HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A Priori Relevance Based On Quality and Diversity of Social Signals

Ismail Badache and Mohand Boughanem
IRIT - Paul Sabatier University, Toulouse, France
{Badache, Boughanem}@irit.fr

1. Introduction

► Context:

- Exploiting social signals to enhance a search.
- Do the quality and diversity of signals matter to capture relevant documents?

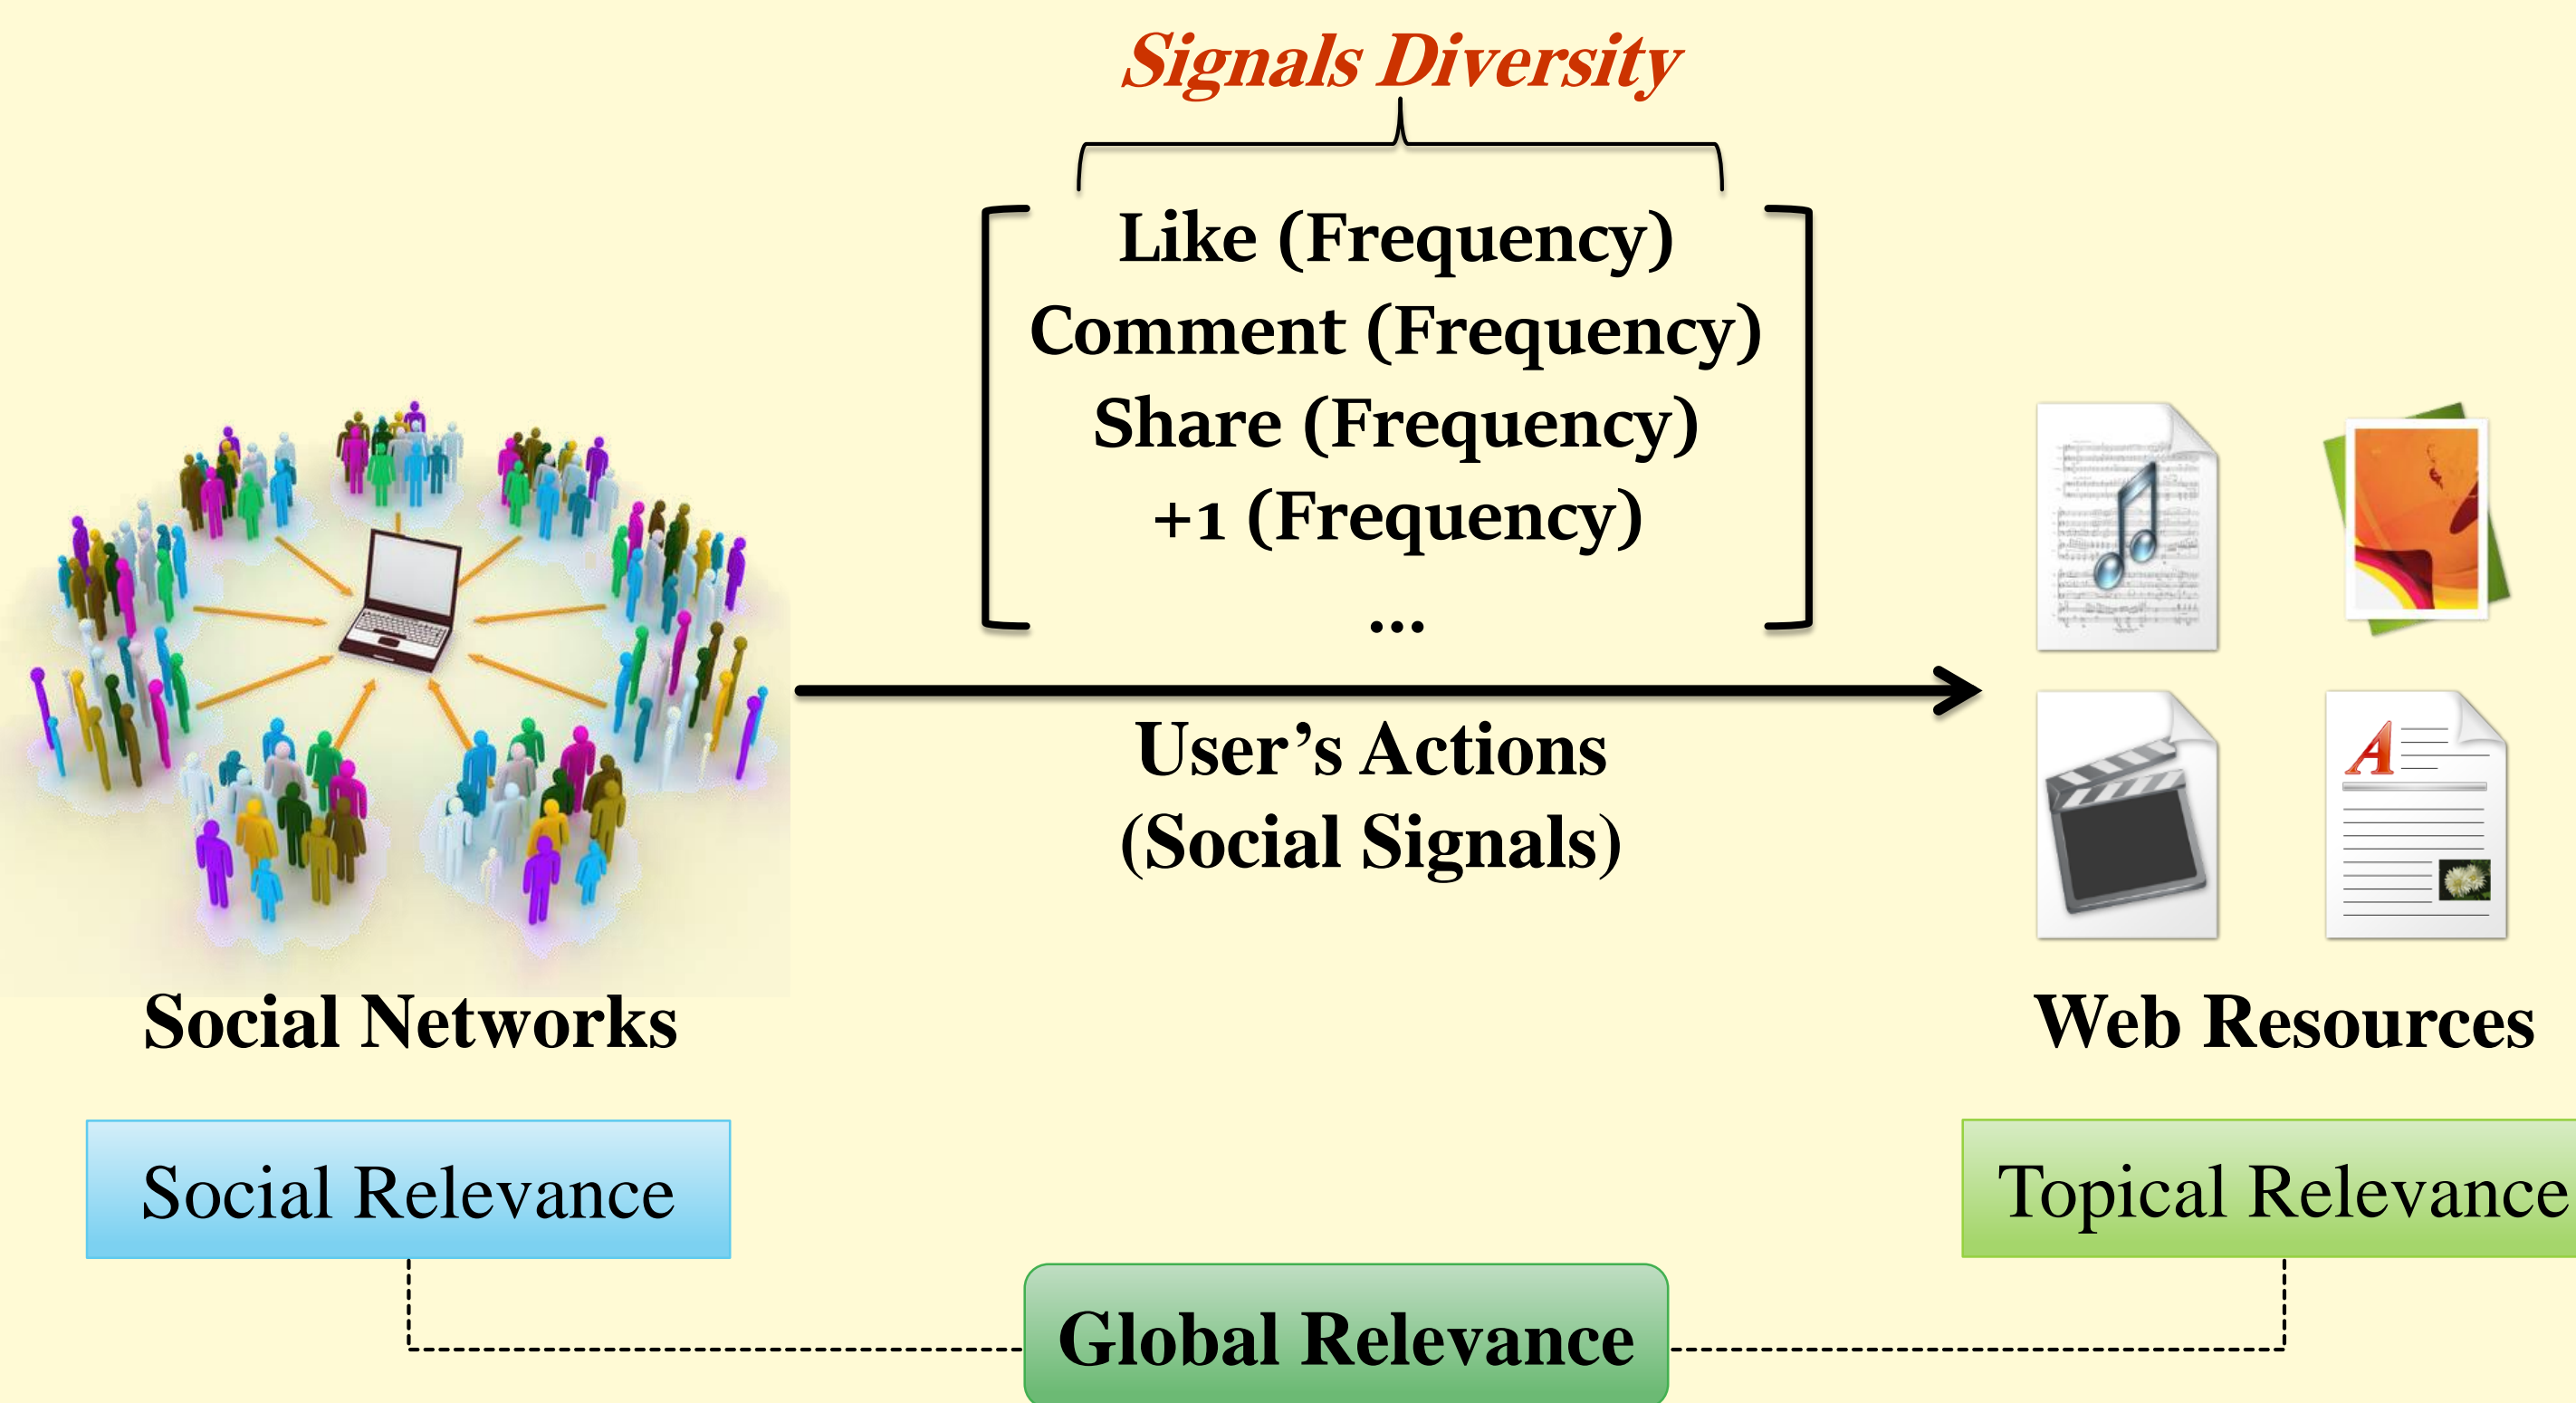

Figure 1. Global presentation of our approach

► **Hypothesis 1:** Diversity of signals associated with a resource is a clue that may indicate an interest beyond a social network or a community, i.e., a resource dominated by a single signal should be disadvantaged versus a resource with an equitable distribution of the signals.

► **Hypothesis 2:** Origin of social signals might impact the retrieval.

► Research Questions:

- How to *estimate* the **signals diversity** of a resource?
- What is the *impact* of **signals diversity** on IR system?
- Is there an *influence* of the **social networks** origin on the *quality* of their **signals**?

2. Social Signals Diversity

► Using language model to estimate the relevance of document D to a query Q .

$$P(D|Q) = \text{Rank } P(D) \cdot P(Q|D) = P(D) \cdot \prod_{w_i \in Q} P(w_i|Q) \quad (1)$$

$P(D)$ is a document prior. w_i represents words of query Q .

