**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

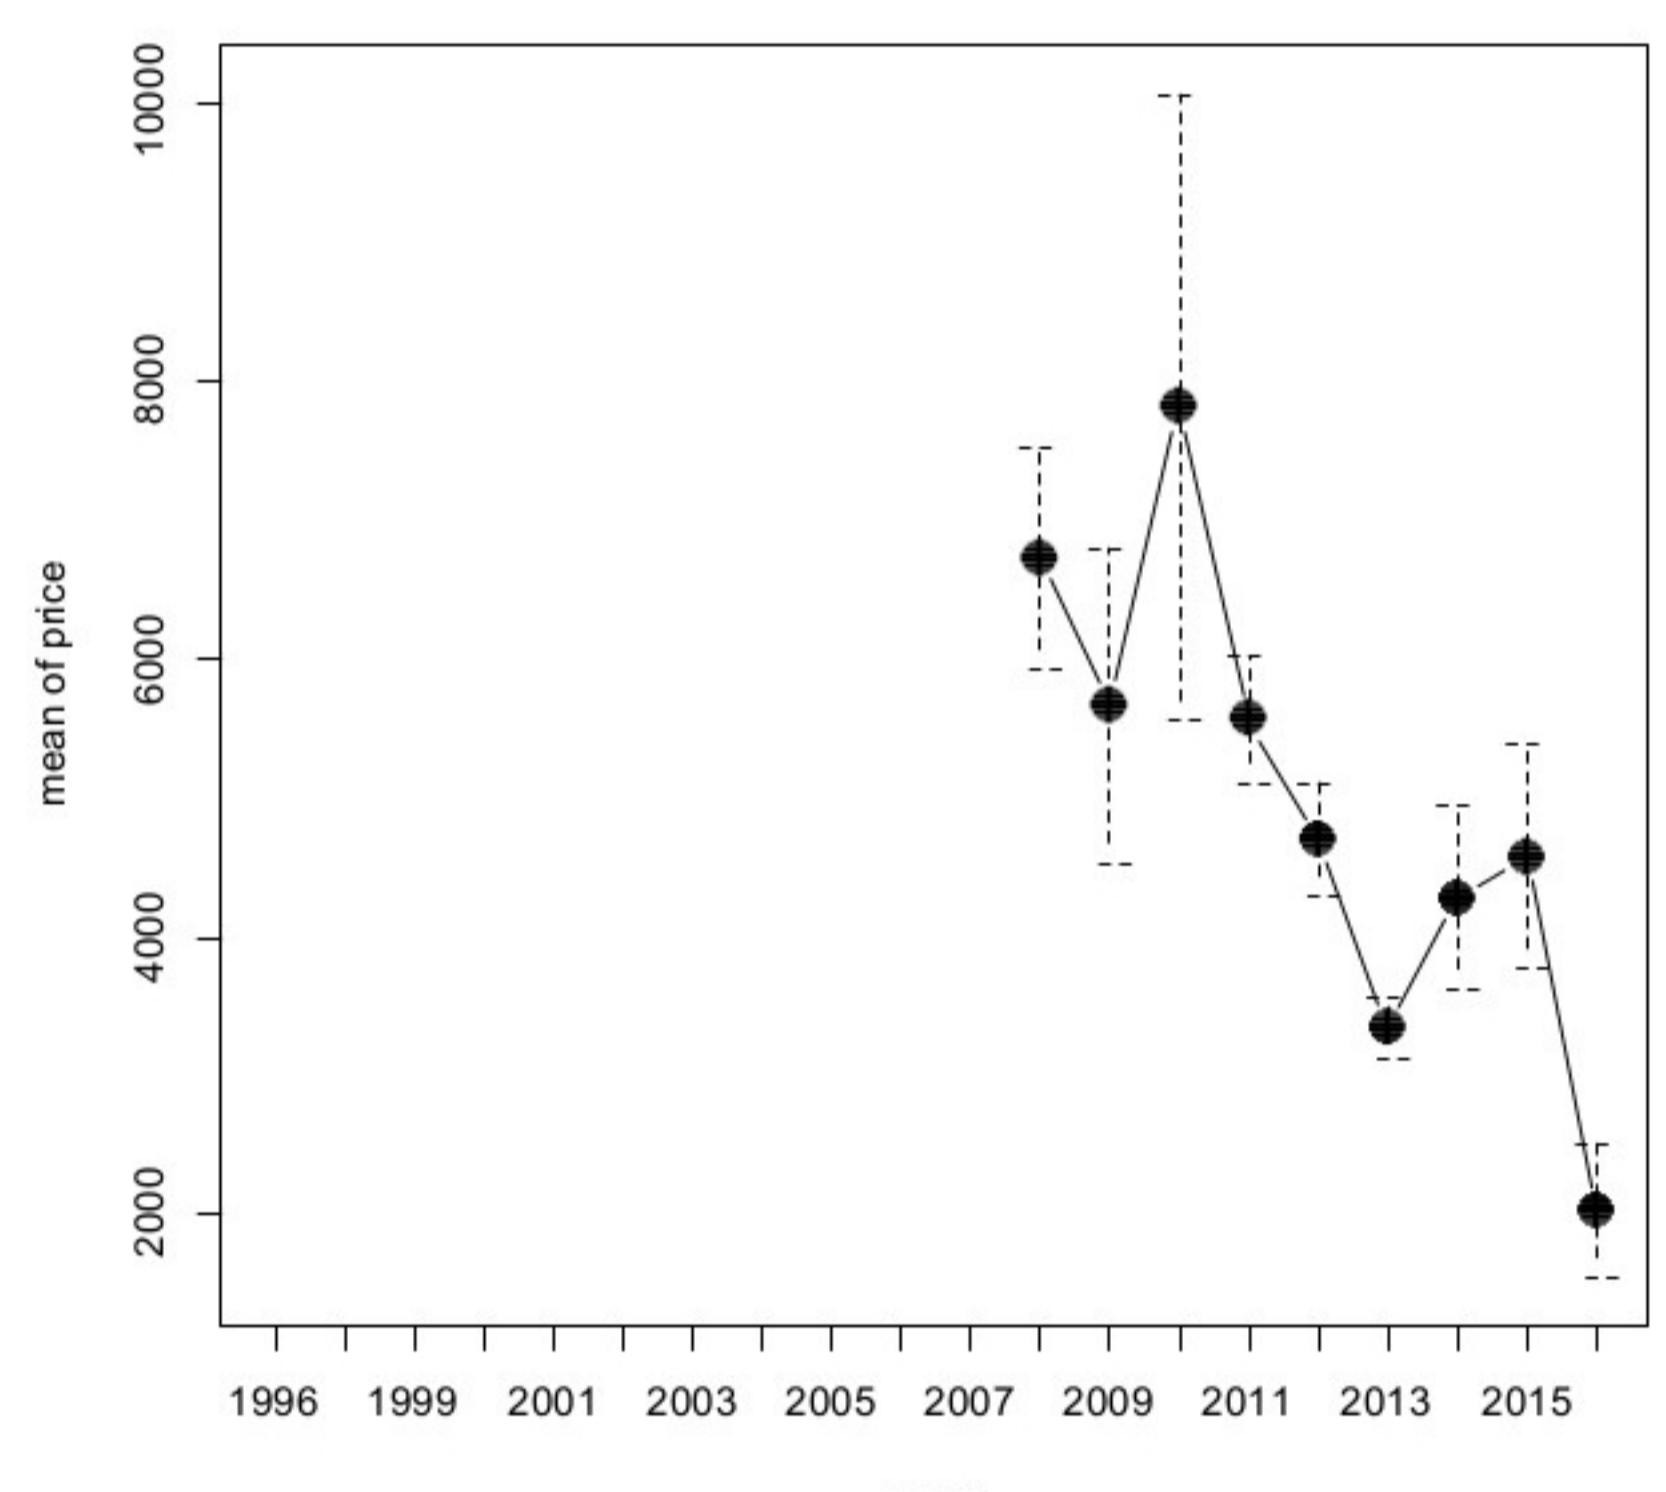

# Domain name valuation: Typology and verification of research hypotheses

Domain names are digital tools that make it easy to locate on the Internet. Only, speculation and gain applause have prompted the registries managing the first-level extensions to liberalize hierarchical levels. So, while yesterday the .FR zone was working with .AEROPORT.FR, .ASSO.FR or TM.FR, today, anyone can record anything. The *identification-trust link* is thus lost [Genty et al., 2016].

