#### Abstract

Herein, we report a new class of dual binding site AChE inhibitor $\mathbf{4}$ designed to exert a central cholinergic activation thanks to a redox-activation step of a prodrug precursor 3. Starting from potent pseudo-irreversible quinolinium salts AChE inhibitors $\mathbf{2}$ previously reported, a new set of diversely substituted quinolinium salts 2a-p was prepared and assayed for their inhibitory activity against AChE. Structure-activity relationship (SAR) analysis of 2a-p coupled with molecular docking studies allowed us to determine which position of the quinolinium scaffold may be considered to anchor the phtalimide fragment presumed to interact with the peripheral anionic site (PAS). In addition, molecular docking provided insight on the linker length required to connect both quinolinium and phatlimide moieties without disrupting the crucial role of quinolinium salt moiety within the catalytic active site (CAS); namely placing the carbamate in the correct position to trigger carbamylation of the active-site serine hydroxyl. Based on this rational design, the putative dual binding site inhibitor $\mathbf{4}$ and its prodrug $\mathbf{3}$ were synthesized and subsequently evaluated in vitro against AChE. Pleasingly, whereas

compound 4 showed to be a highly potent inhibitor of $\mathrm{AChE}\left(\mathrm{IC}_{50}=6 \mathrm{nM}\right)$ and binds to AChE-PAS to the same extent as donepezil, its prodrug $\mathbf{3}$ revealed to be inactive $\left(\mathrm{IC}_{50}>10\right.$ $\mu \mathrm{M})$. These preliminary results constitute one of the few examples of carbamate-based dual binding site AChE inhibitors.

## 1. Introduction

Alzheimer's disease ( AD ) is the most common cause of dementia characterized among other things by the central cholinergic depletion and amyloid- $\beta$ (A $\beta$ ) plaques [1-2]. So far, the use of acetylcholinesterase (AChE) inhibitors has dominated the symptomatic treatment in early-to-moderate AD [3]. There are currently three marketed drugs, namely donepezil, rivastigmine and galantamine. These three molecules, associated in some cases with memantine (NMDA antagonist glutamate) are the only therapeutic arsenal commercially available. Much efforts have been devoted these last years to develop dual binding site AChE inhibitors that simultaneously bind to both catalytic active site (CAS) and peripheral anionic site (PAS) of the enzyme [4-20]. Indeed, it was postulated that PAS of the enzyme binds to the nonamyloidogenic form of $\mathrm{A} \beta$ protein inducing conformational changes and subsequent amyloid fibril formation [21-23]. As a result, these new AChE inhibitors are expected to exhibit a better pharmacological profile in that they may not only alleviate cognitive deficits but also slow down the progression of AD by inhibiting the $\mathrm{A} \beta$ peptide aggregation. Although these findings triggered a renewed interest in the development for AChE inhibitors, the fact remains that peripheral activity commonly encountered with AChE inhibitors causes severe adverse effects and limit seriously their therapeutic efficiency [24]. To address this issue, we recently reported "biooxidisable" prodrugs $\mathbf{1}$ derived from rivastigmine with the aim at improving brain delivery and therapeutic efficacy of AChE inhibitors [25-26]. This prodrug
approach is based on the masking of a positive charge which is involved in a cation- $\pi$ interaction with $\operatorname{Trp} 84$ within the catalytic site of AChE. In contrast to rivastigmine, it is hypothesized that the dihydroquinoline prodrug 1 remains unprotonated at physiological pH , thus masking the crucial positive charge while ensuring a good lipophilicity to cross the blood-brain barrier (BBB). Once in the brain, oxidation of the dihydroquinoline 1 would unmask the permanent positive charge to restore central AChE inhibition while avoiding the resulting quinolinium salt $\mathbf{2}$ to cross back the BBB by passive diffusion (Figure 1a). Although most carbamate quinolinium salts 2 were potent against $h \mathrm{AChE}\left(\mathrm{IC}_{50}\right.$ up to 10 nM ), all corresponding 1,4-dihydroquinolines proved to be unable to inhibit $h \mathrm{AChE}\left(\mathrm{IC}_{50}>10 \mu \mathrm{M}\right)$, providing an in vitro proof of concept of this prodrug approach. In this context, we report herein the rational design of new central dual binding site AChE inhibitors $\mathbf{4}$ by exploiting this "biooxidisable" prodrug approach as depicted in Figure 1b. These dual binding site AChE inhibitors are expected to restore the cholinergic transmission and prevent the aggregation of $\mathrm{A} \beta$, all the while avoiding deleterious peripheral effects frequently encountered in the treatment of AD.

## 2. Results and discussion

### 2.1. Synthesis of quinolinium salts 2a-p

These central dual binding site AChE inhibitors 4 are made up of a carbamate quinolinium salt moiety connected via a linker to an aromatic fragment to bind to the PAS of AChE. We had first to figure out how and where to connect the aromatic fragment with the quinolinium salt moiety. From our previous work [25], some structure-activity relationship (SAR) information was already available to us to address this challenge; namely that the best AChE inhibitory activities were obtained when the carbamate group of quinolinium salts $\mathbf{2}$ is located at C-5. To probe which region of the inhibitor may be considered to link a spacer without causing major disruptions on the AChE inhibitory activity, we embarked on the preparation of a new series of carbamate quinolinium salts 2a-p.

The general synthetic route to target compounds 2a-p involves a classical Friedländer approach followed by an appropriate multi-step functionalization sequence of the resulting 5methoxyquinoline derivatives (Schemes 1-2). Thus, quinoline esters 6a,b were readily prepared in $70-77 \%$ yields by reacting methyl trans-3-methoxyacrylate with 2aminobenzaldehyde 5a and 2-aminoacetophenone 5b respectively. Likewise, quinoline carboxamides $\mathbf{6 c}, \mathbf{d}$ were prepared from $\mathrm{N}, \mathrm{N}$-dimethylacetoacetamide and compounds $\mathbf{5 a}, \mathbf{b}$ in $62-72 \%$ yields. The resulting 5 -methoxyquinoline esters $\mathbf{6 a , b}$ were subjected to $O$ demethylation in refluxing concentrated HBr to furnish the corresponding 5-hydroxyquinoline-3-carboxylic acids 7a,b in 74-80\% yields. Furthermore, smooth $O$ demethylation of 5-methoxyquinoline-3-N,N-dimethylcarboxamides $\mathbf{6 c}, \mathbf{d}$ took place by means of ethanethiol and aluminium chloride [27] and without reacting with the carboxamide
function at $\mathrm{C}-3$, thus providing 5-hydroxyquinoline-3- $N, N$-dimethylcarboxamides $\mathbf{8 c}$,d in 66$76 \%$ yields. Additionally, a panel of 5-hydroxyquinoline-3-carboxamides 8a,b,e-k could be prepared in 61-79\% yields from 5-hydroxyquinoline-3-carboxylic acids 7a,b and various amines in the presence of PyBroP as coupling agent (Scheme 1). Lastly, carbamylation of the resulting 5-hydroxyquinoline-3-carboxamides 8a-k afforded the corresponding 5carbamylated quinoline-3-carboxamides $\mathbf{9 a - m}$ in $70-90 \%$ yields which were subsequently quaternized to give rise to the desired target quinolinium salts 2a-p in high yields (85-99\%)
(Scheme 2).

