[a] This is the purely e^+ semileptonic branching fraction: the e^+ fraction from τ^+ decays has been subtracted off. The sum of our (non- τ) e^+ exclusive fractions — an $e^+ \nu_e$ with an η, η', ϕ, K^0 , or K^{*0} — is $5.99 \pm 0.31 \%$.

[b] This fraction includes η from η' decays.

[c] The sum of our exclusive η' fractions — $\eta' e^+ \nu_e, \eta' \mu^+ \nu_\mu, \eta' \pi^+, \eta' \rho^+$, and $\eta' K^+$ — is $11.8 \pm 1.6 \%$.

[d] This branching fraction includes all the decay modes of the final-state resonance.

[e] A test for $u\bar{u}$ or $d\bar{d}$ content in the D_s^+ . Neither Cabibbo-favored nor Cabibbo-suppressed decays can contribute, and ω - ϕ mixing is an unlikely explanation for any fraction above about 2×10^{-4} .

[f] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.

[g] We decouple the $D_s^+ \rightarrow \phi \pi^+$ branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the $D_s^+ \rightarrow \phi \pi^+, \phi \rightarrow K^+ K^-$ branching fraction obtained from the Dalitz-plot analysis of $D_s^+ \rightarrow K^+ K^- \pi^+$. That is, the ratio of these two branching fractions is not exactly the $\phi \rightarrow K^+ K^-$ branching fraction 0.491.

[h] This is the average of a model-independent and a K -matrix parametrization of the $\pi^+ \pi^-$ S-wave and is a sum over several f_0 mesons.

[i] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.

[j] This is *not* a test for the $\Delta C=1$ weak neutral current, but leads to the $\pi^+ \ell^+ \ell^-$ final state.

CONSTRAINED FIT INFORMATION

An overall fit to 13 branching ratios uses 18 measurements and one constraint to determine 10 parameters. The overall fit has a $\chi^2 = 6.8$ for 9 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

- 0.173±0.023±0.035 182 ³ CHADHA 98 CLE2 $e^+e^- \approx \Upsilon(4S)$
 0.245±0.052±0.074 39 ⁴ ACOSTA 94 CLE2 See CHADHA 98
- AUBERT 07v gets $f_{D_s^+} = (283 \pm 17 \pm 16)$ MeV, using $\Gamma(D_s^+ \rightarrow \phi\pi^+)/\Gamma(\text{total}) = (4.71 \pm 0.46)\%$.
 - ALEXANDROV 00 uses $f_D^2/f_{D_s}^2 = 0.82 \pm 0.09$ from a lattice-gauge-theory calculation to get the relative numbers of $D^+ \rightarrow \mu^+\nu_\mu$ and $D_s^+ \rightarrow \mu^+\nu_\mu$ events. The present result leads to $f_{D_s} = (323 \pm 44 \pm 36)$ MeV.
 - CHADHA 98 obtains $f_{D_s} = (280 \pm 19 \pm 28 \pm 34)$ MeV from this measurement, using $\Gamma(D_s^+ \rightarrow \phi\pi^+)/\Gamma(\text{total}) = 0.036 \pm 0.009$.
 - ACOSTA 94 obtains $f_{D_s} = (344 \pm 37 \pm 52 \pm 42)$ MeV from this measurement, using $\Gamma(D_s^+ \rightarrow \phi\pi^+)/\Gamma(\text{total}) = 0.037 \pm 0.009$.

$\Gamma(\tau^+\nu_\tau)/\Gamma_{\text{total}}$ Γ_{21}/Γ
 See the note on "Decay Constants of Charged Pseudoscalar Mesons" above.

- ABLIKIM 160 value is constrained by the Standard Model ratio of $\Gamma(D_s^+ \rightarrow \tau^+\nu_\tau)/\Gamma(D_s^+ \rightarrow \mu^+\nu_\mu) = 9.76$; the unconstrained value is $(3.28 \pm 1.83 \pm 0.37)\%$.
- ZUPANC 13 uses both $\mu^+\nu$ and $\tau^+\nu$ events to get $f_{D_s} = (255.5 \pm 4.2 \pm 5.1)$ MeV.
- DEL-AMO-SANCHEZ 10j (with a small correction; see LEES 15d) uses $\mu^+\nu_\mu$ and $\tau^+\nu_\tau$ events together to get $f_{D_s} = (259.9 \pm 6.6 \pm 7.6)$ MeV.
- ALEXANDER 09, NAIK 09A, and ONYISI 09 use different τ decay modes and are independent. The three papers combined give $f_{D_s} = (259.7 \pm 7.8 \pm 3.4)$ MeV.
- ECKLUND 08 and PEDLAR 07A are independent: ECKLUND 08 uses $\tau^+ \rightarrow e^+\nu_e \bar{\nu}_\tau$ events, PEDLAR 07A uses $\tau^+ \rightarrow \pi^+ \bar{\nu}_\tau$ events.
- HEISTER 02i combines its $D_s^+ \rightarrow \tau^+\nu_\tau$ and $\mu^+\nu_\mu$ branching fractions to get $f_{D_s} = (285 \pm 19 \pm 40)$ MeV.
- This ABBIENDI 01L value gives a decay constant f_{D_s} of $(286 \pm 44 \pm 41)$ MeV.
- The second ACCIARRI 97F error here combines in quadrature systematic (0.016) and normalization (0.018) errors. The branching fraction gives $f_{D_s} = (309 \pm 58 \pm 33 \pm 38)$ MeV.

3.9 ^{+5.1 +1.8} _{-1.9 -1.1}		⁴ BAI	95c	BES	e^+e^- 4.03 GeV

The results here are model-independent. For earlier, model-dependent results, see our PDG 06 edition. We decouple the $D_s^+ \rightarrow \phi\pi^+$ branching fraction obtained from mass projections (and used to get some of the other branching fractions) from the $D_s^+ \rightarrow \phi\pi^+, \phi \rightarrow K^+K^-$ branching fraction obtained from the Dalitz-plot analysis of $D_s^+ \rightarrow K^+K^-\pi^+$. That is, the ratio of these two branching fractions is not exactly the $\phi \rightarrow K^+K^-$ branching fraction 0.491.

- ¹ This AUBERT 06N measurement uses $\bar{B}^0 \rightarrow D_s^{(*)-}D^{(*)+}$ and $B^- \rightarrow D_s^{(*)-}D^{(*)+}$ decays, including some from other papers. However, the result is independent of AUBERT 05v.
- ² AUBERT 05v uses the ratio of $B^0 \rightarrow D^{*-}D_s^{*+}$ events seen in two different ways, in both of which the $D^{*-} \rightarrow \bar{D}^0\pi^-$ decay is fully reconstructed: (1) The $D_s^{*+} \rightarrow D_s^+\gamma, D_s^+ \rightarrow \phi\pi^+$ decay is fully reconstructed. (2) The number of events in the D_s^+ peak in the missing mass spectrum against the $D^{*-}\gamma$ is measured.
- ³ ARTUSO 96 uses partially reconstructed $\bar{B}^0 \rightarrow D^{*+}D_s^{*-}$ decays to get a model-independent value for $\Gamma(D_s^- \rightarrow \phi\pi^-)/\Gamma(D^0 \rightarrow K^-\pi^+)$ of $0.92 \pm 0.20 \pm 0.11$.
- ⁴ BAI 95c uses $e^+e^- \rightarrow D_s^+D_s^-$ events in which one or both of the D_s^\pm are observed to obtain the first model-independent measurement of the $D_s^+ \rightarrow \phi\pi^+$ branching fraction, without assumptions about $\sigma(D_s^\pm)$. However, with only two "doubly-tagged" events, the statistical error is very large.

$\Gamma(\pi^+(\pi^+\pi^-\text{s-wave})/\Gamma(2\pi^+\pi^-)$ Γ_{66}/Γ_{64}

This is the "fit fraction" from the Dalitz-plot analysis. See also KLEMPPT 08, which uses 568 $D_s^\pm \rightarrow 3\pi$ decays (over 280 background events) from FNAL E791 to study various parametrizations of the decay amplitudes. The emphasis there is more on S-wave $\pi\pi$ decay products — 20 different solutions are given — than on D_s^\pm fit fractions.

VALUE	DOCUMENT ID	TECN	COMMENT
0.833 ± 0.020 OUR AVERAGE			
0.830 ± 0.009 ± 0.019	¹ AUBERT 09o	BABR	Dalitz fit, $\approx 10.5k$ evts
0.8704 ± 0.0560 ± 0.0438	² LINK 04	FOCS	Dalitz fit, 1475 ± 50 evts

¹AUBERT 09o gives the amplitude and phase of the $\pi^+\pi^-$ S-wave in 29 $\pi^+\pi^-$ invariant-mass bins.
²LINK 04 borrows a K-matrix parametrization from ANISOVICH 03 of the full $\pi-\pi$ S-wave isoscalar scattering amplitude to describe the $\pi^+\pi^-$ S-wave component of the $\pi^+\pi^+\pi^-$ state. The fit fraction given above is a sum over five f_0 mesons, the $f_0(980)$, $f_0(1300)$, $f_0(1200-1600)$, $f_0(1500)$, and $f_0(1750)$. See LINK 04 for details and discussion.

 $D_s^+ - D_s^-$ CP-VIOLATING DECAY-RATE ASYMMETRIES

This is the difference between D_s^+ and D_s^- partial widths for the decay to state f , divided by the sum of the widths:

$$A_{CP}(f) = [\Gamma(D_s^+ \rightarrow f) - \Gamma(D_s^- \rightarrow \bar{f})] / [\Gamma(D_s^+ \rightarrow f) + \Gamma(D_s^- \rightarrow \bar{f})].$$

$A_{CP}(\mu^\pm\nu)$ in $D_s^+ \rightarrow \mu^+\nu$, $D_s^- \rightarrow \mu^-\bar{\nu}_\mu$

CP VIOLATING ASYMMETRIES OF P-ODD (T-ODD) MOMENTS

 $A_{Tviol}(K_S^0 K^\pm \pi^+ \pi^-)$ in $D_s^\pm \rightarrow K_S^0 K^\pm \pi^+ \pi^-$

$C_T \equiv \bar{p}_{K^+} \cdot (\bar{p}_{\pi^+} \times \bar{p}_{\pi^-})$ is a parity-odd correlation of the K^+ , π^+ , and π^- momenta for the D_s^+ . $\bar{C}_T \equiv \bar{p}_{K^-} \cdot (\bar{p}_{\pi^-} \times \bar{p}_{\pi^+})$ is the corresponding quantity for the D_s^- . Then

$A_T \equiv [\Gamma(C_T > 0) - \Gamma(C_T < 0)] / [\Gamma(C_T > 0) + \Gamma(C_T < 0)]$, and

$\bar{A}_T \equiv [\Gamma(-\bar{C}_T > 0) - \Gamma(-\bar{C}_T < 0)] / [\Gamma(-\bar{C}_T > 0) + \Gamma(-\bar{C}_T < 0)]$, and

$A_{Tviol} \equiv \frac{1}{2}(A_T - \bar{A}_T)$. C_T and \bar{C}_T are commonly referred to as T -odd moments, because they are odd under T reversal. However, the T -conjugate process $K_S^0 K^\pm \pi^+ \pi^- \rightarrow D_s^\pm$ is not accessible, while the P -conjugate process is.

D_s^{*+} DECAY MODES

D_s^{*-} modes are charge conjugates of the modes below.

Mode	Fraction (Γ_j/Γ)
$\Gamma_1 D_s^+ \gamma$	(93.5 ± 0.7) %
$\Gamma_2 D_s^+ \pi^0$	(5.8 ± 0.7) %
$\Gamma_3 D_s^+ e^+ e^-$	(6.7 ± 1.6) × 10 ⁻³

CONSTRAINED FIT INFORMATION

An overall fit to 2 branching ratios uses 3 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 0.0$ for 1 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

x_2	-97	
x_3	-19	-4

CONSTRAINED FIT INFORMATION

An overall fit to 7 branching ratios uses 8 measurements and one constraint to determine 5 parameters. The overall fit has a $\chi^2 = 3.4$ for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

$D_{s1}(2536)^\pm$

$I(J^P) = 0(1^+)$
 J, P need confirmation.

Seen in $D^*(2010)^+ K^0$, $D^*(2007)^0 K^+$, and $D_s^+ \pi^+ \pi^-$. Not seen in $D^+ K^0$ or $D^0 K^+$. $J^P = 1^+$ assignment strongly favored.

$D_{s1}(2536)^\pm$ MASS

The fit includes $D^\pm, D^0, D_s^\pm, D^{*\pm}, D^{*0}, D_s^{*\pm}, D_1(2420)^0, D_2^*(2460)^0$, and $D_{s1}(2536)^\pm$ mass and mass difference measurements.

- From a fit of the D_S^\pm recoil mass distribution with an incoherent sum of the S-wave and D-wave Breit-Wigner line shapes.
- Using the $D^*(2010)^\pm$ mass of 2010.0 ± 0.4 MeV from PDG 06.
- Calculated using $m(D^*(2010)^\pm) = 2010.0 \pm 0.5$ MeV, $m(D^*(2007)^0) = 2006.7 \pm 0.5$ MeV, and the mass difference below.
- Systematic uncertainties not evaluated.
- Calculated using the mass difference $m(D_{s1}^\pm) - m(D^{*+})_{PDG}$ below and $m(D^{*+})_{PDG} = 2010.25 \pm 0.14$ MeV. Assuming S-wave decay of the $D_{s1}(2536)$ to $D^{*+} K_S^0$, using a Breit-Wigner line shape corresponding to L=0.
- Calculated using the mass difference $m(D_{s1}^\pm) - m(D^{*+})_{PDG}$ reported below and $m(D^{*+})_{PDG} = 2010.27 \pm 0.17$ MeV.
- Calculated using $m(D^*(2007)^0) = 2006.6 \pm 0.5$ MeV and the mass difference below.
- Calculated using $m(D^*(2010)^\pm) = 2010.1 \pm 0.6$ MeV and the mass difference below.
- Not seen in $D^* K$.

$m_{D_{s1}(2536)^\pm} - m_{D^*(2111)}$

The fit includes $D^\pm, D^0, D_S^\pm, D^{*\pm}, D^{*0}, D_1(2420)^0, D_2^*(2460)^0$, and $D_{s1}(2536)^\pm$ mass and mass difference measurements.

BOTTOM MESONS**($B = \pm 1$)** $B^+ = u\bar{b}$, $B^0 = d\bar{b}$, $\bar{B}^0 = \bar{d}b$, $B^- = \bar{u}b$, similarly for B^{*s} **B-particle organization**

Many measurements of B decays involve admixtures of B hadrons. Previously we arbitrarily included such admixtures in the B^\pm section, but because of their importance we have created two new sections: “ B^\pm/B^0 Admixture” for $\Upsilon(4S)$ results and “ $B^\pm/B^0/B_s^0/b$ -baryon Admixture” for results at higher energies. Most inclusive decay branching fractions and χ_b at high energy are found in the Admixture sections. $B^0\bar{B}^0$ mixing data are found in the B^0 section, while $B_s^0\bar{B}_s^0$ mixing data and $B\bar{B}$ mixing data for a B^0/B_s^0 admixture are found in the B_s^0 section. CP -violation data are found in the B^\pm , B^0 , and B^\pm/B^0 Admixture sections. b -baryons are found near the end of the Baryon section. Recently, we also created a new section: “ V_{cb} and V_{ub} CKM Matrix Elements.”

The organization of the B sections is now as follows, where bullets indicate particle sections and brackets indicate reviews.

[Production and Decay of *b*-flavored Hadrons]

[A Short Note on HFLAV Activities]

- B^\pm

 - mean life
 - branching fractions

See the related review(s):**Production and Decay of *b*-flavored Hadrons****HEAVY FLAVOR AVERAGING GROUP**

Revised August 2019 by U. Egede (Monash University) and A. Soffer (Tel Aviv University)

The Heavy Flavor Averaging Group (HFLAV)* is an international collaboration of physicists from experiments measuring properties of heavy flavored particles, *i.e.*, hadrons containing b and c quarks, and τ leptons. HFLAV calculates and publishes [1] world average values of quantities such as lifetimes, branching fractions, form factors, mixing parameters, and CP -violating asymmetries. Most parameters concern decays of B and D mesons, and many are related to elements of the Cabibbo-Kobayashi-Maskawa (CKM) quark mixing matrix [2], [3].

HFLAV was originally formed in 2002 to continue the activities of the LEP Heavy Flavor Steering group. Since its inception, a wide range of results have become available from increasingly larger data sets. Consequently, HFLAV has expanded to include seven subgroups:

- b -hadron lifetimes and oscillations, including parameters of CP violation in b mixing;
- decay-time-dependent CP violation in B decays, and angles of the CKM Unitarity Triangle;
- semileptonic decays of b -hadrons ($B \rightarrow X\ell\nu$, $\ell = e, \mu, \tau$), including determinations of the CKM matrix elements $|V_{cb}|$ and $|V_{ub}|$;
- b -hadron decays to hadronic final states containing c -quarks (open charm and charmonium);
- (rarer) b -hadron decays to final states not containing c -quarks, including fully hadronic, semileptonic ($B \rightarrow X\ell\ell, X\nu\bar{\nu}$), leptonic, and radiative decays;
- c -hadron physics including branching fractions, CP - and T -violating asymmetries, $D^0\bar{D}^0$ mixing, semileptonic decays, and properties of excited D states and charm baryons;
- τ -lepton physics including branching fractions, tests of lepton universality, determination of the CKM matrix element $|V_{us}|$, and searches for lepton flavor violation.

* The group was originally referred to as “HFAG.” This acronym was changed to “HFLAV” in 2017.

Meson Particle Listings

b -flavored hadrons, B^\pm

Each subgroup has one or two conveners and typically a half-dozen members representing experiments that conduct measurements in that area. Most groups contain representatives from the BABAR, Belle, Belle II and LHCb experiments, and some groups have representatives from the ATLAS, BESIII, CLEO(c), CDF, CMS and D0 experiments. Members of HFLAV are appointed by their respective experimental collaborations. HFLAV has two co-leaders, who are appointed by the managements of Belle II and LHCb.

The averaging procedures used by HFLAV are similar to those of the PDG [4]. When calculating world averages, common parameters used for different input measurements are adjusted (rescaled) to common values. The confidence level of the fit is provided to indicate the consistency of the measurements included in the average. However, unlike the PDG, when obtaining a world average with a small confidence level (*i.e.*, a large χ^2 per degree of freedom), HFLAV does not usually scale the resulting uncertainty. Rather, the systematic uncertainties of the measurements are reviewed with experts from the experiments to understand the discrepancy. Unless inconsistencies among measurements are found, no correction is made to the calculated uncertainty. Close communication between representatives of the experiments and HFLAV members who perform averages helps ensure that measurement uncertainties, known correlations, and systematic effects are properly accounted for. If a special treatment is needed to calculate an average, or if an approximation used in an average calculation might not be sufficiently accurate (*e.g.*, assuming Gaussian uncertainties when the likelihood function is non-Gaussian), a note is included in the HFLAV publication and online documentation to describe this.

In general, HFLAV uses all publicly available results that have written documentation such as a journal publication, preprint, or conference note. These include preliminary results presented at conferences and workshops. However, preliminary results that remain unpublished for an extended period of time, or for which no publication is planned, are not included. A special subset of HFLAV averages are included in the PDG listings; for these averages, only measurements that are published or accepted for publication are used. The averages provided by HFLAV are listed by the PDG as “OUR EVALUATION” with a corresponding note.

All HFLAV averages and input measurements are documented in an approximately biennial journal paper or preprint; the most recent version is Ref. [1]. The latest results and plots are posted on an extensive set of webpages that are updated several times per year; these are available at

<https://hflav.web.cern.ch>.

¹ Uses $B^+ \rightarrow J/\psi K^+$ fully reconstructed decays.

² Uses exclusively reconstructed final states containing a $J/\psi \rightarrow \mu^+\mu^-$ decays.

³ CSORNA 00 uses fully reconstructed 526 $B^+ \rightarrow J/\psi(\ell) K^+$ events and invariant masses without beam constraint.

⁴ ALBRECHT 90J assumes 10580 for $\Upsilon(4S)$ mass. Supersedes ALBRECHT 87C and ALBRECHT 87D.

⁵ Found using fully reconstructed decays with $J/\psi(1S)$. ALBRECHT 87D assume $m_{\Upsilon(4S)} = 10577$ MeV.

B^\pm MEAN LIFE

See $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE section for data on B -hadron mean life averaged over species of bottom particles.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements and asymmetric lifetime errors.

B^+ DECAY MODES

B^- modes are charge conjugates of the modes below. Modes which do not identify the charge state of the B are listed in the B^\pm/B^0 ADMIXTURE section.

The branching fractions listed below assume 50% $B^0 \bar{B}^0$ and 50% $B^+ B^-$ production at the $\Upsilon(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $\Upsilon(4S)$ production ratio to 50:50 and their assumed D, D_s, D^* , and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g., $B \rightarrow D^\pm X$, the values usually are multiplicities, not branching fractions. They can be greater than one.

[a] An ℓ indicates an e or a μ mode, not a sum over these modes.
 [b] An $CP(\pm 1)$ indicates the $CP=+1$ and $CP=-1$ eigenstates of the $D^0-\bar{D}^0$ system.

[c] D denotes D^0 or \bar{D}^0 .
 [d] D_{CP+}^0 decays into $D^0 \pi^0$ with the D^0 reconstructed in CP -even eigenstates $K^+ K^-$ and $\pi^+ \pi^-$.
 [e] \bar{D}^{**} represents an excited state with mass $2.2 < M < 2.8$ GeV/ c^2 .
 [f] $\chi_{c1}(3872)^+$ is a hypothetical charged partner of the $\chi_{c1}(3872)$.
 [g] $\Theta(1710)^{++}$ is a possible narrow pentaquark state and $G(2220)$ is a possible glueball resonance.
 [h] $(\bar{\Lambda}_c^- p)_s$ denotes a low-mass enhancement near 3.35 GeV/ c^2 .

CONSTRAINED FIT INFORMATION

An overall fit to 3 branching ratios uses 6 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 3.7$ for 4 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

10.1 ± 1.8 ± 1.5	ATHANAS 94	CLE2	Sup. by ARTUSO 97
¹ URQUIJO 07 report a measurement of $(10.34 \pm 0.23 \pm 0.25)\%$ for the partial branching fraction of $B^+ \rightarrow e^+ \nu_e X_c$ decay with electron energy above 0.6 GeV. We converted the result to $B^+ \rightarrow e^+ \nu_e X$ branching fraction.			
² The measurements are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/ c in the B rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV: $B(B^+ \rightarrow e^+ \nu_e X) / B(B^0 \rightarrow e^+ \nu_e X) = 1.074 \pm 0.041 \pm 0.026$.			
³ ARTUSO 97 uses partial reconstruction of $B \rightarrow D^* \ell \nu_e$ and inclusive semileptonic branching ratio from BARISH 96b $(0.1049 \pm 0.0017 \pm 0.0043)$.			
⁴ The measurements are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/ c in the B rest frame, and their ratio of $B(B^+ \rightarrow e^+ \nu_e X) / B(B^0 \rightarrow e^+ \nu_e X) = 1.08 \pm 0.05 \pm 0.02$.

- 4.1 ± 0.8 ± 0.8 ⁸ FULTON 91 CLEO $e^+e^- \rightarrow \Upsilon(4S)$
- 7.0 ± 1.8 ± 1.4 ⁹ ANTREASYAN 90B CBAL $e^+e^- \rightarrow \Upsilon(4S)$

- ¹ Measured using the dependence of $B^- \rightarrow D^{*0} e^- \overline{\nu}_e$ decay differential rate and the form factor description by CAPRINI 98.
- ² Simultaneous measurements of both $B^0 \rightarrow D^*(2010)^- \ell \nu$ and $B^+ \rightarrow \overline{D}^*(2007)^0 \ell \nu$.
- ³ ALBRECHT 92C reports $0.058 \pm 0.014 \pm 0.013$. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \rightarrow K^- \pi^+)$. Assumes equal production of $B^0 \overline{B}^0$ and $B^+ B^-$ at the $\Upsilon(4S)$.
- ⁴ Uses a fully reconstructed B meson as a tag on the recoil side.
- ⁵ The results are based on the same analysis and data sample reported in ADAM 03.
- ⁶ BARISH 95 use $B(D^0 \rightarrow K^- \pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$ and $B(D^{*0} \rightarrow D^0 \pi^0) = (63.6 \pm 2.3 \pm 3.3)\%$.

⁷ Combining $\overline{D}^{*0} \ell^+ \nu_\ell$ and $\overline{D}^{*-} \ell^+ \nu_\ell$ SANGHERA 93 test $V-A$ structure and fit the decay angular distributions to obtain $A_{FB} = 3/4 * (\Gamma^- - \Gamma^+) / \Gamma = 0.14 \pm 0.06 \pm 0.03$. Assuming a value of V_{cb} , they measure $V, A_1,$ and A_2 , the three form factors for the $D^* \ell \nu_\ell$ decay, where results are slightly dependent on model assumptions.

⁸ Assumes equal production of $B^0 \overline{B}^0$ and $B^+ B^-$ at the $\Upsilon(4S)$. Uncorrected for D and D^* branching ratio assumptions.

⁹ ANTREASYAN 90B is average over B and $\overline{D}^*(2010)$ charge states.

¹ Requires one reconstructed semileptonic B decay $B^- \rightarrow D^{(*)0} \ell^- \bar{\nu}_\ell$ in the recoil.

² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

³ The authors combine their result with that from HARA 10 obtaining $B(B^- \rightarrow \tau^- \bar{\nu}_\tau) = (0.96 \pm 0.26) \times 10^{-4}$ and deriving $f_B |V_{ub}| = (7.4 \pm 0.8 \pm 0.5) \times 10^{-4}$ GeV.

⁴ Requires a fully reconstructed hadronic B -decay in the recoil. Reports that this result combined with AUBERT 10E value gives $B(B^- \rightarrow \tau^- \bar{\nu}_\tau) = (1.79 \pm 0.48) \times 10^{-4}$.

⁵ Requires one reconstructed semileptonic B decay $B^- \rightarrow D^0 \ell^- \bar{\nu}_\ell X$ in the recoil.

⁶ Requires one reconstructed semileptonic B decay $B^- \rightarrow D^{(*)0} \ell^- \bar{\nu}_\ell X$ in the recoil.

⁷ The analysis is based on a sample of events with one fully reconstructed tag B in a hadronic decay mode $B^- \rightarrow D^{(*)0} X^-$.

⁸ The energy-flow and b -tagging algorithms were used.

⁹ ACCIARRI 97F uses missing-energy technique and $f(b \rightarrow B^-) = (38.2 \pm 2.5)\%$.

¹⁰ ALBRECHT 95D uses full reconstruction of one B decay as tag.

¹¹ BUSKULIC 95 uses same missing-energy technique as in $\bar{b} \rightarrow \tau^+ \nu_\tau X$, but analysis is restricted to endpoint region of missing-energy distribution.

 $1.9 \pm 1.0 \pm 0.6$ 7 10 ALBRECHT 88K ARG $e^+e^- \rightarrow \Upsilon(4S)$

1 Measures absolute branching fractions using a missing-mass technique.
 2 Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
 3 ABULENCIA 06J reports $[\Gamma(B^+ \rightarrow \bar{D}^0 \pi^+)/\Gamma_{total}] / [B(B^0 \rightarrow D^- \pi^+)] = 1.97 \pm 0.10 \pm 0.21$ which we multiply by our best value $B(B^0 \rightarrow D^- \pi^+) = (2.52 \pm 0.13) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
 4 Uses a missing-mass method. Does not depend on D branching fractions or B^+/B^0 production rates.
 5 AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of B^0 and B^+ , which is not included here.
 6 Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses the MarkIII branching fractions for the D .
 7 BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.
 8 AUBERT,B 04P reports $[\Gamma(B^+ \rightarrow \bar{D}^0 \pi^+)/\Gamma_{total}] \times [B(D^0 \rightarrow K^- \pi^+)] = (1.846 \pm 0.032 \pm 0.097) \times 10^{-4}$ which we divide by our best value $B(D^0 \rightarrow K^- \pi^+) = (3.950 \pm 0.031) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
 9 ALAM 94 assume equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the CLEOII absolute $B(D^0 \rightarrow K^- \pi^+)$ and the PDG 1992 $B(D^0 \rightarrow K^- \pi^+ \pi^0)/B(D^0 \rightarrow K^- \pi^+)$ and $B(D^0 \rightarrow K^- 2\pi^+ \pi^-)/B(D^0 \rightarrow K^- \pi^+)$.
 10 ALBRECHT 88K assumes $B^0 \bar{B}^0 : B^+ B^-$ ratio is 45:55. Superseded by ALBRECHT 90J.

