\pi, P\text{-wave}$	47–77 %
Γ_8 $\Delta(1232)\pi, F\text{-wave}$	<12 %
Γ_9 $N\rho$	
Γ_{10} $N\rho, S=1/2, P\text{-wave}$	1–2 %
Γ_{11} $N\sigma$	2–14 %

Γ_{12} $N(1440)\pi$	<2 %
Γ_{13} $N(1520)\pi, S\text{-wave}$	1–5 %
Γ_{14} $p\gamma$	0.05–0.25 %
Γ_{15} $p\gamma, \text{ helicity}=1/2$	0.05–0.15 %
Γ_{16} $p\gamma, \text{ helicity}=3/2$	0.002–0.16 %
Γ_{17} $n\gamma$	0.0–0.016 %
Γ_{18} $n\gamma, \text{ helicity}=1/2$	0.0–0.01 %
Γ_{19} $n\gamma, \text{ helicity}=3/2$	0.0–0.015 %

$$I(J^P) = \frac{1}{2}(\frac{5}{2}^+) \text{ Status: } **$$

OMITTED FROM SUMMARY TABLE

Before the 2012 Review, all the evidence for a $J^P = 5/2^+$ state with a mass above 1800 MeV was filed under a two-star $N(2000)$. There is now some evidence from ANISOVICH 12A for two $5/2^+$ states in this region, so we have split the older data (according to mass) between two two-star $5/2^+$ states, an $N(1860)$ and an $N(2000)$.

$N(1875) 3/2^-$

$$I(J^P) = \frac{1}{2}(\frac{3}{2}^-) \text{ Status: } ***$$

Before the 2012 Review, all the evidence for a $J^P = 3/2^-$ state with a mass above 1800 MeV was filed under a two-star $N(2080)$. There is now evidence from ANISOVICH 12A for two $3/2^-$ states in this region, so we have split the older data (according to mass) between a three-star $N(1875)$ and a two-star $N(2120)$.

$N(2000) 5/2^+$

$$I(J^P) = \frac{1}{2} \left(\frac{5}{2}^+ \right) \text{ Status: } **$$

OMITTED FROM SUMMARY TABLE

Before the 2012 Review, all the evidence for a $J^P = 5/2^+$ state with a mass above 1800 MeV was filed under a two-star $N(2000)$. There is now some evidence from ANISOVICH 12A for two $5/2^+$ states in this region, so we have split the older data (according to mass) between two two-star $5/2^+$ states, an $N(1860)$ and an $N(2000)$.

$N(2120) 3/2^-$

$$J(P) = \frac{1}{2}(3/2^-) \text{ Status: } ***$$

Before the 2012 Review, all the evidence for a $J^P = 3/2^-$ state with a mass above 1800 MeV was filed under a two-star $N(2080)$. There is now evidence from ANISOVICH 12A for two $3/2^-$ states in this region, so we have split the older data (according to mass) between a three-star $N(1875)$ and a two-star $N(2120)$.

$N(\sim 3000)$ Region Partial-Wave Analyses

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-1/2 resonances found in partial-wave analyses.

Our 1982 edition had an $N(3245)$, an $N(3690)$, and an $N(3755)$, each a narrow peak seen in a production experiment. Since nothing has been heard from them since the 1960's, we declare them to be dead. There was also an $N(3030)$, deduced from total cross-section and 180° elastic cross-section measurements; it is the KOCH 80 $L_{1,15}$ state below.

$\Delta(1620)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_i/Γ)
Γ_1 $N\pi$	25-35 %
Γ_2 $N\pi\pi$	55-80 %
Γ_3 $\Delta(1232)\pi$	
Γ_4 $\Delta(1232)\pi, D\text{-wave}$	52-72 %
Γ_5 $N\rho$	
Γ_6 $N\rho, S=1/2, S\text{-wave}$	seen
Γ_7 $N\rho, S=3/2, D\text{-wave}$	seen
Γ_8 $N(1440)\pi$	3-9 %
Γ_9 $N\gamma, \text{helicity}=1/2$	0.03-0.10 %