## ACCEPTED MANUSCRIPT

### 2.2. In vitro evaluation of compounds 2a-p, SAR analysis and docking

In vitro hAChE inhibitory activity of these new quinolinium salts $\mathbf{2 a}-\mathbf{p}$ was evaluated using the classical Ellman's assay [28]. Preliminary SAR analysis indicated that substitution at C-2 or/and C-4 by a methyl group resulted in a complete loss of AChE inhibitory activity (Fig. 2a). Second, the inhibiting activity drops sharply when the $N$-substituent of the quinolinium salt increases in size (Fig. 2b). We also looked at the nature of the carbamate and showed that only $N, N$-dimethyl carbamate exhibits an AChE inhibitory activity, all structural modifications at the carbamate moiety leading to a collapse of the AChE inhibitory activity (Fig. 2c). This finding is likely related to the inhibition mechanism of these pseudoirreversible AChE inhibitors, transferring the carbamate moiety to the serine hydroxyl group at the esterasic site of the enzyme. Interestingly, we investigated the nature of the electron withdrawing group at C-3 and showed that quite large structural variations at this position are tolerated without compromising as much $h \mathrm{AChE}$ inhibition; $\mathrm{IC}_{50}$ values ranging from 20 to 93 nM (Fig. 2d). It is worth mentioning that this functional group was deemed essential to ensure some stability of the corresponding prodrugs $\mathbf{1}$ at the periphery by protecting the enamine double bond against electrophilic attack.

Figure 2. Structure-activity relationship of carbamate-quinolinium salts 2a-p - In vitro $h \mathrm{AChE}$ inhibition assay (Ellman's test).

Analysis of this SAR data prompted us to suggest that the functional group located at C-3 is likely the most appropriate attachment-point to link the aromatic fragment to the quinolinium salt. Moreover, this assumption was supported by a molecular docking simulation study of compounds $\mathbf{2 h}, \mathbf{2 j}, \mathbf{2 k}$ and $\mathbf{2 p}$ on $T c \mathrm{AChE}$ (PDB ID: 2CKM) (Figure 3A-D). For all compounds, the docking interactions showed that the carbamate group is pointing towards Ser200 residue present in the active site of $T c \mathrm{AChE}$. It was also observed a strong nitrogen cation- $\pi$ interaction and $\pi-\pi$ stacking with Phe330 amino acid and $\pi-\pi$ stacking between quinolinium and indole ring of $\operatorname{Trp} 84$. These interactions position the structure of the quinolinium compounds in the active site such that the substituent in $\mathrm{C}-3$ position is located near the bottom of the hydrophobic gorge and can thus allow the chain to be elongated towards PAS.

Figure 3. Top-scored poses obtained with Autodock Vina [29] for compounds $\mathbf{2 h}(\mathrm{A}), \mathbf{2 j}$ (B), 2k (C) and $\mathbf{2 p}$ (D) positioned in active site of $T c$ AChE (PDB ID: 2CKM). The compounds and the selected side chains of the binding site residues are in stick and the protein in cartoon representation. This figure was made with PyMol [30].

### 2.3. Docking, synthesis and in vitro evaluation of compound 4 and its prodrug 3

Armed with this valuable SAR study, quinolinium-phtalimide heterodimer $\mathbf{4}$ was proposed as a putative dual binding site AChE inhibitor (Figure 4). The proposed heterodimeric AChE inhibitors $\mathbf{4}$ contain a phtalimide moiety which is clearly highlighted in the literature as being one of the most popular aromatic fragments for binding to the PAS region of AChE. [31-34]

Figure 4. Quinolinium-phtalimide heterodimer 4.

We next examined from a docking simulation study with $T c \mathrm{AChE}$ ((PDB ID: 2CKM) whether the polyethylene glycol (PEG)-based spacer length in heterodimer 4 makes it possible for quinolinium and phtalimide fragments to simultaneously bind to the CAS and the PAS respectively. A detailed analysis of the binding mode of the best docked conformation highlights dual-binding mode of action; while the quinolinium moiety interacts with the CAS through aromatic interactions with Trp84 and Phe330 leading the carbamate group to point towards Ser200, the PEG linker goes up the aromatic gorge and the phtalimide core binds by $\pi$-stacking to both Tyr70 and Trp279 PAS residues (Figure 5A). In addition, a docking simulation of compound $\mathbf{4}$ with rhAChE (PDB ID: 4EY7) was also achieved and the bestscored pose confirmed the preceding results; namely strong interactions with both CAS and PAS amino-acid residues (Figure 5B).

Figure 5. Top-scored poses obtained with Autodock Vina [29] for compound 4 positioned in active site of $T c A C h E$ (Figure 5A, PDB ID: 2CKM) and in rhAChE (Figure 5B, PDB ID: 4EY7). The compounds and the selected side chains of the binding site residues are in stick and the protein in cartoon representation. This figure was made with PyMol [30].

Supported by these promising predictions, we embarked on the synthesis of quinoliniumphtalimide heterodimer 4 (Scheme 3). The phtalimide-amine 10 [35] and 5-hydroxyquinoline-3-carboxylic acid 7a were treated with CDI to afford the expected quinoline-phtalimide 11a in $32 \%$ yield. All attempts to increase the yield by using other coupling agents such as HATU or HBTU failed, leading to poorly reproducible yields and tedious purifications. Subsequent carbamylation of 11a afforded 5-carbamylated quinoline-phtalimide 11b in good yield (73\%) which was readily converted to the corresponding quinolinium salt 4 in $86 \%$ yield in the presence of MeOTf as quaternization reagent. Finally, the putative prodrug $\mathbf{3}$ was obtained by regioselective 1,4-reduction of $\mathbf{4}$ with 1-benzyl-1,4-dihydronicotinamide (BNAH).

Scheme 3. Synthesis and $h$ AChE inhibitory activity of dual binding site AChE inhibitor 4 and its prodrug 3.

Pleasingly, whereas ligand 4 showed to be a potent $h \mathrm{AChE}$ inhibitor $\left(\mathrm{IC}_{50}=6 \mathrm{nM}\right.$, Ellman's test [28]), its "biooxidisable"prodrug form 3 revealed no inhibitory activity towards the enzyme ( $\mathrm{IC}_{50}>10 \mu \mathrm{M}$ ). Pleasingly, the prodrug also displayed good permeability in Caco-2 assay $\left(\mathrm{P}_{\text {app }}(\mathrm{A}-\mathrm{B})=11.1 \times 10^{-6} \mathrm{~cm} / \mathrm{s}\right.$, recovery $\left.=91 \%\right)$. More importantly, ligand 4 showed to
displace propidium iodide from the PAS of $h \mathrm{AChE}(20 \%)$ and to inhibit the $\mathrm{A} \beta$ (1-42) selfaggregation ( $14 \%$ at $10 \mu \mathrm{M}$ ) to the same extent as donepezil [36]. In addition, compound $\mathbf{1 2}$ was also prepared by reaction with methyl iodide in acetonitrile at $40^{\circ} \mathrm{C}$ (Scheme 4). It was proved to be inactive against $h \mathrm{AChE}$ activity, i.e. $35 \%$ inhibition at $10^{-5} \mathrm{M}$, confirming the crucial role of carbamate group in the enhancement of the anti-AChE activity.