¹ Reports a double ratio of $B(B^+ \rightarrow D_{CP(-1)} K^+)/B(B^+ \rightarrow D_{CP(-1)} \pi^+)$ and $B(B^+ \rightarrow \bar{D}^0 K^+)/B(B^+ \rightarrow \bar{D}^0 \pi^+)$, $1.17 \pm 0.14 \pm 0.14$. We multiply by our best value of $B(B^+ \rightarrow \bar{D}^0 K^+)/B(B^+ \rightarrow \bar{D}^0 \pi^+) = 0.083 \pm 0.006$. Our first error is their experiment's error and the second error is systematic error from using our best value.

² $CP=-1$ eigenstate of $D^0 \bar{D}^0$ system is reconstructed via $K_S^0 \pi^0$, $K_S^0 \omega$, $K_S^0 \phi$, $K_S^0 \eta$, and $K_S^0 \eta'$.

 3 BORTOLETTO 92 reports $(1.2 \pm 0.6 \pm 0.4) \times 10^{-3}$ from a measurement of $[\Gamma(B^+ \rightarrow J/\psi(1S) K^+ \pi^+ \pi^-)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+ e^-)]$ assuming $B(J/\psi(1S) \rightarrow e^+ e^-) = 0.069 \pm 0.009$, which we rescale to our best value

$B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁴ALBRECHT 87D reports $(1.2 \pm 0.8) \times 10^{-3}$ from a measurement of $[\Gamma(B^+ \rightarrow J/\psi(1S)K^+\pi^+\pi^-)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$ assuming $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. They actually report 0.0011 ± 0.0007 assuming $B^+B^-/B^0\bar{B}^0$ ratio is 55/45. We rescale to 50/50. Analysis explicitly removes $B^+ \rightarrow \psi(2S)K^+$.

⁵ALBRECHT 90J reports $< 1.6 \times 10^{-3}$ from a measurement of $[\Gamma(B^+ \rightarrow J/\psi(1S)K^+\pi^+\pi^-)/\Gamma_{\text{total}}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$ assuming $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069$, which we rescale to our best value $B(J/\psi(1S) \rightarrow e^+e^-) = 5.971 \times 10^{-2}$. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

- ¹ CHILIKIN 19 reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow p\bar{p}\pi^+\pi^-)] = (3.7^{+1.2+0.2}_{-1.0-0.3}) \times 10^{-7}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow p\bar{p}\pi^+\pi^-) = (2.1 \pm 0.7) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
- ² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- ³ Measured in the $B^+ \rightarrow K^+ K^- K^+$ decay.
- ⁴ Measured in the $B^+ \rightarrow K^+ K_S^0 K_S^0$ decay.
- ⁵ LEES 11i reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow \pi\pi)] = (1.53 \pm 0.66 \pm 0.27) \times 10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow \pi\pi) = (8.51 \pm 0.33) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
- ⁶ AUBERT 08Ai reports $(0.70 \pm 0.10^{+0.13}_{-0.10}) \times 10^{-6}$ for $B(B^+ \rightarrow \chi_{c0} K^+) \times B(\chi_{c0} \rightarrow \pi^+ \pi^-)$. We compute $B(B^+ \rightarrow \chi_{c0} K^+)$ using the PDG value $B(\chi_{c0} \rightarrow \pi\pi) = (8.51 \pm 0.33) \times 10^{-3}$ and 2/3 for the $\pi^+ \pi^-$ fraction. Our first error is their experiment's error and the second error is systematic error from using our best value.
- ⁷ AUBERT,BE 06M reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow \gamma J/\psi(1S))] = (6.1 \pm 2.6 \pm 1.1) \times 10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow \gamma J/\psi(1S)) = (1.40 \pm 0.05) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. The significance of the observed signal is 2.4 σ .
- ⁸ Measures absolute branching fractions using a missing-mass technique.
- ⁹ AAIJ 13s reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow p\bar{p})] < 6 \times 10^{-8}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow p\bar{p}) = 2.21 \times 10^{-4}$.
- ¹⁰ WICHT 08 reports $[\Gamma(B^+ \rightarrow \chi_{c0} K^+)/\Gamma_{total}] \times [B(\chi_{c0}(1P) \rightarrow \gamma\gamma)] < 0.11 \times 10^{-6}$ which we divide by our best value $B(\chi_{c0}(1P) \rightarrow \gamma\gamma) = 2.04 \times 10^{-4}$.

- ¹¹ Measured in the $B^+ \rightarrow K^+ K^- K^+$ decay.
- ¹² AUBERT,B 05N reports $(0.66 \pm 0.22 \pm 0.08) \times 10^{-6}$ for $B(B^+ \rightarrow \chi_{c0}^0 K^+) \times B(\chi_{c0}^0 \rightarrow \pi^+ \pi^-)$. We compute $B(B^+ \rightarrow \chi_{c0}^0 K^+)$ using the PDG value $B(\chi_{c0}^0 \rightarrow \pi^+ \pi^-) = (7.1 \pm 0.6) \times 10^{-3}$ and 2/3 for the $\pi^+ \pi^-$ fraction.
- ¹³ The measurement performed using decay channels $\chi_{c0} \rightarrow \pi^+ \pi^-$ and $\chi_{c0} \rightarrow K^+ K^-$. The ratio of the branching ratios for these channels is found to be consistent with world average.
- ¹⁴ AUBERT 04P reports $B(B^+ \rightarrow \chi_{c0} K^+) \times B(\chi_{c0} \rightarrow \pi^+ \pi^-) = (1.5 \pm 0.4 \pm 0.1) \times 10^{-6}$ and used PDG value of $B(\chi_{c0} \rightarrow \pi\pi) = (7.4 \pm 0.8) \times 10^{-3}$ and Clebsh-Gordan coefficient to compute $B(B^+ \rightarrow \chi_{c0} K^+)$.
- ¹⁵ ABE 02b measures the ratio of $B(B^+ \rightarrow \chi_{c0} K^+)/B(B^+ \rightarrow J/\psi(1S) K^+) = 0.60 \pm 0.21 - 0.18 \pm 0.05 \pm 0.08$, where the third error is due to the uncertainty in the $B(\chi_{c0} \rightarrow \pi^+ \pi^-)$, and uses $B(B^+ \rightarrow J/\psi(1S) K^+) = (10.0 \pm 1.0) \times 10^{-4}$ to obtain the result.
- ¹⁶ EDWARDS 01 assumes equal production of B^0 and B^+ at the $\Upsilon(4S)$. The correlated uncertainties (28.3)% from $B(J/\psi(1S) \rightarrow \gamma\eta_c)$ in those modes have been accounted for.

<210	90	AVERY	87 CLEO	$e^+e^- \rightarrow \Upsilon(4S)$

¹ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
² Uses $B(B^+ \rightarrow J/\psi K^+) = (1.00 \pm 0.04) \times 10^{-3}$ and $B(J/\psi \rightarrow \mu^+ \mu^-) = 0.0588 \pm 0.0010$.
³ Uses a reference decay mode $B^+ \rightarrow \bar{D}^0 \pi^+$ and $\bar{D}^0 \rightarrow K^+ \pi^-$ with $B(B^+ \rightarrow \bar{D}^0 \pi^+) \cdot B(\bar{D}^0 \rightarrow K^+ \pi^-) = (20.3 \pm 2.0) \times 10^{-5}$.
⁴ ABE 00C assumes $B(Z \rightarrow b\bar{b}) = (21.7 \pm 0.1)\%$ and the B fractions $f_{B^0} = f_{B^+} = (39.7 \pm 1.8)\%$ and $f_{B_S} = (10.5 \pm 1.8)\%$.
⁵ ADAM 96D assumes $f_{B^0} = f_{B^-} = 0.39$ and $f_{B_S} = 0.12$.
⁶ Assumes a B^0, B^- production fraction of 0.39 and a B_S production fraction of 0.12.
⁷ AVERY 89B reports $< 8 \times 10^{-5}$ assuming the $\Upsilon(4S)$ decays 43% to $B^0 \bar{B}^0$. We rescale to 50%.

<240 90 ⁵BORTOLETTO89 CLEO $e^+e^- \rightarrow \Upsilon(4S)$

¹AAIJ 19AL reports $0.075 \pm 0.008 \pm 0.007$ fit fraction for $B^+ \rightarrow f_2(1270)\pi^+$ from the amplitude analysis of $B^\pm \rightarrow \pi^\pm K^+ K^-$ decays. We use the PDG 19 value $B(B^+ \rightarrow K^+ K^- \pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \rightarrow f_2(1270)\pi^+, f_2(1270) \rightarrow K^+ K^-)$. We compute $B(B^+ \rightarrow f_2(1270)\pi^+)$ using 1/2 of PDG 19 value of $B(f_2(1270) \rightarrow K^+ K^-) = (4.6^{+0.5}_{-0.4})\%$ for $K^+ K^-$ fraction. Our first error is the experiment's error and the second error is systematic error from using our best value.

²AUBERT 09L reports $[\Gamma(B^+ \rightarrow \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \rightarrow \pi^+ \pi^-)] = (0.9 \pm 0.2 \pm 0.1^{+0.3}_{-0.1}) \times 10^{-6}$ which we divide by our best value $B(f_2(1270) \rightarrow \pi^+ \pi^-) = (56.2^{+1.9}_{-0.6}) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

³Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁴AUBERT,B 05G reports $[\Gamma(B^+ \rightarrow \pi^+ f_2(1270))/\Gamma_{\text{total}}] \times [B(f_2(1270) \rightarrow \pi^+ \pi^-)] = (2.3 \pm 0.6 \pm 0.4) \times 10^{-6}$ which we divide by our best value $B(f_2(1270) \rightarrow \pi^+ \pi^-) = (56.2^{+1.9}_{-0.6}) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

<15300	90	⁴ ABE	00C SLD	$e^+e^- \rightarrow Z$
< 500	90	³ BERGFELD	98 CLE2	
¹ AAIJ 19AL reports $(0.3 \pm 0.1 \pm 0.1) \times 10^{-2}$ fit fraction for $B^+ \rightarrow \phi(1020)\pi^+$ from the amplitude analysis of $B^\pm \rightarrow \pi^\pm K^+ K^-$ decays. We use the PDG 19 value $B(B^+ \rightarrow K^+ K^- \pi^+) = (5.2 \pm 0.4) \times 10^{-6}$ to obtain $B(B^+ \rightarrow \phi(1020)\pi^+, \phi(1020) \rightarrow K^+ K^-)$. We compute $B(B^+ \rightarrow \phi(1020)\pi^+)$ using the PDG 19 value of $B(\phi(1020) \rightarrow K^+ K^-) = (49.2 \pm 0.5)\%$. Our first error is the experiment's error and the second error is systematic error from using our best value.				
² Measures $B(B^+ \rightarrow \phi\pi^+)/B(B^+ \rightarrow \phi K^+) < 0.018$ at 90% C.L. and assumes $B(B^+ \rightarrow \phi K^+) = (8.8^{+0.7}_{-0.6}) \times 10^{-6}$.				
³ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.				
⁴ ABE 00c assumes $B(Z \rightarrow b\bar{b}) = (21.7 \pm 0.1)\%$ and the B fractions $f_{B^0} = f_{B^+} = (39.7^{+1.8}_{-2.2})\%$ and $f_{B_s} = (10.5^{+1.8}_{-2.2})\%$.

¹ Uses $B(B^+ \rightarrow J/\psi(1S)K^+) = (0.998 \pm 0.014 \pm 0.040) \times 10^{-3}$ for normalization.

² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

³ Uses $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+\mu^-K^+) = (6.01 \pm 0.21) \times 10^{-5}$.

⁴ Assumes equal production of B^0 and B^+ at $\Upsilon(4S)$. The second error is a total of systematic uncertainties including model dependence.

⁵ The result is for di-lepton masses above 0.5 GeV.

⁶ AFFOLDER 99B measured relative to $B^+ \rightarrow J/\psi(1S)K^+$.

⁷ ABE 96L measured relative to $B^+ \rightarrow J/\psi(1S)K^+$ using PDG 94 branching ratios.

⁸ ALBRECHT 91E reports $< 2.2 \times 10^{-4}$ assuming the $\Upsilon(4S)$ decays 45% to $B^0\bar{B}^0$. We rescale to 50%.

⁹ WEIR 90B assumes B^+ production cross section from LUND.

¹⁰ AVERY 89B reports $< 1.5 \times 10^{-4}$ assuming the $\Upsilon(4S)$ decays 43% to $B^0\bar{B}^0$. We rescale to 50%.

¹¹ AVERY 87 reports $< 3.2 \times 10^{-4}$ assuming the $\Upsilon(4S)$ decays 40% to $B^0\bar{B}^0$. We rescale to 50%.

POLARIZATION IN B^+ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L) or both are transverse and parallel (\parallel) or perpendicular (\perp) to each other with the parameters Γ_L/Γ , $\Gamma_{\parallel}/\Gamma$, and the relative phases ϕ_{\parallel} and ϕ_{\perp} . See the definitions in the note on "Polarization in B Decays" review in the B^0 Particle Listings.

CP VIOLATION PARAMETERS IN $B^+ \rightarrow DK^+$ AND SIMILAR DECAYS

The parameters r_{B^+} and δ_{B^+} are the magnitude ratio and strong phase difference between the amplitudes of $A(B^+ \rightarrow \bar{D}^{(*)0}K^{(*)+})$ and $A(B^+ \rightarrow D^{(*)0}K^{(*)-})$. The measured observables are defined as $x_{\pm} = r_{B^+} \cos(\delta_{B^+} \pm \gamma)$ and $y_{\pm} = r_{B^+} \sin(\delta_{B^+} \pm \gamma)$, and can be used to measure the CKM angle γ .

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV). It is derived from combinations of their results on $B^+ \rightarrow DK^+$ and related processes.

γ For angle $\gamma(\phi_3)$ of the CKM unitarity triangle, see the review on “CP Violation” in the Reviews section.
 “OUR EVALUATION” is provided by the Heavy Flavor Averaging Group (HFLAV).

- Uses binned analysis of $D \rightarrow K_S^0 \pi^+ \pi^- \pi^0$ from $B^\pm \rightarrow DK^\pm$ modes over the phase space. Strong phase measurements from RESM1 18 analysis of CLEO-c data of the D decay over the phase space binning are used as input.
- Uses binned Dalitz plot analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ and $K_S^0 K^+ K^-$ from $B^\pm \rightarrow DK^\pm$ modes. Strong phase measurements from CLEO-c of the D decay over the Dalitz plot are used as input.
- Measured in $B_S^0 \rightarrow D_S^\mp K^\pm$ decays, constraining $-2\beta_S$ by the measurement of $\phi_S = 0.030 \pm 0.033$ from HFLAV. The value is modulo 180° .
- AAIJ 18Z reports the intervals $(5-86)^\circ$ or $(185-266)^\circ$ at 68% C.L. The extraction uses the time dependent CP violation measurement in $B^0 \rightarrow D^\mp \pi^\pm$ decays with external input and some theoretical assumptions.
- Uses Dalitz plot analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ decays coming from $B^0 \rightarrow DK^*(892)^0$ modes. Measures $r_{B^0} = 0.39 \pm 0.13$, and $\delta_{B^0} = 197^{+24}_{-20}$ degrees.
- A combination of measurements from analyses of time-integrated $B^+ \rightarrow DK^+$, $B^0 \rightarrow DK^*(892)^0$, $B^0 \rightarrow DK^+ \pi^-$, and $B^+ \rightarrow DK^+ \pi^+ \pi^-$ tree-level decays. In addition, results from a time-dependent analysis of $B_S^0 \rightarrow D_S K$ decays are included.
- A model-independent binned Dalitz plot analysis of the decays $B^0 \rightarrow DK^*(892)^0$, with $D \rightarrow K_S^0 \pi^+ \pi^-$ and $D \rightarrow K_S^0 K^+ K^-$. The results cannot be combined with the model-dependent analysis of the same dataset reported in AAIJ 16AA.
- Angle γ required to satisfy $0 < \gamma < 180$ degrees.
- Obtained by measuring time-dependent CP asymmetry in $B_S^0 \rightarrow K^+ K^-$ and using a U-spin relation between $B_S^0 \rightarrow K^+ K^-$ and $B^0 \rightarrow \pi^+ \pi^-$.
- Results are also presented using additional inputs on $B^0 \rightarrow \pi^0 \pi^0$ and $B^+ \rightarrow \pi^+ \pi^0$ decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.
- Uses binned Dalitz plot analysis of $B^+ \rightarrow DK^+$ decays, with $D \rightarrow K_S^0 \pi^+ \pi^-$ and $D \rightarrow K_S^0 K^+ K^-$. Strong phase measurements from CLEO-c (LIBBY 10) of the D decay over the Dalitz plot are used as input. Solution that satisfies $0 < \gamma < 180$ is chosen.
- AAIJ 14BE uses model-dependent analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.
- Measured in $B_S^0 \rightarrow D_S^\mp K^\pm$ decays, constraining $-2\beta_S$ by the measurement of $\phi_S = 0.01 \pm 0.07 \pm 0.0$ from AAIJ 13AR. The value is modulo 180° at 68% CL.
- Presents a confidence region $55.4^\circ < \gamma < 82.3^\circ$ at 68% CL with best fit value 72.6° and includes both statistical and systematic uncertainties. The corresponding 95% CL is $40.2^\circ < \gamma < 92.7^\circ$. The value is determined from combination of measurements using D meson decaying to $K^+ K^-$, $\pi^+ \pi^-$, $K^\pm \pi^\mp$, $K_S^0 \pi^+ \pi^-$, $K_S^0 K^+ K^-$, and $K^\pm \pi^\mp \pi^\pm \pi^\mp$. Combines $B^\pm \rightarrow DK^\pm$ and $B^\pm \rightarrow D\pi^\pm$.

- Reports combination of published measurements using GGSZ, GLW, and ADS methods. Reports also 2σ range of $41-102^\circ$ and a 5.9σ significance for $\gamma(B^+ \rightarrow D^{(*)0} K^{(*)+}) \neq 0$ hypothesis.
- Reports combined statistical and systematic uncertainties.
- Uses binned Dalitz plot of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays from $B^+ \rightarrow \overline{D}^0 K^+$. Measurement of strong phases in $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ Dalitz plot from LIBBY 10 is used as input.
- We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between D^0 and \overline{D}^0 amplitudes.
- Uses Dalitz plot analysis of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$, $K_S^0 K^+ K^-$ decays from $B^+ \rightarrow D^{(*)} K^+$, $D K^{*+}$ modes. The corresponding two standard deviation interval for γ is $39^\circ < \gamma < 98^\circ$. CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.
- Reports confidence intervals for the CKM angle γ from the measured values of the GLW parameters using $B^\pm \rightarrow DK^\pm$ decays with D mesons decaying to non-CP($K\pi$), CP-even ($K^+ K^-$, $\pi^+ \pi^-$), and CP-odd ($K_S^0 \pi^0$, $K_S^0 \omega$) states.
- Uses Dalitz plot analysis of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays from $B^+ \rightarrow D^{(*)} K^+$ modes. The corresponding two standard deviation interval for γ is $54.2^\circ < \gamma < 100.5^\circ$. CP conservation in the combined result is ruled out with a significance of 3.5 standard deviations.
- Uses Dalitz plot analysis of $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays coming from $B^0 \rightarrow D^0 K^{*0}$ modes. The corresponding 95% CL interval is $77^\circ < \gamma < 247^\circ$. A 180 degree ambiguity is implied.
- Uses Dalitz plot analysis of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ and $\overline{D}^0 \rightarrow K_S^0 K^+ K^-$ decays coming from $B^\pm \rightarrow D^{(*)} K^{(\pm)}$ modes. The corresponding two standard deviation interval is $29^\circ < \gamma < 122^\circ$.
- Uses a Dalitz plot analysis of the $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays; Combines the DK^+ , $D^* K^+$ and DK^{*+} modes. The corresponding two standard deviations interval for gamma is $8^\circ < \gamma < 111^\circ$.
- Uses a Dalitz plot analysis of neutral $D \rightarrow K_S^0 \pi^+ \pi^-$ decays coming from $B^\pm \rightarrow DK^\pm$ and $B^\pm \rightarrow D^{*0} K^\pm$ followed by $D^{*0} \rightarrow D\pi^0$, $D\gamma$. The corresponding two standard deviations interval for gamma is $12^\circ < \gamma < 137^\circ$. AUBERT,B 05Y also reports the amplitude ratios and the strong phases.
- Uses a Dalitz plot analysis of the 3-body $D \rightarrow K_S^0 \pi^+ \pi^-$ decays coming from $B^\pm \rightarrow DK^\pm$ and $B^\pm \rightarrow D^* K^\pm$ followed by $D^* \rightarrow D\pi^0$; here we use D to denote that the neutral D meson produced in the decay is an admixture of D^0 and \overline{D}^0 . The corresponding two standard deviations interval for γ is $26^\circ < \gamma < 126^\circ$. POLUEKTOV 04 also reports the amplitude ratios and the strong phases.

$r_B(B^+ \rightarrow D^0 K^+)$

r_B and δ_B are the amplitude ratio and relative strong phase between the amplitudes of $A(B^+ \rightarrow D^0 K^+)$ and $A(B^+ \rightarrow \overline{D}^0 K^+)$,

“OUR EVALUATION” is provided by the Heavy Flavor Averaging Group (HFLAV).

- Uses binned analysis of $D \rightarrow K_S^0 \pi^+ \pi^- \pi^0$ from $B^\pm \rightarrow DK^\pm$ modes over the phase space. Strong phase measurements from RESM1 18 analysis of CLEO-c data of the D decay over the phase space binning are used as input.
- Uses binned Dalitz plot analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ and $K_S^0 K^+ K^-$ from $B^\pm \rightarrow DK^\pm$ modes. Strong phase measurements from CLEO-c of the D decay over the Dalitz plot are used as input.
- Uses binned Dalitz plot analysis of $B^+ \rightarrow DK^+$ decays, with $D \rightarrow K_S^0 \pi^+ \pi^-$ and $D \rightarrow K_S^0 K^+ K^-$. Strong phase measurements from CLEO-c (LIBBY 10) of the D decay over the Dalitz plot are used as input.
- AAIJ 14BE uses model-dependent analysis of $D \rightarrow K_S^0 \pi^+ \pi^-$ amplitudes. The model is the same as in DEL-AMO-SANCHEZ 10F.
- Uses $B^\pm \rightarrow [K^\pm \pi^\mp \pi^\pm \pi^\mp]_D h^\pm$ mode.
- Reports combination of published measurements using GGSZ, GLW, and ADS methods.
- Reports combined statistical and systematic uncertainties.
- Uses binned Dalitz plot of $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays from $B^+ \rightarrow \overline{D}^0 K^+$. Measurement of strong phases in $\overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^-$ Dalitz plot from LIBBY 10 is used as input.

Meson Particle Listings

 B^\pm

- ⁹We combined the systematics in quadrature. The authors report separately the contribution to the systematic uncertainty due to the uncertainty on the bin-averaged strong phase difference between D^0 and \bar{D}^0 amplitudes.
- ¹⁰Uses decays of neutral D to $K^-\pi^+\pi^0$.
- ¹¹Uses Dalitz plot analysis of $\bar{D}^0 \rightarrow K_S^0\pi^+\pi^-$, $K_S^0K^+K^-$ decays from $B^+ \rightarrow D^{(*)}K^{(*)+}$ modes. The corresponding two standard deviation interval is $0.037 < r_B < 0.155$.
- ¹²Uses the Cabibbo suppressed decay of $B^+ \rightarrow \bar{D}^0K^+$ followed by $\bar{D}^0 \rightarrow K^-\pi^+$.
- ¹³Uses Dalitz plot analysis of $\bar{D}^0 \rightarrow K_S^0\pi^+\pi^-$ decays from $B^+ \rightarrow D^0K^+$ modes. The corresponding two standard deviation interval is $0.084 < r_B < 0.239$.
- ¹⁴Uses Dalitz plot analysis of $\bar{D}^0 \rightarrow K_S^0\pi^+\pi^-$ and $\bar{D}^0 \rightarrow K_S^0K^+K^-$ decays coming from $B^\pm \rightarrow D^{(*)}K^{(*)\pm}$ modes.
- ¹⁵Uses a Dalitz plot analysis of the $\bar{D}^0 \rightarrow K_S^0\pi^+\pi^-$ decays; Combines the DK^+ , D^*K^+ and DK^{*+} modes.
- ¹⁶Uses a Dalitz analysis of neutral D decays to $K_S^0\pi^+\pi^-$ in the processes $B^\pm \rightarrow D^{(*)}K^\pm$, $D^* \rightarrow D\pi^0, D\gamma$.

 $\delta_B(B^+ \rightarrow D^0K^+)$

5 CSORNA 00 uses fully reconstructed 135 $B^0 \rightarrow J/\psi(\ell) K_S^0$ events and invariant masses without beam constraint.
 6 ALBRECHT 90J assumes 10580 for $\Upsilon(4S)$ mass. Supersedes ALBRECHT 87c and ALBRECHT 87D.
 7 Found using fully reconstructed decays with J/ψ . ALBRECHT 87D assume $m_{\Upsilon(4S)} = 10577$ MeV.

VALUE (MeV)	DOCUMENT ID	TECN	COMMENT

$2.0 \pm 1.1 \pm 0.3$	4 BEBEK	87 CLEO	$e^+e^- \rightarrow \Upsilon(4S)$

1 Uses exclusively reconstructed final states containing a $J/\psi \rightarrow \mu^+\mu^-$ decay.
 2 Uses the B -momentum distributions in the e^+e^- rest frame.
 3 Uses exclusively reconstructed final states containing a $J/\psi \rightarrow \mu^+\mu^-$ decays.
 4 BEBEK 87 actually measure the difference between half of E_{cm} and the B^\pm or B^0 mass, so the $m_{B^0} - m_{B^\pm}$ is more accurate. Assume $m_{\Upsilon(4S)} = 10580$ MeV.

$m_{B_H^0} - m_{B_L^0}$
 See the $B^0\text{-}\bar{B}^0$ MIXING PARAMETERS section near the end of these B^0 Listings.

B^0 MEAN LIFE
 See $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE section for data on B -hadron mean life averaged over species of bottom particles.

- Measured using $B^0 \rightarrow J/\psi K^*(892)^0$ and $B^0 \rightarrow J/\psi K_S^0$ decays.
- Measured using $B^0 \rightarrow D^-\mu^+\nu_X$ decays.
- Measured mean life using $B^0 \rightarrow J/\psi K_S^0$ decays.
- Measured using $B^0 \rightarrow J/\psi K^*0$ decays.
- Measured using $B^0 \rightarrow K^+\pi^-$ decays.
- Measured with $B_d^0 \rightarrow J/\psi(\mu^+\mu^-)K_S^0(\pi^+\pi^-)$ decays.
- Measured mean life using fully reconstructed decays ($J/\psi K^*$).
- Measured mean life using $B^0 \rightarrow J/\psi K^*0$ decays.
- Measured using a simultaneous fit of the B^0 lifetime and $\bar{B}^0 B^0$ oscillation frequency Δm_d in the partially reconstructed $B^0 \rightarrow D^{*-}\ell\nu$ decays.
- Measurement performed using a combined fit of CP -violation, mixing and lifetimes.
- Measurement performed using an inclusive reconstruction and B flavor identification technique.
- AUBERT 03c uses a sample of approximately 14,000 exclusively reconstructed $B^0 \rightarrow D^*(2010)^-\ell\nu$ and simultaneously measures the lifetime and oscillation frequency.
- Measurement performed with decays $B^0 \rightarrow D^{*-}\pi^+$ and $B^0 \rightarrow D^{*-}\rho^+$ using a partial reconstruction technique.
- Measured mean life using fully reconstructed decays.
- Data analyzed using partially reconstructed $\bar{B}^0 \rightarrow D^{*+}\ell^-\bar{\nu}$ decays.
- Events are selected in which one B meson is fully reconstructed while the second B meson is reconstructed inclusively.
- Data analyzed using $D/D^* \ell X$ event vertices.
- Data analyzed using charge of secondary vertex.
- Data analyzed using inclusive $D/D^* \ell X$.
- Measured mean life using partially reconstructed $D^{*-}\pi^+ X$ vertices.
- ABREU 95Q assumes $B(B^0 \rightarrow D^{*-}\ell^+\nu_\ell) = 3.2 \pm 1.7\%$.
- Data analyzed using vertex-charge technique to tag B charge.
- AKERS 95T assumes $B(B^0 \rightarrow D_s^{*+}D^0(*)^0) = 5.0 \pm 0.9\%$ to find B^+ / B^0 yield.
- Measured using the time-dependent angular analysis of $B_d^0 \rightarrow J/\psi K^*0$ decays.
- Combined result of $D/D^* \ell X$ analysis, fully reconstructed B analysis, and partially reconstructed $D^{*-}\pi^+ X$ analysis.
- Combined ABREU 95Q and ADAM 95 result.
- WAGNER 90 tagged B^0 mesons by their decays into $D^{*-}e^+\nu$ and $D^{*-}\mu^+\nu$ where the D^{*-} is tagged by its decay into $\pi^-\bar{D}^0$.
- AVERRILL 89 is an estimate of the B^0 mean lifetime assuming that $B^0 \rightarrow D^{*+} + X$ always.