- Signals are grouped according to their property $x \in \{P: \text{Popularity}, R: \text{Reputation}\}$
- The priors are estimated by a counting of actions a_i associated with D .

$$P_x(D) = \prod_{a_i^x \in A} P_x(a_i^x) \quad (2)$$

► Smoothing $P(a_i^x)$ by collection C using *Dirichlet*:

$$P_x(D) = \prod_{a_i^x \in A} \left(\frac{\text{Count}(a_i^x, D) + \mu \cdot P(a_i^x|C)}{\text{Count}(a_i^x, D) + \mu} \right) \quad (3)$$

Where $P_x(D)$ represents the a priori probability of D . $x \in \{P, R\}$ refers to the social property estimated from a set of specific actions. $\text{Count}(a_i^x, D)$ represents number of occurrence of action a_i^x on resource D . a_i^x designs action a_i used to estimate x property. a_i^x is the total number of signals.

► Estimating signals diversity in a resource using diversity clue of *Shannon-Wiener*.

$$\text{Diversity}_s(D) = - \sum_{i=1}^m P_x(a_i^x) \cdot \log(P_x(a_i^x)) \quad (4)$$

Where m represents the total number of signals.

► The *Shannon* clue is often accompanied by *Pielou* evenness clue :

$$\text{Diversity}_s^{\text{evenness}}(D) = \frac{\text{Diversity}_s(D)}{\text{MAX}(\text{Diversity}_s(D))} = \frac{\text{Diversity}_s(D)}{\log(m)} \quad (5)$$

► The general formula of $P_x(D)$ becomes as follows:

$$P_x(D) = \left(\prod_{a_i^x \in A} P_x(a_i^x) \right) \cdot \text{Diversity}_s^{\text{evenness}}(D) \quad (6)$$

3. Experimental Evaluation

► Dataset:

- INEX IMDb Dataset.
- 30 INEX IMDb Topics and their relevance judgments.
- 7 social signals from 5 social networks.

