Supplementary methods

Commercially available reagents and solvents were used without further purification. Reactions were monitored by HPLC using an analytical Chromolith Speed Rod RP-C18 185 Pm column (50x4.6 mm, 5 mm), at a flow rate of 3.0 mL/min, and gradients of 100/0 to 0/100 eluents A/B for 5 min (eluent A = H₂O/0.1% TFA and B = CH₃CN/0.1% TFA). Detection was performed at 214 nm using a photodiode array detector. Retention times (Tr) are reported in min. ¹H and ¹³C NMR spectra were recorded at room temperature in deuterated solvents. Chemical shifts (δ) are expressed in parts per million (ppm), relative to the resonance of CDCl₃ = 7.26 ppm for ¹H (77.16 ppm for ¹³C), CD₃OD = 3.31 ppm for ¹H (49.00 ppm for ¹³C) or DMSO d_6 = 2.50 ppm for ¹H (39.52 ppm for ¹³C). The following abbreviations were used: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), br (broad). Analytical thin-layer chromatography (TLC) was performed using 60 F254 aluminium-backed silica gel plates coated with a 0.2 mm thickness of neutral aluminium oxide. LC-MS spectra (ESI) were recorded using an analytical Chromolith Speed Rod RP-C18 185 Pm column (50 x 4.6 mm, 5 mm); solvent A, H₂O/HCOOH 0.1%; solvent B, CH₃CN/HCOOH 0.1%; gradient, 0% solvent B to 100% solvent B in solvent A in 3 min; flow rate, 3.0 mL/min. High-resolution mass spectrometry analyses were performed with a time-of-flight mass spectrometer fitted with an electrospray ionisation source. All measurements were performed in the positive ion mode. Melting points (Mp) are uncorrected and were recorded on a capillary melting point apparatus.

Synthesis of compounds 2 :

To a solution of 2 g of anthranilic acid **1a** or **1b** in 20 mL of dichloromethane was added one equivalent of triethylamine. The reaction was stirred and cooled at 0°C. Synthesis of quinazolines **3** and **3'**

To a solution of 1.4 mmol of compound **2a** or **2b** in 10 mL of toluene, were added 7 mmol of PCl₃ (5 equiv.) and 2.1 mmol of the suitable aniline (1.5 equiv.). The reaction mixture was neutralized with the addition of sodium bicarbonate and extracted with chloroform (4 x 25 mL). The organic layers were combined, dried over Na₂SO₄, filtered and evaporated under vacuum to offer a mixture of **3** + **3'** which was used without further purification in the next step.

Synthesis of quinazolines 5 :

A solution of compound **4** (0.3 mmol) and $SnCl_2 \cdot H_2O$ (1.5 mmol, 5 equiv.) in MeOH (40 mL) was refluxed for 2 h. After completion of the reaction (HPLC monitoring), the mixture was evaporated to dryness. 20 mL of dichloromethane and 20 mL of saturated aqueous $NaHCO_3$ were added and the mixture was stirred for 16 h at room temperature. The mixture was then filtered through a pad of Celite and the organic layer separated. The aqueous layer was extracted with CH_2Cl_2 and the combined organic layer were washed with water, dried (Na_2SO_4), and evaporated in vacuo to give **5**.