$\tau_{B^0} / \tau_{\bar{B}^0}$

- Measured using $B \rightarrow J/\psi K^*$ decays.
- Measured mean life using fully reconstructed decays ($J/\psi K^*$).
- Data analyzed using $D/D^* \mu X$ vertices.
- Measurement performed using a combined fit of CP -violation, mixing and lifetimes.
- Measurement performed using an inclusive reconstruction and B flavor identification technique.
- Measured using fully reconstructed decays.
- Events are selected in which one B meson is fully reconstructed while the second B meson is reconstructed inclusively.
- Data analyzed using charge of secondary vertex.
- ABREU 95Q assumes $B(B^0 \rightarrow D^{*-}\ell^+\nu_\ell) = 3.2 \pm 1.7\%$.
- Data analyzed using vertex-charge technique to tag B charge.
- AKERS 95T assumes $B(B^0 \rightarrow D_s^{*+}D^0(*)^0) = 5.0 \pm 0.9\%$ to find B^+ / B^0 yield.
- Combined result of $D/D^* \ell X$ analysis and fully reconstructed B analysis.

τ_{B^+} / τ_{B^0} (inferred from branching fractions)

These measurements are inferred from the branching fractions for semileptonic decay or other spectator-dominated decays by assuming that the rates for such decays are equal for B^0 and B^+ . We do not use measurements which assume equal production of B^0 and B^+ because of the large uncertainty in the production ratio.

"OUR EVALUATION" has been obtained by the Heavy Flavor Averaging Group (HFLAV) by taking into account correlations between measurements.

- ARTUSO 97 uses partial reconstruction of $B \rightarrow D^* \ell \nu_\ell$ and independent of B^0 and B^+ production fraction.
- Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- ATHANAS 94 uses events tagged by fully reconstructed B^- decays and partially or fully reconstructed B^0 decays.
- Assumes equal production of B^0 and B^+ .
- ALBRECHT 92G data analyzed using $B \rightarrow D_s \bar{D}, D_s \bar{D}^*, D_s^* \bar{D}, D_s^* \bar{D}^*$ events.
- BEAN 87B assume the fraction of $B^0 \bar{B}^0$ events at the $\Upsilon(4S)$ is 0.41.

$\Delta\Gamma_{B_d^0} / \Gamma_{B_d^0}$

$\Gamma_{B_d^0}$ and $\Delta\Gamma_{B_d^0}$ are the decay rate average and difference between two B_d^0 CP eigenstates (light – heavy). The λ_{CP} characterizes B^0 and \bar{B}^0 decays to states of charmonium plus K_L^0 , see the review on "CP Violation" in the reviews section.

 0.50 ± 1.38 ABAZOV 14 D0 $p\bar{p}$ at 1.96 TeV
 < 80 95 7 BEHRENS 00B CLE2 $e^+e^- \rightarrow \Upsilon(4S)$
¹ Measured using $B^0 \rightarrow J/\psi K^*(892)^0$ and $B^0 \rightarrow J/\psi K_S^0$ decays, and assuming $\beta = 21.9 \pm 0.7$ degrees.
² Measured from the ratio of decay time distributions of $B^0 \rightarrow J/\psi K_S^0$ and $B^0 \rightarrow J/\psi K^{*0}$ decays.
³ Measured using the effective lifetimes of $B^0 \rightarrow J/\psi K_S^0$ and $B^0 \rightarrow J/\psi K^{*0}$ decays.
⁴ Reports $-\Delta\Gamma_d/\Gamma_d$ using $B^0 \rightarrow J/\psi K_S^0, J/\psi K_L^0, D^-\pi^+, D^{*-}\pi^+, D^{*-}\rho^+$, and $D^{*-}\ell^+\nu$ decays.
⁵ Corresponds to 90% confidence range [-0.084, 0.068].
⁶ Used the measured $\tau_{B^0} = 1.55 \pm 0.03$ ps. Corresponds to an upper limit of < 0.18 at 95% C.L.
⁷ BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\bar{B}^0 \rightarrow D^{*+}\pi^-, \rho^-$ decays to determine the flavor of the B meson. Assumes $\Delta_{md} = 0.478 \pm 0.018$ ps⁻¹ and $\tau_{B^0} = 1.548 \pm 0.032$ ps.

B^0 DECAY MODES

\bar{B}^0 modes are charge conjugates of the modes below. Reactions indicate the weak decay vertex and do not include mixing. Modes which do not identify the charge state of the B are listed in the B^\pm/B^0 ADMIXTURE section.

The branching fractions listed below assume 50% $B^0\bar{B}^0$ and 50% B^+B^- production at the $\Upsilon(4S)$. We have attempted to bring older measurements up to date by rescaling their assumed $\Upsilon(4S)$ production ratio to 50:50 and their assumed D, D_s, D^* , and ψ branching ratios to current values whenever this would affect our averages and best limits significantly.

Indentation is used to indicate a subchannel of a previous reaction. All resonant subchannels have been corrected for resonance branching fractions to the final state so the sum of the subchannel branching fractions can exceed that of the final state.

For inclusive branching fractions, e.g., $B \rightarrow D^\pm X$, the values usually are multiplicities, not branching fractions. They can be greater than one.

[a] An ℓ indicates an e or a μ mode, not a sum over these modes.

[b] D^{*0} represents an excited state with mass $2.2 < M < 2.8$ GeV/ c^2 .

[c] $\chi_{c1}(3872)^+$ is a hypothetical charged partner of the $\chi_{c1}(3872)$.

[d] Stands for the possible candidates of $K^*(1410)$, $K_0^*(1430)$ and $K_2^*(1430)$.

[e] B^0 and B_s^0 contributions not separated. Limit is on weighted average of the two decay rates.

[f] This decay refers to the coherent sum of resonant and nonresonant $J^P = 0^+ K\pi$ components with $1.60 < m_{K\pi} < 2.15$ GeV/ c^2 .

[g] $X(214)$ is a hypothetical particle of mass 214 MeV/ c^2 reported by the HyperCP experiment, Physical Review Letters **94** 021801 (2005)

[h] The value is for the sum of the charge states or particle/antiparticle states indicated.

[i] $\Theta(1540)^+$ denotes a possible narrow pentaquark state.

[j] Here S and P are the hypothetical scalar and pseudoscalar particles with masses of 2.5 GeV/ c^2 and 214.3 MeV/ c^2 , respectively.

CONSTRAINED FIT INFORMATION

An overall fit to 34 branching ratios uses 89 measurements and one constraint to determine 22 parameters. The overall fit has a $\chi^2 = 64.3$ for 68 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

- Uses fully reconstructed $D^{*-}\ell^+\nu$ events ($\ell = e$ or μ).
- Uses a fully reconstructed B meson as a tag on the recoil side.
- Measured using fully reconstructed D^* sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters: $\rho^2 = 1.191 \pm 0.048 \pm 0.028$, $R_1(1) = 1.429 \pm 0.061 \pm 0.044$, and $R_2(1) = 0.827 \pm 0.038 \pm 0.022$.
- Measured using fully reconstructed D^* sample.
- Uses the combined fit of both $B^0 \rightarrow D^*(2010)^-\ell\nu$ and $B^+ \rightarrow \overline{D}(2077)^0\ell\nu$ samples.
- ABREU 01H measured using about 5000 partial reconstructed D^* sample.
- ABBIENDI 00Q assumes the fraction $B(b \rightarrow B^0) = (39.7_{-2.2}^{+1.8})\%$. This result is an average of two methods using exclusive and partial D^* reconstruction.
- BUSKULIC 97 assumes fraction (B^+) = fraction (B^0) = $(37.8 \pm 2.2)\%$ and PDG 96 values for B lifetime and D^* and D branching fractions.
- Combines with previous partial reconstructed D^* measurement.
- Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- The results are based on the same analysis and data sample reported in ADAM 03.
- ACKERSTAFF 97G assumes fraction (B^+) = fraction (B^0) = $(37.8 \pm 2.2)\%$ and PDG 96 values for B lifetime and branching ratio of D^* and D decays.
- ABREU 96P result is the average of two methods using exclusive and partial D^* reconstruction.
- BARISH 95 use $B(D^0 \rightarrow K^-\pi^+) = (3.91 \pm 0.08 \pm 0.17)\%$ and $B(D^{*+} \rightarrow D^0\pi^+) = (68.1 \pm 1.0 \pm 1.3)\%$.
- BUSKULIC 95N assumes fraction (B^+) = fraction (B^0) = $38.2 \pm 1.3 \pm 2.2\%$ and $\tau_{B^0} = 1.58 \pm 0.06$ ps. $\Gamma(D^{*-}\ell^+\nu_\ell)/\text{total} = [5.18 - 0.13(\text{fraction}(B^0) - 38.2) - 1.5(\tau_{B^0} - 1.58)]\%$.
- ALBRECHT 94 assumes $B(D^{*+} \rightarrow D^0\pi^+) = 68.1 \pm 1.0 \pm 1.3\%$. Uses partial reconstruction of D^{*+} and is independent of D^0 branching ratios.
- ALBRECHT 93 reports $0.052 \pm 0.005 \pm 0.006$. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \rightarrow K^-\pi^+)$. We have taken their average e and μ value. They also obtain $\alpha = 2\Gamma^0/(\Gamma^- + \Gamma^+) - 1 = 1.1 \pm 0.4 \pm 0.2$, $A_{AF} = 3/4 * (\Gamma^- - \Gamma^+)/\Gamma = 0.2 \pm 0.08 \pm 0.06$ and a value of $|V_{cb}| = 0.036 - 0.045$ depending on model assumptions.
- Combining $\overline{D}^{*0}\ell^+\nu_\ell$ and $\overline{D}^{*-}\ell^+\nu_\ell$ SANGHERA 93 test $V-A$ structure and fit the decay angular distributions to obtain $A_{FB} = 3/4 * (\Gamma^- - \Gamma^+)/\Gamma = 0.14 \pm 0.06 \pm 0.03$. Assuming a value of V_{cb} , they measure V , A_1 , and A_2 , the three form factors for the $D^*\ell\nu_\ell$ decay, where results are slightly dependent on model assumptions.
- ANTREASIAN 90B is average over B and $\overline{D}^*(2010)$ charge states.
- The measurement of ALBRECHT 89c suggests a D^* polarization γ_L/γ_T of 0.85 ± 0.45 , or $\alpha = 0.7 \pm 0.9$.
- ALBRECHT 89j is ALBRECHT 87j value rescaled using $B(D^*(2010)^- \rightarrow D^0\pi^-) = 0.57 \pm 0.04 \pm 0.04$. Superseded by ALBRECHT 93.
- We have taken average of the the BORTOLETTO 89B values for electrons and muons, $0.046 \pm 0.005 \pm 0.007$. We rescale using the method described in STONE 94 but with the updated PDG 94 $B(D^0 \rightarrow K^-\pi^+)$. The measurement suggests a D^* polarization parameter value $\alpha = 0.65 \pm 0.66 \pm 0.25$.
- ALBRECHT 87j assume μ - e universality, the $B(\Upsilon(4S) \rightarrow B^0\overline{B}^0) = 0.45$, the $B(D^0 \rightarrow K^-\pi^+) = (0.042 \pm 0.004 \pm 0.004)$, and the $B(D^*(2010)^- \rightarrow D^0\pi^-) = 0.49 \pm 0.08$. Superseded by ALBRECHT 89j.

<4.1	90	10 BEAN 93B	CLE2 $e^+e^- \rightarrow \Upsilon(4S)$

¹ The signal events are tagged by a second B meson reconstructed in the fully hadronic decays.
² B^+ and B^0 decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.
³ The B^0 and B^+ results are combined assuming the isospin, B lifetimes, and relative charged/neutral B production at the $\Upsilon(4S)$.
⁴ The signal events are tagged by a second B meson reconstructed in the semileptonic mode $B \rightarrow D^{(*)}\ell\nu_\ell$.
⁵ Averaging with ALEXANDER 96T results including experimental and theoretical correlations considered, BEHRENS 00 reports systematic errors $+0.33 \pm 0.41$, where the second error is theoretical model dependence. We combine these in quadrature.
⁶ ATHAR 03 reports systematic errors $+0.47 \pm 0.41 \pm 0.01$, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.
⁷ Uses isospin constraints and extrapolation to all electron energies according to five different form-factor calculations. The second error combines the systematic and theoretical uncertainties in quadrature.
⁸ BEHRENS 00 reports $+0.35 \pm 0.50$, where the second error is the theoretical model dependence. We combine these in quadrature. B^+ and B^0 decays combined using isospin symmetry: $\Gamma(B^0 \rightarrow \rho^-\ell^+\nu) = 2\Gamma(B^+ \rightarrow \rho^0\ell^+\nu) \approx 2\Gamma(B^+ \rightarrow \omega\ell^+\nu)$. No evidence for $\omega\ell\nu$ is reported.
⁹ ALEXANDER 96T reports $+0.5 \pm 0.5$ where the second error is the theoretical model dependence. We combine these in quadrature. B^+ and B^0 decays combined using isospin symmetry: $\Gamma(B^0 \rightarrow \rho^-\ell^+\nu) = 2\Gamma(B^+ \rightarrow \rho^0\ell^+\nu) \approx 2\Gamma(B^+ \rightarrow \omega\ell^+\nu)$. No evidence for $\omega\ell\nu$ is reported.
¹⁰ BEAN 93B limit set using ISGW Model. Using isospin and the quark model to combine $\Gamma(\rho^0\ell^+\nu_\ell)$ and $\Gamma(\omega\ell^+\nu_\ell)$ with this result, they obtain a limit $<(1.6-2.7) \times 10^{-4}$ at 90% CL for $B^+ \rightarrow (\omega$ or $\rho^0)\ell^+\nu_\ell$. The range corresponds to the ISGW, WSB, and KS models. An upper limit on $|V_{ub}/V_{cb}| < 0.08-0.13$ at 90% CL is derived as well.

$\Gamma(\pi^-\ell^+\nu_\ell)/\Gamma_{\text{total}}$ Γ_{19}/Γ

- The signal events are tagged by a second *B* meson reconstructed in the fully hadronic decays.
- Uses loose neutrino reconstruction technique. Assumes $B(\Upsilon(4S) \rightarrow B^+ B^-) = (51.6 \pm 0.6)\%$ and $B(\Upsilon(4S) \rightarrow B^0 \bar{B}^0) = (48.4 \pm 0.6)\%$.
- Reports also a branching fraction value $B(B^0 \rightarrow \pi^- \ell^+ \nu) = (1.45 \pm 0.04 \pm 0.06) \times 10^{-4}$ from the decays of B^+ and B^0 that are combined using the isospin symmetry relation.
- Using the isospin symmetry relation, B^+ and B^0 branching fractions are combined.
- The B^0 and B^+ results are combined assuming the isospin, *B* lifetimes, and relative charged/neutral *B* production at the $\Upsilon(4S)$.
- Also report the rate for $q^2 > 16 \text{ GeV}^2$ of $(0.41 \pm 0.08 \pm 0.04) \times 10^{-4}$ from which they obtain $|V_{ub}| = 3.6 \pm 0.4 \pm 0.2^{+0.6}_{-0.4}$ (last error is from theory).
- The signal events are tagged by a second *B* meson reconstructed in the semileptonic mode $B \rightarrow D^{(*)} \ell \nu_\ell$.
- The analysis uses events in which the signal *B* decays are reconstructed with an innovative loose neutrino reconstruction technique.
- The signals are tagged by a second *B* meson reconstructed in a semileptonic or hadronic decay. The B^0 and B^+ results are combined assuming the isospin symmetry.
- B^+ and B^0 decays combined assuming isospin symmetry. Systematic errors include both experimental and form-factor uncertainties.
- ATHAR 03 reports systematic errors $0.11 \pm 0.01 \pm 0.07$, which are experimental systematic, systematic due to residual form-factor uncertainties in the signal, and systematic due to residual form-factor uncertainties in the cross-feed modes, respectively. We combine these in quadrature.
- ALEXANDER 96T gives systematic errors $\pm 0.3 \pm 0.2$ where the second error reflects the estimated model dependence. We combine these in quadrature. Assumes isospin symmetry: $\Gamma(B^0 \rightarrow \pi^- \ell^+ \nu) = 2 \times \Gamma(B^+ \rightarrow \pi^0 \ell^+ \nu)$.

¹ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
² Uses a missing-mass method. Does not depend on D branching fractions or B^{\pm}/B^0 production rates.
³ AHMED 02B reports an additional uncertainty on the branching ratios to account for 4.5% uncertainty on relative production of B^0 and B^+ , which is not included here.
⁴ BORTOLETTO 92 assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .
⁵ ALBRECHT 88K assumes $B^0\bar{B}^0:B^+B^-$ production ratio is 45:55. Superseded by ALBRECHT 90J which assumes 50:50.
⁶ BEBEK 87 value has been updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92.
⁷ AUBERT,B 04O reports $[\Gamma(B^0 \rightarrow D^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^+ \rightarrow K_S^0\pi^+)] = (42.7 \pm 2.1 \pm 2.2) \times 10^{-6}$ which we divide by our best value $B(D^+ \rightarrow K_S^0\pi^+) = (1.562 \pm 0.031) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
⁸ ALAM 94 reports $[\Gamma(B^0 \rightarrow D^-\pi^+)/\Gamma_{\text{total}}] \times [B(D^+ \rightarrow K^-2\pi^+)] = (0.265 \pm 0.032 \pm 0.023) \times 10^{-3}$ which we divide by our best value $B(D^+ \rightarrow K^-2\pi^+) = (9.38 \pm 0.16) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

$8.4 \pm 0.4 \pm 0.8$			² KUZMIN	07	BELL $e^+e^- \rightarrow \Upsilon(4S)$

• • • We do not use the following data for averages, fits, limits, etc. • • •
 $8.0 \pm 0.6 \pm 1.5$ ^{2,3} SATPATHY 03 BELL Repl. by KUZMIN 07
 < 16 90 ² ALAM 94 CLE2 $e^+e^- \rightarrow \Upsilon(4S)$
 < 70 90 ⁴ BORTOLETTO92 CLEO $e^+e^- \rightarrow \Upsilon(4S)$
 < 340 90 ⁵ BEBEK 87 CLEO $e^+e^- \rightarrow \Upsilon(4S)$
 700 ± 500 5 ⁶ BEHRENDTS 83 CLEO $e^+e^- \rightarrow \Upsilon(4S)$

¹ The second uncertainty combines in quadrature all systematic uncertainties quoted in the paper. AAIJ 15Y reports $B(B^0 \rightarrow \bar{D}^0\pi^+\pi^-) = (8.46 \pm 0.14 \pm 0.49) \times 10^{-4}$ in the kinematic region $m(\bar{D}^0\pi^+) > 2.1$ GeV which we corrected to the full phase-space dividing by 0.945 from Belle.

² Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

³ No assumption about the intermediate mechanism is made in the analysis.

⁴ BORTOLETTO 92 assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D . The product branching fraction into $D_1^*(2340)\pi$ followed by $D_1^*(2340) \rightarrow D^0\pi$ is < 0.0001 at 90% CL and into $D_2^*(2460)\pi$ followed by $D_2^*(2460) \rightarrow D^0\pi$ is < 0.0004 at 90% CL.

⁵ BEBEK 87 assume the $\Upsilon(4S)$ decays 43% to $B^0\bar{B}^0$. We rescale to 50%. $B(D^0 \rightarrow K^-\pi^+) = (4.2 \pm 0.4 \pm 0.4)\%$ and $B(D^0 \rightarrow K^-\pi^+\pi^-\pi^-) = (9.1 \pm 0.8 \pm 0.8)\%$ were used.

⁶ Corrected by us using assumptions: $B(D^0 \rightarrow K^-\pi^+) = (0.042 \pm 0.006)$ and $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 50\%$. The product branching ratio is $B(B^0 \rightarrow \bar{D}^0\pi^+\pi^-)B(\bar{D}^0 \rightarrow K^+\pi^-) = (0.39 \pm 0.26) \times 10^{-2}$.

17 ± 5 ± 5	41	12 GILES	84	CLEO $e^+e^- \rightarrow \Upsilon(4S)$

- Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- AUBERT, BE 06J reports $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{total}] / [B(B^0 \rightarrow D^-\pi^+)] = 0.99 \pm 0.11 \pm 0.08$ which we multiply by our best value $B(B^0 \rightarrow D^-\pi^+) = (2.52 \pm 0.13) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.
- Uses a missing-mass method. Does not depend on D branching fractions or B^{\pm}/B^0 production rates.
- BRANDENBURG 98 assume equal production of B^+ and B^0 at $\Upsilon(4S)$ and use the D^* reconstruction technique. The first error is their experiment's error and the second error is the systematic error from the PDG 96 value of $B(D^* \rightarrow D\pi)$.
- ALAM 94 assume equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the CLEO II $B(D^*(2010)^+ \rightarrow D^0\pi^+)$ and absolute $B(D^0 \rightarrow K^-\pi^+)$ and the PDG 1992 $B(D^0 \rightarrow K^-\pi^+\pi^0)/B(D^0 \rightarrow K^-\pi^+)$ and $B(D^0 \rightarrow K^-2\pi^+\pi^-)/B(D^0 \rightarrow K^-\pi^+)$.
- BORTOLETTO 92 reports $(4.0 \pm 1.0 \pm 0.7) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .
- ALBRECHT 90J reports $(2.8 \pm 0.9 \pm 0.6) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .
- BEBEK 87 reports $(2.8 \pm 1.5 \pm 1.0) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^-\pi^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BERKELMAN 91 to use same assumptions as noted for BORTOLETTO 92 and ALBRECHT 90J.
- Assumes $B(Z \rightarrow b\bar{b}) = 0.217$ and 38% B_d production fraction.
- ALBRECHT 87c use PDG 86 branching ratios for D and $D^*(2010)$ and assume $B(\Upsilon(4S) \rightarrow B^+B^-) = 55\%$ and $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 45\%$. Superseded by ALBRECHT 90J.
- ALBRECHT 86F uses pseudomass that is independent of D^0 and D^+ branching ratios.
- Assumes $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.60 \pm 0.08$. Assumes $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 0.40 \pm 0.02$. Does not depend on D branching ratios.

- The second error combines the systematic and theoretical uncertainties in quadrature. CSORNA 03 includes data used in ALAM 94. A full angular fit to three complex helicity amplitudes is performed.
- Assumes equal production of B^0 and B^+ at the $\Upsilon(4S)$ resonance.
- BORTOLETTO 92 reports $0.019 \pm 0.008 \pm 0.011$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^-\rho^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .
- ALBRECHT 90J reports $0.007 \pm 0.003 \pm 0.003$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^-\rho^+)/\Gamma_{total}] \times [B(D^*(2010)^+ \rightarrow D^0\pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0\pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .
- MATVIENKO 15 reports $B(B^0 \rightarrow D^*(2010)^-\rho^+, \rho^+ \rightarrow \omega\pi^+) = (1.48 \pm 0.27 \pm 0.15 \pm 0.21) \times 10^{-3}$. The last uncertainty is a model one.
- ALAM 94 assume equal production of B^+ and B^0 at the $\Upsilon(4S)$ and use the CLEO II $B(D^*(2010)^+ \rightarrow D^0\pi^+)$ and absolute $B(D^0 \rightarrow K^-\pi^+)$ and the PDG 1992 $B(D^0 \rightarrow K^-\pi^+\pi^0)/B(D^0 \rightarrow K^-\pi^+)$ and $B(D^0 \rightarrow K^-2\pi^+\pi^-)/B(D^0 \rightarrow K^-\pi^+)$.
- This decay is nearly completely longitudinally polarized, $\Gamma_L/\Gamma = (93 \pm 5 \pm 5)\%$, as expected from the factorization hypothesis (ROSNER 90). The nonresonant $\pi^+\pi^0$ contribution under the ρ^+ is less than 9% at 90% CL.
- Uses $B(D^* \rightarrow D^0\pi^+) = 0.6 \pm 0.15$ and $B(\Upsilon(4S) \rightarrow B^0\bar{B}^0) = 0.4$. Does not depend on D branching ratios.

¹ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$. The signal is consistent with all observed $\omega \pi^+$ having proceeded through the ρ^+ resonance at mass $1349 \pm 25^{+10}_{-5}$ MeV and width $547 \pm 86^{+46}_{-45}$ MeV.

² ALBRECHT 90J reports $0.041 \pm 0.015 \pm 0.016$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^- \pi^+ \pi^+ \pi^- \pi^0)/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$ and uses Mark III branching fractions for the D .

 0.016 ± 0.005 ± 0.001 6 GIBAUT 96 CLE2 Repl. by AHMED 00b

1 AUBERT 06N reports $(1.68 \pm 0.21 \pm 0.19) \times 10^{-2}$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^- D_s^{*+})/\Gamma_{total}] \times [B(D_s^{*+} \rightarrow \phi\pi^+)]$ assuming $B(D_s^{*+} \rightarrow \phi\pi^+) = 0.0462 \pm$

0.0062 , which we rescale to our best value $B(D_s^{*+} \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

2 A partial reconstruction technique is used and the result is independent of the particle decay rate of D_s^+ meson. It also provides a model-independent determination of $B(D_s^+ \rightarrow \phi\pi^+) = (4.81 \pm 0.52 \pm 0.38)\%$.

3 AUBERT 03i reports $0.0197 \pm 0.0015 \pm 0.0030$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^- D_s^{*+})/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi\pi^+)]$ assuming $B(D_s^+ \rightarrow \phi\pi^+) = 0.036$, which we rescale to our best value $B(D_s^+ \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

4 AHMED 00b reports $0.0182 \pm 0.0037 \pm 0.0025$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^- D_s^{*+})/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi\pi^+)]$ assuming $B(D_s^+ \rightarrow \phi\pi^+) = 0.036$, which we rescale to our best value $B(D_s^+ \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

5 ALBRECHT 92G reports $0.026 \pm 0.014 \pm 0.006$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^- D_s^{*+})/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi\pi^+)]$ assuming $B(D_s^+ \rightarrow \phi\pi^+) = 0.027$, which we rescale to our best value $B(D_s^+ \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes PDG 1990 D^+ and $D^*(2010)^+$ branching ratios, e.g., $B(D^0 \rightarrow K^-\pi^+) = 3.71 \pm 0.25\%$, $B(D^+ \rightarrow K^-2\pi^+) = 7.1 \pm 1.0\%$, and $B(D^*(2010)^+ \rightarrow D^0\pi^+) = 55 \pm 4\%$.

6 GIBAUT 96 reports $0.0203 \pm 0.0050 \pm 0.0036$ from a measurement of $[\Gamma(B^0 \rightarrow D^*(2010)^- D_s^{*+})/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi\pi^+)]$ assuming $B(D_s^+ \rightarrow \phi\pi^+) = 0.035$, which we rescale to our best value $B(D_s^+ \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

¹ Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

² AUBERT,B 04s reports $(0.8 \pm 0.2^{+0.3}_{-0.2}) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow D_{sJ}(2457)^+ D^- , D_{sJ}^{*+} \rightarrow D_s^+ \gamma)/\Gamma_{total}] \times [B(D_s^+ \rightarrow \phi \pi^+)]$ assuming $B(D_s^+ \rightarrow \phi \pi^+) = 0.036 \pm 0.009$, which we rescale to our best value $B(D_s^+ \rightarrow \phi \pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

0.045 ^{+0.056} _{-0.050} ± 0.028	1,2 NEGISHI	12 BELL	e ⁺ e ⁻ → T(4S)
0.068 ± 0.042	3 AUBERT	09AE BABR	e ⁺ e ⁻ → T(4S)

1 Assumes equal production of B⁰ and B⁺ at T(4S).
 2 Uses D⁰ → K⁻π⁺ mode. Restricts K⁺π⁻ mass within ±50 MeV of the nominal K⁺π⁻ mass. Corresponds to the upper limit, < 0.16 at 95% CL.
 3 Reports a signal at the level of 2.5 standard deviations after combining results from D⁰ → K⁺π⁻, K⁺π⁻π⁰, and K⁺π⁻π⁺π⁻.

Our first error is their experiment's error and our second error is the systematic error from using our best value.

²Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

³ABE 98O reports $[B(B^0 \rightarrow J/\psi(1S)K^*(892)^0)]/[B(B^+ \rightarrow J/\psi(1S)K^+)] = 1.76 \pm 0.14 \pm 0.15$. We multiply by our best value $B(B^+ \rightarrow J/\psi(1S)K^+) = (9.9 \pm 1.0) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁵BORTOLETTO 92 reports $(1.1 \pm 0.5 \pm 0.3) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow J/\psi(1S)K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$ assuming $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁶ALBRECHT 90J reports $(1.1 \pm 0.5 \pm 0.2) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow J/\psi(1S)K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$ assuming $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

⁷BEBEK 87 reports $(3.5 \pm 1.6 \pm 0.3) \times 10^{-3}$ from a measurement of $[\Gamma(B^0 \rightarrow J/\psi(1S)K^*(892)^0)/\Gamma_{total}] \times [B(J/\psi(1S) \rightarrow e^+e^-)]$ assuming $B(J/\psi(1S) \rightarrow e^+e^-) = 0.069 \pm 0.009$, which we rescale to our best value $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Updated in BORTOLETTO 92 to use the same assumptions.

⁸ABE 96H assumes that $B(B^+ \rightarrow J/\psi K^+) = (1.02 \pm 0.14) \times 10^{-3}$.

⁹The neutral and charged B events together are predominantly longitudinally polarized, $\Gamma_{\perp}/\Gamma = 0.080 \pm 0.08 \pm 0.05$. This can be compared with a prediction using HQET, 0.73 (KRAMER 92). This polarization indicates that the $B \rightarrow \psi K^*$ decay is dominated by the $CP = -1$ CP eigenstate. Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.

¹⁰ALBRECHT 94G measures the polarization in the vector-vector decay to be predominantly longitudinal, $\Gamma_T/\Gamma = 0.03 \pm 0.16 \pm 0.15$ making the neutral decay a CP eigenstate when the K^*0 decays through $K_S^0\pi^0$.

¹¹ALBAJAR 91E assumes B_S^0 production fraction of 36%.

¹²ALBRECHT 87D assume $B^+B^-/B^0\bar{B}^0$ ratio is 55/45. Superseded by ALBRECHT 90J.

¹³ALAM 86 assumes B^\pm/B^0 ratio is 60/40. The observation of the decay $B^+ \rightarrow J/\psi K^*(892)^+$ (HAAS 85) has been retracted in this paper.

$\Gamma(J/\psi(1S)K^*(892)^0)/\Gamma(J/\psi(1S)K^0)$ $\Gamma_{200}/\Gamma_{198}$

Limits are given for the weighted average of the decay rates for the two neutral B mesons.⁴ BUSKULIC 96v assumes PDG 96 production fractions for B^0, B^+, B_s, b baryons.⁵ Assumes a B^0, B^- production fraction of 0.39 and a B_s production fraction of 0.12. Contributions from B^0 and B_s decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral B mesons.⁶ Assumes $B(Z \rightarrow b\bar{b}) = 0.217$ and $B^0_d(B^0_s)$ fraction 39.5% (12%).⁷ BATTLE 93 assumes equal production of $B^0\bar{B}^0$ and B^+B^- at $\Upsilon(4S)$.⁸ Assumes the $\Upsilon(4S)$ decays 43% to $B^0\bar{B}^0$. $\Gamma(K^+ \pi^-)/\Gamma(K^0 \pi^0)$ $\Gamma_{275}/\Gamma_{276}$

- • • We do not use the following data for averages, fits, limits, etc. • • •
- 1 Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- 2 Assumes a_1^\pm decays only to 3π and $B(a_1^\pm \rightarrow \pi^\pm \pi^\mp \pi^\pm) = 0.5$.
- 3 ADAM 96D assumes $f_{B^0} = f_{B^-} = 0.39$ and $f_{B_s} = 0.12$. Contributions from B^0 and B_s decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral B mesons.
- 4 Assumes a B^0 , B^- production fraction of 0.39 and a B_s production fraction of 0.12. Contributions from B^0 and B_s^0 decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral B mesons.

- 1 Supersedes results of AAIJ 12AR.
- 2 DUH 13 reports also for the same data $B(B^0 \rightarrow K^+ K^-) < 0.20 \times 10^{-6}$ at 90% CL.
- 3 Assumes equal production of B^+ and B^0 at the $\Upsilon(4S)$.
- 4 AAIJ 12AR reports $[\Gamma(B^0 \rightarrow K^+ K^-)/\Gamma_{total}] / [B(B_s^0 \rightarrow K^+ K^-)] / [\Gamma(\bar{B} \rightarrow B^0)] / \Gamma(\bar{B} \rightarrow B^0) = 0.018^{+0.008}_{-0.007} \pm 0.009$ which we multiply by our best values $B(B_s^0 \rightarrow$

$K^+ K^-) = (2.66 \pm 0.22) \times 10^{-5}$, $\Gamma(\bar{B} \rightarrow B^0)/\Gamma(\bar{B} \rightarrow B^0) = 0.246 \pm 0.023$. Our first error is their experiment's error and our second error is the systematic error from using our best values.

- 5 Reported a central value of $(0.23 \pm 0.10 \pm 0.10) \times 10^{-6}$ using $B(B^0 \rightarrow K^+ \pi^-) = (19.4 \pm 0.6) \times 10^{-6}$.
- 6 Obtains this result from $B(K^+ K^-)/B(K^+ \pi^-) = 0.020 \pm 0.008 \pm 0.006$, assuming $B(B^0 \rightarrow K^+ \pi^-) = (19.4 \pm 0.6) \times 10^{-6}$.
- 7 ABULENCIA,A 06D obtains this from $\Gamma(K^+ K^-)/\Gamma(K^+ \pi^-) < 0.10$ at 90% CL, assuming $B(B^0 \rightarrow K^+ \pi^-) = (18.9 \pm 0.7) \times 10^{-6}$.
- 8 ABE 00c assumes $B(Z \rightarrow b\bar{b}) = (21.7 \pm 0.1)\%$ and the B fractions $f_{B^0} = f_{B^+} = (39.7^{+1.8}_{-2.2})\%$ and $f_{B_s} = (10.5^{+1.8}_{-2.2})\%$.
- 9 ADAM 96D assumes $f_{B^0} = f_{B^-} = 0.39$ and $f_{B_s} = 0.12$. Contributions from B^0 and B_s decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral B mesons.
- 10 BUSKULIC 96v assumes PDG 96 production fractions for B^0 , B^+ , B_s , b baryons.
- 11 Assumes a B^0 , B^- production fraction of 0.39 and a B_s production fraction of 0.12. Contributions from B^0 and B_s^0 decays cannot be separated. Limits are given for the weighted average of the decay rates for the two neutral B mesons.

WEIGHTED AVERAGE
0.11+0.14-0.13 (Error scaled by 1.6)

- ¹ Corresponds to a 95% CL upper limit of $< 2.1 \times 10^{-10}$.
- ² Uses normalization mode $B(B^+ \rightarrow J/\psi K^+) = (1.010 \pm 0.029) \times 10^{-3}$ and B production ratio $f(b \rightarrow B_s^0) / (f(b \rightarrow B^0)) = 0.256 \pm 0.013$.
- ³ Corresponds to a 95% CL upper limit of $< 3.4 \times 10^{-10}$.
- ⁴ Reports also a limit of $< 9.2 \times 10^{-10}$ at 90% CL. and uses $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+\mu^- K^+) = (6.0 \pm 0.2) \times 10^{-5}$ for normalization.

Meson Particle Listings

 B^0

⁵ This value is obtained from a profile-likelihood fit, see Fig. 9. It corresponds to an upper limit of $< 0.42 \times 10^{-9}$ at 95% C.L.

⁶ Derived from the combined fit to CMS and LHCb data. Uncertainty includes both statistical and systematic component. Also reports $B(B^0 \rightarrow \mu^+ \mu^-)/B(B_s \rightarrow \mu^+ \mu^-) = 0.14^{+0.08}_{-0.06}$.

⁷ Uses $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$ and $B(B^0 \rightarrow K^+ \pi^-) = (1.94 \pm 0.06) \times 10^{-5}$ for normalization.

⁸ Reports also a limit of $< 7.4 \times 10^{-10}$ at 95% CL. Uses normalization modes $B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+$ and $B^0 \rightarrow K^+ \pi^-$.

⁹ Uses normalization mode $B(B^+ \rightarrow J/\psi K^+) = (10.22 \pm 0.35) \times 10^{-4}$.

¹⁰ Uses $B(B^+ \rightarrow J/\psi K^+ \rightarrow \mu^+ \mu^- K^+) = (6.01 \pm 0.21) \times 10^{-5}$.

¹¹ Uses B production ratio $f(\bar{b} \rightarrow B^+)/f(\bar{b} \rightarrow B_s^0) = 3.71 \pm 0.47$ and three normalization modes.

POLARIZATION IN B^0 DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L) or both are transverse and parallel (\parallel) or perpendicular (\perp) to each other with the parameters Γ_L/Γ , Γ_\perp/Γ , and the relative phases ϕ_\parallel and ϕ_\perp . See the definitions in the note on "Polarization in B Decays" review in the B^0 Particle Listings.

0.80 ± 0.08 ± 0.05	42	6 ALAM	94	CLE2 Sup. by JESSOP 97

¹ AAIJ 13AT obtains $\Gamma_\parallel/\Gamma = 0.227 \pm 0.004 \pm 0.011$. The relation $1 = (\Gamma_L + \Gamma_\perp + \Gamma_\parallel)/\Gamma$ is used to obtain Γ_L/Γ .

² Measured the angular and lifetime parameters for the time-dependent angular untagged decays $B_d^0 \rightarrow J/\psi K^{*0}$ and $B_s^0 \rightarrow J/\psi \phi$.

³ Obtained by combining the B^0 and B^+ modes.

⁴ AFFOLDER 00N measurements are based on 190 B^0 candidates obtained from a data sample of 89 pb⁻¹. The P -wave fraction is found to be $0.13_{-0.09}^{+0.12} \pm 0.06$.

⁵ JESSOP 97 is the average over a mixture of B^0 and B^+ decays. The P -wave fraction is found to be $0.16 \pm 0.08 \pm 0.04$.

⁶ Averaged over an admixture of B^0 and B^+ decays.

⁷ Averaged over an admixture of B^0 and B^+ decays and the P wave fraction is $(19 \pm 2 \pm 3)\%$.

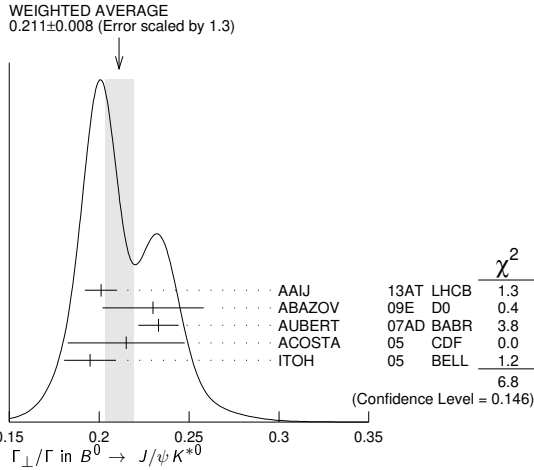

⁸ Averaged over an admixture of B^0 and B^- decays and the P wave fraction is $(16.0 \pm 3.2 \pm 1.4) \times 10^{-2}$.

Related to A_{FB}^e, F_L by $A_T^{\text{Re}} = (4/3) A_{FB}^e / (1 - F_L)$.

See the related review(s):

 $B^0 - \bar{B}^0$ Mixing $B^0 - \bar{B}^0$ MIXING PARAMETERSFor a discussion of $B^0 - \bar{B}^0$ mixing see the note on " $B^0 - \bar{B}^0$ Mixing" in the B^0 Particle Listings above. χ_d is a measure of the time-integrated $B^0 - \bar{B}^0$ mixing probability that a produced $B^0(\bar{B}^0)$ decays as a $\bar{B}^0(B^0)$. Mixing violates $\Delta B \neq 2$ rule.

$$\chi_d = \frac{x_d^2}{2(1+x_d^2)}$$

$$x_d = \frac{\Delta m_{B^0}}{\Gamma_{B^0}} = (m_{B_H^0} - m_{B_L^0}) \tau_{B^0}$$

where H, L stand for heavy and light states of two B^0 CP eigenstates and $\tau_{B^0} = \frac{1}{0.5(\Gamma_{B_H^0} + \Gamma_{B_L^0})}$.

See key on page 999

Meson Particle Listings

B^0

χ_d

This $B^0\text{-}\bar{B}^0$ mixing parameter is the probability (integrated over time) that a produced B^0 (or \bar{B}^0) decays as a \bar{B}^0 (or B^0), e.g. for inclusive lepton decays

$$\chi_d = \Gamma(B^0 \rightarrow \ell^- X \text{ (via } \bar{B}^0)) / \Gamma(B^0 \rightarrow \ell^\pm X)$$

$$= \Gamma(\bar{B}^0 \rightarrow \ell^+ X \text{ (via } B^0)) / \Gamma(\bar{B}^0 \rightarrow \ell^\pm X)$$

Where experiments have measured the parameter $r = \chi / (1 - \chi)$, we have converted to χ . Mixing violates the $\Delta B \neq 2$ rule.

Note that the measurement of χ at energies higher than the $\Upsilon(4S)$ have not separated χ_d from χ_s where the subscripts indicate $B^0(\bar{B}d)$ or $B_s^0(\bar{B}s)$. They are listed in the $B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE section.

The experiments at $\Upsilon(4S)$ make an assumption about the $B^0\bar{B}^0$ fraction and about the ratio of the B^\pm and B^0 semileptonic branching ratios (usually that it equals one).

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements, includes χ_d calculated from Δm_{B^0} and τ_{B^0} .

- BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\bar{B}^0 \rightarrow D^{*+} \pi^-, \rho^-$ decays to determine the flavor of the B meson.
- ALBRECHT 94 reports $r=0.194 \pm 0.062 \pm 0.054$. We convert to χ for comparison. Uses tagged events (lepton + pion from D^*).
- BARTELT 93 analysis performed using tagged events (lepton+pion from D^*). Using dilepton events they obtain $0.157 \pm 0.016 \pm^{+0.033}_{-0.028}$.
- ALBRECHT 92L is a combined measurement employing several lepton-based techniques. It uses all previous ARGUS data in addition to new data and therefore supersedes ALBRECHT 87I. A value of $r = 20.6 \pm 7.0\%$ is directly measured. The value can be used to measure $x = \Delta M/\Gamma = 0.72 \pm 0.15$ for the B_d meson. Assumes $f_{+,-}/f_0 = 1.0 \pm 0.05$ and uses $\tau_{B^\pm}/\tau_{B^0} = (0.95 \pm 0.14) (f_{+,-}/f_0)$.
- Uses $D^{*+} K^\pm$ correlations.
- Uses $(D^{*+} \ell^-) K^\pm$ correlations.
- These experiments see a combination of B_s and B_d mesons.
- ALBRECHT 87I is inclusive measurement with like-sign dileptons, with tagged B decays plus leptons, and one fully reconstructed event. Measures $r=0.21 \pm 0.08$. We convert to χ for comparison. Superseded by ALBRECHT 92L.
- BEAN 87B measured $r < 0.24$; we converted to χ .
- Same-sign dilepton events. Limit assumes semileptonic BR for B^+ and B^0 equal. If B^0/B^\pm ratio < 0.58 , no limit exists. The limit was corrected in BEAN 87B from $r < 0.30$ to $r < 0.37$. We converted this limit to χ .

$\Delta m_{B^0} = m_{B_H^0} - m_{B_L^0}$

Δm_{B^0} is a measure of 2π times the $B^0\text{-}\bar{B}^0$ oscillation frequency in time-dependent mixing experiments.

The second “OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

The first “OUR EVALUATION”, also provided by the HFLAV, includes Δm_d calculated from χ_d measured at $\Upsilon(4S)$.

- Uses semileptonic decays of $B^0 \rightarrow D^- \mu^+ \nu_\mu X$ and $B^0 \rightarrow D^{(*)-} \mu^+ \nu_\mu X$, where the D mesons are reconstructed in $D^- \rightarrow K^+ \pi^- \pi^-$ and $D^{(*)-} \rightarrow \bar{D}^0 \pi^-$ with $\bar{D}^0 \rightarrow K^+ \pi^-$.
- Uses semileptonic decays of $B^0 \rightarrow D^- \mu^+ \nu_\mu X$ where the D^- mesons are reconstructed in $D^- \rightarrow K^+ K^- \pi^-$.
- Measured using $B^0 \rightarrow D^- \pi^+$ and $B^0 \rightarrow J/\psi K^*(892)^0$ decays.
- Measured using $B^0 \rightarrow D^- \pi^+$.
- Uses opposite-side flavor-tagging with $B \rightarrow D^{(*)} \mu \nu_\mu X$ events.
- Measured using a simultaneous fit of the B^0 lifetime and $\bar{B}^0 B^0$ oscillation frequency Δm_d in the partially reconstructed $B^0 \rightarrow D^{*-} \ell \nu$ decays.
- Measurement performed using a combined fit of CP -violation, mixing and lifetimes.
- Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.
- AUBERT 03C uses a sample of approximately 14,000 exclusively reconstructed $B^0 \rightarrow D^{*}(2010)^- \ell \nu$ and simultaneously measures the lifetime and oscillation frequency.
- HASTINGS 03 measurement based on the time evolution of dilepton events. It also reports $f_+/f_0 = 1.01 \pm 0.03 \pm 0.09$ and CPT violation parameters in $B^0\text{-}\bar{B}^0$ mixing.
- ZHENG 03 data analyzed using partially reconstructed $\bar{B}^0 \rightarrow D^{*-} \pi^+$ decay and a flavor tag based on the charge of the lepton from the accompanying B decay.
- Uses a tagged sample of fully-reconstructed neutral B decays at $\Upsilon(4S)$.
- Measured based on the time evolution of dilepton events in $\Upsilon(4S)$ decays.
- Data analyzed using partially reconstructed $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}$ decay and a combination of flavor tags from the rest of the event.
- Uses di-muon events.
- Uses jet-charge and lepton-flavor tagging.
- Uses $\ell^- D^{*+} - \ell$ events.
- Uses $\pi^- B$ in the same side.
- Uses $\ell\text{-}\ell$.
- Uses $\ell\text{-}Q_{\text{hem}}$.
- Uses $\ell\text{-}\ell$ with impact parameters.
- Uses $D^{*+}\text{-}Q_{\text{hem}}$.
- Uses $\pi_s^\pm \ell\text{-}Q_{\text{hem}}$.
- Uses $D^{*+}\text{-}\ell/Q_{\text{hem}}$.
- Uses $D^{*+}\text{-}\ell\text{-}Q_{\text{hem}}$.
- Uses $D^{*+}\text{-}\ell$.
- AUBERT 02N result based on the same analysis and data sample reported in AUBERT 02I.
- Uses a tagged sample of B^0 decays reconstructed in the mode $B^0 \rightarrow D^{*} \ell \nu$.
- Uses a tagged sample of fully-reconstructed hadronic B^0 decays at $\Upsilon(4S)$.
- ACCIARRI 98D combines results from $\ell\text{-}\ell$, $\ell\text{-}Q_{\text{hem}}$, and $\ell\text{-}\ell$ with impact parameters.

$$\chi_d = \Delta m_{B^0} / \Gamma_{B^0}$$

The second "OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

The first "OUR EVALUATION", also provided by the HFLAV, includes χ_d measured at $\Upsilon(4S)$.

VALUE	DOCUMENT ID
0.769 ± 0.004 OUR EVALUATION	First
0.769 ± 0.004 OUR EVALUATION	Second

$\text{Re}(\lambda_{CP} / |\lambda_{CP}|) \text{Re}(z)$

The λ_{CP} characterizes B^0 and \bar{B}^0 decays to states of charmonium plus K_S^0 . Parameter z is used to describe CPT violation in mixing, see the review on "CP Violation" in the reviews section.

- ⁴ Corresponds to 90% confidence range $[-0.028, 0.104]$.
- ⁵ Measured using inclusive dilepton events from B^0 decay.

CP VIOLATION PARAMETERS

$\text{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)$

CP impurity in B_d^0 system. It is obtained from either $a_{\ell\ell}$, the charge asymmetry in like-sign dilepton events or a_{CP} , the time-dependent asymmetry of inclusive B^0 and \bar{B}^0 decays.

"OUR EVALUATION" is an average obtained by the Heavy Flavor Averaging Group (HFLAV) and described at <https://hflav.web.cern.ch/>. It is the result of a fit to B_d and B_s CP asymmetries, which includes the B_d measurements listed below and the B_s measurements listed in the B_s section, taking into account correlations between those measurements.

< 45	¹⁶ BARTELT 93 CLE2	$e^+ e^- \rightarrow \Upsilon(4S)$

- ¹ AAIJ 15F uses semileptonic B^0 decays in the inclusive final states $D^-\mu^+$ and $D^{*-}\mu^+$, where the D^- meson decays into the $K^+\pi^-\pi^-$ final state, and the D^{*-} meson into the $\bar{D}^0(\rightarrow K^+\pi^-\pi^-)$ final state. Reports $A_{SL}^d = (-0.02 \pm 0.19 \pm 0.30)\%$, which equals to $4\text{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)$.
- ² Uses the charge asymmetry in like-sign dilepton events. LEES 15A reports $A_{SL}^d = (-3.9 \pm 3.5 \pm 1.9) \times 10^{-3}$.
- ³ ABAZOV 14 uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^d = (-0.62 \pm 0.42) \times 10^{-2}$.
- ⁴ Uses $B^0 \rightarrow D^{*-} X \ell^+ \nu_\ell$ and a kaon-tagged sample which yields measurement of $A_{SL}^d = (0.06 \pm 0.17_{-0.32}^{+0.38})\%$, corresponding to $\Delta_{CP} = 1 - |q/p| = (0.29 \pm 0.84_{-1.61}^{+1.88}) \times 10^{-3}$.
- ⁵ ABAZOV 12AC uses $B^0 \rightarrow D^-\mu^+ X$ and $B^0 \rightarrow D^*(2010)^-\mu^+ X$ decays without initial state flavor tagging which yields measurement of $A_{SL}^d = (6.8 \pm 4.5 \pm 1.4) \times 10^{-3}$.
- ⁶ AUBERT 06T reports $|q/p| - 1 = (-0.8 \pm 2.7 \pm 1.9) \times 10^{-3}$. We convert to $1 - |q/p|/2$.
- ⁷ Uses the charge asymmetry in like-sign dilepton events and reports $|q/p| = 1.0005 \pm 0.0040 \pm 0.0043$.
- ⁸ JAFFE 01 finds $a_{\ell\ell} = 0.013 \pm 0.050 \pm 0.005$ and combines with the previous BEHRENS 00B independent measurement.
- ⁹ ABAZOV 11U uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^d = (-1.2 \pm 5.2) \times 10^{-3}$.
- ¹⁰ Uses the dimuon charge asymmetry.
- ¹¹ AUBERT 04C reports $|q/p| = 1.029 \pm 0.013 \pm 0.011$ and we converted it to $(1 - |q/p|)/2$.
- ¹² BARATE 01D measured by investigating time-dependent asymmetries in semileptonic and fully inclusive B_d^0 decays.
- ¹³ BEHRENS 00B uses high-momentum lepton tags and partially reconstructed $\bar{B}^0 \rightarrow D^{*+}\pi^-, \rho^-$ decays to determine the flavor of the B meson.
- ¹⁴ Data analyzed using the time-dependent asymmetry of inclusive B^0 decay. The production flavor of B^0 mesons is determined using both the jet charge and the charge of secondary vertex in the opposite hemisphere.
- ¹⁵ ACKERSTAFF 97U assumes CPT and is based on measuring the charge asymmetry in a sample of B^0 decays defined by lepton and Q_{hem} tags. If CPT is not invoked, $\text{Re}(\epsilon_B) = -0.006 \pm 0.010 \pm 0.006$ is found. The indirect CPT violation parameter is determined to $\text{Im}(\delta B) = -0.020 \pm 0.016 \pm 0.006$.
- ¹⁶ BARTELT 93 finds $a_{\ell\ell} = 0.031 \pm 0.096 \pm 0.032$ which corresponds to $|a_{\ell\ell}| < 0.18$, which yields the above $|\text{Re}(\epsilon_{B^0})/(1+|\epsilon_{B^0}|^2)|$.

$A_{T/CP}$

$A_{T/CP}$ is defined as

$$\frac{P(\bar{B}^0 \rightarrow B^0) - P(B^0 \rightarrow \bar{B}^0)}{P(\bar{B}^0 \rightarrow B^0) + P(B^0 \rightarrow \bar{B}^0)}$$

the CPT invariant asymmetry between the oscillation probabilities $P(\bar{B}^0 \rightarrow B^0)$ and $P(B^0 \rightarrow \bar{B}^0)$.

VALUE	DOCUMENT ID	TECN	COMMENT
0.005 ± 0.012 ± 0.014	1 AUBERT	02K	BABR $e^+ e^- \rightarrow \Upsilon(4S)$

- ¹ AUBERT 02K uses the charge asymmetry in like-sign dilepton events.

$A_{CP}(B^0 \rightarrow D^*(2010)^+ D^-)$

A_{CP} is defined as

$$\frac{B(\bar{B}^0 \rightarrow \bar{D}^+) - B(B^0 \rightarrow D^+)}{B(\bar{B}^0 \rightarrow \bar{D}^+) + B(B^0 \rightarrow D^+)}$$

the CP-violation charge asymmetry of exclusive B^0 and \bar{B}^0 decay.

¹ Uses fully reconstructed $B^0 \rightarrow D^{\pm} \pi^{\mp}$ decays.

² Combines the results from fully reconstructed and partially reconstructed $D\pi$ events by taking weighted averages. Assumes that systematic errors from physics parameters and fit biases in the two measurements are 100% correlated.

$S_+ (B^0 \rightarrow D^- \pi^+)$

VALUE	DOCUMENT ID	TECN	COMMENT
-------	-------------	------	---------

$0.058 \pm 0.020 \pm 0.011$

¹ Measured in the simultaneous analysis of $B^0 \rightarrow D^{\mp} \pi^{\pm}$ decays. AAIJ 18Z reports a statistical (systematic) correlation of 0.6 (-0.41) with the measured value of $S_-(B^0 \rightarrow D^+ \pi^-)$.

$S_- (B^0 \rightarrow D^+ \pi^-)$

¹ Measurement based on $B^0 \rightarrow J/\psi K_S^0, B^0 \rightarrow \psi(2S) K_S^0$ with $J/\psi \rightarrow \mu^+ \mu^-, J/\psi \rightarrow e^+ e^-$ and $\psi(2S) \rightarrow \mu^+ \mu^-$.

² AAIJ 17BN provides the correlation coefficient $\rho=0.42$ between the uncertainties of $S_{B^0 \rightarrow c\bar{c}K^{(*)0}}$ and $C_{c\bar{c}K^{(*)0}}$ ($B^0 \rightarrow c\bar{c}K^{(*)0}$) measurements.

³ Measurement based on $B^0 \rightarrow J/\psi K_S^0, B^0 \rightarrow \psi(2S) K_S^0, B^0 \rightarrow J/\psi K_L^0$, and $B^0 \rightarrow \chi_{c1}(1P) K_S^0$ decays.

⁴ Uses Dalitz plot analysis of $B^0 \rightarrow K^0 \pi^+ \pi^-$ decays and the first of two equivalent solutions is used.

⁵ Measurement based on $B^0 \rightarrow c\bar{c}K^{(*)0}$ decays.

⁶ Reports value of A of $B^0 \rightarrow \psi(2S) K^0$ which is equal to $-C$.

⁷ Reports value of A of $B^0 \rightarrow J/\psi K^0$ which is equal to $-C$.

⁸ Measurement based on $15.2 \times 10^6 B\bar{B}$ pairs.

⁹ Measurement based on $227 \times 10^6 B\bar{B}$ pairs.

¹⁰ Measured with both $\eta_f = \pm 1$ samples.

¹¹ Measured with the high purity of $\eta_f = -1$ samples.