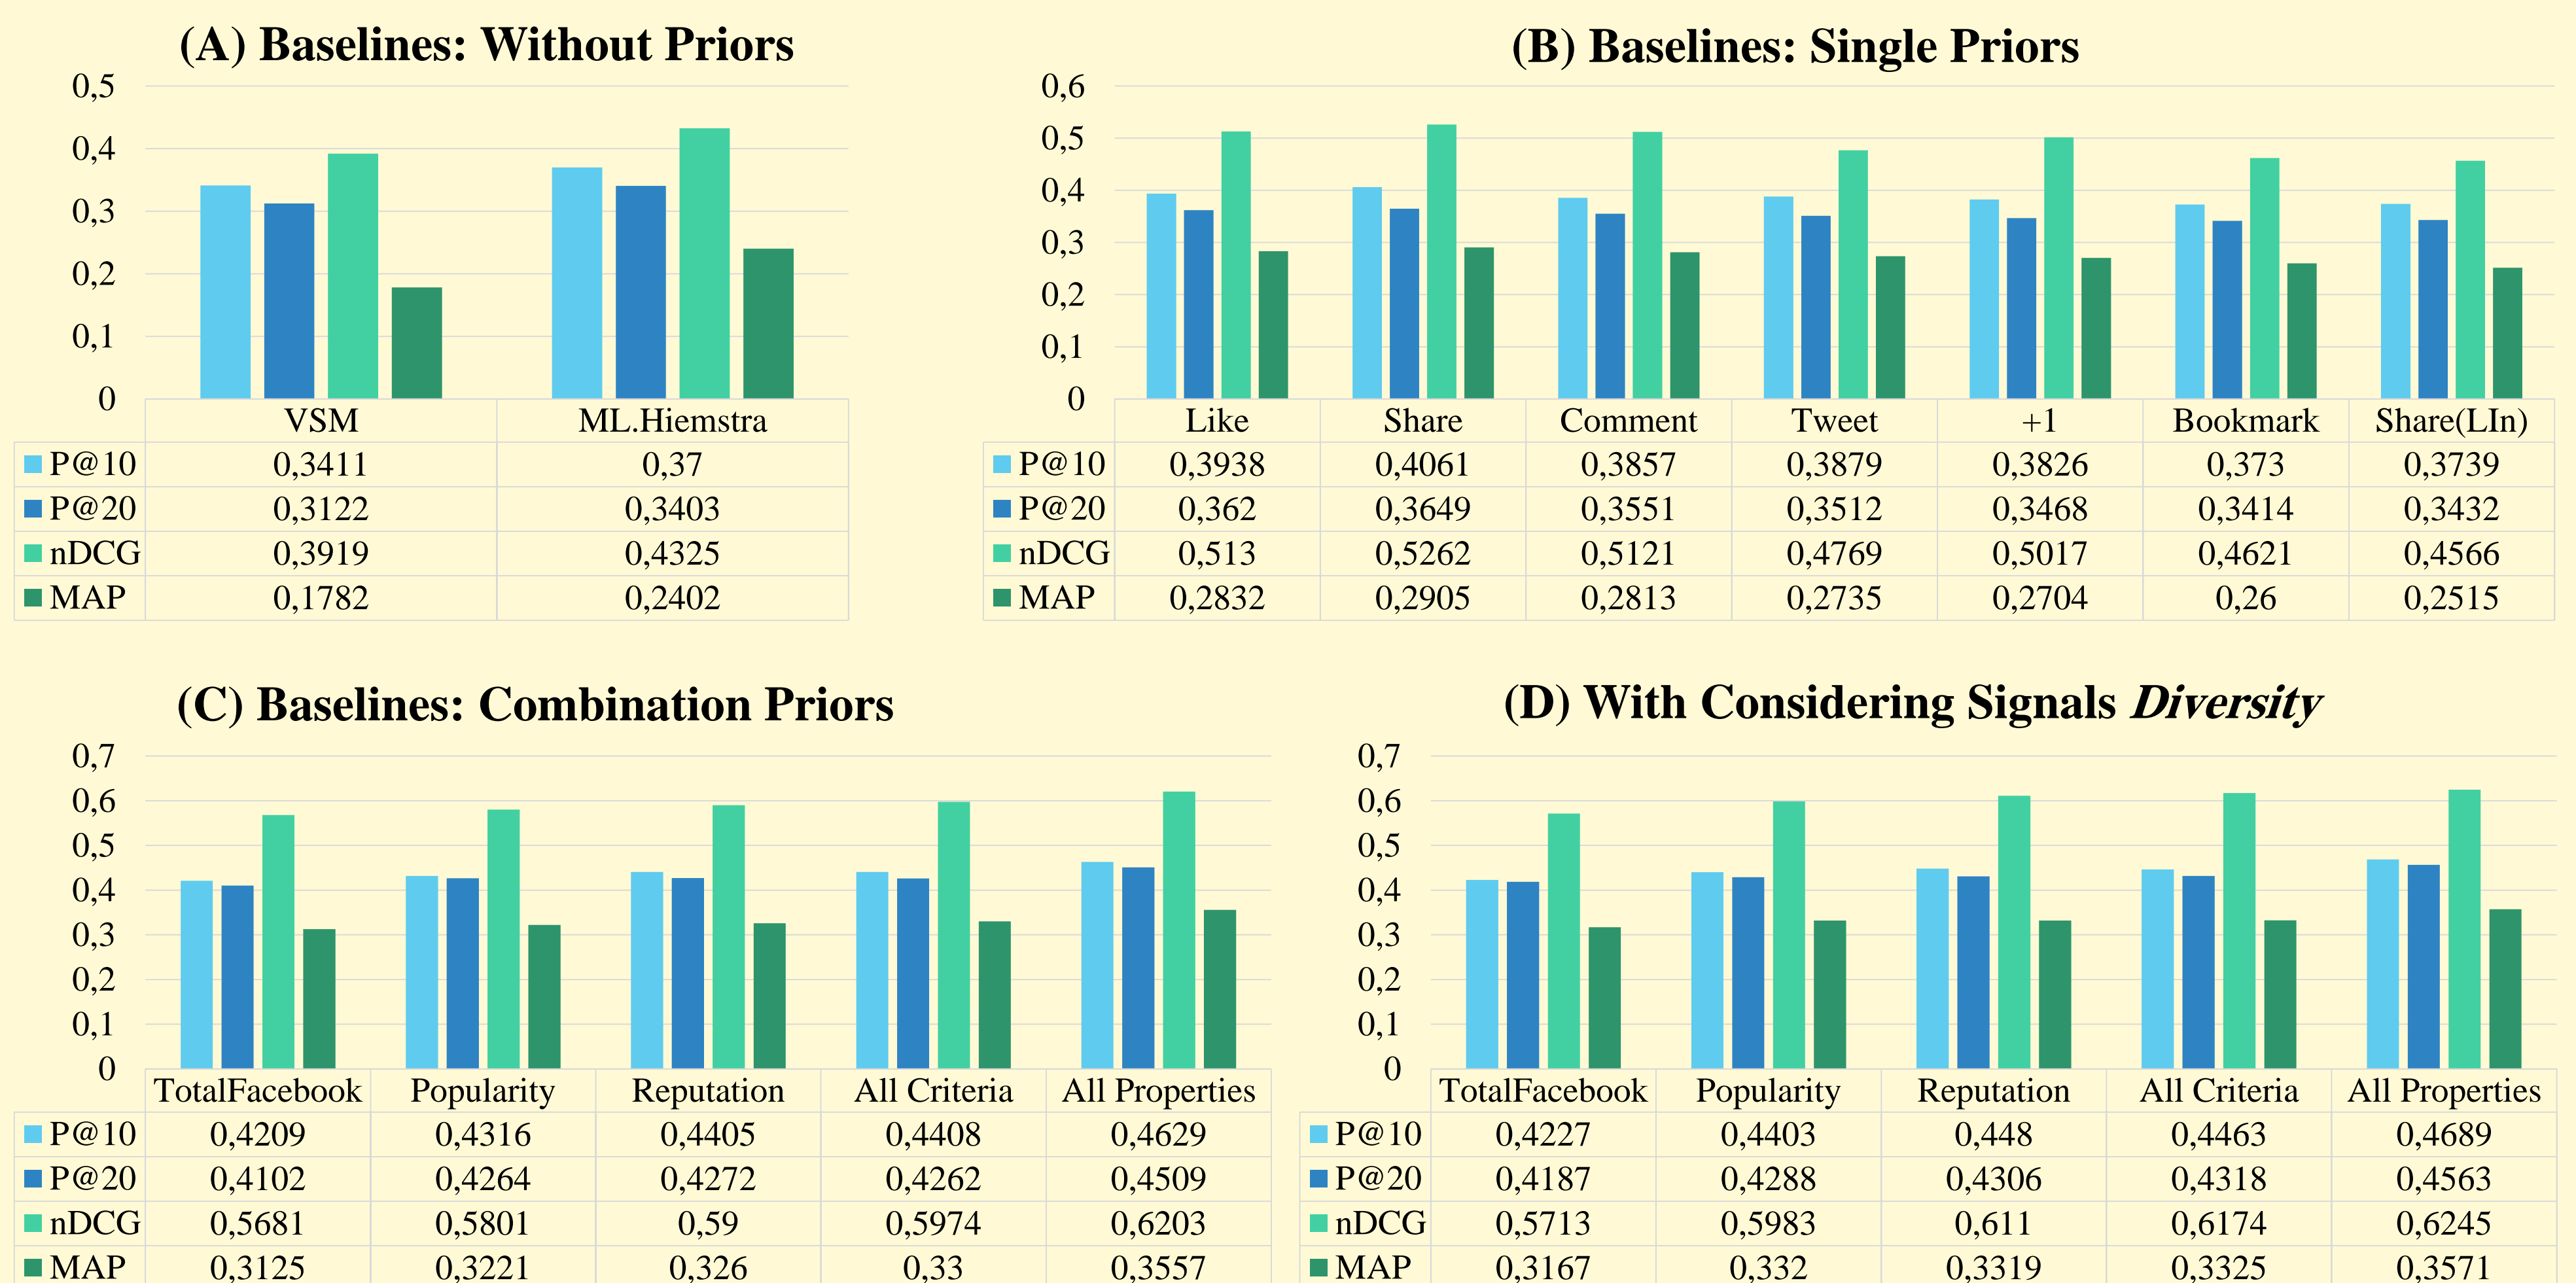

Table 1. Exploited social signals in quantification

Property	Social signal	Social Network
Popularity	Number of <i>Comment</i>	Facebook
	Number of <i>Tweet</i>	Twitter
	Number of <i>Share(LIn)</i>	LinkedIn
	Number of <i>Share</i>	Facebook
Reputation	Number of <i>Like</i>	Facebook
	Number of <i>+1</i>	Google+
	Number of <i>Bookmark</i>	Delicious

Table 2. Instance of document with social signals

Document id	Like	Share	Comment	+1
tt1730728	30	11	2	0
	Bookmark	Tweet	Share(LIn)	
	0	2	0	

► Results:

4. Quantitative and Qualitative Analysis

Figure 2. Signals % in the relevant documents

Figure 3. Relevant documents % containing signals

Table 3. Statistics on the distribution of the signals in the documents (relevant and irrelevant)

	Relevant documents containing signals			Relevant documents without signals		Irrelevant documents	
	Number of documents	Number of actions	Average	Number of documents	Number of actions	Number of actions	Average
Like	2210	800458	362,1981	555	1678040	61,6133
