# Computer Algebra in Physics: The hidden $\mathrm{SO}(4)$ symmetry of the hydrogen atom 

Pascal Szriftgiser ${ }^{\text {a,** }}$, Edgardo S. Cheb-Terrab ${ }^{\text {b }}$<br>${ }^{a}$ University of Lille, CNRS, UMR 8523 - PhLAM - Physique des Lasers, Atomes et Molécules, F-59000 Lille, France<br>${ }^{b}$ Maplesoft, Canada

#### Abstract

Pauli first noticed the hidden $\operatorname{SO}(4)$ symmetry for the hydrogen atom in the early stages of quantum mechanics [1]. Starting from that symmetry, one can recover the spectrum of a spinless hydrogen atom and the degeneracy of its states without explicitly solving Schrödinger's equation [2], [3]. In this paper, we derive that $\mathrm{SO}(4)$ symmetry and spectrum using a computer algebra system (CAS). While this problem is well known [4], [5], its solution involves several steps of manipulating expressions with tensorial quantum operators, including simplifying them by taking into account a combination of commutator rules and Einstein's sum rule for repeated indices. Therefore, it is an excellent model to test the current status of CAS concerning this kind of quantum-and-tensor-algebra computations and to showcase the CAS technique. Generally speaking, when capable, CAS can significantly help with manipulations that, like non-commutative tensor calculus subject to algebra rules, are tedious, time-consuming and error-prone. The presentation also shows two alternative patterns of computer algebra steps that can be used for systematically tackling more complicated symbolic problems of this kind.

Keywords: Quantum mechanics; tensor calculus; commutator;

## PROGRAM SUMMARY

Program Title: Maple specific worksheet
CPC Library link to program files: https://doi.org/10.17632/knbckjrwfc. 1
Developer's repository link: https://www.maplesoft.com/applications/view.aspx?SID=154764
Licensing provisions: GPLv3
Programming language: Maple (Maplesoft)
Nature of problem: Provide a general framework to handle Quantum Mechanics' non-commutative algebra systematically. Noncommutative tensor calculus, subject to algebra rules, is tedious, time-consuming and error-prone. This Maple worksheet provides a general framework to implement, test and address a wide range of non-commutative problems commonly found in advanced quantum mechanics. It can be customized and adapted to potentially more complicated algebra problems.
Solution method: Make use of Maple's Physics package. First, configure the problem parameters: space dimension, tensor objects and non-commutative quantities. Then provide the most basic commutation rules, such as position, linear and angular momentum commutators. From there, using the Simplify command and a short set of other key commands, demonstrate further commutation rules until the complete target algebra is reconstructed. One should notice that the Physics package commands employed here take into account custom algebra rules, the sum rule for repeated indices, and use tensor-simplification algorithms.
Additional comments including restrictions and unusual features: This article mirrors a Maple worksheet. As such, it is not an usual code intended to make a computation for a given set of parameters. It is rather a general template or guideline, useful to extend the present problem with new computations or, more generally, widely open to tackle new quantum mechanics problem involving tensor and commutator heavy calculus.

[^0]
## Introduction

In this work we derive, step-by-step, the $\operatorname{SO}(4)$ symmetry of the hydrogen atom and its spectrum using a computer algebra system (CAS). To the best of our knowledge, such a derivation using symbolic computation has not been shown before. The goal was to see whether this computation can be performed entering only the main definition formulas, followed by only simplification commands, and without using previous knowledge of the result. The presentation that follows showcases that approach, illustrating different techniques. The intricacy of this problem is in the symbolic manipulation and simplification of expressions involving noncommutative quantum tensor operators. The simplifications need to take into account commutator rules, symmetries under permutation of indices of tensorial subexpressions, and use Einstein's sum rule for repeated indices.

We performed the derivation using the Maple 2020 CAS with the Maplesoft Physics Updates v.913. Generally speaking, the default computational domains of CAS don't include tensors, noncommutative operators and related simplifications. The main exception is the Maple system, distributed with a Physics package that extends the default domain to include those objects and related operations. Physics redefines the multiplication and differentiation operators, so that they work with noncommutative and tensorial objects, including handling a new class, operators, that can have specific properties (Hermitian, Unitary, differential, etc.). Relevant for our purpose Physics includes a Simplify command which takes into account custom algebra rules, tensor symmetries, the sum rule for repeated indices, and uses tensor-simplification algorithms [6] adapted to work on a noncommutative domain.