$\sin(2\beta)$

For a discussion of CP violation, see the review on "CP Violation" in the Reviews section. $\sin(2\beta)$ is a measure of the CP -violating amplitude in the $B^0_d \rightarrow J/\psi(1S) K_S^0$.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. - Measurement based on $B^0 \rightarrow J/\psi K_S^0, B^0 \rightarrow \psi(2S) K_S^0$ with $J/\psi \rightarrow \mu^+ \mu^-, J/\psi \rightarrow e^+ e^-$ and $\psi(2S) \rightarrow \mu^+ \mu^-$.
- AAIJ 17BN provides the correlation coefficient $\rho = 0.42$ between the uncertainties of $\sin(2\beta)$ and $\cos(2\beta)$ measurements.
- Measurement based on $B^0 \rightarrow J/\psi K_S^0, B^0 \rightarrow \psi(2S) K_S^0, B^0 \rightarrow J/\psi K_L^0$, and $B^0 \rightarrow \chi_{c1}(1P) K_S^0$ decays.
- SATO 12 uses 121 fb^{-1} data collected on $\Upsilon(5S)$ resonance. Uses the " $B - \pi$ tagging" where $B\pi^+$ and $B\pi^-$ tagged $J/\psi K_S^0$ events are compared.
- Uses Dalitz plot analysis of $B^0 \rightarrow K^0 \pi^+ \pi^-$ decays and the first of two equivalent solutions.
- Measurement based on $B^0 \rightarrow c\bar{c}K^0(*)$ decays.
- Measurement in which the J/ψ decays to hadrons or to muons that do not satisfy the standard identification criteria.
- AFFOLDER 00C uses about 400 $B^0 \rightarrow J/\psi(1S) K_S^0$ events. The production flavor of B^0 was determined using three tagging algorithms: a same-side tag, a jet-charge tag, and a soft-lepton tag.
- BARATE 00Q uses 23 candidates for $B^0 \rightarrow J/\psi(1S) K_S^0$ decays. A combination of jet-charge, vertex-charge, and same-side tagging techniques were used to determine the B^0 production flavor.
- ACKERSTAFF 98Z uses 24 candidates for $B_d^0 \rightarrow J/\psi(1S) K_S^0$ decay. A combination of jet-charge and vertex-charge techniques were used to tag the B_d^0 production flavor.
- Based on $B^0 \rightarrow \psi(2S) K_S^0$ decays.
- Measurement based on $152 \times 10^6 B\bar{B}$ pairs.
- Measurement based on $227 \times 10^6 B\bar{B}$ pairs.
- ABE 02U result is based on the same analysis and data sample reported in ABE 01G.
- ABE 02Z result is based on $85 \times 10^6 B\bar{B}$ pairs.
- AUBERT 02N result based on the same analysis and data sample reported in AUBERT 01B.
- AUBERT 02P result is based on $88 \times 10^6 B\bar{B}$ pairs.
- First observation of CP violation in B^0 meson system.
- ABE 98U uses $198 \pm 17 B_d^0 \rightarrow J/\psi(1S) K^0$ events. The production flavor of B^0 was determined using the same side tagging technique.

- • • We do not use the following data for averages, fits, limits, etc. • • •
- ¹ Based on an isospin analysis of the $B \rightarrow \rho\rho$ system.
- ² Obtained using the time dependent analysis of $B^0 \rightarrow a_1(1260)\pi^\pm\pi^\mp$ and branching fraction measurements of $B \rightarrow a_1(1260)K$ and $B \rightarrow K_1\pi$. Uses SU(3) flavor relations.
- ³ The angle α_{eff} is obtained using the measured CP parameters of $B^0 \rightarrow a_1(1260)\pi^\pm\pi^\mp$ and choosing one of the four solutions that is compatible with the result of SM-based fits.
- ⁴ Obtained using isospin relation and selecting a solution closest to the CKM best fit average; the 90% CL allowed interval is $59^\circ < \phi_2 (\equiv \alpha) < 115^\circ$.
- ⁵ Obtained using isospin relation and selecting a solution closest to the CKM best fit average; 90% CL allowed interval is $79^\circ < \alpha < 123^\circ$.
- ⁶ Obtained from the measured CP parameters of the longitudinal polarization by selecting the solution closest to the CKM best fit central value of $\alpha = 95^\circ - 98^\circ$.

CP VIOLATION PARAMETERS IN $B^0 \rightarrow D^0 K^{*0}$ DECAY

The parameters r_{B^0} and δ_{B^0} are the magnitude ratio and strong phase difference between the amplitudes of $A(B^0 \rightarrow D^0 K^{*0})$ and $A(B^0 \rightarrow \bar{D}^0 K^{*0})$. The measured observables and are defined as $x_\pm = r_{B^0} \cos(\delta_{B^0} \pm \gamma)$ and $y_\pm = r_{B^0} \sin(\delta_{B^0} \pm \gamma)$ where γ is the CKM angle γ .

“OUR EVALUATION” is provided by the Heavy Flavor Averaging Group (HFLAV). The CKM angle γ is listed in the B^+ section for “CP VIOLATION PARAMETERS IN $B^+ \rightarrow D K^+$ AND SIMILAR DECAYS.”

T and CPT VIOLATION PARAMETERS

Measured values of the T -, CP -, and CPT -asymmetry parameters, defined as the differences in $S_{\alpha,\beta}^\pm$ and $C_{\alpha,\beta}^\pm$ between symmetry-transformed transitions. The indices $\alpha = \ell^+, \ell^-$ and $\beta = K_S^0, K_L^0$ stand for reconstructed the flavor final state and the CP final states from $\Upsilon(4S)$ decay. The sign \pm indicates whether the decay to the flavor final state α occurs before or after the decay to the CP final state.

Alternatively, violations of CPT symmetry and Lorentz invariance are searched for by studying interference effects in B^0 mixing. Results are expressed in terms of the standard model extension parameter Δ_a , which describes the difference between the couplings of the valence quarks within B^0 meson with the Lorentz-violating fields.

Meson Particle Listings
B0, B±/B0 ADMIXTURE

Table listing meson particles with columns for particle name, quantum numbers, and references. Includes a section for B±/B0 ADMIXTURE and B DECAY MODES.

Downloaded from https://academic.oup.com/ptep/article/2020/8/083C01/5891211 by Aix Marseille Universite user on 06 January 2021

Meson Particle Listings

 B^\pm/B^0 ADMIXTURE

Γ_{11}	$\bar{D}_1(2420)\ell^+\nu_\ell$ anything	(3.8 ± 1.3) × 10 ⁻³	S=2.4	Γ_{72}	$K_4^*(2045)\gamma$	< 1.0	× 10 ⁻³	CL=90%
Γ_{12}	$D\pi\ell^+\nu_\ell$ anything + $D^*\pi\ell^+\nu_\ell$ anything	(2.6 ± 0.5) %	S=1.5	Γ_{73}	$K\eta'(958)$	(8.3 ± 1.1) × 10 ⁻⁵		
Γ_{13}	$D\pi\ell^+\nu_\ell$ anything	(1.5 ± 0.6) %		Γ_{74}	$K^*(892)\eta'(958)$	(4.1 ± 1.1) × 10 ⁻⁶		
Γ_{14}	$D^*\pi\ell^+\nu_\ell$ anything	(1.9 ± 0.4) %		Γ_{75}	$K\eta$	< 5.2	× 10 ⁻⁶	CL=90%
Γ_{15}	$\bar{D}_2^*(2460)\ell^+\nu_\ell$ anything	(4.4 ± 1.6) × 10 ⁻³		Γ_{76}	$K^*(892)\eta$	(1.8 ± 0.5) × 10 ⁻⁵		
Γ_{16}	$D^*\pi^+\ell^+\nu_\ell$ anything	(1.00 ± 0.34) %		Γ_{77}	$K\phi\phi$	(2.3 ± 0.9) × 10 ⁻⁶		
Γ_{17}	$\bar{D}\pi^+\pi^-\ell^+\nu_\ell$	(1.62 ± 0.32) × 10 ⁻³		Γ_{78}	$\bar{b} \rightarrow \bar{s}\gamma$	(3.49 ± 0.19) × 10 ⁻⁴		
Γ_{18}	$\bar{D}^*\pi^+\pi^-\ell^+\nu_\ell$	(9.4 ± 3.2) × 10 ⁻⁴		Γ_{79}	$\bar{b} \rightarrow \bar{d}\gamma$	(9.2 ± 3.0) × 10 ⁻⁶		
Γ_{19}	$D_s^-\ell^+\nu_\ell$ anything	[b] < 7	× 10 ⁻³ CL=90%	Γ_{80}	$\bar{b} \rightarrow \bar{s}$ gluon	< 6.8	%	CL=90%
Γ_{20}	$D_s^-\ell^+\nu_\ell K^+$ anything	[b] < 5	× 10 ⁻³ CL=90%	Γ_{81}	η anything	(2.6 ± 0.5) × 10 ⁻⁴		
Γ_{21}	$D_s^-\ell^+\nu_\ell K^0$ anything	[b] < 7	× 10 ⁻³ CL=90%	Γ_{82}	η' anything	(4.2 ± 0.9) × 10 ⁻⁴		
Γ_{22}	$X_c\ell^+\nu_\ell$	(10.65 ± 0.16) %		Γ_{83}	K^+ gluon (charmless)	< 1.87	× 10 ⁻⁴	CL=90%
Γ_{23}	$X_u\ell^+\nu_\ell$	(2.13 ± 0.30) × 10 ⁻³		Γ_{84}	K^0 gluon (charmless)	(1.9 ± 0.7) × 10 ⁻⁴		
Γ_{24}	$K^+\ell^+\nu_\ell$ anything	[b] (6.3 ± 0.6) %		Light unflavored meson modes				
Γ_{25}	$K^-\ell^+\nu_\ell$ anything	[b] (10 ± 4) × 10 ⁻³		Γ_{85}	$\rho\gamma$	(1.39 ± 0.25) × 10 ⁻⁶		S=1.2
Γ_{26}	$K^0/\bar{K}^0\ell^+\nu_\ell$ anything	[b] (4.6 ± 0.5) %		Γ_{86}	$\rho/\omega\gamma$	(1.30 ± 0.23) × 10 ⁻⁶		S=1.2
Γ_{27}	$\bar{D}^*\tau^+\nu_\tau$	(9.9 ± 1.2) × 10 ⁻³		Γ_{87}	π^\pm anything	[f, i] (358 ± 7) %		
Γ_{28}	$D^*\tau^+\nu_\tau$	(1.50 ± 0.08) %		Γ_{88}	π^0 anything	(235 ± 11) %		
D, D*, or D_s modes				Γ_{89}	η anything	(17.6 ± 1.6) %		
Γ_{29}	D^\pm anything	(23.1 ± 1.2) %		Γ_{90}	ρ^0 anything	(21 ± 5) %		
Γ_{30}	D^0/\bar{D}^0 anything	(61.5 ± 2.9) %	S=1.3	Γ_{91}	ω anything	< 81	%	CL=90%
Γ_{31}	$D^*(2010)^\pm$ anything	(22.5 ± 1.5) %		Γ_{92}	ϕ anything	(3.43 ± 0.12) %		
Γ_{32}	$D^*(2007)^0$ anything	(26.0 ± 2.7) %		Γ_{93}	$\phi K^*(892)$	< 2.2	× 10 ⁻⁵	CL=90%
Γ_{33}	D_s^\pm anything	[f] (8.3 ± 0.8) %		Γ_{94}	$\bar{b} \rightarrow \bar{d}$ gluon			
Γ_{34}	D_s^\pm anything	(6.3 ± 1.0) %		Γ_{95}	π^+ gluon (charmless)	(3.7 ± 0.8) × 10 ⁻⁴

- [a] These values are model dependent.
- [b] An ℓ indicates an e or a μ mode, not a sum over these modes.
- [c] Here "anything" means at least one particle observed.
- [d] This is a $B(B^0 \rightarrow D^{*-} \ell^+ \nu_\ell)$ value.
- [e] D^{**} stands for the sum of the $D(1^1P_1)$, $D(1^3P_0)$, $D(1^3P_1)$, $D(1^3P_2)$, $D(2^1S_0)$, and $D(2^1S_1)$ resonances.
- [f] The value is for the sum of the charge states or particle/antiparticle states indicated.
- [g] $D^{(*)} \bar{D}^{(*)}$ stands for the sum of $D^* \bar{D}^*$, $D^* \bar{D}$, $D \bar{D}^*$, and $D \bar{D}$.
- [h] $X(3915)$ denotes a near-threshold enhancement in the $\omega J/\psi$ mass spectrum.
- [i] Inclusive branching fractions have a multiplicity definition and can be greater than 100%.

B^\pm/B^0 ADMIXTURE BRANCHING RATIOS

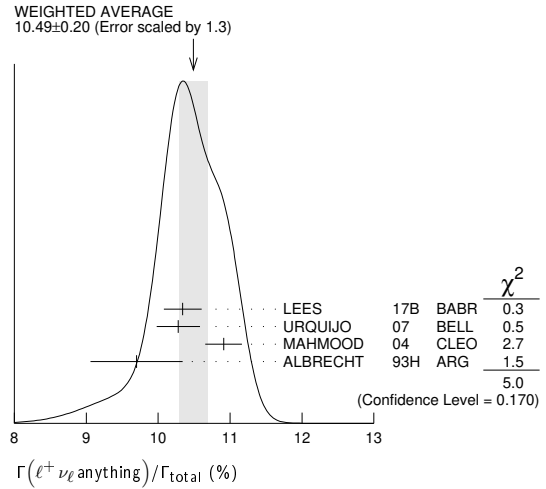

$\Gamma(\ell^+ \nu_\ell \text{ anything})/\Gamma_{\text{total}}$ Γ_3/Γ
 These branching fraction values are model dependent.

"OUR EVALUATION" assumes lepton universality and is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

- 1 LEES 17B measurement is obtained from semileptonic decays to electrons. The result is averaged over B^\pm and B^0 mesons, assuming lepton universality.
- 2 URQUIJO 07 report a measurement of $(10.07 \pm 0.18 \pm 0.21)\%$ for the partial branching fraction of $B \rightarrow e \nu_e X_c$ decay with electron energy above 0.6 GeV. We converted the result to $B \rightarrow e \nu_e X$ branching fraction.
- 3 Uses charge and angular correlations in $\Upsilon(4S)$ events with a high-momentum lepton and an additional electron.
- 4 ALBRECHT 93H analysis performed using tagged semileptonic decays of the B . This technique is almost model independent for the lepton branching ratio.
- 5 The measurements are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the B rest frame. The best precision on the ratio is achieved for a momentum threshold of 1.0 GeV: $B(B^+ \rightarrow e^+ \nu_e X) / B(B^0 \rightarrow e^+ \nu_e X) = 1.074 \pm 0.041 \pm 0.026$.
- 6 The measurements are obtained for charged and neutral B mesons partial rates of semileptonic decay to electrons with momentum above 0.6 GeV/c in the B rest frame, and their ratio of $B(B^+ \rightarrow e^+ \nu_e X)/B(B^0 \rightarrow e^+ \nu_e X) = 1.08 \pm 0.05 \pm 0.02$.
- 7 The semileptonic branching ratio, $|V_{cb}|$ and other heavy-quark parameters are determined from a simultaneous fit to moments of the hadronic-mass and lepton-energy distribution.
- 8 Uses the high-momentum lepton tag method and requires the electron energy above 0.6 GeV.
- 9 Uses the high-momentum lepton tag method. They also report $|V_{cb}| = 0.0423 \pm 0.0007(\text{exp}) \pm 0.0020(\text{theo.})$.
- 10 Uses the high-momentum lepton tag method. ABE 02Y also reports $|V_{cb}| = 0.0408 \pm 0.0010(\text{exp}) \pm 0.0025(\text{theo.})$. The second error is due to uncertainties of theoretical inputs.
- 11 BARISH 96B analysis performed using tagged semileptonic decays of the B . This technique is almost model independent for the lepton branching ratio.
- 12 HENDERSON 92 measurement employs e and μ . The systematic error contains 0.004 in quadrature from model dependence. The authors average a variation of the Isgur, Scora,

- Grinstein, and Wise model with that of the Altarelli-Cabibbo-Corbo-Maiani-Martinelli model for semileptonic decays to correct the acceptance.
- 13 YA NAGISAWA 91 also measures an average semileptonic branching ratio at the $\Upsilon(5S)$ of 9.6–10.5% depending on assumptions about the relative production of different B meson species.
- 14 ALBRECHT 90H uses the model of ALTARELLI 82 to correct over all lepton momenta. 0.099 ± 0.006 is obtained using ISGUR 89b.
- 15 ALBRECHT 90H uses the model of ALTARELLI 82 to correct over all lepton momenta. 0.097 ± 0.006 is obtained using ISGUR 89b.
- 16 Using data above $p(e) = 2.4$ GeV, WACHS 89 determine $\sigma(B \rightarrow e \nu \mu p)/\sigma(B \rightarrow e \nu \text{charm}) < 0.065$ at 90% CL.
- 17 Ratio $\sigma(b \rightarrow e \nu \mu p)/\sigma(b \rightarrow e \nu \text{charm}) < 0.055$ at CL = 90%.

- ¹ Obtained from the partial rate $\Delta B = (1.554 \pm 0.082 +0.095 -0.086) \times 10^{-3}$ for the electron momentum interval of 0.8–2.7 GeV/c based on GGOU1 method ($X_c\ell\nu$, m_c constraint fit of SF parameters).
² Measures several partial branching fractions in different phase space regions. The most precise result on the full branching fraction is obtained in the region for lepton momentum in B rest frame $p_\ell^* > 1$ GeV/c, where the measured partial branching fraction is $\Delta B = (1.80 \pm 0.13 \pm 0.15) \times 10^{-3}$. The acceptance in that region is reported in a private communication by the Authors to be 0.894. The corresponding $|V_{ub}|$ from the BLPN method is $(4.28 \pm 0.15 \pm 0.18 \pm 0.19) \times 10^{-3}$, where the last uncertainty comes from theoretical prediction.
³ Determined from the partial rate $\Delta B = (4.41 \pm 0.42 \pm 0.42) \times 10^{-4}$ measured for electron energy > 2 GeV and hadronic mass squared < 3.5 GeV², and calculated acceptance 0.174 in that region. The V_{ub} is measured as $(4.41 \pm 0.30 +0.65 -0.47 \pm 0.28) \times 10^{-3}$.
⁴ Uses electrons in the momentum interval 1.9–2.6 GeV/c in the center-of-mass frame. The V_{ub} is found to be $(5.08 \pm 0.47 +0.49 -0.48) \times 10^{-3}$.
⁵ BORNHEIM 02 uses the observed yield of leptons from semileptonic B decays in the end-point momentum interval 2.2–2.6 GeV/c with recent CLEO-2 data on $B \rightarrow X_s\gamma$. The V_{ub} is found to be $(4.08 \pm 0.34 \pm 0.53) \times 10^{-3}$.
⁶ Uses a multivariate analysis method and requires lepton momentum in the B rest frame, $p_\ell^{*B} > 1.0$ GeV/c.
⁷ Measures several partial branching fractions in different phase space regions. The most precise result is obtained in the region for hadronic mass $M_X < 1.55$ GeV/c², and is $\Delta B = (1.18 \pm 0.09 \pm 0.07) \times 10^{-3}$. The corresponding $|V_{ub}|$ from the BLPN method

See key on page 999

B^\pm/B^0 ADMIXTURE

is $(4.27 \pm 0.16 \pm 0.13 \pm 0.30) \times 10^{-3}$, where the last uncertainty comes from the theoretical prediction of the partial rate in the given phase-space region.

⁸ Obtained from the partial rate $\Delta B = (0.572 \pm 0.041 \pm 0.065) \times 10^{-3}$ for the electron momentum interval of 2.0–2.6 GeV/c based on BLNP method.

⁹ Used BaBar measurement of Semileptonic branching fraction $B(B \rightarrow X \ell \nu_\ell) = (10.87 \pm 0.18 \pm 0.30)\%$ to convert the ratio of rates to branching fraction.

¹⁰ The third error includes the systematics and theoretical errors summed in quadrature.

$\Gamma(X_u \ell^+ \nu_\ell)/\Gamma(\ell^+ \nu_\ell \text{ anything})$ Γ_{23}/Γ_3
 ℓ denotes e or μ , not the sum. These experiments measure this ratio in very limited momentum intervals.

<4.0	90		KLOPFEN...	83b	CUSB Direct e at $\Upsilon(4S)$
<5.5	90				

¹ The third error includes the systematics and theoretical errors summed in quadrature.

² ALBRECHT 94c find $\Gamma(b \rightarrow c)/\Gamma(b \rightarrow \text{all}) = 0.99 \pm 0.02 \pm 0.04$.

³ BARTELT 93b (CLEO II) measures an excess of $107 \pm 15 \pm 11$ leptons in the lepton momentum interval 2.3–2.6 GeV/c which is attributed to $b \rightarrow u \ell \nu_\ell$. This corresponds to a model-dependent partial branching ratio Δ_{ub} between $(1.15 \pm 0.16 \pm 0.15) \times 10^{-4}$, as evaluated using the KS model (KOERNER 88), and $(1.54 \pm 0.22 \pm 0.20) \times 10^{-4}$ using the ACCMM model (ARTUSO 93). The corresponding values of $|V_{ub}/V_{cb}|$ are 0.056 ± 0.006 and 0.076 ± 0.008 , respectively.

⁴ ALBRECHT 91c result supersedes ALBRECHT 90. Two events are fully reconstructed providing evidence for the $b \rightarrow u$ transition. Using the model of ALTARELLI 82, they obtain $|V_{ub}/V_{cb}| = 0.11 \pm 0.012$ from 77 leptons in the 2.3–2.6 GeV momentum range.

⁵ ALBRECHT 90 observes 41 ± 10 excess e and μ (lepton) events in the momentum interval $p = 2.3$ –2.6 GeV signaling the presence of the $b \rightarrow u$ transition. The events correspond to a model-dependent measurement of $|V_{ub}/V_{cb}| = 0.10 \pm 0.01$.

⁶ FULTON 90 observe 76 ± 20 excess e and μ (lepton) events in the momentum interval $p = 2.4$ –2.6 GeV signaling the presence of the $b \rightarrow u$ transition. The average branching ratio, $(1.8 \pm 0.4 \pm 0.3) \times 10^{-4}$, corresponds to a model-dependent measurement of approximately $|V_{ub}/V_{cb}| = 0.1$ using $B(b \rightarrow c \ell \nu) = 10.2 \pm 0.2 \pm 0.7\%$.

⁷ The quoted possible limits range from 0.018 to 0.04 for the ratio, depending on which model or momentum range is chosen. We select the most conservative limit they have calculated. This corresponds to a limit on $|V_{ub}/V_{cb}| < 0.20$. While the endpoint technique employed is more robust than their previous results in CHEN 84, these results do not provide a numerical improvement in the limit.

¹ GIBBONS 97B reports $B(B \rightarrow D^*(2010)^+ \text{ anything}) = 0.239 \pm 0.015 \pm 0.014 \pm 0.009$ using CLEO measured D and D^* branching fractions. We rescale to our PDG 96 values of D and D^* branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.

² ALBRECHT 96D reports $B(B \rightarrow D^*(2010)^+ \text{ anything}) = 0.196 \pm 0.019$ using CLEO measured $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.681 \pm 0.01 \pm 0.013$, $B(D^0 \rightarrow K^- \pi^+) = 0.0401 \pm 0.0014$, $B(D^0 \rightarrow K^- \pi^+ \pi^+) = 0.081 \pm 0.005$. We rescale to our PDG 96 values of D and D^* branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.

³ BORTOLETTO 92 reports $B(B \rightarrow D^*(2010)^+ \text{ anything}) = 0.25 \pm 0.03 \pm 0.04$ using MARK II $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.57 \pm 0.06$ and $B(D^0 \rightarrow K^- \pi^+) = 0.042 \pm 0.008$. We rescale to our PDG 96 values of D and D^* branching ratios. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁴ ALBRECHT 91H reports $0.348 \pm 0.060 \pm 0.035$ from a measurement of $[\Gamma(B \rightarrow D^*(2010)^\pm \text{ anything})/\Gamma_{\text{total}}] \times [B(D^*(2010)^+ \rightarrow D^0 \pi^+)]$ assuming $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.55 \pm 0.04$, which we rescale to our best value $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (67.7 \pm 0.5) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value. Uses the PDG 90 $B(D^0 \rightarrow K^- \pi^+) = 0.0371 \pm 0.0025$.

⁵ BORTOLETTO 87 uses old MARK III (BALTRUSAITIS 86E) branching ratios $B(D^0 \rightarrow K^- \pi^+) = 0.056 \pm 0.004 \pm 0.003$ and also assumes $B(D^*(2010)^+ \rightarrow D^0 \pi^+) = 0.60^{+0.08}_{-0.15}$. The product branching ratio for $B(B \rightarrow D^*(2010)^+) B(D^*(2010)^+ \rightarrow D^0 \pi^+)$ is $0.13 \pm 0.02 \pm 0.012$. Superseded by BORTOLETTO 92.

⁶ $V-A$ momentum spectrum used to extrapolate below $p = 1$ GeV. We correct the value assuming $B(D^0 \rightarrow K^- \pi^+) = 0.042 \pm 0.006$ and $B(D^+ \rightarrow D^0 \pi^+) = 0.6^{+0.08}_{-0.15}$. The product branching fraction is $B(B \rightarrow D^*(2010)^+) B(D^*(2010)^+ \rightarrow D^0 \pi^+) = (68 \pm 15 \pm 9) \times 10^{-4}$.

seen

- ¹ALBRECHT 93i value is not independent of the sum of $B \rightarrow K^+ \text{ anything}$ and $B \rightarrow K^- \text{ anything}$ ALBRECHT 94c values.
- ²Assuming $T(4S) \rightarrow B\bar{B}$, a total of $3.38 \pm 0.34 \pm 0.68$ kaons per $T(4S)$ decay is found (the second error is systematic). In the context of the standard B -decay model, this leads to a value for $(b\text{-quark} \rightarrow c\text{-quark})/(b\text{-quark} \rightarrow \text{all})$ of $1.09 \pm 0.33 \pm 0.13$.
- ³GIANNINI 82 at CESR-CUSB observed 1.58 ± 0.35 K^0 per hadronic event much higher than 0.82 ± 0.10 below threshold. Consistent with predominant $b \rightarrow cX$ decay.

• • • We do not use the following data for averages, fits, limits, etc. • • •			
6.2 ± 1.6 ± 1.3	3 BROWDER	98	CLE2 $e^+e^- \rightarrow \Upsilon(4S)$

¹ AUBERT,B 04F reports branching ratio $B \rightarrow \eta' X_S$ for high momentum η' between 2.0 and 2.7 GeV/c in the $\Upsilon(4S)$ center-of-mass frame. X_S represents a recoil system consisting of a kaon and zero to four pions.

² BONVICINI 03 observed a signal of 61.2 ± 13.9 events in $B \rightarrow \eta' X_{nc}$ production for high momentum η' between 2.0 and 2.7 GeV/c in the $\Upsilon(4S)$ center-of-mass frame. The X_{nc} denotes "charmless" hadronic states recoiling against η' . The second error combines systematic and background subtraction uncertainties in quadrature.

³ BROWDER 98 observed a signal of 39.0 ± 11.6 events in high momentum $B \rightarrow \eta' X_S$ production between 2.0 and 2.7 GeV/c. The branching fraction is based on the interpretation of $b \rightarrow \text{sg}$, where the last error includes additional uncertainties due to the color-suppressed $b \rightarrow \text{backgrounds}$.

• • • We do not use the following data for averages, fits, limits, etc. • • •

1 AUBERT 07c reports $0.045 \pm 0.003 \pm 0.012$ from a measurement of $[\Gamma(B \rightarrow \Lambda_c^+ / \bar{\Lambda}_c^- \text{ anything}) / \Gamma_{\text{total}}] \times [B(\Lambda_c^+ \rightarrow pK^- \pi^+)]$ assuming $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (5.0 \pm 1.3) \times 10^{-2}$, which we rescale to our best value $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (6.28 \pm 0.32) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

2 CRAWFORD 92 result derived from lepton baryon correlations. Assumes all charmed baryons in B^0 and B^\pm decay are Λ_c .

3 ALBRECHT 88E measured $B(B \rightarrow \Lambda_c^+ X) \cdot B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (0.30 \pm 0.12 \pm 0.06)\%$ and used $B(\Lambda_c^+ \rightarrow pK^- \pi^+) = (2.2 \pm 1.0)\%$ from ABRAMS 80 to obtain above number.

4 Assuming all baryons result from charmed baryons, ALAM 86 conclude the branching fraction is $7.4 \pm 2.9\%$. The limit given above is model independent.

• • • We do not use the following data for averages, fits, limits, etc. • • •

0.076 ± 0.014	² ALBRECHT 89k	ARG	$e^+e^- \rightarrow \Upsilon(4S)$	
---------------	---------------------------	-----	-----------------------------------	--

¹ ALBRECHT 92a result is from simultaneous analysis of p and Λ yields, $p\bar{p}$ and $\Lambda\bar{\Lambda}$ correlations, and various lepton-baryon and lepton-baryon-antibaryon correlations. Supersedes ALBRECHT 89k.

² ALBRECHT 89k obtain this result by adding their their measurements (5.5 ± 1.6)% for direct protons and (4.2 ± 0.5 ± 0.6)% for inclusive Λ production. They then assume (5.5 ± 1.6)% for neutron production and add it in also. Since each B decay has two baryons, they divide by 2 to obtain (7.6 ± 1.4)%.

CP VIOLATION

A_{CP} is defined as

$$\frac{B(\bar{B} \rightarrow \bar{f}) - B(B \rightarrow f)}{B(\bar{B} \rightarrow \bar{f}) + B(B \rightarrow f)},$$

the CP-violation charge asymmetry of inclusive B^\pm and B^0 decay.

