HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

[“Foreword”](#), chapter in Paving the Way from Interpretable Fuzzy Systems to Explainable AI Systems, vol. 970, Studies in Computational Intelligence, pp. vii-ix, (Springer International Publishing), (ISBN: 978-3-030-71098-9) (2021)

Foreword

The explainability of decisions based on Artificial Intelligence systems goes beyond a scientific issue, as Artificial Intelligence is nowadays ubiquitous and many organizations have drawn our attention to the necessity to provide the decision-maker and the decision subject with an easy to understand explanation. After the DARPA’s advocacy for Explainable AI¹, the European Commission published guidelines² to make AI systems and their decisions transparent and explained to all parties involved. Many efforts are currently made by AI researchers to provide solutions to this problem, generally approaching only one of the aspects of explainability, mainly interpretability, understandability, expressiveness or transparency. These aspects are clearly interrelated and lead to a better acceptability of decisions, as well as trustworthiness in the decision-making process.

Of all these components, interpretability and expressiveness are often considered to be of primary importance for the acceptability of systems based on artificial intelligence by users, considered from the point of view of natural language expression of decisions and their reasons. However, most knowledge in human brains is implicit and therefore not verbalizable, so that human beings themselves are used to decisions based on non-expressible reasoning. It should also be noted that words are not the only knowledge representation easily understandable by users, as graphs, charts, histograms or statistics can be well appreciated, depending on their clarity and the expertise of the user.

In addition to interpretability and expressiveness, Explainable Artificial Intelligence requires that the reasons for the decision based on artificial intelligence be presented to the user. The automatic generation of explanations has various forms and we can cite for instance the use of feature importance vectors that quantify the relative impact of each feature in the prediction³, an

example of which is the interpretability method LIME⁴. Visualization provides another form of explanation, in particular through partial dependence plots⁵ which show the marginal effect of a feature over the model outcome. The comparison of decisions with particular ones is another solution to explain the decision, for instance using prototypes⁶ or counterfactuals⁷. The detection of the most influential training instances influential for a given prediction gives another form of explanation⁸. A general overview of these approaches⁹ provides more aspects of automatic explanations.

The most popular methods to address the problem of the explainability of models based on artificial intelligence are based on decision rules¹⁰ and decision trees¹¹. They are at the core of the very comprehensive book prepared by J. M. Alonso, C. Castiello, L. Magdalena and C. Mencar in the specific realm of a fuzzy knowledge representation.

A certain conception of interpretability and expressiveness can be dealt with immediately by fuzzy systems, since fuzzy sets were created by Lotfi Zadeh to treat classes or concepts in a manner similar to the human way of manipulating them. The paradigm of Computing With Words¹² has, in particular, been introduced to establish a bridge between computation and natural language.

Lotfi Zadeh showed later that a fuzzy knowledge-based representation can be employed to represent the meaning by means of a constraint-based semantics of natural languages¹³.

To approach the meaning of artificial intelligence-based decision supports is certainly one of the requests of Explainable Artificial Intelligence. In this sense, fuzzy classes or categories appear more acceptable to users than crisp classes, as they avoid the risk of an arbitrary boundary preventing the users to reach an expected decision category of which they are very close. Expressed in natural language, such categories look familiar to the user and easily understandable. Moreover, fuzzy rule-based systems and fuzzy decision trees add to the general capabilities of decision rules and decision trees to be directly approached the flexibility and familiarity of classes with gradual boundaries.

This remarkable book explains in details how fuzzy models can participate in the construction of decision systems that are interpretable, and moreover explainable. It goes far beyond the classic representation of fuzzy classes and fuzzy rule-based systems. It establishes a bridge with natural language processing and automatic text generation and it proposes solutions to deal with the well-known interpretability-accuracy trade-off. All aspects of interpretability of fuzzy rule-based systems are covered, from interpretability rating to directly exploitable software.

It paves the way for a greater involvement of fuzzy methods in Explainable Artificial Intelligence, participating in the general search for greater acceptability of artificial intelligence-based decision systems by users, more confidence in the resulting decisions and, hopefully, more fairness in decisions.