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_i/Γ)
Γ_1 $N\pi$	10–20 %
Γ_2 $N\pi\pi$	10–55 %
Γ_3 $\Delta(1232)\pi$	10–50 %
Γ_4 $\Delta(1232)\pi, S\text{-wave}$	5–35 %
Γ_5 $\Delta(1232)\pi, D\text{-wave}$	4–16 %
Γ_6 $N\rho$	
Γ_7 $N\rho, S=3/2, S\text{-wave}$	seen
Γ_8 $N(1520)\pi, P\text{-wave}$	1–5 %
Γ_9 $N(1535)\pi$	0.5–1.5 %
Γ_{10} $\Delta(1232)\eta$	3–7 %
Γ_{11} $N\gamma$	0.22–0.60 %
Γ_{12} $N\gamma, \text{helicity}=1/2$	0.12–0.30 %
Γ_{13} $N\gamma, \text{helicity}=3/2$	0.10–0.30 %

 $\Delta(1900)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

Mode	Fraction (Γ_i/Γ)
Γ_1 $N\pi$	4-12 %
Γ_2 ΣK	seen
Γ_3 $N\pi\pi$	45-85 %
Γ_4 $\Delta(1232)\pi$	
Γ_5 $\Delta(1232)\pi, D$ -wave	30-70 %
Γ_6 $N\rho$	
Γ_7 $N\rho, S=1/2, S$ -wave	8-16 %
Γ_8 $N\rho, S=3/2, D$ -wave	18-28 %
Γ_9 $N(1440)\pi$	8-32 %
Γ_{10} $N(1520)\pi$	2-10 %
Γ_{11} $\Delta(1232)\eta$	0-2 %
Γ_{12} $N\gamma, \text{ helicity}=1/2$	0.06-0.43 %

 Partial-Wave Analyses

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-3/2 resonances found in partial-wave analyses.

Our 1982 edition also had a $\Delta(2850)$ and a $\Delta(3230)$. The evidence for them was deduced from total cross-section and 180° elastic cross-section measurements. The $\Delta(2850)$ has been resolved into the $\Delta(2750) \frac{1}{2}^-$ and $\Delta(2950) \frac{3}{2}^-$. The $\Delta(3230)$ is perhaps related to the $K_{3,13}$ of HENDRY 78 and to the $L_{3,17}$ of KOCH 80.

$\Delta(\sim 3000)$ BREIT-WIGNER MASS

VALUE (MeV)	DOCUMENT ID	TECN	COMMENT

CONSTRAINED FIT INFORMATION

An overall fit to 5 branching ratios uses 20 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 10.5$ for 16 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$\Lambda(1405) 1/2^-$

$I(J^P) = 0(\frac{1}{2}^-)$ Status: ****

In the 1998 Note on the $\Lambda(1405)$ in PDG 98, R.H. Dalitz discussed the S-shaped cusp behavior of the intensity at the $N\bar{K}$ threshold observed in THOMAS 73 and HEMINGWAY 85. He commented that this behavior "is characteristic of S-wave coupling; the other below threshold hyperon, the $\Sigma(1385)$, has no such threshold distortion because its $N\bar{K}$ coupling is P-wave. For $\Lambda(1405)$ this asymmetry is the sole direct evidence that $J^P = 1/2^-$."

A recent measurement by the CLAS collaboration, MORIYA 14, definitively established the long-assumed $J^P = 1/2^-$ spin-parity assignment of the $\Lambda(1405)$. The experiment produced the $\Lambda(1405)$ spin-polarized in the photoproduction process $\gamma p \rightarrow K^+ \Lambda(1405)$ and measured the decay of the $\Lambda(1405)$ (polarized) $\rightarrow \Sigma^+$ (polarized) π^- . The observed isotropic decay of $\Lambda(1405)$ is consistent with spin $J = 1/2$. The polarization transfer to the Σ^+ (polarized) direction revealed negative parity, and thus established $J^P = 1/2^-$.

37.0 ± 3.2	KIM 65	HBC	
28.2 ± 4.1	⁵ SAKITT 65	HBC	

¹ The KIMURA 00 values are from fits A and B from a coupled-channel potential model using low-energy $\bar{K}N$ and $\Sigma\pi$ data, kaonic-hydrogen x-ray measurements, and our $\Lambda(1405)$ mass and width. The results bear mainly on the nature of the $\Lambda(1405)$: three-quark state or $\bar{K}N$ bound state.
² The MARTIN 81 fit includes the $K^\pm p$ forward scattering amplitudes and the dispersion relations they must satisfy.
³ An asymmetric shape, with $\Gamma/2 = 41$ MeV below resonance, 14 MeV above.
⁴ See also the accompanying paper of THOMAS 73.
⁵ Data of SAKITT 65 are used in the fit by KITTEL 66.