Scheme 4. Synthesis and $h \mathrm{AChE}$ inhibitory activity of quinolinium 12.
These preliminary in vitro assays allow not only to identify a novel class of highly potent heterodimeric $h \mathrm{AChE}$ inhibitors, but also to consider further development of highly centrally active dual binding site $h \mathrm{AChE}$ inhibitors with increased efficacy and/or decreased side effects by means of a "biooxidisable" prodrug approach.

## 3. Conclusion

From our previous work dealing with central pseudo-irreversible AChE inhibitors based on a redox-activated prodrug strategy [25-26], a new quinolinium-phtalimide heterodimeric ligand 4 was designed to simultaneously interact with both the active and peripheral sites of AChE . By means of a SAR study of diverse synthesized quinolinium salts 2a-p and a molecular docking simulation of compounds $\mathbf{2 h}, \mathbf{2} \mathbf{j}, \mathbf{2 k}$ and $\mathbf{2 p}$, we could determine which position of the quiniolium ring is the most suitable to attach the PEG linker so that the phtalimide fragment at its end is able to interact with the PAS of $h \mathrm{AChE}$. After docking simulation of the designed heterodimer $\mathbf{4}$ in $h \mathrm{AChE}$ showing a possible dual-site binding fashion, ligand $\mathbf{4}$ was efficiently prepared and revealed to be highly potent against $h \mathrm{AChE}$ activity $\left(\mathrm{IC}_{50}=6 \mathrm{nM}\right)$
while the corresponding prodrug 3 turned out to be inactive $\left(\mathrm{IC}_{50}>10 \mu \mathrm{M}\right)$. Moreover, a propidium competition assay confirms the interaction of compound $\mathbf{4}$ at the PAS inducing A $\beta$ (1-42) self-aggregation inhibitory activities. All together, these findings pave the way for the development of novel and side-effects free prodrugs of potent dual binding site AChE inhibitors for the treatment of amnesic disorders like Alzheimer disease.

## 4. Experimental section

### 4.1. General

All commercial reagents were used without further purification. The solvents were dried with appropriate desiccants and distilled prior to use or were obtained anhydrous from commercial suppliers. Silica gel (60, 230-400 mesh or 70-230 mesh) was used for column chromatography. Reactions were monitored by thin layer chromatography on silica gel precoated aluminum plates. UV light at 254 nm or $\mathrm{KMnO}_{4}$ stains were used to visualize TLC plates. ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ NMR spectra were recorded using a spectrometer operating at 300 and 75 MHz respectively. Abbreviations used for peak multiplicities are s: singlet, d: doublet, t: triplet, q: quadruplet $\mathrm{dd}=$ doublet of doublet, $\mathrm{br}=\mathrm{broad}, \mathrm{dq}=$ doublet of quadruplet and m : multiplet. Coupling constants $J$ are in Hz and chemical shifts are given in ppm and calibrated with DMSO- $d_{6}$ or $\mathrm{CDCl}_{3}$ (residual solvent signals). ${ }^{1} \mathrm{H}$ NMR spectra obtained in $\mathrm{CDCl}_{3}$ were referenced to $7.26 \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR spectra obtained in $\mathrm{CDCl}_{3}$ were referenced to 77.16 ppm and in DMSO- $d_{6}$ were referenced to 39.52 ppm . High-resolution mass spectrometry (HRMS) was carried out on a waters LCT XE spectrometer. Elemental analyses were performed by the microanalysis service of the University of Rouen and were recorded with a Thermo Scientific FLASH 2000 analyzer.

Derivatives 5a,b were synthesized from 3-anisidine using a previously described synthesis.[37-38] Compounds 6a, 7a, $\mathbf{2 0}$ were prepared according to the same procedure as we have already reported in the literature. [25]

### 4.2. Chemistry

### 4.2.1. Methyl 5-methoxy-4-methyl-quinoline-3-carboxylate (6b)

To a solution of ketone $\mathbf{5 b}(7.73 \mathrm{~g}, 31.0 \mathrm{mmol})$ and methyl trans-3-methoxyacrylate ( 7.4 mL , 68.4 mmol ) dissolved in 150 mL of methanol was slowly added 3 M aqueous solution of hydrochloric acid ( 100 mL ). The resulting mixture was stirred under reflux for 3 hours, then cooled to room temperature and neutralized by adding solid $\mathrm{Na}_{2} \mathrm{CO}_{3}$. The aqueous solution was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 150 \mathrm{~mL})$ and the combined organic layers were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under vacuum. The crude product was then filtered on silica gel to afford 5.52 g of quinoline $\mathbf{6 b}$. Pale yellow solid, yield: $77 \% . \mathrm{Mp} 85^{\circ} \mathrm{C} . R_{f}=0.39$ (Petroleum ether:EtOAc 1:1). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.03(\mathrm{~s}, 1 \mathrm{H}), 7.67-7.58(\mathrm{~m}, 2 \mathrm{H}), 6.87$ (dd, $J$ $=7.5 \mathrm{~Hz}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.96(\mathrm{~s}, 3 \mathrm{H}), 3.93(\mathrm{~s}, 3 \mathrm{H}), 3.04(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 168.0$, 158.6, 150.5, 149.8, 148.7, 130.8, 124.9, 122.4, 120.4, 106.4, 55.7, 52.5, 20.6. HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{13} \mathrm{H}_{14} \mathrm{NO}_{3} \mathrm{~m} / \mathrm{z} 232.0973$, found 232.0964.

### 4.2.2. General procedure for reaction with N,N-dimethylacetoacetamide ( $\boldsymbol{\sigma} \boldsymbol{c}-\boldsymbol{d}$ )

To a solution of aldehyde $\mathbf{5 a}$ or ketone $\mathbf{5 b}(4.0 \mathrm{mmol})$ and $N, N$-dimethylacetoacetamide ( 0.49 $\mathrm{mL}, 4.0 \mathrm{mmol}$ ) dissolved in 20 mL of dioxan was slowly added $37 \%$ aqueous hydrochloric acid $(6 \mathrm{~mL})$. The resulting mixture was stirred under reflux for 6 hours, then cooled to room temperature and neutralized by adding solid $\mathrm{K}_{2} \mathrm{CO}_{3}$. The aqueous solution was extracted with
$\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 15 \mathrm{~mL})$ and the combined organic layers were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under vacuum. The crude product was purified by chromatography on silica gel to afford quinolines $\mathbf{6 c}$ or $\mathbf{6 d}$.

### 4.2.2.1. 5-Methoxy-N,N,2-trimethyl-quinoline-3-carboxamide (6c)

Pale brown solid, yield: $72 \% . \mathrm{Mp} 126^{\circ} \mathrm{C} . R_{f}=0.15(\mathrm{EtOAc}) .{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $8.38(\mathrm{~s}, 1 \mathrm{H}), 7.62-7.56(\mathrm{~m}, 2 \mathrm{H}), 6.81(\mathrm{dd}, J=4.8 \mathrm{~Hz}, J=2.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.96(\mathrm{~s}, 3 \mathrm{H}), 3.17(\mathrm{~s}$, $3 \mathrm{H}), 2.87(\mathrm{~s}, 3 \mathrm{H}), 2.67(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.0,155.3,148.4,130.3$, 129.4, 128.7, 120.7, 118.3, 104.3, 55.8, 38.7, 34.9, 23.1 ppm. HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{14} \mathrm{H}_{17} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~m} / \mathrm{z}$ 245.1290, found 245.1279.

