HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Temporal Knowledge Representation and Exploitation for the Henri Poincaré (1854-1912) Correspondence Corpus

Nicolas Lasolle, Université de Lorraine, AHP-PReST, Loria

Data for History

Modelling, curation, interoperability

A historical corpus

- Composed of around 2200 letters
- Important knowledge base
 - Scientific content
 - Administrations and learned societies
 - Social, political and cultural context
- Semantic Web technologies used to represent and to exploit corpus data (RDF, RDFS, SPARQL) [1]

Examples of facts that require a temporal extent

- Student at the *École polytechnique* from 1873 to 1875
- Member of the French Academy of Sciences from 1887
- Lived in Paris from 1881 to 1912
- etc.

How to add a temporal extent to facts represented using the RDF model? How to exploit this newly formed knowledge?

A model based on n-ary representations [2]

OWL-Time ontology and reasoning process

OWL-Time provides specific predicates to support, or to make explicit the results of, reasoning over the order or sequence of temporal entities [3].

A system based on custom inference rules has been set up to automatically enrich the corpus knowledge base.

Example of graph with inferred relations