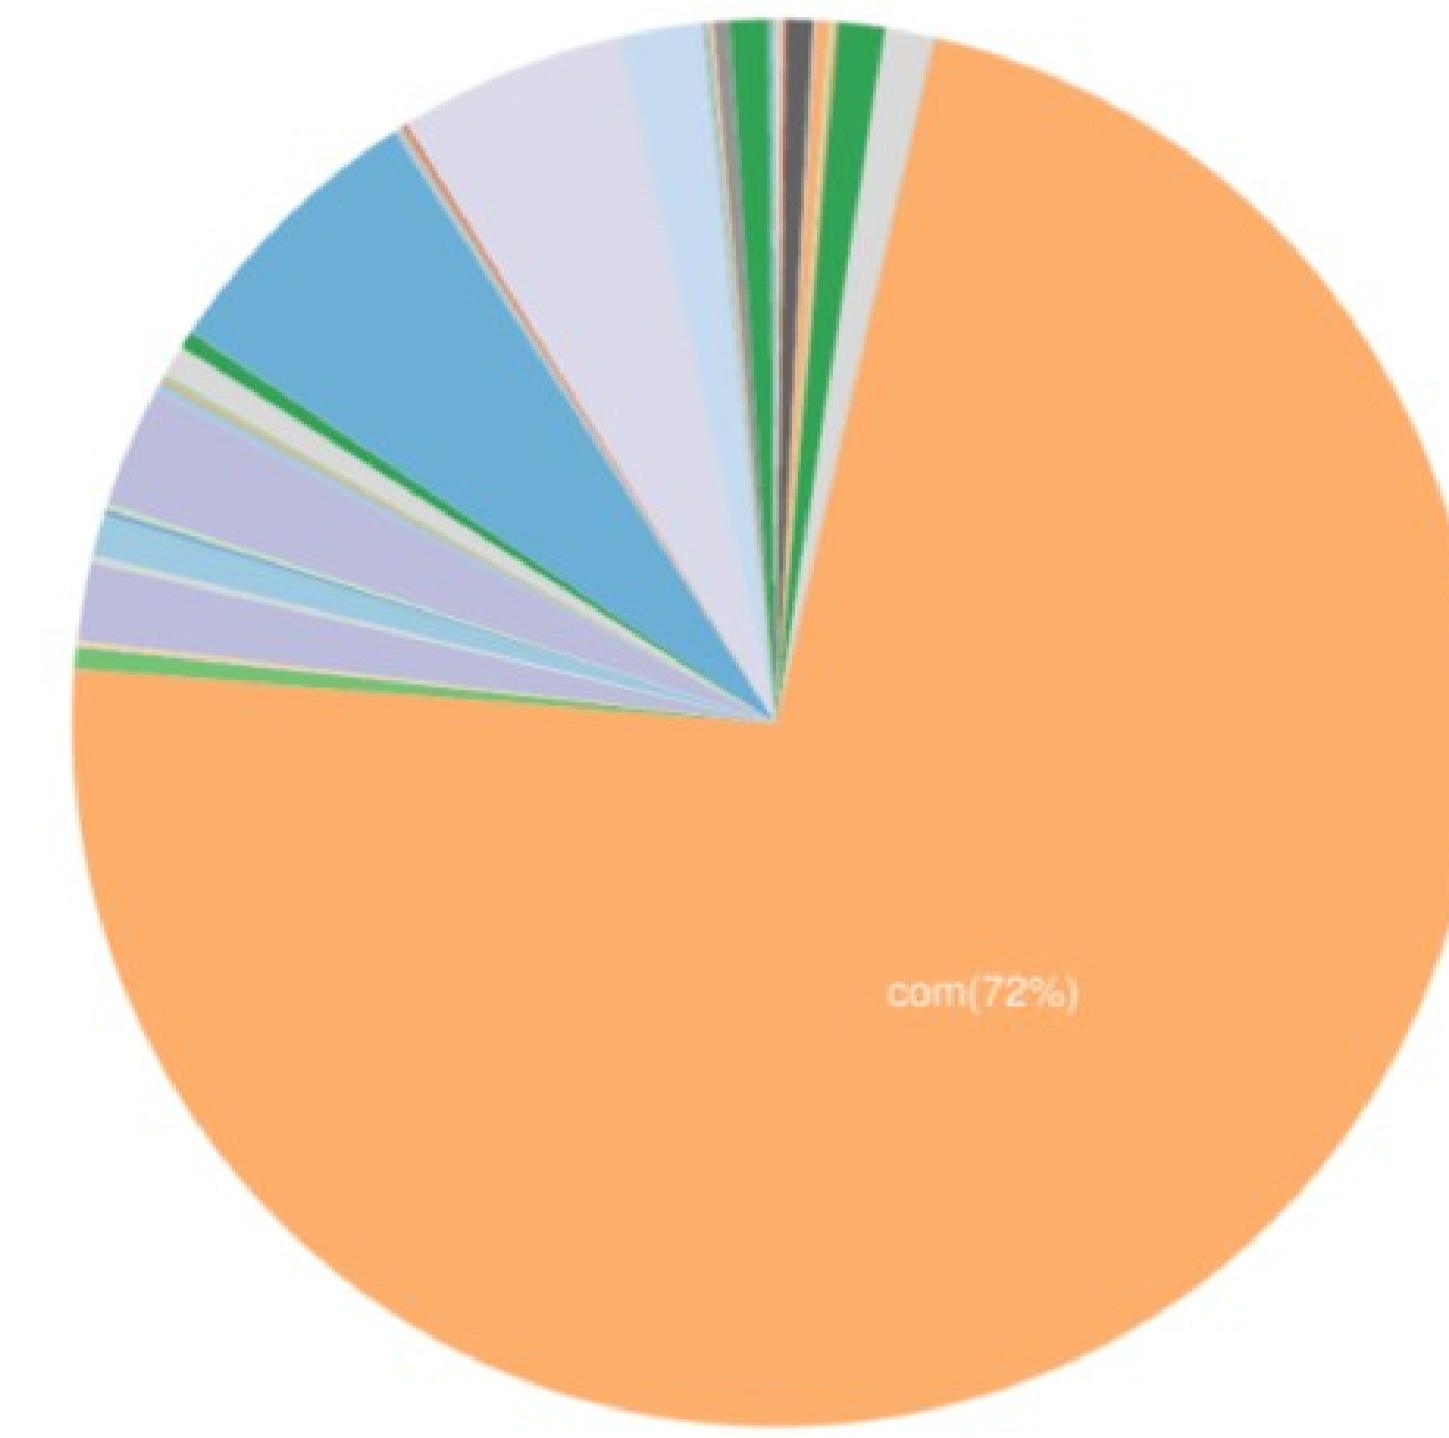

To enhance the value of domain names as intangible assets, and in order to give them a status similar to that of trademarks or patents, the sales made on the second market should be carried out by reverse engineering. In this study, we will carry out different *Principal Component Analysis* on **dnprix.es database** in order to determine what parameters are influencing the value of a domain name, and what their weight is.

A domain name is historically valued according to the value it can hold according to its *semantic composition*. However, the development of associated services allows a valuation higher than that of simple semantics. If one understands that *sex.com* is valued according to its semantics, *google.com* will be it through its *associated services*: its traffic, its ranking, its links, etc. Another valuation method is *valuation by loss*. Thus, *diplomatie.gouv.fr* contains all the Email addresses of the French diplomacy. If tomorrow his domain name falls, it's a whole zone of influence that will also fall. Highlighted in 2017 [GENTY et al., 2017], this type of valuation remains to be studied.