$A_{CP}(B \rightarrow K^*(892)\gamma)$

¹ Uses $B(\Upsilon(4S) \rightarrow B^+ B^-) = (51.4 \pm 0.6)\%$ and $B(\Upsilon(4S) \rightarrow B^0 \overline{B}^0) = (48.6 \pm 0.6)\%$.

POLARIZATION IN B DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L) or both are transverse and parallel (||) or perpendicular (⊥) to each other with the parameters Γ_L/Γ , Γ_{\perp}/Γ , and the relative phases $\phi_{||}$ and ϕ_{\perp} . See the definitions in the note on "Polarization in B Decays" review in the B⁰ Particle Listings.

LEPTON (HADRON) FORWARD-BACKWARD ASYMMETRY IN $B \rightarrow K^{(*)} \ell^+ \ell^-$ ($B \rightarrow K/\pi h^+ h^-$) DECAY

The forward-backward angular asymmetry of the lepton pair in $B \rightarrow K^{(*)} \ell^+ \ell^-$ ($B \rightarrow K/\pi h^+ h^-$) decay is defined as

$$A_{FB}(s) = \frac{N(\cos\theta > 0) - N(\cos\theta < 0)}{N(\cos\theta > 0) + N(\cos\theta < 0)}$$

where $s=q^2/m_B^2$, and θ is the angle of the ℓ^- (h^-) with respect to the flight direction of the B meson, measured in the dilepton (dihadron) rest frame. In addition, the fraction of longitudinal polarization F_L of the K^* and F_S , the relative contribution from scalar and pseudoscalar penguin amplitudes in $B \rightarrow K \ell^+ \ell^-$, can be measured from the angular distribution of its decay products.

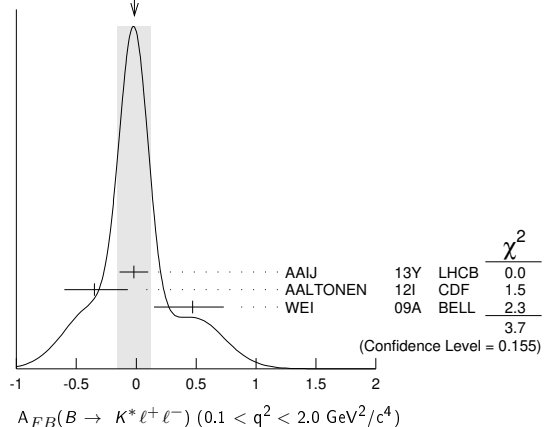

$A_{FB}(B \rightarrow K^* \ell^+ \ell^-)$ ($q^2 > 0.1 \text{ GeV}^2/c^4$)

$B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE

$B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE MEAN LIFE

Each measurement of the B mean life is an average over an admixture of various bottom mesons and baryons which decay weakly. Different techniques emphasize different admixtures of produced particles, which could result in a different B mean life.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. This is a weighted average of the lifetimes of the five main b -hadron species (B^+ , B^0 , B_s^0 , B_{sH}^0 , and Λ_b) that assumes the production fractions in Z decays (given at the end of this section) and equal production fractions of B_{sH}^0 and B_{sL}^0 mesons.

- Measurement performed using an inclusive reconstruction and B flavor identification technique.
- Measured using inclusive $J/\psi(1S) \rightarrow \mu^+\mu^-$ vertex.
- ACCIARRI 98 uses inclusively reconstructed secondary vertex and lepton impact parameter.
- ACKERSTAFF 97F uses inclusively reconstructed secondary vertices.
- Combines ABREU 96E secondary vertex result with ABREU 94L impact parameter result.
- BUSKULIC 96F analyzed using 3D impact parameter.
- ABE,K 95B uses an inclusive topological technique.
- ABREU 94L uses charged particle impact parameters. Their result from inclusively reconstructed secondary vertices is superseded by ABREU 96E.
- From proper time distribution of $b \rightarrow J/\psi(1S)$ anything.
- ABE 93J analyzed using $J/\psi(1S) \rightarrow \mu\mu$ vertices.
- ABREU 93D data analyzed using D/D^* anything event vertices.
- ABREU 93G data analyzed using charged and neutral vertices.
- ACTON 93C analysed using D/D^* anything event vertices.
- ACTON 93L and ADRIANI 93K analyzed using lepton (e and μ) impact parameter at Z.
- BUSKULIC 93O analyzed using dipole method.
- ABREU 92 is combined result of muon and hadron impact parameter analyses. Hadron tracks gave $(12.7 \pm 0.4 \pm 1.2) \times 10^{-13}$ s for an admixture of B species weighted by production fraction and mean charge multiplicity, while muon tracks gave $(13.0 \pm 1.0 \pm 0.8) \times 10^{-13}$ s for an admixture weighted by production fraction and semileptonic branching fraction.
- ACTON 92 is combined result of muon and electron impact parameter analyses.

Meson Particle Listings

$B^\pm/B^0/B_s^0/b$ -baryon ADMIXTURE

- ¹⁸BUSKULIC 92F uses the lepton impact parameter distribution for data from the 1991 run.
- ¹⁹BUSKULIC 92c use $J/\psi(1S)$ tags to measure the average b lifetime. This is comparable to other methods only if the $J/\psi(1S)$ branching fractions of the different b -flavored hadrons are in the same ratio.
- ²⁰Using $Z \rightarrow e^+X$ or μ^+X , ADEVA 91H determined the average lifetime for an admixture of B hadrons from the impact parameter distribution of the lepton.
- ²¹Using $Z \rightarrow J/\psi(1S)X$, $J/\psi(1S) \rightarrow \ell^+\ell^-$, ALEXANDER 91G determined the average lifetime for an admixture of B hadrons from the decay point of the $J/\psi(1S)$.
- ²²Using $Z \rightarrow eX$ or μX , DECAMP 91c determines the average lifetime for an admixture of B hadrons from the signed impact parameter distribution of the lepton.
- ²³HAGEMANN 90 uses electrons and muons in an impact parameter analysis.
- ²⁴LYONS 90 combine the results of the B lifetime measurements of ONG 89, BRAUNSCHWEIG 89B, KLEM 88, and ASH 87, and JADE data by private communication. They use statistical techniques which include variation of the error with the mean life, and possible correlations between the systematic errors. This result is not independent of the measured results used in our average.
- ²⁵We have combined an overall scale error of 15% in quadrature with the systematic error of ± 0.7 to obtain ± 2.1 systematic error.
- ²⁶Statistical and systematic errors were combined by BROM 87.

$$\text{cor}(B_s^0, B^\pm=B^0) = -0.633$$

$$\text{cor}(b\text{-baryon}, B^\pm=B^0) = -0.813.$$

The notation for production fractions varies in the literature ($f_B, d_{B^0}, f(b \rightarrow \bar{B}^0), \text{Br}(b \rightarrow \bar{B}^0)$). We use our own branching fraction notation here, $\text{B}(\bar{b} \rightarrow B^0)$.

Note these production fractions are b -hadronization fractions, not the conventional branching fractions of b -quark to a B -hadron, which may have considerable dependence on the initial and final state kinematic and production environment.

\bar{b} PRODUCTION FRACTIONS AND DECAY MODES

The branching fraction measurements are for an admixture of B mesons and baryons at energies above the $T(4S)$. Only the highest energy results (LHC, LEP, Tevatron, $S\bar{p}\bar{S}$) are used in the branching fraction averages. In the following, we assume that the production fractions are the same at the LHC, LEP, and at the Tevatron.

For inclusive branching fractions, e.g., $B \rightarrow D^\pm$ anything, the values usually are multiplicities, not branching fractions. They can be greater than one.

The modes below are listed for a \bar{b} initial state. b modes are their charge conjugates. Reactions indicate the weak decay vertex and do not include mixing.

Mode	Fraction (Γ_j/Γ)	Scale factor/ Confidence level
------	--------------------------------	-----------------------------------

PRODUCTION FRACTIONS

The production fractions for weakly decaying b -hadrons at high energy have been calculated from the best values of mean lives, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFLAV) as described in the note " $B^0\text{-}\bar{B}^0$ Mixing" in the B^0 Particle Listings. We no longer provide world averages of the b -hadron production fractions, where results from LEP, Tevatron and LHC are averaged together; indeed the available data (from CDF and LHCb) shows that the fractions depend on the kinematics (in particular the p_T) of the produced b hadron. Hence we would like to list the fractions in Z decays instead, which are well-defined physics observables. The production fractions in $p\bar{p}$ collisions at the Tevatron are also listed at the end of the section. Values assume

$$\text{B}(\bar{b} \rightarrow B^+) = \text{B}(\bar{b} \rightarrow B^0)$$

$$\text{B}(\bar{b} \rightarrow B^+) + \text{B}(\bar{b} \rightarrow B^0) + \text{B}(\bar{b} \rightarrow B_s^0) + \text{B}(b \rightarrow b\text{-baryon}) = 100\%.$$

The correlation coefficients between production fractions are also reported:
 $\text{cor}(B_s^0, b\text{-baryon}) = 0.064$

0.21 ± 0.036 +0.038 / -0.030	⁶ ABE	99P CDF	$p\bar{p}$ at 1.8 TeV

¹ AAIJ 19AD measured the average value using b -hadron semileptonic decays and assuming isospin symmetry for b -hadron p_T of 4 and 25 GeV and η of 2 and 5.

² AAIJ 12J measured this value using b -hadron semileptonic decays and assuming isospin symmetry.

³ AAIJ 11F measured $f_s/f_d = 0.253 \pm 0.017 \pm 0.017 \pm 0.020$, where the errors are statistical, systematic, and theoretical. We divide their value by 2. Our second error combines systematic and theoretical uncertainties.

⁴ AALTONEN 08N reports $[\Gamma(\bar{b} \rightarrow B_s^0)/[\Gamma(\bar{b} \rightarrow B^+) + \Gamma(\bar{b} \rightarrow B^0)]] \times [B(D_s^+ \rightarrow \phi\pi^+)] = (5.76 \pm 0.18 +0.45 / -0.42) \times 10^{-3}$ which we divide by our best value $B(D_s^+ \rightarrow \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

⁵ AFFOLDER 00E uses several electron-charm final states in $b \rightarrow ce^-X$.
⁶ ABE 99P uses the numbers of $K^*(892)^0$, $K^*(892)^+$, and $\phi(1020)$ events produced in association with the double semileptonic decays $b \rightarrow c\mu^-X$ with $c \rightarrow s\mu^+X$.

$\Gamma(B_s^0)/\Gamma(B^0)$ Γ_3/Γ_2

¹ Uses the combination of lepton transverse momentum spectrum and the correlation between the charge of the lepton and opposite jet charge. The first error is statistic and the second error is the total systematic error including the modeling.

² The experimental systematic and model uncertainties are combined in quadrature.

³ ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged $Z \rightarrow b\bar{b}$ sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.

⁴ ACCIARRI 00 result obtained from a combined fit of $R_D = \Gamma(Z \rightarrow b\bar{b})/\Gamma(Z \rightarrow \text{hadrons})$ and $B(b \rightarrow \ell\nu X)$, using double-tagging method.

⁵ ACCIARRI 96c result obtained by a fit to the single lepton spectrum.

⁶ Assumes Standard Model value for R_B .

⁷ ABREU 95D give systematic errors ± 0.0019 (model) and 0.0012 (R_c). We combine these in quadrature.

⁸ BUSKULIC 94G uses e and μ events. This value is from a global fit to the lepton p and p_T (relative to jet) spectra which also determines the b and c production fractions, the fragmentation functions, and the forward-backward asymmetries. This branching ratio depends primarily on the ratio of dileptons to single leptons at high p_T , but the lower p_T portion of the lepton spectrum is included in the global fit to reduce the model dependence. The model dependence is ± 0.0026 and is included in the systematic error.

⁹ ABREU 93c event count includes $e\bar{e}$ events. Combining $e\bar{e}$, $\mu\bar{\mu}$, and $e\mu$ events, they obtain 0.100 ± 0.007 ± 0.007.

¹⁰ AKERS 93B analysis performed using single and dilepton events.

¹ ABBIENDI 00E result is determined by comparing the distribution of several kinematic variables of leptonic events in a lifetime tagged $Z \rightarrow b\bar{b}$ sample using artificial neural network techniques. The first error is statistic; the second error is the total systematic error.

² ACCIARRI 96c result obtained by a fit to the single lepton spectrum.

³ Assumes Standard Model value for R_B .

⁴ ABREU 93c event count includes $\mu\bar{\mu}$ events. Combining $e\bar{e}$, $\mu\bar{\mu}$, and $e\mu$ events, they obtain 0.100 ± 0.007 ± 0.007.

⁵ ADEVA 91c measure the average $B(b \rightarrow eX)$ branching ratio using single and double tagged b enhanced Z events. Combining e and μ results, they obtain 0.113 ± 0.010 ± 0.006. Constraining the initial number of b quarks by the Standard Model prediction (378 ± 3 MeV) for the decay of the Z into $b\bar{b}$, the muon result gives 0.123 ± 0.003 ± 0.006. They obtain 0.119 ± 0.003 ± 0.006 when e and μ results are combined. Used to measure the $b\bar{b}$ width itself, this muon result gives 394 ± 9 ± 22 MeV and combined with the electron result gives 385 ± 7 ± 22 MeV.

⁶ AKERS 93B analysis performed using single and dilepton events.

$1.230 \pm 0.036 \pm 0.065$	4	BUSKULIC	96Y	ALEP $e^+e^- \rightarrow Z$

¹ Measurement performed using an inclusive identification of B mesons and the D candidates.

² Evaluated via summation of exclusive and inclusive channels.

³ ABREU 98D results are extracted from a fit to the b -tagging probability distribution based on the impact parameter.

⁴ BUSKULIC 96Y assumes PDG 96 production fractions for B^0, B^+, B_s, b baryons, and PDG 96 branching ratios for charm decays. This is sum of their inclusive $\bar{D}^0, D^-, \bar{D}_s^-, \Lambda_c$ branching ratios, corrected to include inclusive Ξ_c and charmonium.

χ_b AT HIGH ENERGY

For a discussion of B - \bar{B} mixing, see the note on " B^0 - \bar{B}^0 Mixing" in the B^0 Particle Listings.

χ_b is the average B - \bar{B} mixing parameter at high-energy $\chi_b = f'_d \chi_d + f'_s \chi_s$ where f'_d and f'_s are the fractions of B^0 and B_s^0 hadrons in an unbiased sample of semileptonic b -hadron decays.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at <https://hflav.web.cern.ch/>. The averaging/rescaling procedure takes into account correlations between the measurements.

¹ Uses the dimuon charge asymmetry. Averaged over the mix of b -flavored hadrons.

² Measurement performed using events containing a dimuon or an e/μ pair.
³ The average B mixing parameter is determined simultaneously with b and c forward-backward asymmetries in the fit.

⁴ The experimental systematic and model uncertainties are combined in quadrature.
⁵ ACCIARRI 99D uses maximum-likelihood fits to extract χ_b as well as the A_{FB}^b in $Z \rightarrow b\bar{b}$ events containing prompt leptons.

⁶ This ABREU 94J result is from 5182 $\ell\ell$ and 279 $\ell\ell$ events. The systematic error includes 0.004 for model dependence.

⁷ BUSKULIC 94G data analyzed using ee , $e\mu$, and $\mu\mu$ events.

⁸ BUSKULIC 92B uses a jet charge technique combined with electrons and muons.

⁹ ABE 91G measurement of χ is done with $e\mu$ and ee events.

¹⁰ ALBAJAR 91D measurement of χ is done with dimuons.

¹¹ Uses di-muon events.

¹² ALEXANDER 96 uses a maximum likelihood fit to simultaneously extract χ as well as the forward-backward asymmetries in $e^+e^- \rightarrow Z \rightarrow b\bar{b}$ and $c\bar{c}$.

¹³ UENO 96 extracted χ from the energy dependence of the forward-backward asymmetry.

¹⁴ ABREU 94F uses the average electric charge sum of the jets recoiling against a b -quark jet tagged by a high p_T muon. The result is for $\bar{\chi} = f'_d \chi_d + 0.9 f'_s \chi_s$.

¹⁵ This ABREU 94J result combines $\ell\ell$, $\ell\ell$, and jet-charge ℓ (ABREU 94F) analyses. It is for $\bar{\chi} = f'_d \chi_d + 0.96 f'_s \chi_s$.

¹⁶ ALBAJAR 94 uses dimuon events. Not independent of ALBAJAR 91D.

¹⁷ ABREU 93C data analyzed using ee , $e\mu$, and $\mu\mu$ events.

¹⁸ AKERS 93B analysis performed using dilepton events.

¹⁹ ACTON 92C uses electrons and muons. Superseded by AKERS 93B.

²⁰ ADEVA 92C uses electrons and muons.

²¹ DECAMP 91 done with opposite and like-sign dileptons. Superseded by BUSKULIC 92B.

²² ADEVA 90P measurement uses ee , $\mu\mu$, and $e\mu$ events from 118k events at the Z. Superseded by ADEVA 92C.

²³ These experiments are not in the average because the combination of B_s and B_d mesons which they see could differ from those at higher energy.

²⁴ The WEIR 90 measurement supersedes the limit obtained in SCHAAD 85. The 90% CL are 0.06 and 0.38.

²⁵ ALBAJAR 87C measured $\chi = (\bar{B}^0 \rightarrow B^0 \rightarrow \mu^+ X)$ divided by the average production weighted semileptonic branching fraction for B hadrons at 546 and 630 GeV.

²⁶ Limit is average probability for hadron containing B quark to produce a positive lepton.

CP VIOLATION PARAMETERS in semileptonic b -hadron decays.

$\text{Re}(\epsilon_b) / (1 + |\epsilon_b|^2)$

CP impurity in semileptonic b -hadron decays.

VALUE (units 10 ⁻³)	DOCUMENT ID	TECN	COMMENT	
• • • We do not use the following data for averages, fits, limits, etc. • • •				
-6.2 ± 5.2 ± 4.7	1	AABOUD	17E	ATLS $p\bar{p}$ at 8 TeV
-1.24 ± 0.38 ± 0.18	2	ABAZOV	14	D0 $p\bar{p}$ at 1.96 TeV
-1.97 ± 0.43 ± 0.23	3	ABAZOV	11U	D0 Repl. by ABAZOV 14
-2.39 ± 0.63 ± 0.37	4	ABAZOV	10H	D0 Repl. by ABAZOV 11U

¹ AABOUD 17E reports a measurement of charge asymmetry of $A_{SL}^b = (-25 \pm 21 \pm 19) \times 10^{-3}$ in lepton + jets $t\bar{t}$ events in which a b -hadron decays semileptonically to a soft muon.

² ABAZOV 14 reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^b = (-4.96 \pm 1.53 \pm 0.72) \times 10^{-3}$ in semileptonic b -hadron decays.

³ ABAZOV 11U reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^b = (-7.87 \pm 1.72 \pm 0.93) \times 10^{-3}$ in semileptonic b -hadron decays.

⁴ ABAZOV 10H reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^b = (-9.57 \pm 2.51 \pm 1.46) \times 10^{-3}$ in semileptonic b -hadron decays. Using the measured production ratio of B_d^0 and B_s^0 , and the asymmetry of $B_d^0, A_{SL}^d = (-4.7 \pm 4.6) \times 10^{-3}$ measured from B -factories, they obtain the asymmetry for B_s^0 as $A_{SL}^s = (-14.6 \pm 7.5) \times 10^{-3}$.

B-HADRON PRODUCTION FRACTIONS IN $p\bar{p}$ COLLISIONS AT Tevatron

The production fractions for b -hadrons in $p\bar{p}$ collisions at the Tevatron have been calculated from the best values of mean lifetimes, mixing parameters, and branching fractions in this edition by the Heavy Flavor Averaging Group (HFLAV) (see <https://hflav.web.cern.ch/>).

The values reported below assume:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0)$$

$$f(\bar{b} \rightarrow B^+) + f(\bar{b} \rightarrow B^0) + f(\bar{b} \rightarrow B_s^0) + f(b \rightarrow b\text{-baryon}) = 1$$

The values are:

$$f(\bar{b} \rightarrow B^+) = f(\bar{b} \rightarrow B^0) = 0.344 \pm 0.021$$

$$f(\bar{b} \rightarrow B_s^0) = 0.115 \pm 0.013$$

$$f(b \rightarrow b\text{-baryon}) = 0.198 \pm 0.046$$

$$f(\bar{b} \rightarrow B_s^0) / f(\bar{b} \rightarrow B^0) = 0.334 \pm 0.041$$

and their correlation coefficients are:

$$\text{cor}(B_s^0, b\text{-baryon}) = -0.429$$

$$\text{cor}(B_s^0, B^+ = B^0) = +0.159$$

$$\text{cor}(b\text{-baryon}, B^+ = B^0) = -0.960$$

as obtained with the Tevatron average of time-integrated mixing parameter $\bar{\chi} = 0.147 \pm 0.011$.

See key on page 999

Vcb MEASUREMENTS

For the discussion of Vcb measurements, which is not repeated here, see the review on "Determination of |Vcb| and |Vub|."

The CKM matrix element |Vcb| can be determined by studying the rate of the semileptonic decay B -> D(*) l nu as a function of the recoil kinematics of D(*) mesons.

"OUR EVALUATION" is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV) and are described at https://hflav.web.cern.ch/.

|Vcb| x F(1) (from B0 -> D*- l+ nu)

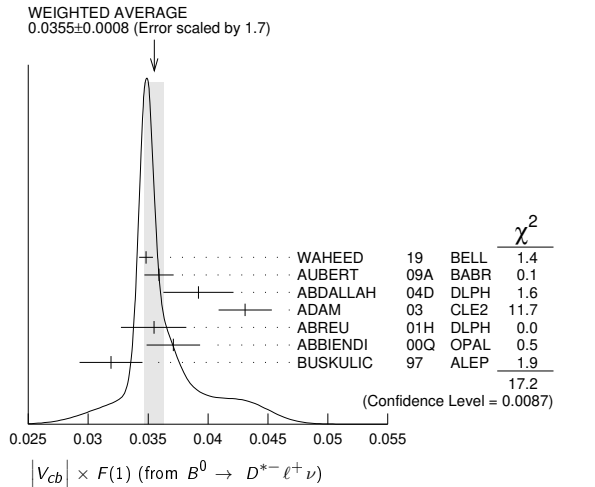

Table of Vcb measurements, listing values, document IDs, and technical details for various decays.

- Uses fully reconstructed $D^{*+} \ell^+ \nu$ events ($\ell = e$ or μ) and $\eta_{EW} = 1.0066$.
- Obtained from a global fit to $B \rightarrow D^{(*)} \ell \nu \ell$ events, with reconstructed $D^0 \ell$ and $D^+ \ell$ final states and $\rho^2 = 1.22 \pm 0.02 \pm 0.07$.
- Measurement using fully reconstructed D^* sample with a $\rho^2 = 1.32 \pm 0.15 \pm 0.33$.
- Average of the $B^0 \rightarrow D^{*}(2010)^- \ell^+ \nu$ and $B^+ \rightarrow \bar{D}^{*}(2007) \ell^+ \nu$ modes with $\rho^2 = 1.61 \pm 0.09 \pm 0.21$ and $f_{+-} = 0.521 \pm 0.012$.
- ABREU 01H measured using about 5000 partial reconstructed D^* sample with a $\rho^2 = 1.34 \pm 0.14^{+0.24}_{-0.22}$.
- ABBIENDI 00q: measured using both inclusively and exclusively reconstructed $D^{*\pm}$ samples with a $\rho^2 = 1.21 \pm 0.12 \pm 0.20$. The statistical and systematic correlations between $|V_{cb}| \times F(1)$ and ρ^2 are 0.90 and 0.54 respectively.
- BUSKULIC 97: measured using exclusively reconstructed $D^{*\pm}$ with a $a^2 = 0.31 \pm 0.17 \pm 0.08$. The statistical correlation is 0.92.
- Uses fully reconstructed $D^{*+} \ell^+ \nu$ events ($\ell = e$ or μ).
- Measured using the dependence of $B^- \rightarrow D^{*0} e^- \bar{\nu}_e$ decay differential rate and the form factor description by CAPRINI 98 with $\rho^2 = 1.16 \pm 0.06 \pm 0.08$.
- Measured using fully reconstructed D^* sample and a simultaneous fit to the Caprini-Lellouch-Neubert form factor parameters: $\rho^2 = 1.191 \pm 0.048 \pm 0.028$, $R_1(1) = 1.429 \pm 0.061 \pm 0.044$, and $R_2(1) = 0.827 \pm 0.038 \pm 0.022$.
- Measurement using fully reconstructed D^* sample with a $\rho^2 = 1.29 \pm 0.03 \pm 0.27$.
- Combines with previous partial reconstructed D^* measurement with a $\rho^2 = 1.39 \pm 0.10 \pm 0.33$.
- Measured using exclusive $B^0 \rightarrow D^{*}(892)^- e^+ \nu$ decays with $\rho^2 = 1.35 \pm 0.17 \pm 0.19$ and a correlation of 0.91.
- BRIERE 02 result is based on the same analysis and data sample reported in ADAM 03.
- ABREU 96p: measured using both inclusively and exclusively reconstructed $D^{*\pm}$ samples.
- BARISH 95: measured using both exclusive reconstructed $B^0 \rightarrow D^{*-} \ell^+ \nu$ and $B^+ \rightarrow D^{*0} \ell^+ \nu$ samples. They report their experiment's uncertainties $\pm 0.0019 \pm 0.0018 \pm 0.0008$, where the first error is statistical, the second is systematic, and the third is the uncertainty in the lifetimes. We combine the last two in quadrature.

- Obtained from a fit to the combined partially reconstructed $B \rightarrow \bar{D} \ell \nu \ell$ sample while tagged by the other fully reconstructed B meson in the event. Also reports fitted $\rho^2 = 1.09 \pm 0.05$.
- Obtained from a fit to the combined $B \rightarrow \bar{D} \ell^+ \nu \ell$ sample in which a hadronic decay of the second B meson is fully reconstructed and $\rho^2 = 1.20 \pm 0.09 \pm 0.04$.
- Obtained from a global fit to $B \rightarrow D^{(*)} \ell \nu \ell$ events, with reconstructed $D^0 \ell$ and $D^+ \ell$ final states and $\rho^2 = 1.20 \pm 0.04 \pm 0.07$.
- BARTELT 99: measured using both exclusive reconstructed $B^0 \rightarrow D^- \ell^+ \nu$ and $B^+ \rightarrow D^0 \ell^+ \nu$ samples.
- BUSKULIC 97: measured using exclusively reconstructed D^\pm with a $a^2 = -0.05 \pm 0.53 \pm 0.38$. The statistical correlation is 0.99.

- Using the missing energy and momentum to extract kinematic information about the undetected neutrino in the $B^0 \rightarrow D^- \ell^+ \nu$ decay.
- ATHANAS 97: measured using both exclusive reconstructed $B^0 \rightarrow D^- \ell^+ \nu$ and $B^+ \rightarrow D^0 \ell^+ \nu$ samples with a $\rho^2 = 0.59 \pm 0.22 \pm 0.12^{+0.59}_{-0}$. They report their experiment's uncertainties $\pm 0.0044 \pm 0.0048^{+0.0053}_{-0.0012}$, where the first error is statistical, the second is systematic, and the third is the uncertainty due to the form factor model variations. We combine the last two in quadrature.

V_{ub} MEASUREMENTS

For the discussion of V_{ub} measurements, which is not repeated here, see the review on "Determination of $|V_{cb}|$ and $|V_{ub}|$."

The CKM matrix element $|V_{ub}|$ can be determined by studying the rate of the charmless semileptonic decay $b \rightarrow u \ell \nu$. The relevant branching ratio measurements based on exclusive and inclusive decays can be found in the B Listings, and are not repeated here.

- 5713 ± 2 ⁴ ACCIARRI 99N L3 $e^+e^- \rightarrow Z$
- ¹ AFFOLDER 01F uses the reconstructed B meson through semileptonic decay channels. The fraction of light B mesons that are produced at $L=1$ B^{**} states is measured to be $0.28 \pm 0.06 \pm 0.03$.
- ² BARATE 98L uses fully reconstructed B mesons to search for B^{**} production in the $B\pi^\pm$ system. In the framework of heavy quark symmetry (HQs), they also measured the mass of B_2^* to be 5739^{+8+6}_{-11-4} MeV/ c^2 and the relative production rate of $B(b \rightarrow B_2^* \rightarrow B^*(*)\pi)/B(b \rightarrow B_{u,d}) = (31 \pm 9^{+6}_{-5})\%$.
- ³ Using $m_{B\pi^-} - m_B = 424 \pm 4 \pm 10$ MeV.
- ⁴ ACCIARRI 99N uses inclusive reconstructed B mesons to search for B^{**} production in the $B^*(*)\pi^\pm$ system. In the framework of HQET, they measured the mass of B_1^* and B_2^* to be $5670 \pm 10 \pm 13$ MeV and $5768 \pm 5 \pm 6$ with the $B(b \rightarrow B^{**}) = (32 \pm 3 \pm 6) \times 10^{-2}$. They also reported the evidence for the existence of an excited B -meson state or mixture of states in the region 5.9–6.0 GeV.

