HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés. Dyadic Motor Behavior During Co-manipulation: A Study on Humans

INRIA Nancy, LORIA, Universite de Lorraine Waldez A. Gomes Jr., Pauline Maurice, Serena Ivaldi

Introduction

Human-Robot Collaboration

• Control a robot to act efficiently with a human during a task that requires **co-manipulation**;

 Human and robot co-manipulating a shared object

 Good collaboration is not only fast and/or accurate, but it is also legible

Good collaboration feels natural!

Methods

Co-manipulation by a Human Dyad

Task

- Collaborative extraction and insertion of a pipe in a tube
- Contact between the pipe and the tube should be avoided

Experiment

- 10 dyads
- 3 randomly assigned behaviors:

Results

Trajectory in Co-Manipulation

- Planning and execution are a responsibility of all agents
 - The task requires coordination and synchronization
- Is there a Leader, or a Follower?
- So we look into natural motor behavior in human-human dyads!

- Participant 1 leader, Participant 2 follower
- Participant 2 leader, Participant 1 follower
- No pre-assigned leader behavior
- 5 trials per condition
- Practice trials between conditions

- Trajectory seems to deviate towards the position of the participant that is the leader (Hypothesis 2)
- When the pipe is closer to the participant, it is harder for the participant to move the hand in different directions (low arm manipulability values are expected)
- Each participant may have its own desired trajectory, that is chosen according to several criteria, including arm manipulability.

Contact Sensors

Goal

- Design a task to Investigate how human-human (HH) dyads motor behavior is influenced by different leadership conditions (leader or follower) during an object co-manipulation:
 - Hypothesis 1: Arm stiffness is influenced by leadership conditions;
 - **Hypothesis 2**: Object's trajectory is influenced by leadership conditions
 - Hypothesis 3: Accuracy of the task execution is influenced by leadership conditions
- Investigate the same task, but with one human executing the task alone.

Sensors and Data

- Qualisys optical motion capture: 6 markers on each participant's right arm, 1 marker on the pipe
 - \rightarrow Arm kinematics
 - \rightarrow Pipe 3D trajectory
- Wireless EMG Delsys Trigno on 3 pairs of antagonistic muscles: forearm, arm, shoulder
 - \rightarrow Muscle activation \rightarrow Index of Co-Contraction (ICC)
- Contact sensors on each tube (Quantitative measurement of accuracy)

- Less contacts when there is no pre-assigned leader (Hypothesis 3)
- No clear difference between conditions in which there is a leader

Index of Co-Contraction

 The ICC is an indirect measure of the arm stiffness, in here, calculated from a pair of forearm antagonist muscles EMG signals:

Future Work

Rigorous analysis of the trajectories

 $ICC_{follower} < ICC_{natural} < ICC_{leader}$

Arm stiffness is modulated within the same participant for different conditions (Hypothesis 1)
Trajectory deviation may be caused by the arm stiffness modulation.

 Define manipulability metrics for a dyad, and apply them to all dyads

 Use the stiffness modulation from the human arm to modulate the stiffness of the robot in a human-robot collaboration
