Table 2. Properties of an extreme 10 MW generator example.

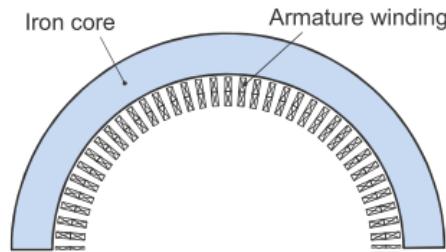

Rated power P_N (MW)	10
Poles	16
Diameter D_{gen} (m)	4.7
Length L_{gen} (m)	1.15
Rotation speed $\omega_{R,\text{rpm}}$ (rpm)	10
Shaft torque τ_T (10^6 N m)	9.7
Mass superconductor m_{sc} (ton)	22
Mass Cu m_{Cu} (ton)	14
Mass Fe m_{Fe} (ton)	32
Mass glass fiber m_{GF} (ton)	20
Mass total (ton)	88
Length of SC (km)	1450
Current density J_c (A m^{-2})	6.3×10^7
Temperature T (K)	20
Maximum field B_{max} (T)	9.1

III. Commercial concepts (>1 MW)

Review of Activities in Superconducting Generators

- Focus mostly on European activities and sort by ambition
 - *Hydrogenie* (Converteam/GE)
 - 2 MW fully tested, 8MW, 10 MW planned
 - *Innwind* 10...20 MW DD (Siemens)
 - Components demonstrated, CoE comparison @ EWEA
 - Comparing HTS to PM and to pseudo DD
 - *SeaTitan* 10 MW DD (AMSC)
 - Design complete, hardware de-risking complete
 - *Suprapower*, 10 MW DD (Tecnalia, ex Acciona)
 - Design complete, hardware in progress
- Trend is a bit towards *lower* power rating (as price of superconductors comes down).
 - *Windspeed*. 3.5 MW DD (ECO 5)
 - Design basics published
 - ***EcoSwing, 3.6 MW DD***
 - Plans to be first on a turbine

Development in USA

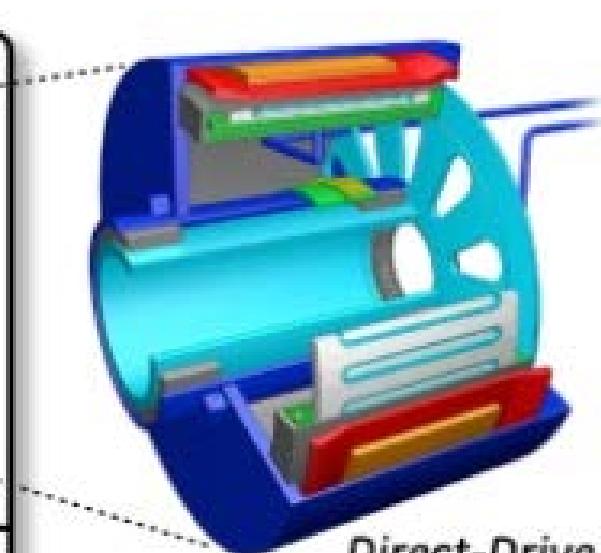

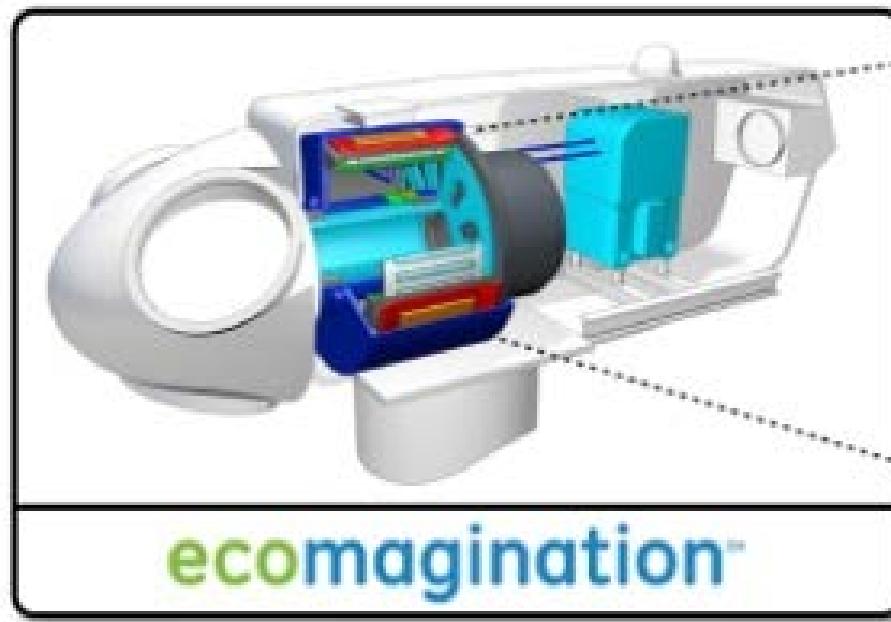

DOE funded project to “Develop High-Efficiency, Lightweight Wind Turbine Generators for Tall Wind and Offshore Applications”