### 4.2.2.2. 5-Methoxy-N,N,2,4-tetramethyl-quinoline-3-carboxamide (6d)

Pale brown solid, yield: $62 \%$. Mp $112^{\circ} \mathrm{C} . R_{f}=0.12(\mathrm{EtOAc}) .{ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 7.61-7.52 (m, 2H), $6.83(\mathrm{dd}, J=7.5 \mathrm{~Hz}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.93(\mathrm{~s}, 3 \mathrm{H}), 3.21(\mathrm{~s}, 3 \mathrm{H}), 2.82(\mathrm{~s}$, $3 \mathrm{H}), 2.76(\mathrm{~s}, 3 \mathrm{H}), 2.58(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 170.3,157.9,154.2$, 149.1, $141.5,130.5,129.5,121.6,118.6,105.5,55.5,37.6,34.5,22.9,20.3 \mathrm{ppm}$. HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{15} \mathrm{H}_{19} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~m} / \mathrm{z}$ 259.1446, found 259.1443.

### 4.2.3. 5-Hydroxy-4-methyl-quinoline-3-carboxylic acid (7b)

A solution of ester $\mathbf{6 b}(5.45 \mathrm{~g}, 23.6 \mathrm{mmol})$ in an aqueous solution of $\mathrm{HBr}(150 \mathrm{~mL}, 48 \%)$ was heated under reflux for 24 hours. After cooling the reaction mixture to room temperature, the pH was adjusted to 2 with 2 M aqueous NaOH . After filtration of the insoluble matter, the pH was adjusted between 5 and 6 , and the resulting precipitate was filtered off, rinsed with cooled
water and dried at $50^{\circ} \mathrm{C}$ under vacuum to afford 3.55 g of carboxylic acid 7 b . Brown solid, yield: $74 \% . \mathrm{Mp} 210^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta 8.89(\mathrm{~s}, 1 \mathrm{H}), 7.55(\mathrm{t}, J=8.1 \mathrm{~Hz}$, $1 \mathrm{H}), 7.44(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.01(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.06(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $(75 \mathrm{MHz}$, DMSO- $d_{6}$ ) $\delta 168.8,156.9,150.1,149.3,147.1,131.1,125.4,120.1,118.7,111.2,20.0 \mathrm{ppm}$. Found: C, 64.9; H, 4.45; N, 6.80. Calc. for $\mathrm{C}_{11} \mathrm{H}_{9} \mathrm{NO}_{3}$ : C, $65.02 ; \mathrm{H}, 4.46 ; \mathrm{N}, 6.89 \%$.

### 4.2.4. General procedure for demethylation of 5-methoxy-quinolines derivatives with $\mathrm{AlCl}_{3}$

Under Argon Atmosphere, $\mathrm{AlCl}_{3}$ ( $1.41 \mathrm{~g}, 5$ equiv) were placed in suspension in 2.5 mL of DCM. The suspension was cooled at $0^{\circ} \mathrm{C}$ then ethanethiol ( $1.7 \mathrm{~mL}, 10.8$ equiv) was dropwise added following by the addition of substrate ( $1.0 \mathrm{mmol}, 1$ equiv) in $\mathrm{DCM}(9 \mathrm{~mL})$. After stirring overnight at room temperature, a Rochelle's salt solution was added at room temperature and the mixture was extracted five times with DCM. The combined organic phase was dried over $\mathrm{MgSO}_{4}$ and concentrated under vacuum to give the expected compound.

### 4.2.4.1. 5-Hydroxy-N,N,2-trimethyl-quinoline-3-carboxamide (8c)

Brown solid, yield: $66 \% . \mathrm{Mp} 95^{\circ} \mathrm{C} . R_{f}=0.09(\mathrm{EtOAc}) .{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.47$ $(\mathrm{s}, 1 \mathrm{H}), 7.45(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.35(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.82(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.18(\mathrm{~s}$, $3 \mathrm{H}), 2.89(\mathrm{~s}, 3 \mathrm{H}), 2.69(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.9,154.5,153.7,146.6$, 132.0, 131.3, 128.2, 118.2, 117.2, 109.9, 39.0, 35.1, 21.9 ppm . HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{13} \mathrm{H}_{15} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~m} / \mathrm{z}$ 231.1133, found 231.1124.

Pale brown solid, yield: $76 \% . \mathrm{Mp} 99^{\circ} \mathrm{C} . R_{f}=0.1$ (EtOAc). ${ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}, \mathrm{MeOD})$ $\delta 11.05(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 8.72-8.64(\mathrm{~m}, 2 \mathrm{H}), 8.15(\mathrm{dd}, J=6.0 \mathrm{~Hz}, J=3.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.42(\mathrm{~s}, 3 \mathrm{H})$, $4.14(\mathrm{~s}, 3 \mathrm{H}), 4.02(\mathrm{~s}, 3 \mathrm{H}), 3.74(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $\left.75 \mathrm{MHz}, \mathrm{MeOD}\right) \delta$ 172.1, 157.7, 155.0, 150.0, 144.5, 131.6, 130.9, 119.8, 118.9, 111.4, 38.2, 34.8, 22.5, 20.5 ppm. HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{14} \mathrm{H}_{17} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~m} / \mathrm{z}$ 245.1290, found 245.1286.

### 4.2.5. General procedure for amidation of carboxylic acid

A suspension of carboxylic acid $\mathbf{7 a}$ or $\mathbf{7 b}(1.0 \mathrm{mmol})$ in anhydrous DMA $(5 \mathrm{~mL})$ was heated to $50^{\circ} \mathrm{C}$ until complete solubilisation then the resulting solution was cooled to $-5^{\circ} \mathrm{C}$. Amine ( $1.0 \mathrm{mmol}, 1$ equiv) and DIEA ( $0.52 \mathrm{~mL}, 3.0 \mathrm{mmol}$ ) were then added followed by PyBrop $(466.2 \mathrm{mg}, 1.0 \mathrm{mmol})$ in one portion. The mixture was then warmed to room temperature and stirred for up to 15 h . Water ( 3 mL ) was added dropwise at $0^{\circ} \mathrm{C}$ and the mixture was neutralized with a saturated aqueous solution of ammonium chloride. The product was extracted with EtOAc (5x) and the combined organic layers washed with brine (2x), dried over $\mathrm{MgSO}_{4}$ and concentrated under vacuum. The crude product was purified by chromatography on silica gel to afford amide derivatives.

### 4.2.5.1. 5-Hydroxy-N,N-dimethyl-quinoline-3-carboxamide (8a)

Pale yellow solid, yield: $61 \% . \mathrm{Mp} 172^{\circ} \mathrm{C} . R_{f}=0.17(\mathrm{EtOAc}) .{ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $d_{6}$ ) $\delta 10.69(\mathrm{~s}, 1 \mathrm{H}), 8.86(\mathrm{~d}, J=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 8.50(\mathrm{~d}, J=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.62(\mathrm{t}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H})$, $7.50(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.98(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.03(\mathrm{brs}, 6 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( 75 MHz , DMSO- $d_{6}$ ) $\delta 168.0,153.7,148.6,148.5,131.1,129.2,127.8,119.0,118.0,109.1,34.9 \mathrm{ppm}$. HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{12} \mathrm{H}_{13} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~m} / \mathrm{z}$ 217.0977, found 217.0971.