- 1 AALTONEN 11AP combines the fully reconstructed $B_s^0 \rightarrow D_s^- \pi^+$ decays and partially reconstructed $B_s^0 \rightarrow D_s X$ decays.
- 2 Measured using $D_s \mu^+$ vertices.
- 3 Uses $D_s^- \ell^+$, and $\phi \ell^+$ vertices.
- 4 Measured using D_s hadron vertices.
- 5 Measured using $D_s^- \ell^+$ vertices.
- 6 ACKERSTAFF 98F use fully reconstructed $D_s^- \rightarrow \phi \pi^-$ and $D_s^- \rightarrow K^*0 K^-$ in the inclusive B_s^0 decay.
- 7 Combined results from $D_s^- \ell^+$ and D_s hadron.
- 8 Measured using $\phi \ell$ vertices.
- 9 Measured using inclusive D_s vertices.
- 10 Combined result for the four ABREU 96F methods.
- 11 Exclusive reconstruction of $B_s \rightarrow \psi \phi$.
- 12 ABREU 94E uses the flight-distance distribution of D_s vertices, ϕ -lepton vertices, and $D_s \mu$ vertices.

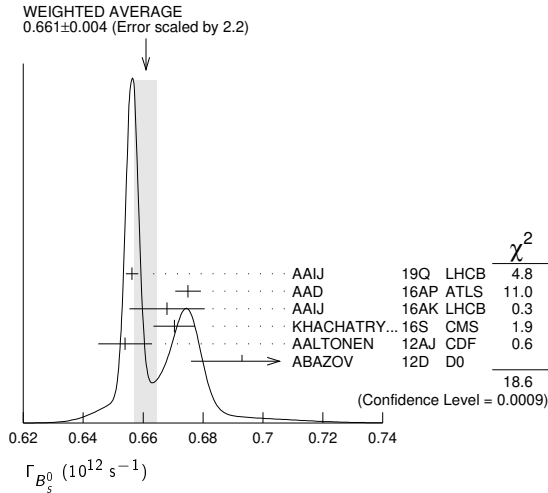

$\Gamma_{B_s^0}$

"OUR EVALUATION" is an average performed by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) as described in our "Review on $B-\bar{B}$ Mixing" in the B^0 section of these Listings. It includes the measurements of Γ_{B^0} and $\Delta \Gamma_{B^0}$ listed in this section, as well as constraints from effective lifetimes with pure CP modes and flavor-specific modes.

- 1 Measured using time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ in the region $m(KK) > 1.05$ GeV.
- 2 Measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.
- 3 Measured using a time-dependent angular analysis of $B_S^0 \rightarrow \psi(2S) \phi$ decays.
- 4 Measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ decays.
- 5 Measured using a combined time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ and $B_S^0 \rightarrow J/\psi \pi^+ \pi^-$ decays.
- 6 Assuming CPV phase $\phi_S = -0.04$.
- 7 Assuming CPV phase $\phi_S = 0$.

- 7 Uses the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays and assuming CP-violating angle $\beta_S(B^0 \rightarrow J/\psi \phi) = 0.02$.
- 8 Measured the angular and lifetime parameters for the time-dependent angular untagged decays $B_d^0 \rightarrow J/\psi K^{*0}$ and $B_S^0 \rightarrow J/\psi \phi$.
- 9 Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays and assuming CP-violating phase $\phi_S = 0$.
- 10 Obtains 90% CL interval $-0.06 < \Delta\Gamma_S < 0.30$.
- 11 ABAZOV 07 reports $0.17 \pm 0.09 \pm 0.02$ with CP-violating phase ϕ_S as a free parameter.
- 12 Combines D^0 measurements of time-dependent angular distributions in $B_S^0 \rightarrow J/\psi \phi$ and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

$\Delta\Gamma_{B_S^0}/\Gamma_{B_S^0}$

$\Gamma_{B_S^0}$ and $\Delta\Gamma_{B_S^0}$ are the decay rate average and difference between two B_S^0 CP eigenstates (light – heavy).

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>). It is derived from the averages of $\Gamma_{B_S^0}$ and $\Delta\Gamma_{B_S^0}$ (and their correlation).

$\Delta\Gamma_{B_S^0}$

"OUR EVALUATION" is an average performed by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) as described in our "Review on $B-\bar{B}$ Mixing" in the B^0 section of these Listings. It includes the measurements of $\Gamma_{B_S^0}$ and $\Delta\Gamma_{B_S^0}$ listed in this section, as well as constraints from effective lifetimes with pure CP modes and flavor-specific modes.

- 1 Measured using time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ decays.
- 2 Measured using time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ in the region $m(KK) > 1.05$ GeV.
- 3 Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.
- 4 Measured using time-dependent angular analysis of $B_S^0 \rightarrow \psi(2S) \phi$ decays.
- 5 The error includes both statistical and systematic uncertainties.
- 6 AAIJ 13AR result comes from a combined fit to $B_S^0 \rightarrow J/\psi K^+ K^-$ and $B_S^0 \rightarrow J/\psi \pi^+ \pi^-$ data sets. Also reports $\Delta\Gamma_S = 0.100 \pm 0.016 \pm 0.003 \text{ ps}^{-1}$ from a fit to $B_S^0 \rightarrow J/\psi K^+ K^-$ decays.

- 1 Assumes CP violation is negligible.
- 2 Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.
- 3 Uses the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays and assuming CP-violating angle $\beta_S(B^0 \rightarrow J/\psi \phi) = 0.02$.
- 4 Measured using fully reconstructed $B_S \rightarrow J/\psi \phi$ decays.
- 5 Assumes $2 \text{B}(B_S^0 \rightarrow D_S^{(*)} D_S^{(*)}) \simeq \Delta\Gamma_S^{CP} / \Gamma_S$.
- 6 Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.
- 7 Uses $|A_0|^2 - |A_{||}|^2 = 0.355 \pm 0.066$ from ACOSTA 05.
- 8 Uses $D_S^- \ell^+$, and $\phi \ell^+$ vertices.
- 9 Measured using D_S hadron vertices.
- 10 Uses $\phi \phi$ correlations from $B_S^0 \rightarrow D_S^{(*)+} D_S^{(*)-}$.
- 11 ABE 99D assumes $\tau_{B_S^0} = 1.55 \pm 0.05 \text{ ps}$.
- 12 ACCIARRI 98s assumes $\tau_{B_S^0} = 1.49 \pm 0.06 \text{ ps}$ and PDG 98 values of b production fraction.

B_{SH}^0 MEAN LIFE

B_{SH}^0 is the heavy mass state of two B_S^0 CP eigenstates.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>). It is derived from the averages of $\Gamma_{B_S^0}$ and $\Delta\Gamma_{B_S^0}$ (and their correlation).

Meson Particle Listings

B_S^0

- 1 Measured using $B_S^0 \rightarrow J/\psi \pi^+ \pi^-$ decays with $0.9240 < m(\pi\pi) < 1.0204$ GeV, which is dominated by the $f_0(980)$ resonance, making it a CP -odd state.
- 2 Measured using $B_S \rightarrow \mu^+ \mu^-$ decays which, in the Standard Model, correspond to B_{SH}^0 decays. Assumes $-2 \operatorname{Re}(\lambda)/(1 + |\lambda|^2) = 1$.
- 3 Measured using $J/\psi \pi^+ \pi^-$ mode with $0.880 < m(\pi\pi) < 1.080$ GeV/ c^2 , which is mostly $J/\psi f(0)(980)$ mode, a pure CP -odd final state.
- 4 Measured using a pure CP -odd final state $J/\psi K_S^0$ with the assumption that contributions from penguin diagrams are small.
- 5 Measured using $B_S \rightarrow J/\psi \pi^+ \pi^-$ decays which, in the limit of $\phi_S = 0$ and $|\lambda| = 1$, correspond to B_{SH}^0 decays.
- 6 Measured using a pure CP -odd final state $J/\psi f_0(980)$.
- 7 Uses the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays assuming CP -violating angle $\beta_S(B^0 \rightarrow J/\psi \phi) = 0.02$.
- 8 Obtained from $\Delta\Gamma_S$ and Γ_S fit with a correlation of 0.6.
- 9 Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi \phi$ decays.

B_{sL}^0 MEAN LIFE

B_{sL}^0 is the light mass state of two B_S^0 CP eigenstates.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>). It is derived from the averages of $\Gamma_{B_S^0}$ and $\Delta\Gamma_{B_S^0}$ (and their correlation).

B_S^0 DECAY MODES

These branching fractions all scale with $B(\bar{B} \rightarrow B_S^0)$.

The branching fraction $B(B_S^0 \rightarrow D_S^- \ell^+ \nu_\ell \text{ anything})$ is not a pure measurement since the measured product branching fraction $B(\bar{B} \rightarrow B_S^0) \times B(B_S^0 \rightarrow D_S^- \ell^+ \nu_\ell \text{ anything})$ was used to determine $B(\bar{B} \rightarrow B_S^0)$, as described in the note on " B^0 - \bar{B}^0 Mixing"

For inclusive branching fractions, e.g., $B \rightarrow D^\pm \text{ anything}$, the values usually are multiplicities, not branching fractions. They can be greater than one.

Mode	Fraction (Γ_i/Γ)	Scale factor/ Confidence level			
$\Gamma_1 D_s^-$ anything	(93 ± 25) %		$\Gamma_{60} J/\psi(1S) f_2(1270), f_2 \rightarrow$	$(1.1 \pm 0.4) \times 10^{-6}$	
$\Gamma_2 \ell \nu_\ell X$	(9.6 ± 0.8) %		$\Gamma_{61} J/\psi(1S) f_2(1270)_0, f_2 \rightarrow$	$(7.5 \pm 1.8) \times 10^{-7}$	
$\Gamma_3 e^+ \nu X^-$	(9.1 ± 0.8) %		$\Gamma_{62} J/\psi(1S) f_2(1270)_\parallel, f_2 \rightarrow$	$(1.09 \pm 0.34) \times 10^{-6}$	
$\Gamma_4 \mu^+ \nu X^-$	(10.2 ± 1.0) %		$\Gamma_{63} J/\psi(1S) f_2(1270)_\perp, f_2 \rightarrow$	$(1.3 \pm 0.8) \times 10^{-6}$

- [a] Not a pure measurement. See note at head of B_s^0 Decay Modes.
- [b] Here S and P are the hypothetical scalar and pseudoscalar particles with masses of 2.5 GeV/c² and 214.3 MeV/c², respectively.
- [c] The value is for the sum of the charge states or particle/antiparticle states indicated.

CONSTRAINED FIT INFORMATION

An overall fit to 12 branching ratios uses 20 measurements and one constraint to determine 8 parameters. The overall fit has a $\chi^2 = 26.7$ for 13 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

B_s^0 BRANCHING RATIOS

$\Gamma(D_s^- \text{ anything}) / \Gamma_{\text{total}}$ Γ_1 / Γ

VALUE	EVTS	DOCUMENT ID	TECN	COMMENT
0.93 ± 0.25 OUR AVERAGE				
0.91 ± 0.18 ± 0.41		¹ DRUSKOY 07	BELL	$e^+e^- \rightarrow \Upsilon(4S)$
0.81 ± 0.24 ± 0.22	90	² BUSKULIC 96E	ALEP	$e^+e^- \rightarrow Z$
1.56 ± 0.58 ± 0.44	147	³ ACTON 92N	OPAL	$e^+e^- \rightarrow Z$

- The extraction of this result takes into account the correlation between the measurements of $B(\Upsilon(5S) \rightarrow D_s X)$ and $B(\Upsilon(5S) \rightarrow D^0 X)$.
- BUSKULIC 96E separate $c\bar{c}$ and $b\bar{b}$ sources of D_s^+ mesons using a lifetime tag, subtract generic $\bar{B} \rightarrow W^+ \rightarrow D_s^+$ events, and obtain $B(\bar{B} \rightarrow B_s^0) \times B(B_s^0 \rightarrow D_s^- \text{ anything}) = 0.088 \pm 0.020 \pm 0.020$ assuming $B(D_s \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$ and PDG 1994 values for the relative partial widths to other D_s channels. We evaluate using our current values $B(\bar{B} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{B} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$.
- ACTON 92N assume that excess of $147 \pm 48 D_s^0$ events over that expected from $B^0, B^+,$ and $c\bar{c}$ is all from B_s^0 decay. The product branching fraction is measured to be $B(\bar{B} \rightarrow B_s^0)B(B_s^0 \rightarrow D_s^- \text{ anything}) \times B(D_s^- \rightarrow \phi\pi^-) = (5.9 \pm 1.9 \pm 1.1) \times 10^{-3}$. We evaluate using our current values $B(\bar{B} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{B} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$.

9.5 ^{+2.5+1.1} _{-2.0-1.9}	² LEES 12A	BABR	e^+e^-

- The measurement corresponds to the average of the electron and muon branching fractions.
- The measurement corresponds to a branching fraction where the lepton originates from bottom decay and is the average between the electron and muon branching fractions. LEES 12A uses the correlation of the production of ϕ mesons in association with a lepton in e^+e^- data taken at center-of-mass energies between 10.54 and 11.2 GeV.

$\Gamma(D_s^- \ell^+ \nu_\ell \text{ anything}) / \Gamma_{\text{total}}$ Γ_5 / Γ

The values and averages in this section serve only to show what values result if one assumes our $B(\bar{B} \rightarrow B_s^0)$. They cannot be thought of as measurements since the underlying product branching fractions were also used to determine $B(\bar{B} \rightarrow B_s^0)$ as described in the note on "Production and Decay of b-Flavored Hadrons."

10.3 ± 3.6 ± 2.8	18	⁴ ACTON 92N	OPAL	$e^+e^- \rightarrow Z$
••• We do not use the following data for averages, fits, limits, etc. •••				
13 ± 4 ± 4	27	⁵ BUSKULIC 92E	ALEP	$e^+e^- \rightarrow Z$

- Obtains $B_s \rightarrow D_s X e \nu$, and $D_s X \mu \nu$ separately, then combines them by assuming systematic uncertainties are fully correlated, except for the one on lepton identification. The third uncertainty adds in quadrature systematic uncertainties from external sources (number of B_s events, and $D_s^{(*)}$ branching fractions). OSWALD 15 also measures the cross-section $\sigma(e^+e^- \rightarrow B_s^{(*)} \bar{B}_s^{(*)}) = 53.8 \pm 1.4 \pm 5.3$ pb at $\sqrt{s} = 10.86$ GeV.
- BUSKULIC 95O use $D_s \ell$ correlations. The measured product branching ratio is $B(\bar{B} \rightarrow B_s) \times B(B_s \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) = (0.82 \pm 0.09_{-0.13}^{+0.14})\%$ assuming $B(D_s \rightarrow \phi\pi) = (3.5 \pm 0.4) \times 10^{-2}$ and PDG 1994 values for the relative partial widths to the six other D_s channels used in this analysis. Combined with results from $\Upsilon(4S)$ experiments this can be used to extract $B(\bar{B} \rightarrow B_s) = (11.0 \pm 1.2_{-2.6}^{+2.5})\%$. We evaluate using our current values $B(\bar{B} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{B} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$.
- ABREU 92M measured muons only and obtained product branching ratio $B(Z \rightarrow b\bar{b}) \times B(\bar{B} \rightarrow B_s) \times B(B_s \rightarrow D_s \mu^+ \nu_\mu \text{ anything}) \times B(D_s \rightarrow \phi\pi) = (18 \pm 8) \times 10^{-5}$. We evaluate using our current values $B(\bar{B} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{B} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$. We use $B(Z \rightarrow b\bar{b}) = 2B(Z \rightarrow b\bar{b}) = 2 \times (0.2212 \pm 0.0019)$.
- ACTON 92N is measured using $D_s \rightarrow \phi\pi^+$ and $K^*(892)^0 K^+$ events. The product branching fraction measured is measured to be $B(\bar{B} \rightarrow B_s^0)B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) \times B(D_s^- \rightarrow \phi\pi^-) = (3.9 \pm 1.1 \pm 0.8) \times 10^{-4}$. We evaluate using our current values $B(\bar{B} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{B} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$.
- BUSKULIC 92E is measured using $D_s \rightarrow \phi\pi^+$ and $K^*(892)^0 K^+$ events. They use $2.7 \pm 0.7\%$ for the $\phi\pi^+$ branching fraction. The average product branching fraction is measured to be $B(\bar{B} \rightarrow B_s^0)B(B_s^0 \rightarrow D_s^- \ell^+ \nu_\ell \text{ anything}) = 0.020 \pm 0.0055_{-0.006}^{+0.005}$. We evaluate using our current values $B(\bar{B} \rightarrow B_s^0) = 0.107 \pm 0.014$ and $B(D_s \rightarrow \phi\pi) = 0.036 \pm 0.009$. Our first error is their experiment's and our second error is that due to $B(\bar{B} \rightarrow B_s^0)$ and $B(D_s \rightarrow \phi\pi)$. Superseded by BUSKULIC 95O.

5.4 ± 0.4 ± 1.0			
	¹ OSWALD 15	BELL	$e^+e^- \rightarrow \Upsilon(5S)$

- Obtains $B_s \rightarrow D_s^* X e \nu$, and $D_s^* X \mu \nu$ separately, then combines them by assuming systematic uncertainties are fully correlated, except for the one on lepton identification. The third uncertainty adds in quadrature systematic uncertainties from external sources (number of B_s events, and $D_s^{(*)}$ branching fractions). OSWALD 15 also measures the cross-section $\sigma(e^+e^- \rightarrow B_s^{(*)} \bar{B}_s^{(*)}) = 53.8 \pm 1.4 \pm 5.3$ pb at $\sqrt{s} = 10.86$ GeV.

1 AAIJ 16P reports $[\Gamma(B_S^0 \rightarrow D_s^{*+} D_s^{*-})/\Gamma_{total}] / [B(B^0 \rightarrow D^- D_s^+)] = 4.24 \pm 0.14 \pm 0.27$ which we multiply by our best value $B(B^0 \rightarrow D^- D_s^+) = (7.2 \pm 0.8) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best value.

2 Use $\Upsilon(5S) \rightarrow B_S^* \bar{B}_S^*$ decays assuming $B(\Upsilon(5S) \rightarrow B_S^* \bar{B}_S^*) = (17.1 \pm 3.0)\%$ and $\Gamma(\Upsilon(5S) \rightarrow B_S^* \bar{B}_S^*) / \Gamma(\Upsilon(5S) \rightarrow B_S^{(*)} \bar{B}_S^{(*)}) = (87.0 \pm 1.7)\%$.

3 AALTONEN 12c reports $(f_s/f_d) (B(B_S^0 \rightarrow D_s^{*+} D_s^{*-}) / B(B^0 \rightarrow D^- D_s^+)) = 1.261 \pm 0.095 \pm 0.112$. We multiply this result by our best value of $B(B^0 \rightarrow D^- D_s^+) = (7.2 \pm 0.8) \times 10^{-3}$ and divide by our best value of f_s/f_d , where $1/2 f_s/f_d = 0.1230 \pm 0.0115$. Our first quoted uncertainty is the combined experiment's uncertainty and our second is the systematic uncertainty from using our best values.

4 Uses the final states where $D_s^+ \rightarrow \phi \pi^+$ and $D_s^- \rightarrow \phi \mu^- \bar{\nu}_\mu$.

5 Reports $B(B_S^0 \text{ (short)} \rightarrow D_s^{*+} D_s^{*-}) = (0.23 \pm 0.10 \pm 0.05) \cdot [0.17/B(D_S \rightarrow \phi \chi)]^2$ assuming $B(B_S^0 \text{ (short)} \rightarrow B_S^0 \text{ (short)}) = 50\%$. We use our best value of $B(D_S \rightarrow \phi \chi) = 15.7 \pm 1.0\%$ to obtain the quoted result.

6 Uses $\phi\phi$ correlations from $B_S^0 \text{ (short)} \rightarrow D_s^{*+} D_s^{*-}$.

7 Sum of exclusive $B_S \rightarrow D_s^+ D_s^-$, $B_S \rightarrow D_s^{*+} D_s^{*-}$ and $B_S \rightarrow D_s^{*+} D_s^{*-}$.

8 Uses $\Upsilon(10860) \rightarrow B_S^* \bar{B}_S^*$ assuming $B(\Upsilon(10860) \rightarrow B_S^{(*)} \bar{B}_S^{(*)}) = (19.3 \pm 2.9)\%$ and $\Gamma(\Upsilon(10860) \rightarrow B_S^* \bar{B}_S^*) / \Gamma(\Upsilon(10860) \rightarrow B_S^{(*)} \bar{B}_S^{(*)}) = (90.1 \pm 3.8)_{-4.0}^{\%}$.

POLARIZATION IN B_S^0 DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L), or both are transverse and parallel (\parallel), or perpendicular (\perp) to each other with the parameters Γ_L/Γ , Γ_{\perp}/Γ , and the relative phases ϕ_{\parallel} and ϕ_{\perp} . In decays involving two tensor mesons, the transverse polarization states are described by parameters $\Gamma_{\parallel 1}$, $\Gamma_{\parallel 2}$, $\Gamma_{\perp 1}$, $\Gamma_{\perp 2}$ and their relative phases $\phi_{\parallel 1}$, $\phi_{\parallel 2}$, $\phi_{\perp 1}$, $\phi_{\perp 2}$. See also the review on "Polarization in B Decays."

³ The error includes both statistical and systematic uncertainties.

⁴ AFFOLDER 00N measurements are based on 40 B_S^0 candidates obtained from a data sample of 89 pb $^{-1}$. The P -wave fraction is found to be $0.23 \pm 0.19 \pm 0.04$.

⁵ Measured the angular and lifetime parameters for the time-dependent angular untagged decays $B_d^0 \rightarrow J/\psi K^{*0}$ and $B_s^0 \rightarrow J/\psi\phi$.

 Γ_L/Γ in $B_S^0 \rightarrow D_s^* D_s^{*-}$

B_s^0 - \bar{B}_s^0 MIXING

For a discussion of B_s^0 - \bar{B}_s^0 mixing see the note on " B^0 - \bar{B}^0 Mixing" in the B^0 Particle Listings above.

χ_s is a measure of the time-integrated B_s^0 - \bar{B}_s^0 mixing probability that produced B_s^0 (\bar{B}_s^0) decays as a \bar{B}_s^0 (B_s^0). Mixing violates $\Delta B \neq 2$ rule.

$$\chi_s = \frac{x_s^2}{2(1+x_s^2)}$$

$$x_s = \frac{\Delta m_{B_s^0}}{\Gamma_{B_s^0}} = (m_{B_{sH}} - m_{B_{sL}}) \tau_{B_s^0}$$

where H, L stand for heavy and light states of two B_s^0 CP eigenstates and $\tau_{B_s^0} = \frac{1}{0.5(\Gamma_{B_{sH}} + \Gamma_{B_{sL}})}$.

$$\Delta m_{B_s^0} = m_{B_{sH}} - m_{B_{sL}}$$

$\Delta m_{B_s^0}$ is a measure of 2π times the B_s^0 - \bar{B}_s^0 oscillation frequency in time-dependent mixing experiments.

"OUR EVALUATION" is provided by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) by taking into account correlations between measurements.

- Measured using time-dependent angular analysis of $B_s^0 \rightarrow J/\psi K^+ K^-$ decays.
- Measured using $B_s^0 \rightarrow D_s^- \pi^+$ decays.
- Measured using $B_s^0 \rightarrow D_s^- \mu^+ \nu_\mu X$ decays.
- Measured using $B_s^0 \rightarrow D_s^- \pi^+$ and $D_s^- \pi^+ \pi^- \pi^+$ decays.
- Significance of oscillation signal is 5.4σ . Also reports $|V_{td} / V_{ts}| = 0.2060 \pm 0.0007^{+0.0008}_{-0.0060}$.
- A likelihood scan over the oscillation frequency, Δm_s , gives a most probable value of 19 ps^{-1} and a range of $17 < \Delta m_s < 21 (\text{ps}^{-1})$ at 90% C.L. assuming Gaussian uncertainties. Also excludes $\Delta m_s < 14.8 \text{ ps}^{-1}$ at 95% C.L.
- Significance of oscillation signal is 0.2%. Also reported the value $|V_{td} / V_{ts}| = 0.208^{+0.001+0.008}_{-0.002-0.006}$.
- Uses leptons emitted with large momentum transverse to a jet and improved techniques for vertexing and flavor-tagging.
- Updates of D_s -lepton analysis.
- Combined results from all Delphi analyses.
- Events with a high transverse momentum lepton were removed and an inclusively reconstructed vertex was required.
- ABE 03 uses the novel "charge dipole" technique to reconstruct separate secondary and tertiary vertices originating from the $B \rightarrow D$ decay chain. The analysis excludes $\Delta m_s < 4.9 \text{ ps}^{-1}$ and $7.9 < \Delta m_s < 10.3 \text{ ps}^{-1}$.
- Three analyses based on complementary event selections: (1) fully-reconstructed hadronic decays; (2) semileptonic decays with D_s exclusively reconstructed; (3) inclusive semileptonic decays.
- ABE 02v uses exclusively reconstructed D_s^- mesons and excludes $\Delta m_s < 1.4 \text{ ps}^{-1}$ and $2.4 < \Delta m_s < 5.3 \text{ ps}^{-1}$ at 95% C.L.
- Uses fully or partially reconstructed $D_s \ell$ vertices and a mixing tag as a flavor tagging.
- Replaced by ABDALLAH 04A. Uses $D_s^- \ell^+$, and $\phi \ell^+$ vertices, and a multi-variable discriminant as a flavor tagging.
- Uses inclusive D_s vertices and fully reconstructed B_s decays and a multi-variable discriminant as a flavor tagging.
- Uses ℓ - Q_{hem} and ℓ - ℓ .
- ABE 99D assumes $\tau_{B_s^0} = 1.55 \pm 0.05 \text{ ps}$ and $\Delta\Gamma/\Delta m = (5.6 \pm 2.6) \times 10^{-3}$.
- ABE 99J uses ϕ ℓ - ℓ correlation.
- BARATE 99J uses combination of an inclusive lepton and D_s^- -based analyses.
- BARATE 98C combines results from $D_s h\ell/Q_{\text{hem}}$, $D_s h\ell$ in the same side, $D_s \ell\ell/Q_{\text{hem}}$ and $D_s \ell\ell$ in the same side.
- Uses ℓ - Q_{hem} .
- Uses ℓ - ℓ .
- ADAM 97 combines results from $D_s \ell$ - Q_{hem} , ℓ - Q_{hem} , and ℓ - ℓ .
- BUSKULIC 96M uses D_s lepton correlations and lepton, kaon, and jet charge tags.
- BUSKULIC 95J uses ℓ - Q_{hem} . They find $\Delta m_s > 5.6$ [> 6.1] for $f_s=10\%$ [12%]. We interpolate to our central value $f_s=10.5\%$.

$x_s = \Delta m_{B_s^0} / \Gamma_{B_s^0}$
 This is derived by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) from the results on $\Delta m_{B_s^0}$ and "OUR EVALUATION" of the B_s^0 mean lifetime.

CP VIOLATION PARAMETERS in B_s^0

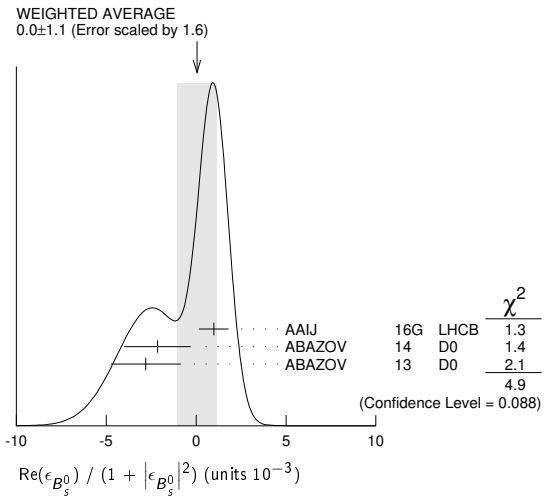

$\text{Re}(\epsilon_{B_s^0}) / (1 + |\epsilon_{B_s^0}|^2)$
 CP impurity in B_s^0 system.

"OUR EVALUATION" is an average obtained by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) and described at <https://hflav.web.cern.ch/>. It is the result of a fit to B_d and B_s CP asymmetries, which includes the B_s measurements listed below and the B_d measurements listed in the B_d section, and takes into account correlations between those measurements.