$\Lambda(1520) 3/2^-$

$$J(J^P) = 0(\frac{3}{2}^-) \text{ Status: } ***$$

Discovered by FERRO-LUZZI 62; the elaboration in WATSON 63 is the classic paper on the Breit-Wigner analysis of a multichannel resonance.

The measurements of the mass, width, and elasticity published before 1975 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

Production and formation experiments agree quite well, so they are listed together here.

$\Gamma(\Sigma(1385)\pi(\rightarrow\Lambda\pi\pi))/\Gamma(\Lambda\pi\pi)$

The $\Lambda\pi\pi$ mode is largely due to $\Sigma(1385)\pi$. Only the values of $(\Sigma(1385)\pi)/(\Lambda\pi\pi)$ given by MAST 73B and CORDEN 75 are based on real 3-body partial-wave analyses. The discrepancy between the two results is essentially due to the different hypotheses made concerning the shape of the $(\pi\pi)_{S\text{-wave}}$ state.

$\Lambda(1690) 3/2^-$

 $I(J^P) = 0(\frac{3}{2}^-)$ Status: * * * *

The measurements of the mass, width, and elasticity published before 1974 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

$\Lambda(1830) 5/2^-$	$I(J^P) = 0(\frac{5}{2}^-)$ Status: ***
---	---

For results published before 1973 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

The best evidence for this resonance is in the $\Sigma\pi$ channel.

$\Lambda(2080)$ REFERENCES

SARANTSEV 19 EPJ A55 180 A.V. Sarantsev et al. (BONN, PNPI)

$\Lambda(2085) 7/2^+$ $I(J^P) = 0(\frac{7}{2}^+)$ Status: **

OMITTED FROM SUMMARY TABLE was $\Lambda(2020)$

In LITCHFIELD 71, need for the state rests solely on a possibly inconsistent polarization measurement at 1.784 GeV/c. HEMINGWAY 75 does not require this state. GOPAL 77 does not need it in either $N\bar{K}$ or $\Sigma\pi$. With new K^-n angular distributions included, DECLAIS 77 sees it. However, this and other new data are included in GOPAL 80 and the state is not required. BACCARI 77 weakly supports it.

$\Lambda(2100) 7/2^-$

 $I(J^P) = 0(\frac{7}{2}^-)$ Status: * * * *

Most of the results published before 1973 are now obsolete and have been omitted. They may be found in our 1982 edition Physics Letters **111B** 1 (1982).

This entry only includes results from partial-wave analyses. Parameters of peaks seen in cross sections and in invariant-mass distributions around 2100 MeV used to be listed in a separate entry immediately following. It may be found in our 1986 edition Physics Letters **170B** 1 (1986).

 $\Lambda(2100)$ FOOTNOTES

¹ The NAKKASYAN 75 values are from the two best solutions found. Each has the $\Lambda(2100)$ and one additional resonance (P_3 or F_5).

² Note that the three for BACCARI 77 entries are for three different waves.

³ The published sign has been changed to be in accord with the baryon-first convention. The upper limit on the G_3 wave is 0.03.

$\Lambda(2325) 3/2^-$

$$I(J^P) = 0(\frac{3}{2}^-) \text{ Status: } *$$

OMITTED FROM SUMMARY TABLE

BACCARI 77 finds this state with either $J^P = 3/2^-$ or $3/2^+$ in an energy-dependent partial-wave analyses of $K^-p \rightarrow \Lambda\omega$ from 2070 to 2436 MeV. A subsequent semi-energy-independent analysis from threshold to 2436 MeV selects $3/2^-$. DEBELLEFON 78 (same group) also sees this state in an energy-dependent partial-wave analysis of $K^-p \rightarrow \bar{K}N$ data, and finds $J^P = 3/2^-$ or $3/2^+$. They again prefer $J^P = 3/2^-$, but only on the basis of model-dependent considerations.

2.4040 ± 0.0198	44k	² ANKENBRA... 83	CNTR	p Cu 400 GeV

¹We assume CPT invariance: this is (minus) the Σ^- magnetic moment as measured by MORELOS 93. See below for the moment difference testing CPT .
²ANKENBRANDT 83 gives the value $2.38 \pm 0.02 \mu_N$. MORELOS 93 uses the same hyperon magnet and channel and claims to determine the field integral better, leading to the revised value given here.