White solid, yield: $67 \% . R_{f}=0.06$ (EtOAc). Mp $241^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( 300 MHz, DMSO- $d_{6}$ ) $\delta$ $10.45(\mathrm{~s}, 1 \mathrm{H}), 8.48(\mathrm{~s}, 1 \mathrm{H}), 7.52(\mathrm{t}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.43(\mathrm{dd}, J=8.4 \mathrm{~Hz}, J=1.2 \mathrm{~Hz}, 1 \mathrm{H})$, $6.96(\mathrm{dd}, J=7.5 \mathrm{~Hz}, J=1.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.06(\mathrm{~s}, 3 \mathrm{H}), 2.80(\mathrm{~s}, 3 \mathrm{H}), 2.74(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR (75 MHz, DMSO- $d_{6}$ ) $\delta 168.5,156.1,149.4,147.1,140.8,130.0,129.8,120.1,118.5,110.6$, 37.7, 34.1, 19.7 ppm . HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{13} \mathrm{H}_{15} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~m} / \mathrm{z} 231.1133$, found 231.1135.

### 4.2.5.3. 5-Hydroxy-N-isopropyl-quinoline-3-carboxamide (8e)

Pale yellow solid, yield: 70\%. $R_{f}=0.1$ (EtOAc). $\mathrm{Mp}>260^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $d_{6}$ ) $\delta 10.81(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 9.22(\mathrm{~d}, J=2.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.99(\mathrm{~d}, J=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 8.66(\mathrm{~d}, J=7.8 \mathrm{~Hz}$, $1 \mathrm{H}), 7.63(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.50(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.99(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.17(\mathrm{dq}, J=$ $13.5 \mathrm{~Hz}, J=6.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.21(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 6 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta$ 164.0, 154.3, 149.5, 149.2, 131.6, 130.0, 125.8, 119.0, 118.2, 109.1, 41.1, 22.3 ppm. HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{13} \mathrm{H}_{15} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~m} / \mathrm{z} 231.1133$, found 231.1129.
4.2.5.4. 5-Hydroxy-N-(2-methoxyethyl)quinoline-3-carboxamide (8f)

Pale white solid, yield: $72 \% . R_{f}=0.12$ (EtOAc). Mp $198^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( 300 MHz, DMSO- $d_{6}$ ) $\delta 10.79(\mathrm{~s}, 1 \mathrm{H}), 9.23(\mathrm{~d}, J=2.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.99(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.93(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.64(\mathrm{t}, J=$ $8.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.49(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.99(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.55-3.46(\mathrm{~m}, 4 \mathrm{H}), 3.29(\mathrm{~s}$, $3 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta 164.9,154.2,149.5,148.9,131.6,130.1,125.3$, 119.0, 118.1, 109.1, 70.3, 57.8, 39.4 ppm . HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{13} \mathrm{H}_{15} \mathrm{~N}_{2} \mathrm{O}_{3}$ $m / z 247.1082$, found 247.1070.

Yellow solid, yield: $71 \% . R_{f}=0.29$ (Petroleum Ether:EtOAc 1:2). Mp $>260^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{MeOD}) \delta 9.30-9.29(\mathrm{~m}, 2 \mathrm{H}), 7.76-7.69(\mathrm{~m}, 3 \mathrm{H}), 7.56(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.42-$ $7.39(\mathrm{~m}, 2 \mathrm{H}), 7.18(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.02(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( 75 MHz , DMSO- $\left.d_{6}\right) \delta 164.1,154.3,149.6,149.2,139.0,132.0,130.7,128.6,125.9,123.8,120.4$, 119.0, 118.1, 109.3 ppm. ### 4.2.6.13. 3-((2-(2-hydroxyethoxy)ethyl)carbamoyl)quinolin-5-yl dimethylcarbamate (9m)

White solid, yield: $90 \% . R f=0.06$ (EtOAc). $\mathrm{Mp} 104-106{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $9.22(\mathrm{~d}, J=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 8.66(\mathrm{~d}, J=1.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.96(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.91(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H})$, 7.68 (appt, $J=8.1 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.31 (d, $J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.69-3.64(\mathrm{~m}, 2 \mathrm{H}), 3.64-3.58(\mathrm{~m}, 4 \mathrm{H})$, 3.56-3.50 (m, 2H), $3.18(\mathrm{~s}, 3 \mathrm{H}), 2.99(\mathrm{~s}, 3 \mathrm{H}), 2.43(1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $166.0,154.7,149.4,148.9,147.6,130.6,130.4,127.5,126.5,121.8,119.6,72.4,69.7,61.6$, 40.2, 37.0, 36.8 ppm . HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{17} \mathrm{H}_{22} \mathrm{~N}_{3} \mathrm{O}_{5} \mathrm{~m} / \mathrm{z} 348.1559$, found 348.1558.

### 4.2.7. General procedure for quaternarization of compounds $\mathbf{9 a - n}, \boldsymbol{p}$

To a stirred solution of carbamylated quinoline $\mathbf{9 a - m}(1.0 \mathrm{mmol})$ in acetonitrile ( 2 mL ) was added methyl iodide or dimethylsulfate ( 10.0 mmol ) (or ethyl iodide ( 2.0 mmol ), or benzyl bromide ( 1.5 mmol )) at room temperature. The resulting mixture was stirred for 17 h at $80^{\circ} \mathrm{C}$ in sealed tube. After cooling at room temperature, diethylether was added to the mixture and the resulting precipitate was filtered off, rinsed with diethylether and dried under vacuum to afford the corresponding quinolinium salt $\mathbf{2 a - n}, \mathbf{p}$.

### 4.2.7.1. [3-(Dimethylcarbamoyl)-1-methyl-quinolin-1-ium-5-yl] N,N-dimethylcarbamate iodide (2a)

Red solid, yield: $94 \%$. Mp $222^{\circ} \mathrm{C}$ (dec.). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 10.00$ (s, 1 H ), 9.00 (s, $1 \mathrm{H}), 8.30(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.20(\mathrm{t}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.76(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.82(\mathrm{~s}, 3 \mathrm{H})$, $3.25(\mathrm{~s}, 3 \mathrm{H}), 3.23(\mathrm{~s}, 3 \mathrm{H}), 3.10(\mathrm{~s}, 3 \mathrm{H}), 3.02(\mathrm{~s}, 3 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ $164.0,152.9,149.3,148.8,139.3,138.8,137.0,130.2,123.9,122.9,115.9,47.9,41.1,37.2$, 37.1, 36.0 ppm . 4.2.7.15. 5-((dimethylcarbamoyl)oxy)-3-((2-(2-hydroxyethoxy)ethyl)carbamoyl)-1-methylquinolin-1-ium methyl sulfate (2p)