- AAIJ 16G reports a measurement of time-integrated flavor-specific asymmetry in $B_s^0 \rightarrow \mu^+ D_s^- X$ decays, $A_{SL}^s = (0.39 \pm 0.26 \pm 0.20)\%$, which is approximately equal to $4 \times \text{Re}(\epsilon_{B_s^0}) / (1 + |\epsilon_{B_s^0}|^2)$.
- ABAZOV 14 uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^s = (-0.86 \pm 0.74) \times 10^{-2}$.
- ABAZOV 13 reports a measurement of time-integrated flavor-specific asymmetry in mixed semileptonic $B_s^0 \rightarrow \mu^+ D_s^- X$ decays $A_{SL}^s = (-1.12 \pm 0.74 \pm 0.17)\%$ which is approximately equal to $4 \times \text{Re}(\epsilon_{B_s^0}) / (1 + |\epsilon_{B_s^0}|^2)$.
- AAIJ 14D reports a measurement of time-integrated flavor-specific asymmetry in $B_s^0 \rightarrow \mu^+ D_s^- X$ decays, $A_{SL}^s = (-0.06 \pm 0.50 \pm 0.36)\%$, which is approximately equal to $4 \times \text{Re}(\epsilon_{B_s^0}) / (1 + |\epsilon_{B_s^0}|^2)$.
- ABAZOV 11U uses the dimuon charge asymmetry with different impact parameters from which it reports $A_{SL}^s = (-18.1 \pm 10.6) \times 10^{-3}$.
- ABAZOV 10E reports a measurement of flavor-specific asymmetry in $B_{(s)}^0 \rightarrow \mu^+ D_{(s)}^{*-} X$ decays with a decay-time analysis including initial-state flavor tagging, $A_{SL}^s = (-1.7 \pm 9.1^{+1.4}_{-1.5}) \times 10^{-3}$ which is approximately equal to $4 \times \text{Re}(\epsilon_{B_s^0}) / (1 + |\epsilon_{B_s^0}|^2)$.
- ABAZOV 10H reports a measurement of like-sign dimuon charge asymmetry of $A_{SL}^s = (-9.57 \pm 2.51 \pm 1.46) \times 10^{-3}$ in semileptonic b -hadron decays. Using the measured production ratio of B_d^0 and B_s^0 , and the asymmetry of B_d^0 , $A_{SL}^s = (-4.7 \pm 4.6) \times 10^{-3}$ measured from B -factories, they obtain the asymmetry for B_s^0 .
- The first direct measurement of the time integrated flavor untagged charge asymmetry in semileptonic B_s^0 decays is reported as $2 \times A_{SL}^s (\text{untagged}) = A_{SL}^s = (2.45 \pm 1.93 \pm 0.35) \times 10^{-2}$.

1 Measured in $B_S^0 \rightarrow D_S^\mp K^\pm$ decays, constraining $-2\beta_S$ by the measurement of $\phi_S = 0.030 \pm 0.033$ from HFLAV. The value is modulo 180° .

2 Measured in $B_S^0 \rightarrow D_S^\mp K^\pm$ decays, constraining $-2\beta_S$ by the measurement of $\phi_S = 0.01 \pm 0.07 \pm 0.0$ from AAIJ 13AR. The value is modulo 180° at 68% CL.

CP Violation phase β_S

$-2\beta_S$ is the weak phase difference between B_S^0 mixing amplitude and the $B_S^0 \rightarrow J/\psi\phi$ decay amplitude driven by the $b \rightarrow c\bar{c}s$ transition (such as $B_S \rightarrow J/\psi\phi$, $J/\psi K^+ K^-$,

$J/\psi\pi^+\pi^-$, and $D_S^+ D_S^-$). The Standard Model value of β_S is $\arg(-\frac{V_{ts}V_{tb}^*}{V_{cs}V_{cb}^*})$ if penguin contributions are neglected.

“OUR EVALUATION” is an average using rescaled values of the data listed below. The average and rescaling were performed by the Heavy Flavor Averaging Group (HFLAV, <https://hflav.web.cern.ch/>) and are described at <https://hflav.web.cern.ch/>. The averaging/scaling procedure takes into account correlation between the measurements.

1 AAIJ 19AF reports $\phi_S = -2\beta_S = 0.002 \pm 0.044 \pm 0.012$ rad. and $|\lambda| = 0.949 \pm 0.036 \pm 0.019$, when direct CP violation is allowed. Measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays, which is sensitive to $\phi_S(s\bar{s}s)$, not $\phi_S(c\bar{c}s)$.

2 AAIJ 19Q reports $\phi_S = -2\beta_S = -0.083 \pm 0.041 \pm 0.006$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ decays.

3 Measured using time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ in the region $m(KK) > 1.05$ GeV.

4 AAD 16AP reports $\phi_S = -2\beta_S = -0.090 \pm 0.078 \pm 0.041$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

5 AAIJ 16AK reports $\phi_S = -2\beta_S = 0.23^{+0.29}_{-0.28} \pm 0.02$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow \psi(2S)\phi$ decays.

6 KHACHATRYAN 16s reports $\phi_S = -2\beta_S = -0.075 \pm 0.097 \pm 0.031$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

7 AAIJ 14AY reports $\phi_S = -2\beta_S = 0.02 \pm 0.17 \pm 0.02$ rad. in a time-dependent fit to $B_S^0 \rightarrow D_S^+ D_S^-$, while allowing CP violation in decay.

8 AALTONEN 12AJ reports $-\pi/2 < \beta_S < -1.51$ or $-0.06 < \beta_S < 0.30$, or $1.26 < \beta_S < \pi/2$ rad. at 68% CL. Measured using the time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

9 ABZOV 12D reports $\phi_S = -2\beta_S = -0.55^{+0.38}_{-0.36}$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays. A single error includes both statistical and systematic uncertainties.

10 AAIJ 19AP reports $\phi_S^{S\bar{S}} = -0.073 \pm 0.115 \pm 0.027$ rad and $|\lambda| = 0.99 \pm 0.05 \pm 0.01$. Measured using a time-dependent fit to $B_S^0 \rightarrow \phi\phi$ decays, assuming independence of the helicity of the $\phi\phi$ decay.

11 AAIJ 19AP reports also polarisation-dependent results assuming that the longitudinal weak phase is CP-conserving and that there is no direct CP violation, giving $\phi_{S||} = 0.014 \pm 0.055 \pm 0.011$ rad and $\phi_{S\perp} = 0.044 \pm 0.059 \pm 0.019$ rad.

12 AAIJ 18s reports $\phi_S = -2\beta_S = -0.10 \pm 0.13 \pm 0.14$ rad measured in $B_S^0 \rightarrow (K^+\pi^-)(K^-\pi^+)$ in the region $0.75 < m(K^\pm\pi^\mp) < 1.6$ GeV. This is a $b \rightarrow d\bar{d}s$ transition with a decay amplitude phase different from that of $b \rightarrow c\bar{c}s$ transition.

13 AAIJ 15i reports $\phi_S = -2\beta_S = -0.058 \pm 0.049 \pm 0.006$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ decays. It also combines this result with that of AAIJ 14s and quotes $\phi_S = -2\beta_S = -0.010 \pm 0.039$ rad.

14 AAIJ 15K reports $-2\beta_S = -0.12^{+0.14}_{-0.16}$ rad. The value was obtained by measuring time-dependent CP asymmetry in $B_S^0 \rightarrow K^+ K^-$ and using a U-spin relation between $B_S^0 \rightarrow K^+ K^-$ and $B^0 \rightarrow \pi^+ \pi^-$.

15 Results are also presented using additional inputs on $B^0 \rightarrow \pi^0\pi^0$ and $B^+ \rightarrow \pi^+\pi^0$ decays from other experiments and isospin symmetry assumptions. The dependence of the results on the maximum allowed amount of U-spin breaking up to 50% is also included.

16 AAD 14U reports $\phi_S = -2\beta_S = 0.12 \pm 0.25 \pm 0.05$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

17 AAIJ 14AE value measured in $B_S^0 \rightarrow \phi\phi$ decays. This is a $b \rightarrow s\bar{s}s$ transition with a decay amplitude phase different from that of $b \rightarrow c\bar{c}s$ transition. Also reports $\phi_S = -0.17 \pm 0.15 \pm 0.03$ rad.

18 AAIJ 14s reports $\phi_S = -2\beta_S = 0.070 \pm 0.068 \pm 0.008$ rad. and $|\lambda| = 0.89 \pm 0.05 \pm 0.01$, when direct CP violation is allowed. Measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays.

19 AAIJ 13AR reports $\phi_S = -2\beta_S = 0.01 \pm 0.07 \pm 0.01$ rad. obtained from combined fit to $B_S^0 \rightarrow J/\psi K^+ K^-$ and $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ data sets. Also reports separate results of $\phi_S = 0.07 \pm 0.09 \pm 0.01$ rad. from $B_S^0 \rightarrow J/\psi K^+ K^-$ decays and $\phi_S = -0.14^{+0.17}_{-0.16} \pm 0.01$ rad. from $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays.

20 AAIJ 13AY uses $B_S^0 \rightarrow \phi\phi$ mode, and reports the 68% CL interval of $\phi_S = -2\beta_S$ as $[-2.46, -0.76]$ rad.

21 AAD 12CV reports $\phi_S = -2\beta_S = 0.22 \pm 0.41 \pm 0.10$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

22 Reports $\phi_S = -2\beta_S = -0.44 \pm 0.44 \pm 0.02$ rad. that was measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi\eta(980)$ decays.

23 Reports $\phi_S = -2\beta_S = 0.15 \pm 0.18 \pm 0.06$ rad. that was measured using a time-dependent angular analysis of $B_S^0 \rightarrow J/\psi\phi$ decays.

24 Reports $\phi_S = -2\beta_S = -0.019^{+0.173+0.004}_{-0.174-0.003}$ rad. which was measured using a time-dependent fit to $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays, with the $\pi^+\pi^-$ mass within 775–1550 MeV. Searches for, but finds no evidence, for direct CP violation in $B_S^0 \rightarrow J/\psi\pi\pi$ decays.

25 Reports $0.02 < \phi_S < 0.52$ or $1.08 < \phi_S < 1.55$ rad. at 68% C.L. confidence regions in the two-dimensional space of ϕ_S and $\Delta\Gamma_{B_S^0}$ from $B_S^0 \rightarrow J/\psi\phi$ decays.

26 Reports $0.32 < 2\beta_S < 2.82$ rad. at 68% C.L. and confidence regions in the two-dimensional space of $2\beta_S$ and $\Delta\Gamma$ from the first measurement of $B_S^0 \rightarrow J/\psi\phi$ decays using flavor tagging. The probability of a deviation from SM prediction as large as the level of observed data is 15%.

27 Reports $\phi_S = -2\beta_S$ and obtains 90% CL interval $-0.03 < \beta_S < 0.60$ rad.

28 The first direct measurement of the CP-violating mixing phase is reported from the time-dependent analysis of flavor untagged $B_S^0 \rightarrow J/\psi\phi$ decays.

29 Reports ϕ_S which equals to $-2\beta_S$.

30 Combines D0 collaboration measurements of time-dependent angular distributions in $B_S^0 \rightarrow J/\psi\phi$ and charge asymmetry in semileptonic decays. There is a 4-fold ambiguity in the solution.

 $|\lambda| (B_S^0 \rightarrow J/\psi(1S)\phi)$

1 Measured in $B_S^0 \rightarrow \phi\phi$ decays.

2 Measured in $B_S^0 \rightarrow (K^+\pi^-)(K^-\pi^+)$ in the region $0.75 < m(K^\pm\pi^\mp) < 1.6$ GeV.

3 Measured using time-dependent angular analysis of $B_S^0 \rightarrow J/\psi K^+ K^-$ in the region $m(KK) > 1.05$ GeV.

4 Measured using time-dependent angular analysis of $B_S^0 \rightarrow \psi(2S)\phi$ decays.

5 Measured in $B_S^0 \rightarrow D_S^+ D_S^-$ decays.

6 Measured using time-dependent analysis of $B_S^0 \rightarrow J/\psi\pi^+\pi^-$ decays.

7 Measured in $B_S^0 \rightarrow \phi\phi$ decays.

$A_{CP}(B_s \rightarrow \pi^+ K^-)$

A_{CP} is defined as

$$\frac{B(\bar{B}_s^0 \rightarrow f) - B(B_s^0 \rightarrow \bar{f})}{B(\bar{B}_s^0 \rightarrow f) + B(B_s^0 \rightarrow \bar{f})}$$

the CP-violation asymmetry of exclusive B_s^0 and \bar{B}_s^0 decay.

¹ Measured in flavor tagged time dependent analysis, using tagged and un-tagged events. This result updates AAIJ 17B with better selection efficiency and other analysis improvements.			
² Measured in time dependent analysis without initial flavor tagging.			

CPT VIOLATION PARAMETERS

In the B_s^0 mixing, propagating mass eigenstates can be written as

$$\begin{aligned} |B_{sL}\rangle &\propto p \sqrt{1-\xi} |B_s^0\rangle + q \sqrt{1+\xi} |\bar{B}_s^0\rangle \\ |B_{sH}\rangle &\propto p \sqrt{1+\xi} |B_s^0\rangle - q \sqrt{1-\xi} |\bar{B}_s^0\rangle \end{aligned}$$

where parameter ξ controls CPT violation. If ξ is zero, then CPT is conserved. The parameter ξ can be written as

$$\xi = \frac{2(M_{11}-M_{22})-i(\Gamma_{11}-\Gamma_{22})}{-2\Delta m_s+i\Delta\Gamma_s} \approx \frac{-2\beta^\mu \Delta a_\mu}{2\Delta m_s-i\Delta\Gamma_s}$$

where M_{ii} , Γ_{ii} , Δm_s , and $\Delta\Gamma_s$ are parameters of Hamiltonian governing B_s oscillations, β^μ is the B_s^0 meson velocity and Δa_μ characterizes Lorentz-invariance violation.

- 1 The lifetime is measured using the decays $B_c^+ \rightarrow J/\psi \pi^+$ and $B^+ \rightarrow J/\psi K^+$.
- 2 Also measures the width difference $\Delta\Gamma = \Gamma_{B_c^+} - \Gamma_{B^+} = 4.46 \pm 0.14 \pm 0.07$ $\text{mm}^{-1}c$.
- 3 Uses fully reconstructed $B_c^+ \rightarrow J/\psi \pi^+$ decays.
- 4 Measured using $B_c^+ \rightarrow J/\psi \mu^+ \nu_\mu X$ decays.
- 5 The lifetime is measured from the $J/\psi e$ decay vertices.

B_c^+ DECAY MODES $\times B(\bar{b} \rightarrow B_c)$

B_c^- modes are charge conjugates of the modes below.

Mode	Fraction (Γ_i/Γ)	Confidence level
The following quantities are not pure branching ratios; rather the fraction $\Gamma_i/\Gamma \times B(\bar{b} \rightarrow B_c)$.

- 1 AALTONEN 16A reports $[\Gamma(B_c^+ \rightarrow J/\psi(1S) \ell^+ \nu_\ell \text{ anything})/\Gamma_{\text{total}} \times B(\bar{b} \rightarrow B_c)] / [B(\bar{b} \rightarrow B^+)] / [B(B^+ \rightarrow J/\psi(1S) K^+)] = 0.211 \pm 0.012^{+0.021}_{-0.020}$ which we multiply by our best values $B(\bar{b} \rightarrow B^+) = (40.8 \pm 0.7) \times 10^{-2}$, $B(B^+ \rightarrow J/\psi(1S) K^+) = (1.006 \pm 0.027) \times 10^{-3}$. Our first error is their experiment's error and our second error is the systematic error from using our best values.
- 2 AALTONEN 16A also measures the cross-section $\sigma(B_c) \times B(B_c \rightarrow J/\psi \mu \nu_\mu) = 0.60 \pm 0.09$ nb and estimates the total cross-section $\sigma(B_c)$ to be in the range 25 ± 4 to 52 ± 8 nb for $p_T(B_c) > 6$ GeV/ c and $|y(B_c)| < 1$.
- 3 ABE 98M result is derived from the measurement of $[\sigma(B_c) \times B(B_c \rightarrow J/\psi(1S) \ell \nu_\ell)] / [\sigma(B^+) \times B(B^+ \rightarrow J/\psi(1S) K^+)] = 0.132^{+0.041}_{-0.037}(\text{stat}) \pm 0.031(\text{sys})^{+0.032}_{-0.020}(\text{lifetime})$ by using PDG 98 values of $B(b \rightarrow B^+)$ and $B(B^+ \rightarrow J/\psi(1S) K^+)$.
- 4 ACKERSTAFF 98o reports $B(Z \rightarrow B_c X)/B(Z \rightarrow qq) \times B(B_c \rightarrow J/\psi(1S) \ell \nu_\ell) < 6.95 \times 10^{-5}$ at 90%CL. We rescale to our PDG 98 values of $B(Z \rightarrow b\bar{b})$.
- 5 ABREU 97E value listed is for an assumed $\tau_{B_c} = 0.4$ ps and improves to 1.6×10^{-4} for $\tau_{B_c} = 1.4$ ps.
- 6 BARATE 97H reports $B(Z \rightarrow B_c X)/B(Z \rightarrow qq) \times B(B_c \rightarrow J/\psi(1S) \ell \nu_\ell) < 5.2 \times 10^{-5}$ at 90%CL. We rescale to our PDG 96 values of $B(Z \rightarrow b\bar{b})$. A $B_c^+ \rightarrow J/\psi(1S) \mu^+ \nu_\mu$ candidate event is found, compared to all the known background sources 2×10^{-3} , which gives $m_{B_c} = 5.96^{+0.25}_{-0.19}$ GeV and $\tau_{B_c} = 1.77 \pm 0.17$ ps.

$2.37 \pm 0.31 \pm 0.11 \pm 0.13$		¹ AAIJ	13Bu LHCB	<i>pp</i> at 7, 8 TeV

¹The last uncertainty is due to the uncertainty of the B_c^+ lifetime measurement.

POLARIZATION IN B_c^+ DECAY

In decays involving two vector mesons, one can distinguish among the states in which meson polarizations are both longitudinal (L) or both are transverse and parallel (\parallel) or perpendicular (\perp) to each other with the parameters Γ_L/Γ , Γ_\perp/Γ , and the relative phases ϕ_\parallel and ϕ_\perp . See the definitions in the note on "Polarization in B Decays" review in the B^0 Particle Listings.

Γ_L/Γ in $B_c^+ \rightarrow J/\psi D_s^{*+}$

$6871.0 \pm 1.4 \pm 0.8$	51	^{3,4} SIRUNYAN	19M CMS	pp at 13 TeV
• • • We do not use the following data for averages, fits, limits, etc. • • •				
not seen		⁵ AAIJ	18AL LHCb	pp at 8 TeV
$6842 \pm 4 \pm 5$	57	^{6,7} AAD	14AQ ATLS	pp at 7, 8 TeV
¹ AAIJ 19Y observed $B_c(2S)^+$ in the decay mode $B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-$ ($B_c^+ \rightarrow J/\psi \pi^+$) with 2.2 (3.2) global (local) standard deviations significance.				
² AAIJ 19Y reports mass difference measurement of $M(B_c(2S)^+) - M(B_c^+) = 597.2 \pm 1.3 \pm 0.1$ MeV. We have adjusted this measurement with our best value of $M(B_c^+) = 6274.9 \pm 0.8$ MeV. The first uncertainty of the $M(B_c(2S)^+)$ value is a total of uncertainties reported by the experiment and the second one comes from our best value of $M(B_c^+)$.				
³ SIRUNYAN 19M observed $B_c(2S)^+$ in the decay mode $B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-$ ($B_c^+ \rightarrow J/\psi \pi^+$) with 6.5 standard deviations significance.				
⁴ SIRUNYAN 19M reports mass difference measurement of $M(B_c(2S)^+) - M(B_c^+) = 596.1 \pm 1.2 \pm 0.8$ MeV. We have adjusted this measurement with our best value of $M(B_c^+) = 6274.9 \pm 0.8$ MeV. The first uncertainty of the $M(B_c(2S)^+)$ value is a total of uncertainties reported by the experiment and the second one comes from our best value of $M(B_c^+)$.				
⁵ AAIJ 18AL reports an upper limit on the ratio of production cross sections for $[\sigma(B_c(2S)^+)/\sigma(B_c^+)] \cdot B(B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-) < 0.04-0.09$ at 95% CL for the mass value reported by AAD 14AQ.				
⁶ Observed in the decay mode $B_c(2S)^+ \rightarrow B_c^+ \pi^+ \pi^-$ ($B_c^+ \rightarrow J/\psi \pi^+$) with 5.2 standard deviations significance.				
⁷ Might be the $B_c^*(2S)$.

Spectroscopy of Mesons Containing Two Heavy Quarks

Meson Particle Listings

Charmonium, $\eta_c(1S)$

$c\bar{c}$ MESONS (including possibly non- $q\bar{q}$ states)

The level scheme of meson states containing a minimal quark content of $c\bar{c}$. The name of a state is determined by its quantum numbers $I^G J^{PC}$ (see the review “Naming Scheme for Hadrons”). States with unestablished quantum numbers are called X and are drawn according to our best estimate of their likely J^{PC} . States included in the Summary Tables are shown with solid lines; selected states not in the Summary Tables, but with assigned quantum numbers, are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including $\psi(nS) \rightarrow \gamma\eta_c(mS)$, $\psi(nS) \rightarrow \gamma\chi_{cJ}(1P)$, and $\chi_{cJ}(1P) \rightarrow \gamma J/\psi$, are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open charm mesons is indicated in the figure.

$\eta_c(1S)$

$$I^G(J^{PC}) = 0^+(0^{-+})$$

- AAIJ 17AD report $m_{J/\psi} - m_{\eta_c(1S)} = 110.2 \pm 0.5 \pm 0.9$ MeV. We use the current value $m_{J/\psi} = 3096.900 \pm 0.006$ MeV to obtain the quoted mass.
- From a fit of the $\phi\phi$ invariant mass with the mass and width of $\eta_c(1S)$ as free parameters.
- AAIJ 15BI reports $m_{J/\psi} - m_{\eta_c(1S)} = 114.7 \pm 1.5 \pm 0.1$ MeV from a sample of $\eta_c(1S)$ and J/ψ produced in b -hadron decays. We have used current value of $m_{J/\psi} = 3096.900 \pm 0.006$ MeV to arrive at the quoted $m_{\eta_c(1S)}$ result.
- Taking into account an asymmetric photon lineshape.
- With floating width.
- Ignoring possible interference with the non-resonant 0^- amplitude.
- Using both, $\eta \rightarrow \gamma\gamma$ and $\eta \rightarrow \pi^+\pi^-\pi^0$ decays.
- From a simultaneous fit to six decay modes of the η_c .
- Accounts for interference with non-resonant continuum.
- Taking into account interference with the non-resonant $J^P = 0^-$ amplitude.
- From a fit of the J/ψ recoil mass spectrum. Supersedes ABE,K 02 and ABE 04g.
- Using mass of $\psi(2S) = 3686.00$ MeV.
- Not independent from the measurements reported by LEES 10.
- MITCHELL 09 observes a significant asymmetry in the lineshapes of $\psi(2S) \rightarrow \gamma\eta_c$ and $J/\psi \rightarrow \gamma\eta_c$ transitions. If ignored, this asymmetry could lead to significant bias whenever the mass and width are measured in $\psi(2S)$ or J/ψ radiative decays.
- From the fit of the kaon momentum spectrum. Systematic errors not evaluated.
- Superseded by LEES 10.
- From a simultaneous fit of five decay modes of the η_c .
- Superseded by VINOKUROVA 11.
- Weighted average of the $\psi(2S)$ and $J/\psi(1S)$ samples. Using an η_c width of 13.2 MeV.
- Average of several decay modes. Using an η_c width of 13.2 MeV.
- Superseded by ASNER 04.
- Average of several decay modes.
- $\eta_c \rightarrow \phi\phi$.
- Mass adjusted by us to correspond to $J/\psi(1S)$ mass = 3097 MeV.

CONSTRAINED FIT INFORMATION

An overall fit to the total width, 8 combinations of partial widths obtained from integrated cross section, and 19 branching ratios uses 93 measurements and one constraint to determine 13 parameters. The overall fit has a $\chi^2 = 121.6$ for 81 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \delta p_j)$, in percent, from the fit to parameters p_i , including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{total}$. The fit constrains the x_i whose labels appear in this array to sum to one.

3096.93 ± 0.09	502	5 ZHOLENTZ 80	REDE	e^+e^-
3097.0 ± 1		6 BRANDELIK 79c	DASP	e^+e^-

1 Supersedes AULCHENKO 03.
 2 Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).
 3 Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the $\psi(2S)$ mass from AULCHENKO 03.
 4 From a sample of $\eta_c(1S)$ and J/ψ produced in b -hadron decays. Systematic uncertainties not estimated.
 5 Superseded by ARTAMONOV 00.
 6 From a simultaneous fit to e^+e^- , $\mu^+\mu^-$ and hadronic channels assuming $\Gamma(e^+e^-) = \Gamma(\mu^+\mu^-)$.

$J/\psi(1S)$ WIDTH

VALUE (keV)	EVTs	DOCUMENT ID	TECN	COMMENT
92.9 ± 2.8 OUR AVERAGE				Error includes scale factor of 1.1.
96.1 ± 3.2	13k	1 ADAMS 06A	CLEO	$e^+e^- \rightarrow \mu^+\mu^-\gamma$
84.4 ± 8.9		BAI 95B	BES	e^+e^-

85.5 ± 6.1 ± 5.8		3 HSUEH 92	RVUE	See Υ mini-review
••• We do not use the following data for averages, fits, limits, etc. •••				
92.94 ± 1.83		4 ANASHIN 18A	KEDR	e^+e^-
94.1 ± 2.7		5 ANASHIN 10	KEDR	$3.097 e^+e^- \rightarrow e^+e^-$, $\mu^+\mu^-$
93.7 ± 3.5	7.8k	1 AUBERT 04	BABR	$e^+e^- \rightarrow \mu^+\mu^-\gamma$

1 Calculated by us from the reported values of $\Gamma(e^+e^-) \times B(\mu^+\mu^-)$ using $B(e^+e^-) = (5.94 \pm 0.06)\%$ and $B(\mu^+\mu^-) = (5.93 \pm 0.06)\%$.
 2 The initial-state radiation correction reevaluated by ANDREOTTI 07 in its Ref. [4].
 3 Using data from COFFMAN 92, BALDINI-CELIO 75, BOYARSKI 75, ESPOSITO 75B, BRANDELIK 79c.
 4 Using $\Gamma(e^+e^-)$ from ANASHIN 18A and $B(J/\psi(1S) \rightarrow e^+e^-) = (5.971 \pm 0.032)\%$ from PDG 16.
 5 Assuming $\Gamma(e^+e^-) = \Gamma(\mu^+\mu^-)$ and using $\Gamma(e^+e^-)/\Gamma_{\text{total}} = (5.94 \pm 0.06)\%$.

[a] For $E_\gamma > 100$ MeV.

[b] The value is for the sum of the charge states or particle/antiparticle states indicated.

[c] Includes $p\bar{p}\pi^+\pi^-\gamma$ and excludes $p\bar{p}\eta, p\bar{p}\omega, p\bar{p}\eta'$.

[d] See the "Note on the $\eta(1405)$ " in the $\eta(1405)$ Particle Listings.

[e] For a narrow state A with mass less than 960 MeV.

[f] For a narrow scalar or pseudoscalar A^0 with mass 0.21–3.0 GeV.

15 ±2	168	FRANKLIN	83 MRK2	e^+e^-

¹ From $J/\psi \rightarrow \pi^+\pi^-\pi^0$ events directly.
² The quoted systematic error includes a contribution of 1.23% (added in quadrature) from the uncertainty on the number of J/ψ events.
³ AUBERT 07AU reports $[\Gamma(J/\psi(1S) \rightarrow \pi^+\pi^-\pi^0)/\Gamma_{total}] \times [\Gamma(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \rightarrow e^+e^-)]/\Gamma_{total} = (18.6 \pm 1.2 \pm 1.1) \times 10^{-3}$ keV which we divide by our best value $\Gamma(\psi(2S) \rightarrow J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \rightarrow e^+e^-)/\Gamma_{total} = 0.808 \pm 0.013$ keV. Our first error is their experiment's error and our second error is the systematic error from using our best value.
⁴ Mostly $\rho\pi$, see also $\rho\pi$ subsection.
⁵ Obtained comparing the rates for $\pi^+\pi^-\pi^0$ and $\mu^+\mu^-$, using J/ψ events produced via $\psi(2S) \rightarrow \pi^+\pi^-J/\psi$ and with $B(J/\psi \rightarrow \mu^+\mu^-) = 5.88 \pm 0.10\%$.