$(\mu_{\Sigma^+} + \mu_{\Sigma^-}) / \mu_{\Sigma^+}$

A test of CPT invariance.

VALUE	DOCUMENT ID	TECN	COMMENT
0.014 ± 0.015	¹ MORELOS 93	SPEC	p Cu 800 GeV

¹This is our calculation from the MORELOS 93 measurements of the Σ^+ and Σ^- magnetic moments given above. The statistical error on μ_{Σ^-} dominates the error here.

Σ^+ DECAY MODES

Mode	Fraction (Γ_i/Γ)	Confidence level
Γ_1 $p\pi^0$	(51.57 ± 0.30) %	
Γ_2 $n\pi^+$	(48.31 ± 0.30) %	
Γ_3 $p\gamma$	(1.23 ± 0.05) × 10 ⁻³	
Γ_4 $n\pi^+\gamma$	[a] (4.5 ± 0.5) × 10 ⁻⁴	
Γ_5 $\Lambda e^+\nu_e$	(2.0 ± 0.5) × 10 ⁻⁵	

$\Delta S = \Delta Q$ (SQ) violating modes or $\Delta S = 1$ weak neutral current ($S1$) modes

Mode	Fraction	Confidence level
Γ_6 $n e^+\nu_e$	$SQ < 5 \times 10^{-6}$	90%
Γ_7 $n\mu^+\nu_\mu$	$SQ < 3.0 \times 10^{-5}$	90%
Γ_8 $p e^+ e^-$	$S1 < 7 \times 10^{-6}$	
Γ_9 $p\mu^+\mu^-$	$S1 (2.4 \pm 1.7) \times 10^{-8}$	

[a] See the Listings below for the pion momentum range used in this measurement.

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 14 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 7.7$ for 12 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

x_2	-100	
x_3	12	-14
	x_1	x_2

Σ^0

$$J(P) = 1(\frac{1}{2}^+) \text{ Status: } ***$$

COURANT 63 and ALFF 65, using $\Sigma^0 \rightarrow \Lambda e^+ e^-$ decays (Dalitz decays), determined the Σ^0 parity to be positive, given that $J = 1/2$ and that certain very reasonable assumptions about form factors are true. The results of experiments involving the Primakoff effect, from which the Σ^0 mean life and $\Sigma^0 \rightarrow \Lambda$ transition magnetic moment come (see below), strongly support $J = 1/2$.

Σ^0 MASS

The fit uses Σ^+ , Σ^0 , Σ^- , and Λ mass and mass-difference measurements.

Σ^0 MEAN LIFE

These lifetimes are deduced from measurements of the cross sections for the Primakoff process $\Lambda \rightarrow \Sigma^0$ in nuclear Coulomb fields. An alternative expression of the same information is the Σ^0 - Λ transition magnetic moment given in the following section. The relation is $(\mu_{\Sigma\Lambda}/\mu_N)^2 \tau = 1.92951 \times 10^{-19}$ s (see DEVLIN 86).

[a] See the Listings below for the pion momentum range used in this measurement.

CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 16 measurements and one constraint to determine 4 parameters. The overall fit has a $\chi^2 = 8.7$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

⁶ BERLEY 70B changed from -5 to +5° to agree with our sign convention.

g_A/g_V FOR $\Sigma^- \rightarrow n e^- \bar{\nu}_e$

Measurements with fewer than 500 events have been omitted. Where necessary, signs have been changed to agree with our conventions, which are given in the "Note on Baryon Decay Parameters" in the neutron Listings. What is actually listed is $|g_1/f_1 - 0.237g_2/f_1|$. This reduces to $g_A/g_V \equiv g_1(0)/f_1(0)$ on making the usual assumption that $g_2 = 0$. See also the note on HSUEH 88.

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
0.340 ± 0.017 OUR AVERAGE				
+0.327 ± 0.007 ± 0.019	50k	⁷ HSUEH	88	SPEC Σ^- 250 GeV
+0.34 ± 0.05	4456	⁸ BOURQUIN	83c	SPEC SPS hyperon beam
0.385 ± 0.037	3507	⁹ TANENBAUM	74	ASPK

• • • We do not use the following data for averages, fits, limits, etc. • • •

0.29 ± 0.07	25k	HSUEH	85	SPEC See HSUEH 88
0.17 $\begin{smallmatrix} +0.07 \\ -0.09 \end{smallmatrix}$	519	DECAMP	77	ELEC Hyperon beam

⁷ The sign is, with our conventions, unambiguously positive. The value assumes, as usual, that $g_2 = 0$. If g_2 is included in the fit, than (with our sign convention) $g_2 = -0.56 \pm 0.37$, with a corresponding reduction of g_A/g_V to $+0.20 \pm 0.08$.