It is worth mentioning that other CAS have some tensorial and noncommutative capabilities, albeit limited. For example, Maxima includes the packages itensor (for indicial tensor manipulation) and atensor (to simplify a noncommutative dot product of tensors). However, to mention but one thing, the algebra rules are not customizable. It is not presently possible to define noncommutative Hermitian - possibly tensorial - operators, like position and momentum, and their commutator rules. Mathematica does not include packages like Physics or similar, but it includes basic noncommutative capabilities and some Tensor constructs. That functionality has been extended to some point by Mathematica users who developed tensor and quantum packages. However, to our knowledge, the combination of those capabilities and packages does not cover the requirements for problems like the one discussed here. E.g. it is not possible to express the starting point, the commutation rules between position, linear and angular momentum, noncommutative tensor operators, in simple terms as we do in equation (1) in Sec. 2, nor to perform the simplifications of intermediate expressions performed in the following sections.

A few notes about notation: when working with a CAS, besides the expectation of achieving a correct result for a complicated symbolic calculation, readability is also an issue. It is desired that one be able to enter the definition formulas and computational steps to be performed (the input, shown in what follows preceded by a prompt $>$ ) in a way that resembles as closely as possible their paper and pencil representation, and that the results (the output, computed by the CAS) use easy-to-read, textbook mathematical-physics notation. The Maple Physics package implements such dedicated typesetting. In what follows, within text and in the output, noncommutative objects are displayed using a different color, e.g. $H$, vectors and tensor indices are displayed in the standard way, as in $\vec{L}$ and $L_{q}$, and commutators are displayed with a minus subscript, e.g. [ $\left.H, L_{q}\right]_{\_}$. Although the Maple system optionally provides dedicated typesetting also for the input, we preferred to keep visible the Maple input syntax, allowing for comparison with paper and pencil notation and to transmit a more accurate picture of what it is like to work on a real problem using CAS. We collected the names of the handful of commands used together with a one line description for them in an Appendix at the end. Maple also implements the concept of inert representations of computations, which are activated only when desired. We use this feature in several places. Inert computations are entered by preceding the command with \% and are displayed in grey. Finally, as is usual in CAS, every output has an equation label, which we use throughout the presentation to refer to previous intermediate results, both in text and in input lines.

In Sec.1, we present the standard formulation of the problem and the computational goal, which is the derivation of the formulas representing the $\mathrm{SO}(4)$ symmetry and related spectrum.

In Sec.2, we formulate the problem on a Maple worksheet by setting tensorial non-commutative operators representing position, linear and angular momentum, respectively $X_{a}, p_{a}$ and $L_{a}$, their commutation rules used as departure point, and the form of the quantum Hamiltonian $H$. That formulation is also used to derive a few related identities used in the sections that follow.

In Sec.3, we derive the conservation of both angular momentum and the Runge-Lenz quantum operator, respectively [ $\left.H, L_{q}\right]_{-}$and $\left[H, Z_{k}\right]_{-}$. Taking advantage of the differentialoperators feature of the Physics package, we explore two equivalent approaches: first, using only a symbolic tensor representation $p_{j}$ of the momentum operator; second, using an explicit differential operator representation for it in configuration space, $p_{j}=-i \hbar \partial_{j}$. With the first approach, expressions are simplified only using the departing commutation rules, symmetries under permutations of tensor indices and Einstein's sum rule for repeated indices. Using the second approach, $p_{j}$ represents an abstract noncommutative differentiation operator with respect to the coordinates which acts over expressions that involve a test function $G(X)$. In the end, $p_{j}$ is given an explicit form in coordinate representation, the differentiation operations are performed and the test function $G(X)$ is removed, yielding the result. Presenting both approaches is of interest as it offers two independent methods for performing the same computation, which is helpful to provide confidence in the results, a relevant issue when using computer algebra and in general.

In Sec.4, we derive $\left[L_{m}, Z_{n}\right]_{-}=\mathrm{i} \hbar \epsilon_{m n u} Z_{u}$ and show that the classical relation between angular momentum and the Runge-Lenz vectors, $\vec{L} \cdot \vec{Z}=0$, due to the orbital momentum being perpendicular to the plane of motion in which the Runge-Lenz vector lies, still holds in quantum mechanics, where the components of these quantum vector operators do not commute.