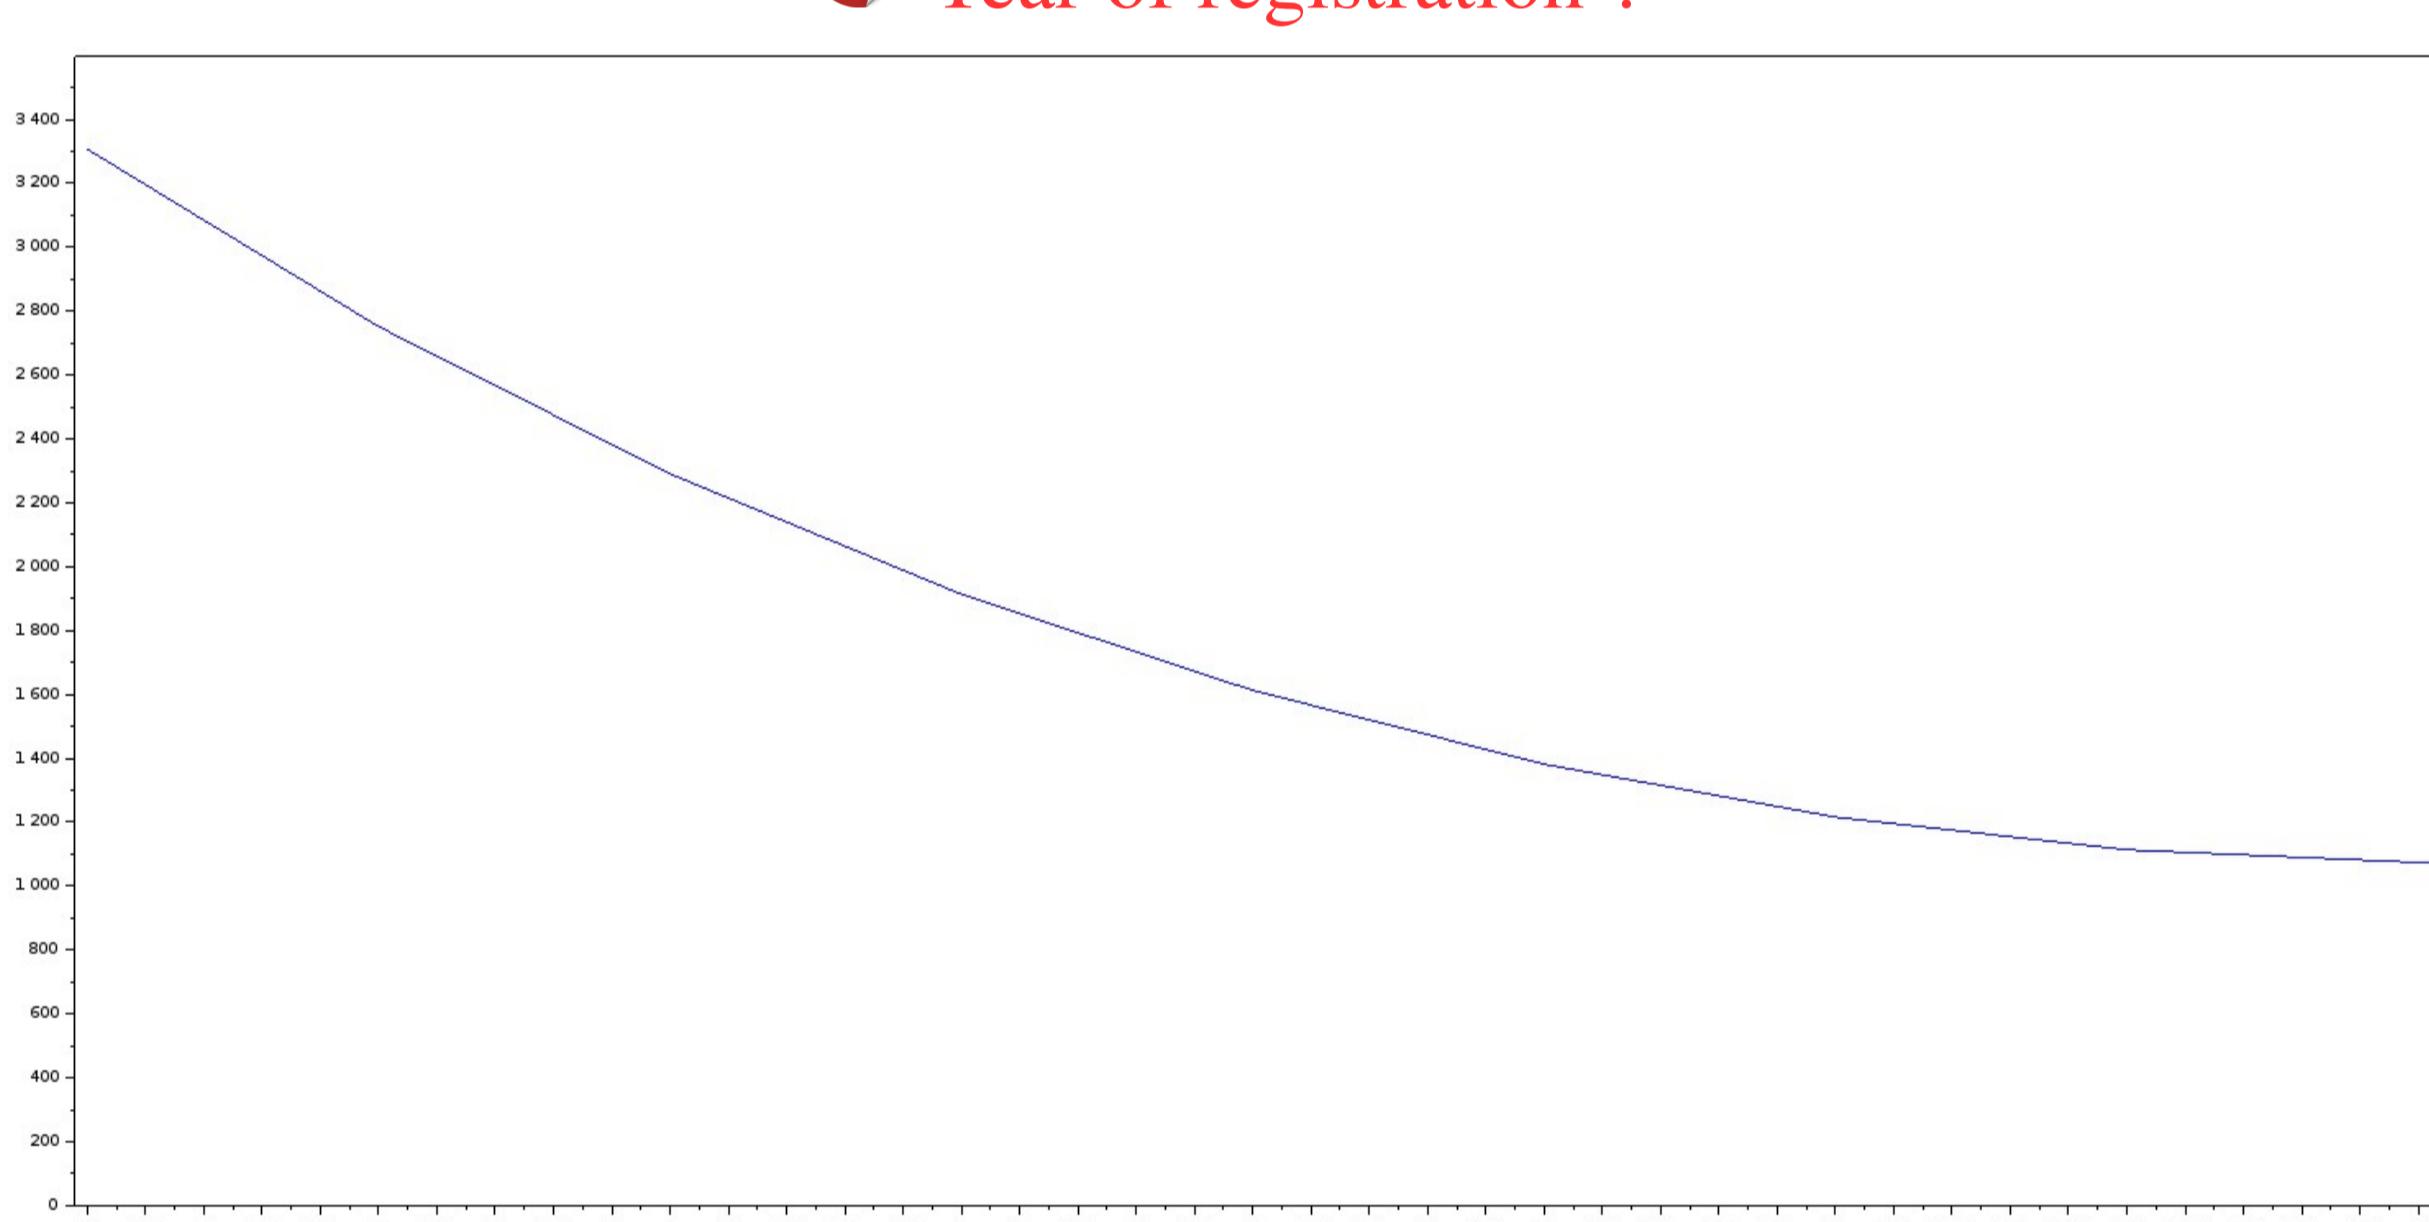

**Research hypothesis H1 - The value is linked to a set of objective and subjective criteria linked to the semantic function of the domain name**