- [July 2019] DOE selected projects
- Each of the selected projects received \$500,000 to design a wind turbine generator that can be scaled up to at least 10 megawatts.
- 2 projects developed superconducting generators
 - AMSC develops HTS based concept – funding stopped
 - GE develops LTS based concept – 2nd phase started to develop a scaled demonstrator
- [Jan 2021] DOE selected GE to receive up to \$20.3 million to build and test a scaled prototype of their generator on a wind turbine.

Superconductivity has matured sufficiently that we can follow an ambitious plan:

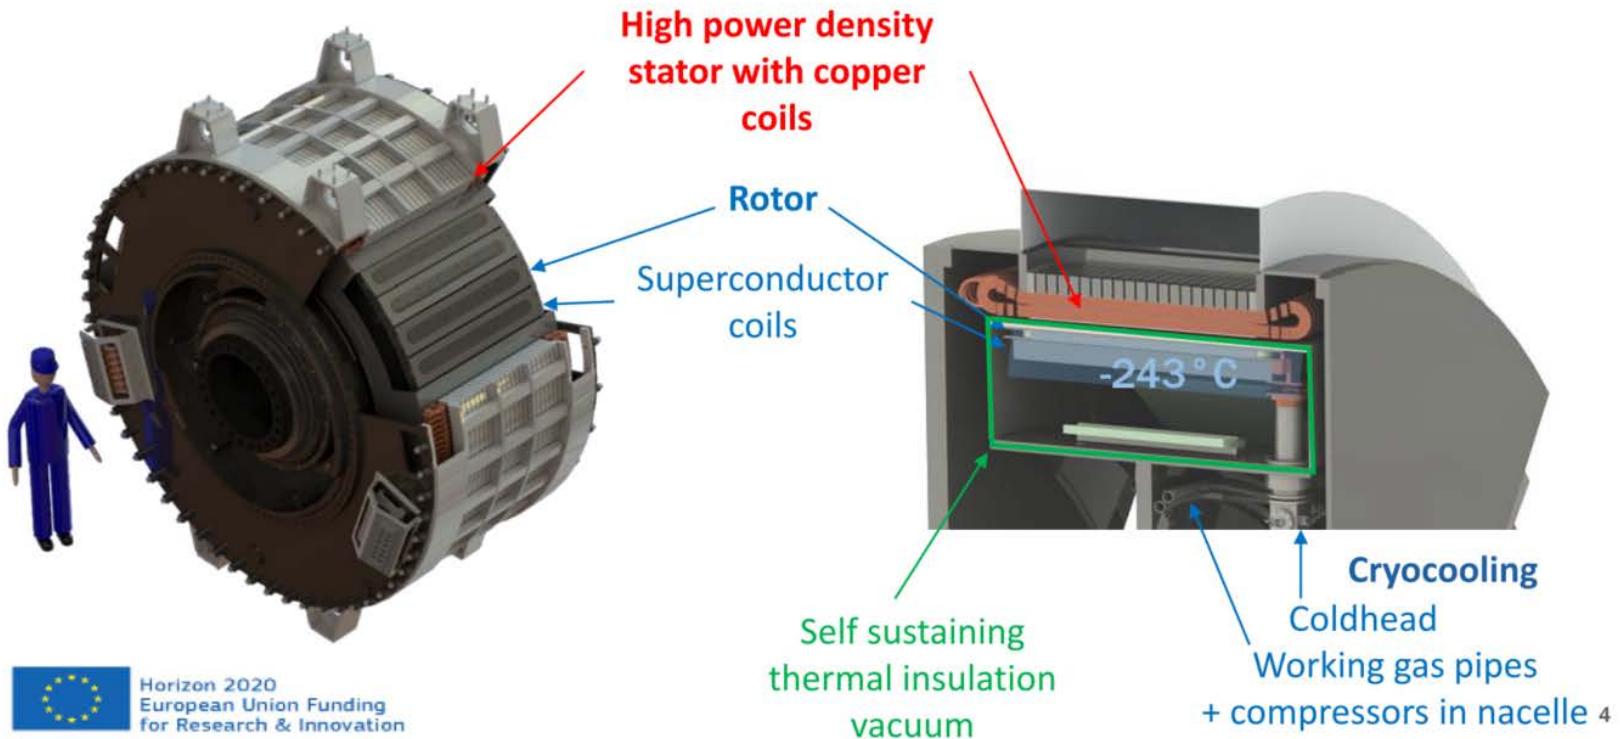

- Design, develop and manufacture a full scale multi-megawatt superconducting wind generator
- Install this superconducting drive train on an existing modern wind turbine in Thyborøn, Denmark, replace existing PM generator (3 MW Class, 14 rpm, 128 m rotor)
- Prove that a superconducting drive train is lighter, smaller and cost-competitive.
- Start Date: 2015-03-01
 End Date: 2019-04-30

EcoSwing

EcoSwing design

- Decreased diameter from 5.4 m (PM generator) to 4 m
- Built EcoSwing generator: **25 % weight reduction** compared to PM generator of same diameter
- Commercial design: **40% weight reduction** compared to PM generator.

EcoSwing

Testing on ground and in turbine

At IWES,
Bremerhaven
for ground
testing

Mounting on