White solid, yield: $81 \%{ }^{1}{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ) $\boldsymbol{\delta} 9.71(\mathrm{~s}, 1 \mathrm{H}), 9.58(\mathrm{~s}, 1 \mathrm{H}), 8.37-8.35(\mathrm{~m}$, $2 \mathrm{H}), 7.89(\mathrm{~d}, ~ J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.75(\mathrm{~s}, 3 \mathrm{H}), 3.84-3.68(\mathrm{~m}, 11 \mathrm{H}), 3.32(\mathrm{~s}, 3 \mathrm{H}), 3.08(\mathrm{~s}, 3 \mathrm{H})$ ppm. ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 161.8,153.0,149.5,149.3,141.1,139.4,137.3,128.6$, 123.9, 122.8, 115.6, 72.5, 69.0, 61.5, 54.6, 46.9, 40.7, 37.2, 36.9 ppm. HRMS (ESI+) mass calcd for $[\mathrm{M}]^{+} \mathrm{C}_{18} \mathrm{H}_{24} \mathrm{~N}_{3} \mathrm{O}_{5}, m / z 362.1716$, found 362.1710.
4.2.8. $\quad N-\{2-(2-(2-(1,3-d i o x o i s o i n d o l i n-2-y l) e t h o x y) e t h o x y)$ ethyl $\}-5-h y d r o x y q u i n o l i n e-3-$ carboxamide (11a)
$N, N$ '-Carbonyldiimidazole $(0.13 \mathrm{~g}, 0.8 \mathrm{mmol})$ was added to a solution of acid 5-hydroxyquinoline-3-carboxylic acid $7 \mathbf{7 a}(0.1 \mathrm{~g}, 0.53 \mathrm{mmol})$ in DMF $(1 \mathrm{~mL})$ under nitrogen and the mixture was stirred at $40^{\circ} \mathrm{C}$ for 1 h . Amine derivative 10, prepared as described by Pastorin et al.,[35] ( $0.2 \mathrm{~g}, 0.53 \mathrm{mmol}$ ) and triethylamine $(0.22 \mathrm{~mL})$ in DMF $(1 \mathrm{~mL})$ were
added and the mixture was stirred at $20^{\circ} \mathrm{C}$ overnight. Solvent was removed under vacuum and the residue was taken up in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, washed successively with water and brine, and then dried over $\mathrm{MgSO}_{4}$. The organic phase was evaporated and the resulted residue was purified by flash chromatography on silica gel $(\mathrm{AcOEt} / \mathrm{MeOH}=97: 3)$ to give 11a as a colourless oil $(89.5 \mathrm{mg}$, $32 \%){ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.37(\mathrm{~d}, J=2.2 \mathrm{~Hz}, 1 \mathrm{H}), 9.04(\mathrm{~d}, J=2.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.73$ (dd, $J=5.4,3.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.67-7.53(\mathrm{~m}, 4 \mathrm{H}), 6.97(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.93(\mathrm{t}, J=5.9 \mathrm{~Hz}, 2 \mathrm{H})$, $3.79(\mathrm{t}, J=5.8 \mathrm{~Hz}, 2 \mathrm{H}), 3.74-3.60(\mathrm{~m}, 8 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}\right) \delta 169.5,167.3$, $155.3,150.7,150.1,135.3,133.2,133.1,131.8,127.0,124.0,120.4,119.9,110.4,71.1,71.0$, $70.3,68.8,61.2,40.8,38.5 \mathrm{ppm}$. HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{24} \mathrm{H}_{24} \mathrm{~N}_{3} \mathrm{O}_{6}, \mathrm{~m} / \mathrm{z}$ 450.1665, found 450.1653.

### 4.2.9. 3-\{(2-(2-(2-(1,3-dioxoisoindolin-2-yl)ethoxy)ethoxy)ethyl)carbamoyl\}quinolin-5-yl dimethylcarbamate (11b)

To a suspension of $11 \mathbf{a}(77.3 \mathrm{mg}, 0.17 \mathrm{mmol})$, dry $\mathrm{K}_{2} \mathrm{CO}_{3}(120.1 \mathrm{mg}, 0.86 \mathrm{mmol})$ in dry acetonitrile ( 10 mL ) was added dimethylcarbamoyl chloride ( $20 \mathrm{~mL}, 0.22 \mathrm{mmol}$ ). Thereafter, the mixture was refluxed for 18 h under nitrogen. The solvent was removed under vacuum and the residue taken up in dichloromethane, washed with water, then brine and dried over $\mathrm{MgSO}_{4}$. The resulting residue was purified by flash chromatography on silica gel $(\mathrm{AcOEt} / \mathrm{MeOH}=97: 3)$ to give 65.4 mg of $\mathbf{1 1 b}(73 \%)$ as a white solid $\left(\mathrm{mp} 152-153{ }^{\circ} \mathrm{C}\right) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.33(\mathrm{~d}, J=2.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.84-8.74(\mathrm{~m}, 1 \mathrm{H}), 7.95(\mathrm{~d}, J=8.5 \mathrm{~Hz}$, $1 \mathrm{H}), 7.77-7.66(\mathrm{~m}, 3 \mathrm{H}), 7.61(\mathrm{dd}, J=5.6,3.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.54-7.41(\mathrm{~m}, 1 \mathrm{H}), 7.35(\mathrm{dd}, J=7.7$, $0.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.86(\mathrm{t}, J=5.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.72(\mathrm{t}, J=5.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.67-3.50(\mathrm{~m}, 8 \mathrm{H}), 3.21(\mathrm{~s}, 3 \mathrm{H})$, $3.01(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 168.4,165.7,154.4,149.7$, 148.7, 147.7, 134.1,

#### Abstract

4.2.10. 5-\{(dimethylcarbamoyl)oxy)-3-((2-(2-(2-(1,3-dioxoisoindolin-2-yl)ethoxy)ethoxy) ethyl)carbamoyll-1-methyl quinolin-1-ium triflate (4)

To a stirred solution of carbamylated quinoline 11b ( $40.0 \mathrm{mg}, 0.077 \mathrm{mmol}$ ) in dry dichloromethane ( 2 mL ) was added methyl trifluoromethanesulfonate $(9.2 \mathrm{~mL}, 85 \mathrm{mmol})$ at $20^{\circ} \mathrm{C}$. The resulting mixture was stirred for 2 h at $20^{\circ} \mathrm{C}$ after which the solvent was evaporated. Diethyl ether ( 5 mL ) was added and the precipitated formed was collected to afford the quinolinium salt $4(45.2 \mathrm{mg}, 86 \%)$ as a light yellow hygroscopic powder. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 9.83(\mathrm{~s}, 1 \mathrm{H}), 9.60(\mathrm{~d}, J=1.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.53(\mathrm{~s}, 1 \mathrm{H}), 8.20(\mathrm{~d}, J=4.7 \mathrm{~Hz}$, $2 \mathrm{H}), 7.76(\mathrm{dq}, J=6.8,4.2 \mathrm{~Hz}, 3 \mathrm{H}), 7.66(\mathrm{dd}, J=5.6,3.0 \mathrm{~Hz}, 2 \mathrm{H}), 4.72(\mathrm{~s}, 3 \mathrm{H}), 3.82(\mathrm{t}, J=$ $5.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.69(\mathrm{t}, J=5.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.61(\mathrm{dd}, J=5.2,3.7 \mathrm{~Hz}, 8 \mathrm{H}), 3.26(\mathrm{~s}, 3 \mathrm{H}), 3.04(\mathrm{~s}, 3 \mathrm{H})$. ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $d$ 168.4, 161.5, 152.9, 149.6, 149.2, 141.4, 139.4, 137.6, 134.1, $132.0,128.6,124.1,123.3,122.9,115.29,70.1,70.0,68.9,67.9,46.9,40.4,37.4,37.3,37.0$. HRMS (ESI+) mass calcd for [M] ${ }^{+} \mathrm{C}_{28} \mathrm{H}_{31} \mathrm{~N}_{4} \mathrm{O}_{7} m / z 535.2193$, found 535.2195.