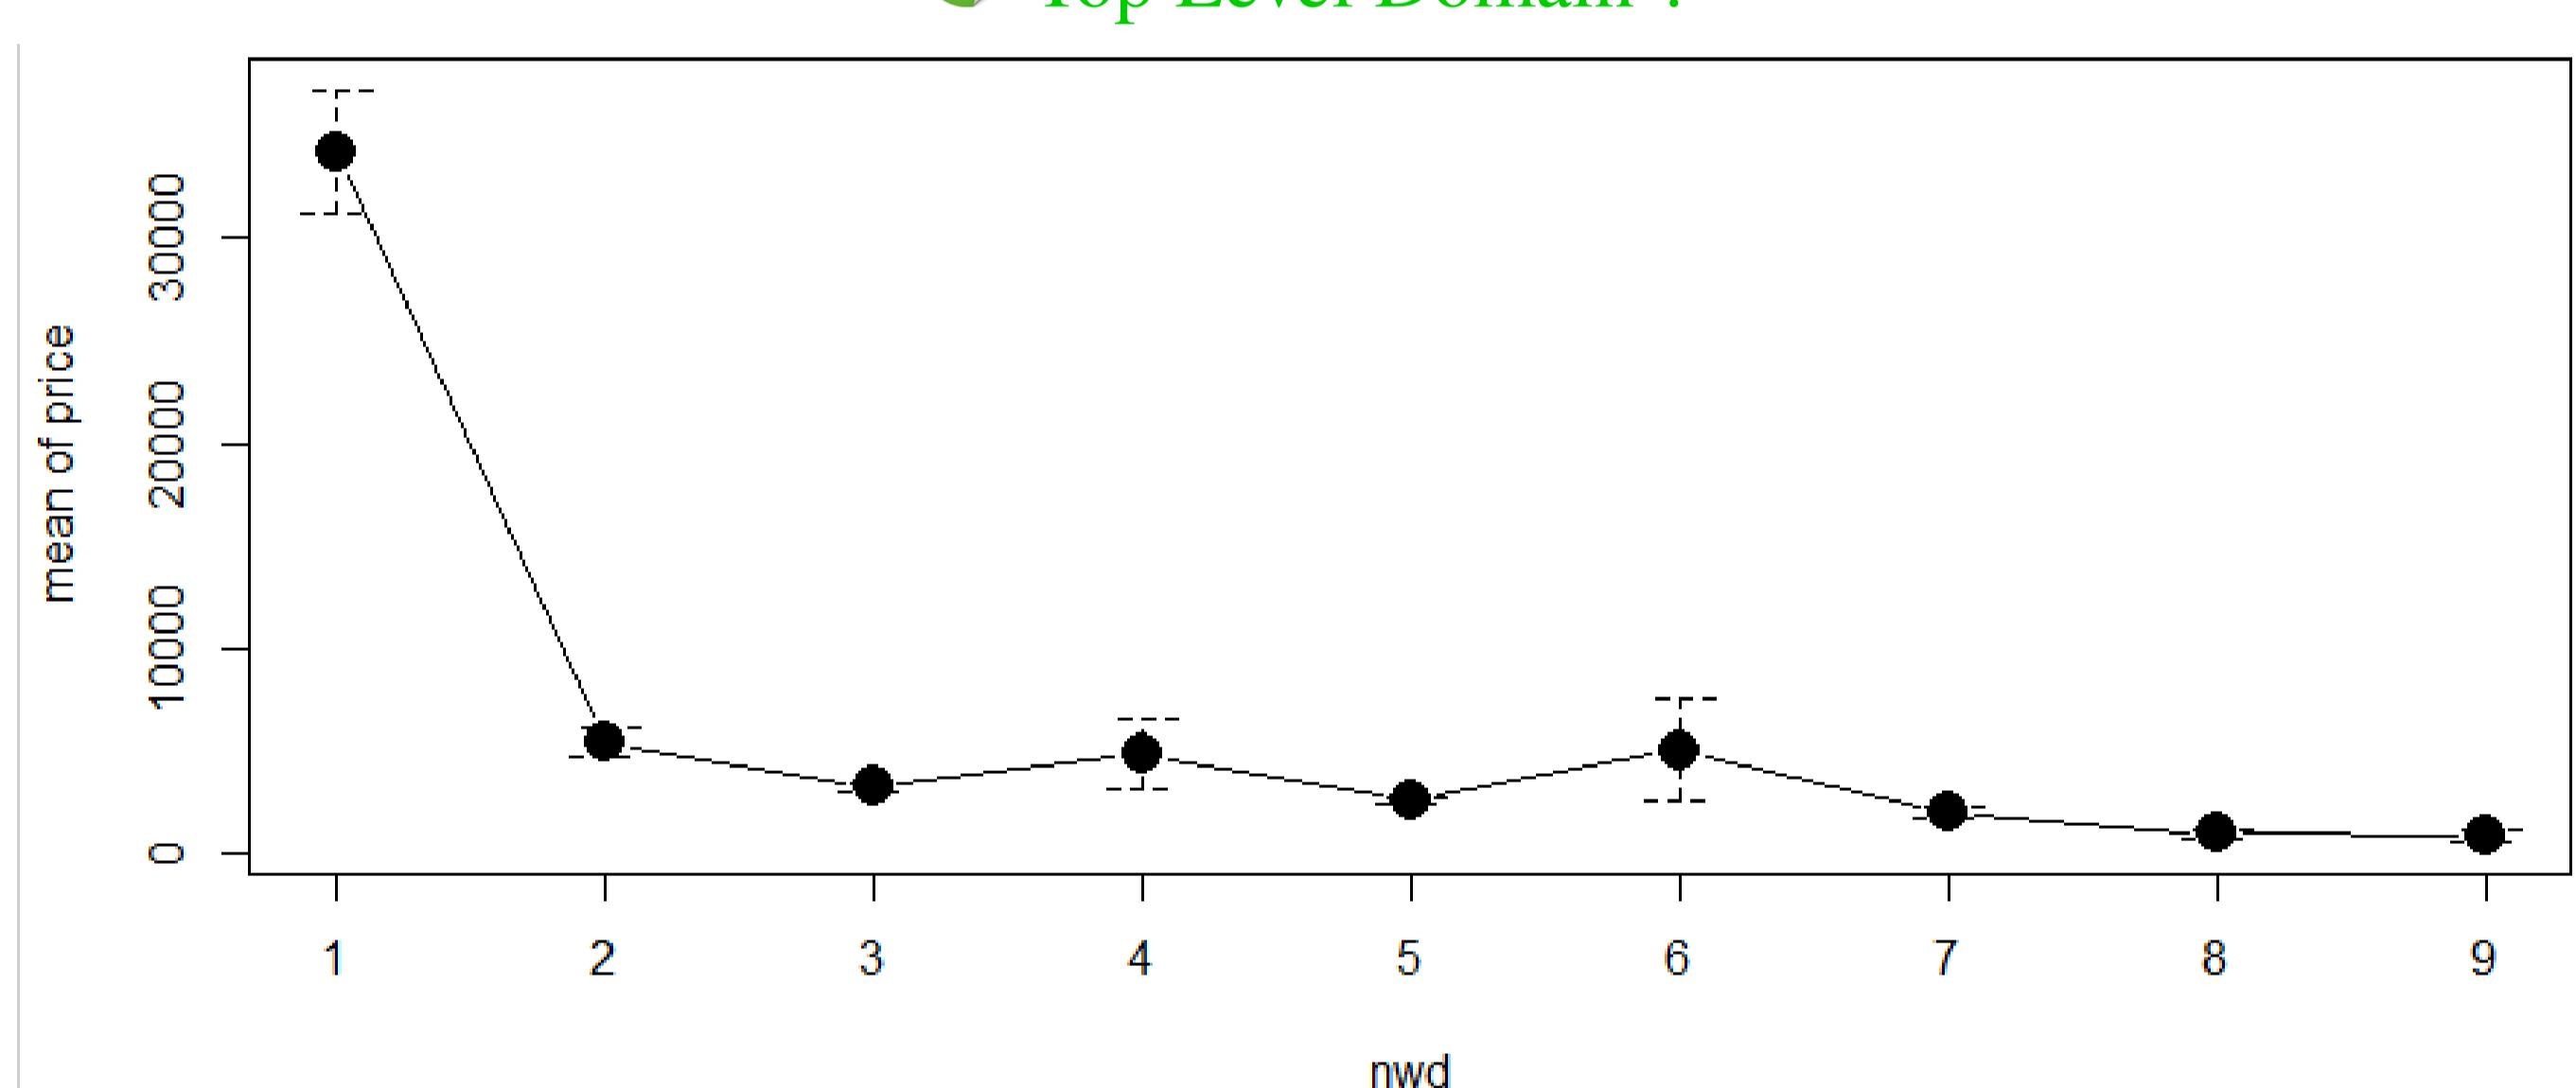

✗ Year of registration ?