⁸ BOURQUIN 83c favors the positive sign by at least 2.6 standard deviations.

⁹ TANENBAUM 74 gives 0.435 ± 0.035 , assuming no q^2 dependence in g_A and g_V . The listed result allows q^2 dependence, and is taken from HSUEH 88.

$f_2(0)/f_1(0)$ FOR $\Sigma^- \rightarrow n e^- \bar{\nu}_e$

The signs have been changed to be in accord with our conventions, given in the "Note on Baryon Decay Parameters" in the neutron Listings.

$\Sigma(1385) 3/2^+$

$$I(J^P) = 1(\frac{3}{2}^+) \text{ Status: } ****$$

Discovered by ALSTON 60. Early measurements of the mass and width for combined charge states have been omitted. They may be found in our 1984 edition Reviews of Modern Physics 56 S1 (1984).

We average only the most significant determinations. We do not average results from inclusive experiments with large backgrounds or results which are not accompanied by some discussion of experimental resolution. Nevertheless systematic differences between experiments remain. (See the ideograms in the Listings below.) These differences could arise from interference effects that change with production mechanism and/or beam momentum. They can also be accounted for in part by differences in the parametrizations employed. (See BORENSTEIN 74 for a discussion on this point.) Thus BORENSTEIN 74 uses a Breit-Wigner with energy-independent width, since a P -wave was found to give unsatisfactory fits. CAMERON 78 uses the same form. On the other hand HOLMGREN 77 obtains a good fit to their $\Lambda\pi$ spectrum with a P -wave Breit-Wigner, but includes the partial width for the $\Sigma\pi$ decay mode in the parametrization. AGUILAR-BENITEZ 81D gives masses and widths for five different Breit-Wigner shapes. The results vary considerably. Only the best-fit S -wave results are given here.

- Includes data of HOLMGREN 77.
- The errors are statistical only. The resolution is not unfolded.
- The error is enlarged to Γ/\sqrt{N} . See the note on the $K^*(892)$ mass in the 1984 edition.
- From a fit to $\Lambda\pi^0$ with the width fixed at 34 MeV.
- From fit to inclusive $\Lambda\pi^0$ spectrum with the width fixed at 40 MeV.
- Redundant with data in the mass Listings.
- Results from $\Lambda\pi^+\pi^-$ and $\Lambda\pi^+\pi^-\pi^0$ combined by us.
- The error is enlarged to Γ/\sqrt{N} . See the note on the $K^*(892)$ mass in the 1984 edition.
- Consistent with +, 0, and - widths equal.
- KELLER 12 gives $\Gamma(\Sigma^+\gamma)/\Gamma(\Sigma^+\pi^0) = (11.95 \pm 2.21 \pm 0.53 \pm 1.21)\%$, using 1/2 our total $\Sigma(1385) \rightarrow \Sigma\pi$ fraction for $\Sigma^+\pi^0$. We divide the KELLER 12 value by two.
- We calculate this from the MOLCHANOV 04 upper limit of 9.5 keV on the $\Sigma^-\gamma$ width.
- We calculate this from the ARIK 77 upper limit of 24 keV on the $\Sigma^-\gamma$ width.
- An extrapolation of the parametrized amplitude below threshold.

$\Sigma(1580) 3/2^-$

$$I(J^P) = 1(\frac{3}{2}^-) \text{ Status: *}$$

OMITTED FROM SUMMARY TABLE

Seen in the isospin-1 $\bar{K}N$ cross section at BNL (LI 73, CARROLL 76) and in a partial-wave analysis of $K^-p \rightarrow \Lambda\pi^0$ for c.m. energies 1560–1600 MeV by LITCHFIELD 74. LITCHFIELD 74 finds $J^P = 3/2^-$. Not seen by ENGLER 78, CAMERON 78C, OLMSTED 04, nor by PRAKHOV 04.

Neither ZHANG 13A nor SARANTSEV 19 see any evidence for this state.