### 4.2.11. 3-((2-(2-(2-(1,3-dioxoisoindolin-2-yl)ethoxy)ethoxy)ethyl)carbamoyl)-1-methyl-1,4-dihydroquinolin-5-yl dimethylcarbamate (3)

To a solution of quinolinium salt $\mathbf{4 a}(60.0 \mathrm{mg}, 0.087 \mathrm{mmol})$ in dry degassed acetonitrile ( 1 mL ) was added BNAH ( 19.0 mg , 1 equiv). The reaction was stirred in the dark for 36 h . Then the solvent was removed under reduced pressure and the residue taken-up in dichloromethane. The organic phase was washed with water and brine, dried over $\mathrm{MgSO}_{4}$ and concentrated under vacuum to afford the desired dihydroquinoline $\mathbf{3}(41.3 \mathrm{mg}, 87 \%)$ as an yellow oil. ${ }^{1} \mathrm{H}$

NMR ( $300 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\boldsymbol{\delta} 7.82-7.68(\mathrm{~m}, 4 \mathrm{H}), 7.11(\mathrm{t}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.01(\mathrm{~s}, 1 \mathrm{H}), 6.63-$ $6.62(\mathrm{~m}, 2 \mathrm{H}), 6.14(\mathrm{t}, J=5.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.79(\mathrm{dd}, J=8.7,3.0 \mathrm{~Hz}, 2 \mathrm{H}), 3.67(\mathrm{dd}, J=8.6,3.0$ $\mathrm{Hz}, 2 \mathrm{H}), 3.55(\mathrm{dd}, J=5.9,2.8 \mathrm{~Hz}, 2 \mathrm{H}), 3.49(\mathrm{dd}, J=5.8,2.6 \mathrm{~Hz}, 4 \mathrm{H}), 3.41(\mathrm{t}, J=5.7 \mathrm{~Hz}$, $2 \mathrm{H}), 3.27(\mathrm{q}, J=5.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.15(\mathrm{~s}, 3 \mathrm{H}), 3.06(\mathrm{~s}, 3 \mathrm{H}), 2.92(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\left.\mathrm{CD}_{3} \mathrm{CN}\right) \delta 169.2,167.8,155.1,151.3,141.7,139.2,135.1,133.1,128.3,123.1,117.0,116.7$, 110.3, 100.6, 70.9, 70.8, 70.5, 68.4, 39.8, 39.5, 38.3, 37.0, 36.9, 22.0. HRMS (ESI+) mass calcd for $[\mathrm{M}+\mathrm{H}]^{+} \mathrm{C}_{28} \mathrm{H}_{33} \mathrm{~N}_{4} \mathrm{O}_{7} \mathrm{~m} / \mathrm{z} 537.2349$, found 537.2358.
4.2.12. 3-((2-(2-(2-(1,3-dioxoisoindolin-2-yl)ethoxy)ethoxy)ethyl)carbamoyl)-5-hydroxy-1-methylquinolin-1-ium iodide (12)

To a solution of compound $\mathbf{1 1 a}(45.0 \mathrm{mg}, 0.1 \mathrm{mmol})$ in dry degassed acetonitrile ( 1 mL ) was added methyl iodide ( $31.0 \mu \mathrm{~L}$, 5 equiv). The reaction was stirred at $40^{\circ} \mathrm{C}$ for 20 h in sealed tube. Then the solvent was removed under reduced pressure and the residue taken-up in diethylether. The resulting precipitate was filtered off and rinsed twice with diethylether. The obtained red solid was dried under vacuum to afford the desired quinolinium salt $\mathbf{1 2}$ ( 38.1 mg , $82 \%)$ as an red solid. ${ }^{1} \mathrm{H}$ NMR ( $\left.300 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right) \boldsymbol{\delta} 9.75(\mathrm{~s}, 1 \mathrm{H}), 9.62(\mathrm{~s}, 1 \mathrm{H}), 8.10(\mathrm{t}, J=$ $8.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.79-7.7 .68(\mathrm{~m}, 5 \mathrm{H}), 7.24(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.60(\mathrm{~s}, 3 \mathrm{H}), 3.87-3.83(\mathrm{~m}, 2 \mathrm{H})$, 3.77-3.73 (m, 2H), 3.68-3.60 (m, 8H). ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ) $\delta$ 169.7, 164.0, 158.7, $150.9,141.4,141.3,140.1,135.3,133.2,127.1,124.0,122.3,113.7,109.5,71.3,71.2,70.2$, 68.9, 46.7, 41.3, 38.3. HRMS (ESI+) mass calcd for [M] ${ }^{+} \mathrm{C}_{25} \mathrm{H}_{26} \mathrm{~N}_{3} \mathrm{O}_{6} \mathrm{~m} / \mathrm{z} 464.1821$, found 464.1823.

### 4.3. Biology

### 4.3.1. AChE inhibition Assay

Inhibitory capacity of compounds on AChE biological activity was evaluated through the use of the spectrometric method of Ellman. Acetylthiocholine iodide and 5,5-dithiobis-(2nitrobenzoic) acid (DTNB) were purchased from Sigma Aldrich. AChE from human erythrocytes (buffered aqueous solution, $\geq 500$ units/mg protein (BCA), Sigma Aldrich) was diluted in 20 mM HEPES buffer $\mathrm{pH} \mathrm{8} 0.1 \$,$% Triton X-100 such as to have enzyme solution$ with 0.25 units/mL enzyme activity.

In the procedure, $100 \mu \mathrm{~L}$ of 0.3 mM DTNB dissolved in phosphate buffer pH 7.4 were added into the 96 wells plate followed by $50 \mu \mathrm{~L}$ of the tested compound solution and $50 \mu \mathrm{~L}$ of enzyme solution. After 5 min of preincubation, the reaction was then initiated by the injection of $50 \mu \mathrm{~L}$ of 10 mM acetylthiocholine iodide solution.

The hydrolysis of acetylthiocholine was monitored by the formation of yellow 5-thio-2nitrobenzoate anion as the result of the reaction of DTNB with thiocholine, released by the enzymatic hydrolysis of acetylthiocholine, at a wavelength of 412 nm every minute for 10 min using a 96-well microplate plate reader (TECAN Infinite ${ }^{\circledR}$ M200, Lyon, France). Tested compounds were dissolved in analytical grade DMSO. Donepezil was used as reference standard. First screening of AChE from human erythrocytes activity were carried out at $10^{-6}$ M concentration of compounds respectively under study. For the compounds with significant inhibition ( $\geq 50 \%$ ) after 4 min of reaction, $\mathrm{IC}_{50}$ values were determined graphically from 6 points inhibition curves using the Origin ${ }^{\circledR}$ software.