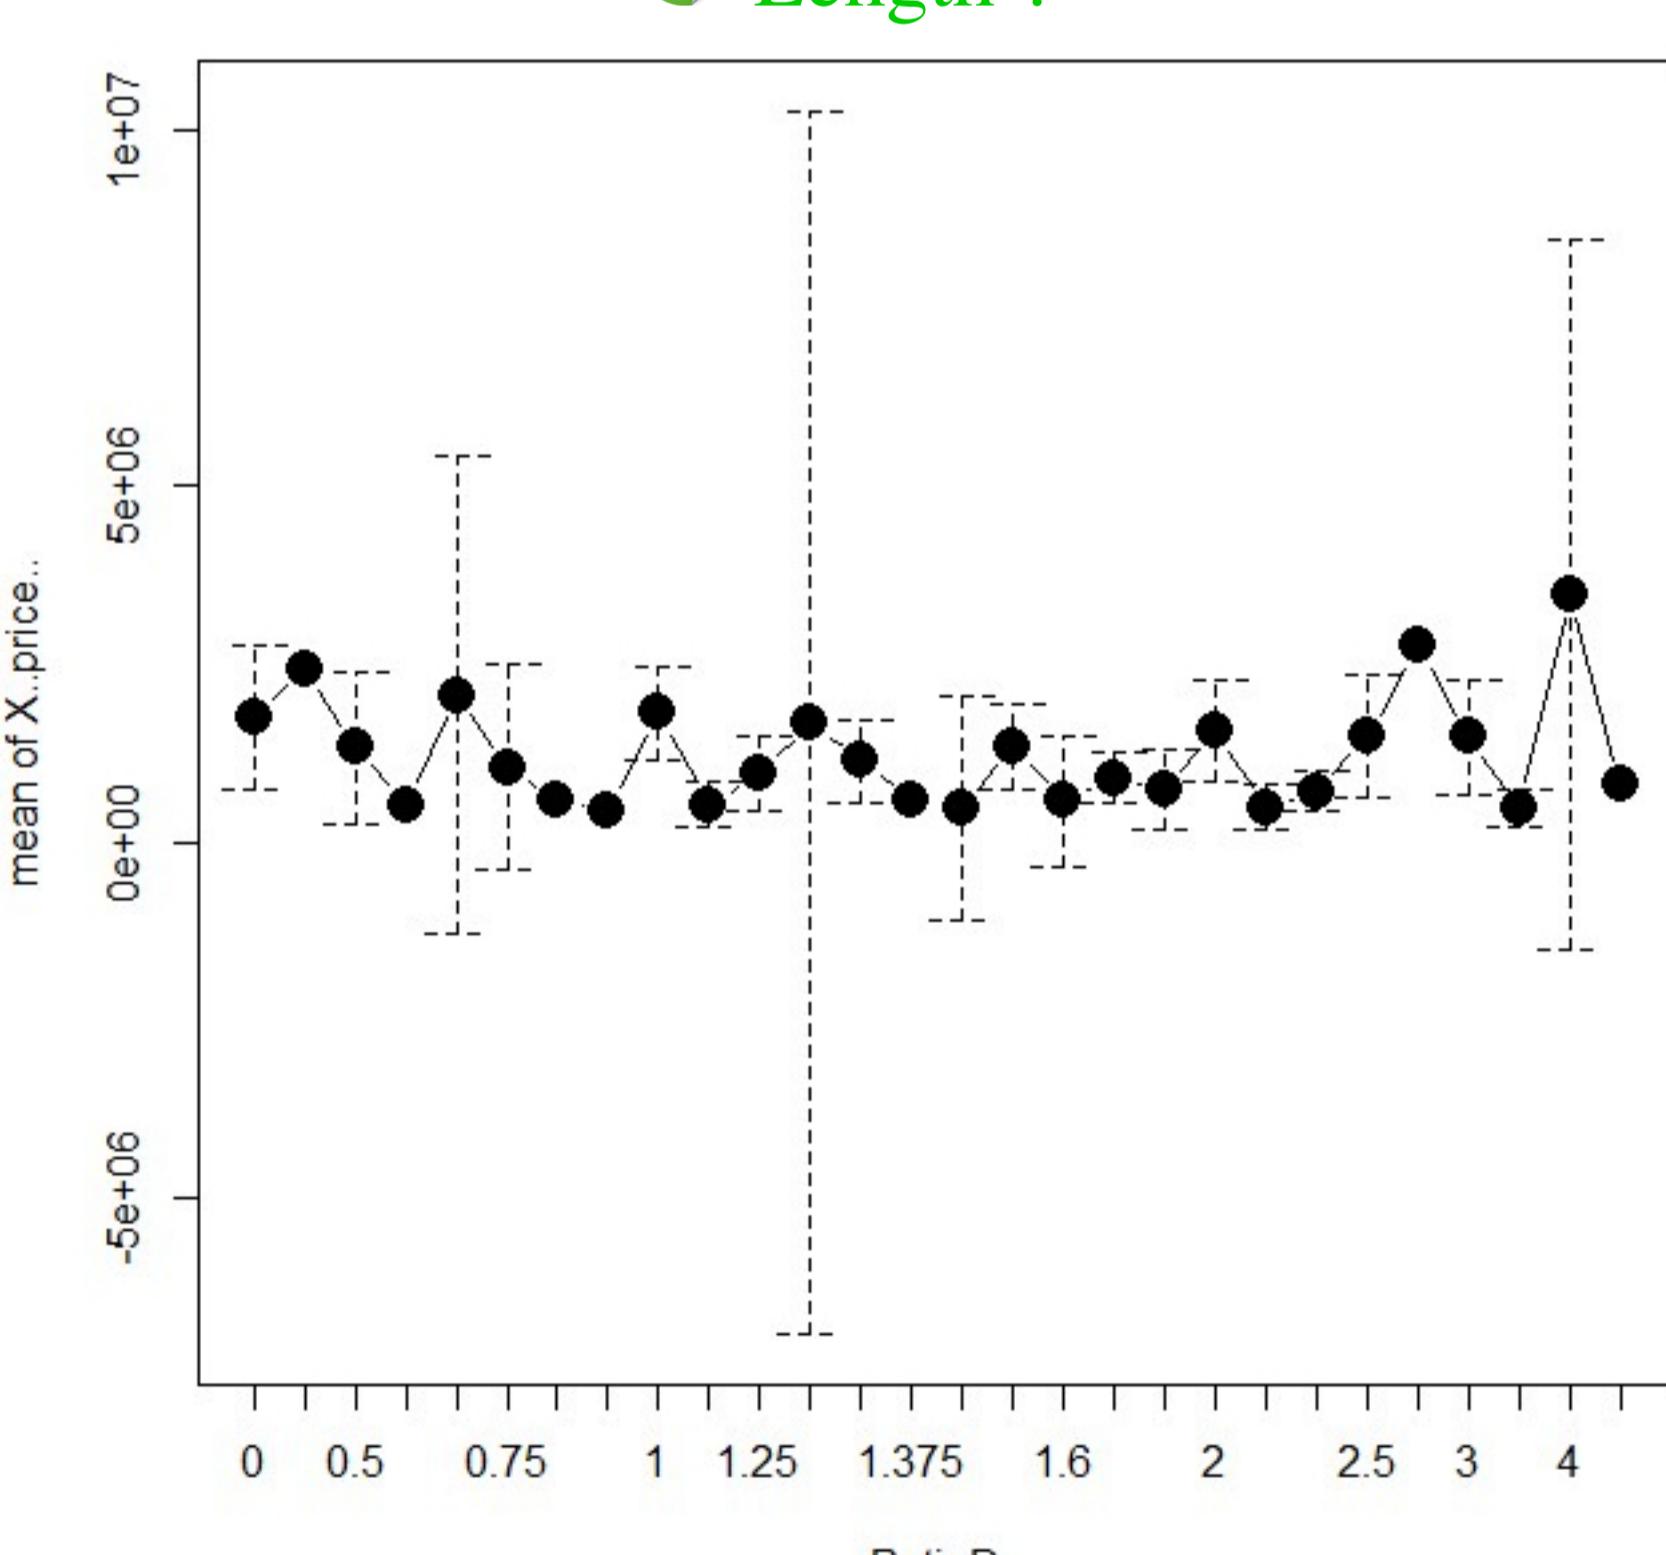

✓ Top Level Domain ?