$\Sigma(1620) 1/2^-$

$I(J^P) = 1(\frac{1}{2}^-)$ Status: *

OMITTED FROM SUMMARY TABLE

The S_{11} state at 1697 MeV reported by VANHORN 75 is tentatively listed under the $\Sigma(1750)$. CARROLL 76 sees two bumps in the isospin-1 total cross section near this mass. GAO 12 sees no evidence for this resonance.

Production experiments are listed separately in the next entry.

THE $\Sigma(1670)$ REGION

Production experiments: The measured $\Sigma\pi/\Sigma\pi\pi$ branching ratio for the $\Sigma(1670)$ produced in the reaction $K^-p \rightarrow \pi^-\Sigma(1670)^+$ is strongly dependent on momentum transfer. This was first discovered by EBERHARD 69 [1], who suggested that there exist two Σ resonances with the same mass and quantum numbers: one with a large $\Sigma\pi\pi$ (mainly $\Lambda(1405)\pi$) branching fraction produced peripherally, and the other with a large $\Sigma\pi$ branching fraction produced at larger angles. The experimental results have been confirmed by AGUILAR-BENITEZ 70 [2], APSELL 74 [3], ESTES 74 [4], and TIMMERMANS 76 [5]. If, in fact, there are two resonances, the most likely quantum numbers for both the $\Sigma\pi$ and the $\Lambda(1405)\pi$ states are D_{13} . There is also possibly a third Σ in this region, the $\Sigma(1690)$ in the Listings, the main evidence for which is a large $\Lambda\pi/\Sigma\pi$ branching ratio. These topics have been reviewed by EBERHARD 73 [6] and by MILLER 70 [7].

Formation experiments: Two states are also observed near this mass in formation experiments. One of these, the $\Sigma(1670)D_{13}$, has the same quantum numbers as those observed in production and has a large $\Sigma\pi/\Sigma\pi\pi$ branching ratio; it may well be the $\Sigma(1670)$ produced at larger angles (see TIMMERMANS 76 [5]). The other state, the $\Sigma(1660)P_{11}$, has different quantum numbers, its $\Sigma\pi/\Sigma\pi\pi$ branching ratio is unknown, and its relation to the produced $\Sigma(1670)$ states is obscure.

$\Sigma(1750) 1/2^-$

$I(J^P) = 1(\frac{1}{2}^-)$ Status: ***

For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

There is evidence for this state in many partial-wave analyses, but with wide variations in the mass, width, and couplings. The latest analyses indicated significant couplings to $N\bar{K}$ and $\Lambda\pi$, as well as to $\Sigma\eta$ whose threshold is at 1746 MeV (JONES 74).

$\Sigma(1775) 5/2^-$

$I(J^P) = 1(5/2^-)$ Status: * * * *

Discovered by GALTIERI 63, this resonance plays the same role as cornerstone for isospin-1 analyses in this region as the $\Lambda(1820)F_{05}$ does in the isospin-0 channel.

For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters 111B 1 (1982).

$\Sigma(1880)$ FOOTNOTES

- The two MARTIN 77 values are from a T-matrix pole and from a Breit-Wigner fit.
- From solution 1 of BAILLON 75; not present in solution 2.
- Only unconstrained states from table 1 of LEA 73 are listed.
- The published sign has been changed to be in accord with the baryon-first convention.

$\Sigma(1910)$ FOOTNOTES

- The two MARTIN 77 values are from a T-matrix pole and from a Breit-Wigner fit.
- The published sign has been changed to be in accord with the baryon-first convention.
- Upper limits on the D_1 and D_3 waves are each 0.03.

$\Sigma(1915) 5/2^+$

$I(J^P) = 1(\frac{5}{2}^+)$ Status: * * * *

Discovered by COOL 66. For results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

This entry only includes results from partial-wave analyses. Parameters of peaks seen in cross sections and invariant-mass distributions in this region used to be listed in a separate entry immediately following. They may be found in our 1986 edition Physics Letters **170B** 1 (1986).

SARANTSEV 19 EPJ A55 180 A.V. Sarantsev et al. (BONN, PNPI)

$\Sigma(2030) 7/2^+$

$I(J^P) = 1(\frac{7}{2}^+)$ Status: ***

Discovered by COOL 66 and by WOHL 66. For most results published before 1974 (they are now obsolete), see our 1982 edition Physics Letters **111B** 1 (1982).

This entry only includes results from partial-wave analyses. Parameters of peaks seen in cross sections and invariant-mass distributions around 2030 MeV may be found in our 1984 edition, Reviews of Modern Physics **56** S1 (1984).