### 4.3.1.2. Propidium competition assay

Propidium exhibits an increase in fluorescence on binding to AChE peripheral site, making it a useful probe for competitive ligand binding to the enzyme. Fluorescence was measured in a Tecan Infinite ${ }^{\circledR}$ M200 plate reader. Measurements were carried out in $200 \mu 1$ solution volume, in 96 -well plates. The buffer used was 1 mM Tris/ $\mathrm{HCl}, \mathrm{pH} 8.0,5 \mathrm{U}$ EeAChE which was incubated, for 6 hours at $25^{\circ} \mathrm{C}$, with a $150 \mu \mathrm{~L} 10^{-5} \mathrm{M}$ solution of the compounds or donepezil (from Tocris) as control. One micromolar propidium iodide $50 \mu \mathrm{~L}$ solution was added 10 min before fluorescence measurement. The excitation wavelength was 535 nm , and that of emission, 595 nm . Each assay was repeated, at least, at three different times.

### 4.3.1.3. Inhibition of Self-Induced $A \beta$ (1-42) Aggregation in the presence of 4.

The SensoLyte ThT $\beta$-amyloid (1-42) aggregation kit provided a convenient and standard method to measure $\mathrm{A} \beta$ (1-42) aggregation using thioflavin T dye. $\mathrm{A} \beta$ (1-42) peptide was pretreated to ensure it was in a monomeric state. An optimized fibrillation buffer was included with the kit, and two known inhibitors were supplied as controls. The protocol used was the one indicated by the supplier ( $\beta$ amyloid aggregation Sensolyte thioflavin kit; Anaspec ref. 72214). Briefly, stock solution of the compound 4 was prepared at a concentration of 1 mM in DMSO. Then, $1 \mu \mathrm{~L}$ of the solution was placed in a 96 -well plate. So, $10 \mu \mathrm{~L}$ of the thioflavine T solution ( 2 mM ) and $85 \mu \mathrm{~L}$ of the solution of the amyloid $\beta$-peptide $1-42(250 \mu \mathrm{~g} / \mathrm{mL}$ in the supplied buffer) were added to each well. The reaction volume was made up to $100 \mu \mathrm{~L}$ with the reaction buffer supplied by the kit. In parallel, a positive control was performed without compound and references were tested (curcumin, $10 \mu \mathrm{M}$ / morin and phenol red, $100 \mu \mathrm{M}$ ). Each compound was tested in triplicate. The fluorescence was measured every 5 min at $37^{\circ} \mathrm{C}$ ( $\lambda$ ex $/ \lambda \mathrm{em}=440 \mathrm{~nm} / 484 \mathrm{~nm}$ ) with the Infinite ${ }^{\circledR}$ M200 reader (Tecan). The calculation of percent inhibition was performed as follows: $100-\left(\mathrm{IF}_{\mathrm{i}} / \mathrm{IF}_{0} \times 100\right)$, with $\mathrm{IF}_{\mathrm{i}}$ corresponding to
the fluorescence measured in the presence of the tested compound and $\mathrm{IF}_{0}$ without the tested compound.

### 4.3.1.4. Caco-2 (A-B) permeability assay

The Caco-2 (A-B) permeability assay was performed by Cerep, Inc. (Redmond, WA98052, USA). Caco-2 cells were cultured for 25 days to form a monolayer on 96 -well multiscreen plates. All samples were run apical (A) side to basolateral (B) side at $37^{\circ} \mathrm{C}$ with pH 7.4 buffer in both the donor and receiver chambers. The prodrug $\mathbf{3}$ was added to the donor chamber at 10 $\mu \mathrm{M}$ and samples were analyzed at 0 and 60 min by HPLC-MS/MS. The apparent permeability coefficient (Papp) was calculated from the following equation: $\mathrm{P}_{\text {app }}(\mathrm{cm} / \mathrm{s})=\left(\mathrm{V}_{\mathrm{R}} \times \mathrm{C}_{\mathrm{R} \text {,end }} / \Delta \mathrm{t}\right)$ $\times\left(1 /\left(A \times\left(C_{D, \text { mid }}-C_{R, \text { mid }}\right)\right)\right.$. Where $V_{R}$ is the volume of in the receiver chamber, $C_{R, \text { end }}$ is the concentration of compound in the receiver chamber at the end of the time point, $\Delta t$ is the incubation time ( 60 min ), and A is the surface area of the cell monolayer. $\mathrm{C}_{\mathrm{D}, \text { mid }}$ is the calculated midpoint concentration of the compound in the donor chamber and $\mathrm{C}_{\mathrm{R}, \text { mid }}$ is the midpoint concentration of the test compound in the receiver chamber. Concentration of the compound were expressed as peak areas of the test compound. The recovery of the test compound was calculated as follows: Recovery $(\%)=\left(V_{D} \times C_{D, \text { end }}+V_{R} * C_{R, \text { end }}\right) \times 100 /\left(V_{D} \times\right.$ $C_{D 0}$ ) where $V_{D}$ and $V_{R}$ are the volumes of the donor and receiver chambers, respectively. $\mathrm{C}_{\mathrm{D}, \text { end }}$ is the concentration of the test compound in the donor sample at the end time point. $\mathrm{C}_{\mathrm{R}, \text { end }}$ is the concentration of the test compound in the receiver sample at the end time point. $\mathrm{C}_{\mathrm{D} 0}$ is the concentration of the test compound in the donor sample at time zero. Concentrations of the test compound are expressed as peak areas of the test compound.

### 4.4. Docking simulation

The crystal structures (PDB ID: 2CKM and PDB 4EY7) of the torpedo and human acetylcholine esterase respectively in complex with the alkylene- linked bis-tacrine dimer and donepezil were downloaded from the RCSB Web site (http://www.pdb.org). The ligands were drawn in Marvin Sketch [39], hydrogen were added and its energy was minimized with Chimera 1.5 .3 software with default setting [40]. Autodock Tools (ADT 1.5.6) was used to add Gasteiger charges to the ligand and to control the flexible torsions [41]. Before the docking, the protein was prepared with the DockPrep module of Chimera 1.5 .3 software with default setting. The original crystal ligand and water molecules were removed from the protein-ligand complexes and ADT 1.5.6 was used with the default setting to add polar hydrogens atoms and to assign Kollman charges. The docking studies of compound $\mathbf{2 h}, \mathbf{2 j}, \mathbf{2 k}, \mathbf{2 p}$ or $\mathbf{4}$ with the $T c \mathrm{AChE}$ protein and $\mathbf{4}$ with $r h \mathrm{AChE}$ protein were carried out using AutodockVina [29] with the docking parameters set at default values. For TcAChE prtotein, the box center was set to $4.9799 / 66.3727 / 70.6527$ and the box size was set to $25 \AA$ in each dimension. For $r h A C h E$, the box center was set to $-13.8673 /-48.5081 / 34.708$ and the box size was set to $25 / 32 / 27 \AA$. Visualization was performed in PyMol 0.99rc6 [30]. The docking procedure were validated by redocking the original ligands into the AChE proteins.

## Highlights

- Synthesis and evaluation of anti-AChE activities for compounds 2a-p
- Grafting point determination by SAR analysis of 2a-p and docking studies
- Synthesis and evaluation of anti-AChE activity for compound $\mathbf{4}$ and its prodrug 3
- Docking simulation of the dual binding site inhibitor 4 in $h A C h E$