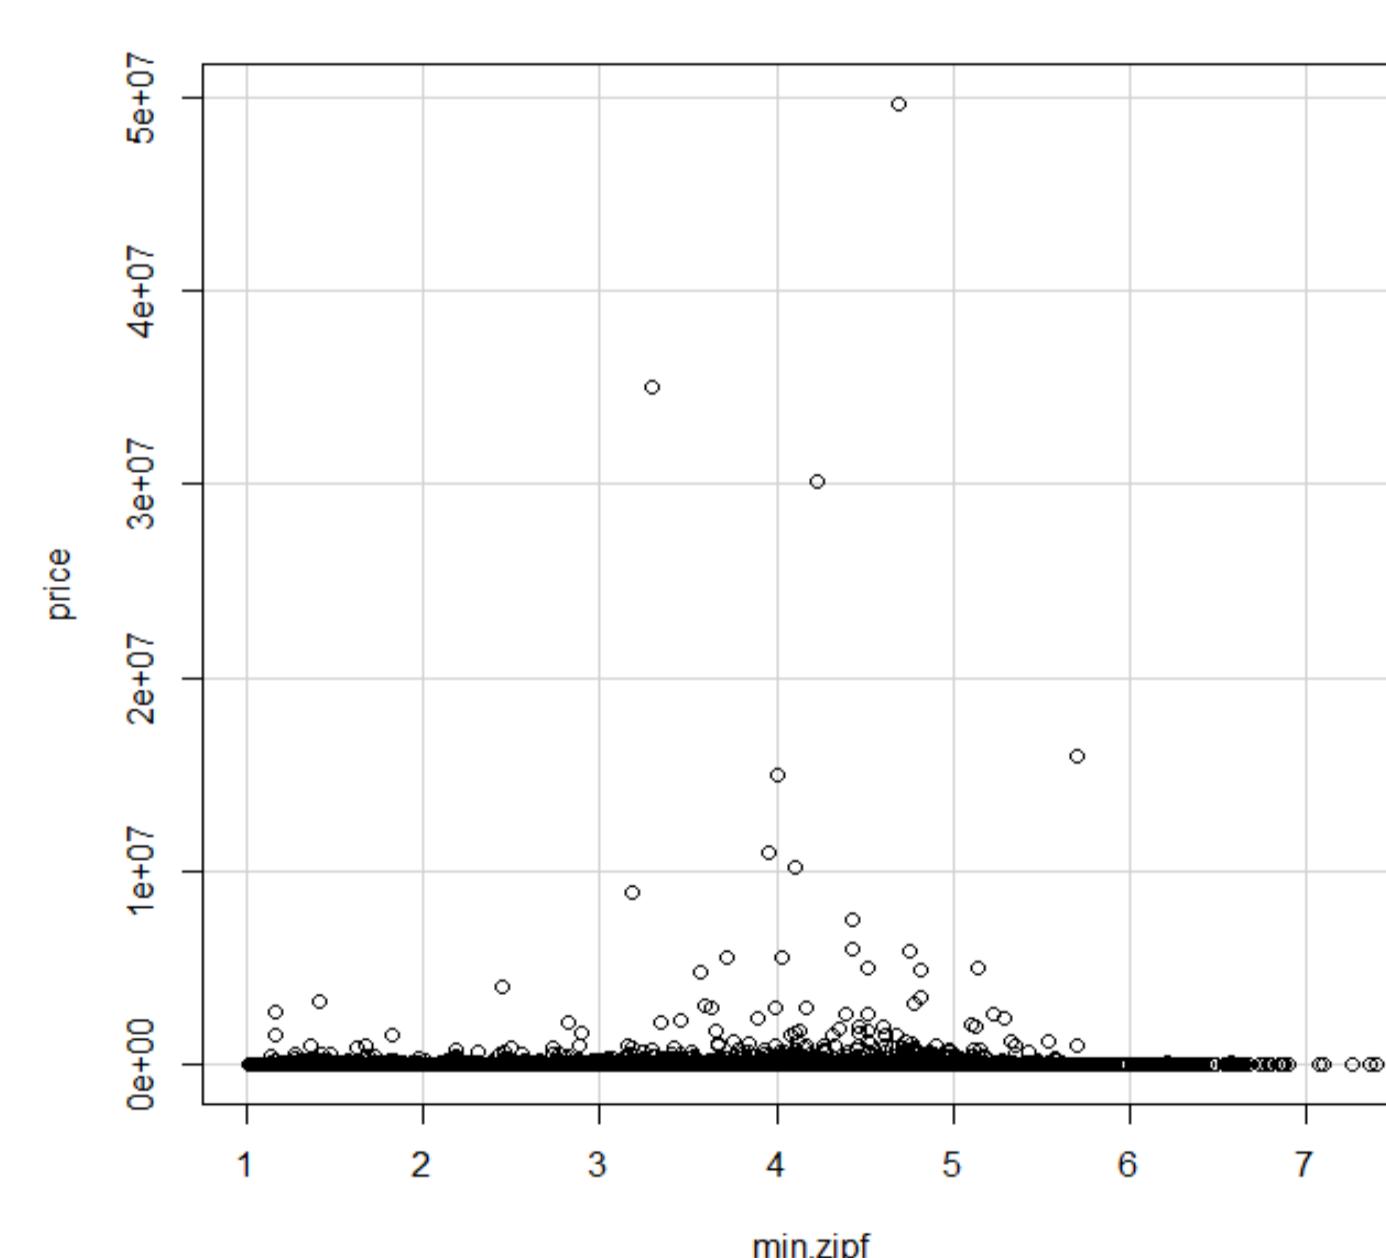

✓ Length ?

✓ Number of words ?

✗ Alternating consonant vowels ?

✗ Frequency of occurrence of words ?