Envision wind
turbine GC-1,
Thyborøn,
Denmark

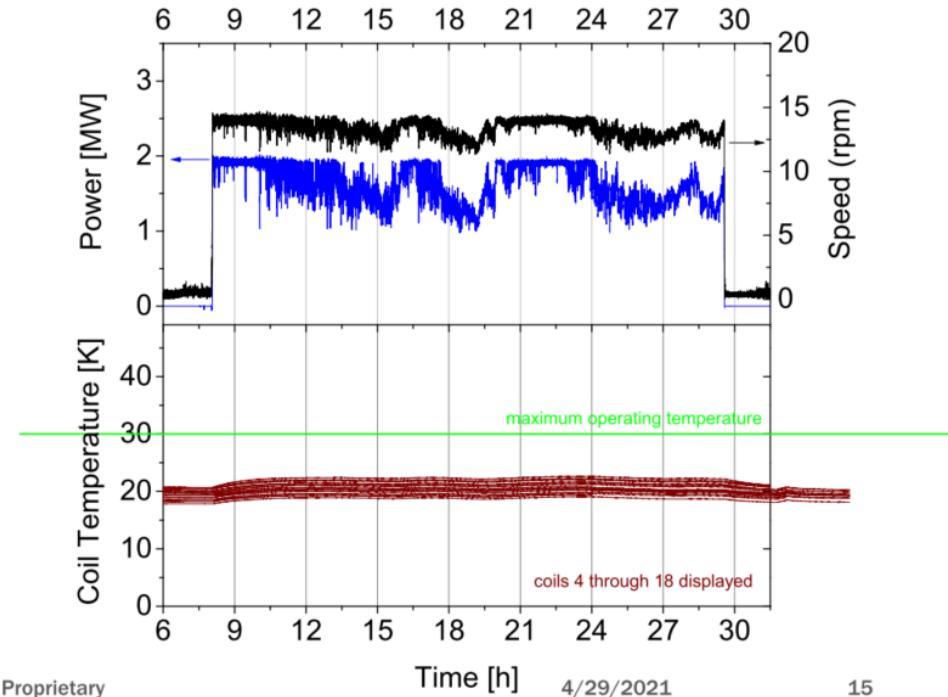

EcoSwing

Main project results

- EcoSwing generator reached +3 MW
- Converter limit exceeded
- 50 months EU project concluded on time
- +7 months stable reliable cryogenics
- +650 h producing power
- Superconducting coils showed great performance
- 25.4.2019 EcoSwing switched-off

Superconducting components for the grid

Superconducting power filter

The Troubled Quest for the Superconducting Wind Turbine

By Samuel K. Moore

Photo: Jeumont Electric

Precision Manufacturing: Workers build the stator of Ecoswing's onshore generator.

EolSupra20's superconducting design did manage to beat its version of a turbine built using conventional technology with respect to LCOE. It chimed in at €119 per megawatt-hour (\$140/MWh) compared with €129/MWh (\$152/MWh) for the conventional turbine. The difference, according to Quéval and the EolSupra20 team, was the substantially lower generator mass enabled by the superconductors. At 178 metric tons, the fully superconducting generator was barely more than one-third of the conventional generator's bulk.

EolSupra20's LCOE is quite noticeably higher than that of InnWind's reference 20-MW turbine, which is €93 (\$108)/MWh. Quéval points out that LCOE is, to some extent, a local affair. InnWind's aim was the deeper waters of