In Sec.5, we derive $\left[Z_{a}, Z_{b}\right]_{-}=-\frac{2 \mathrm{i} \hbar \epsilon_{a b c}}{m_{e}} H L_{c}$ using the two alternative approaches described in Sec.3.
In Sec.6, we derive the well-known formula for the square of the Runge-Lenz vector, $Z_{k}{ }^{2}=\frac{2}{m_{e}} H\left(\hbar^{2}+L_{a}{ }^{2}\right)+\kappa^{2}$.
In Sec.7, we use the $\mathrm{SO}(4)$ algebra derived in the previous sections to obtain the spectrum of the hydrogen atom. Following the literature, this approach is limited to the bound states for which the energy is negative.

Some concluding remarks are presented at the end, and input syntax details are summarized in the Appendix. A Maple worksheet with the contents of this presentation, used to produce this article by exporting to LaTeX, can be downloaded from this Mapleprimes post: The-Hidden-SO4-Symmetry-Of-The-Hydrogen-Atom.

## 1. The hidden $\operatorname{SO}(4)$ symmetry of the hydrogen atom

Let's consider the hydrogen atom and its Hamiltonian

$$
H=\frac{\|\vec{p}\|^{2}}{2 m_{e}}-\frac{\kappa}{r},
$$

where $\vec{p}$ is the electron momentum, $m_{e}$ its mass, $\kappa$ a real positive constant, $r=\|\vec{r}\| \equiv \sqrt{X_{a}{ }^{2}}$ the distance of the electron from the proton located at the origin, and $X_{a}$, with components $x, y$ and $z$, is the tensorial representation of $\vec{r}$. We assume that the proton's mass is infinite. The electron and nucleus spin are not taken into account. Classically, from the potential $-\frac{\kappa}{r}$, one can derive a central force $\vec{F}=-\kappa \frac{\hat{r}}{r^{2}}$ that drives the electron's motion. Introducing the angular momentum

$$
\vec{L}=\vec{r} \times \vec{p}
$$

Figure 1: Artist's view of an hydrogen atomic orbital with a section of this article superimposed
one can further define the Runge-Lenz vector $\vec{Z}$ :

$$
\vec{Z}=\frac{1}{m_{e}}(\vec{L} \times \vec{p})+\kappa \frac{\vec{r}}{r}
$$

It is well known that $\frac{d}{d t} \vec{Z}(t)=0, \vec{Z}$ is a constant of the motion. Switching to Quantum Mechanics, this condition reads

$$
[H, \vec{Z}]_{-}=0
$$

where, for hermiticity purpose, the expression of $\vec{Z}$ must be symmetrized

$$
\vec{Z}=\frac{1}{2 m_{e}}(\vec{L} \times \vec{p}-\vec{p} \times \vec{L})+\kappa \frac{\vec{r}}{r}
$$

In what follows, departing from the Hamiltonian $H$, the basic commutation rules between position $\vec{r}$, momentum $\vec{p}$ and angular momentum $\vec{L}$ in tensor notation, we derive the following commutation rules between the quantum Hamiltonian, angular momentum and Runge-Lenz vector $\vec{Z}$

$$
\begin{aligned}
{\left[H, L_{n}\right]_{-} } & =0 \\
{\left[H, Z_{n}\right]_{-} } & =0 \\
{\left[L_{m}, Z_{n}\right]_{-} } & =\mathrm{i} \hbar \epsilon_{m n o} Z_{o} \\
{\left[Z_{m}, Z_{n}\right]_{-} } & =-2 \frac{\mathrm{i} \hbar}{m_{e}} H \epsilon_{m n o} L_{o}
\end{aligned}
$$

Since $H$ commutes with both $\vec{L}$ and $\vec{Z}$, defining

$$
M_{n}=\sqrt{-\frac{m_{e}}{2 H}} Z_{n}
$$

these commutation rules can be rewritten as

$$
\begin{aligned}
{\left[L_{m}, L_{n}\right]_{-} } & =\mathrm{i} \hbar \epsilon_{m n o} L_{o} \\
{\left[L_{m}, M_{n}\right]_{-} } & =\mathrm{i} \hbar \epsilon_{m n o} M_{o} \\
{\left[M_{m}, M_{n}\right]_{-} } & =\mathrm{i} \hbar \epsilon_{m n o} L_{o}
\end{aligned}
$$

This set constitutes the Lie algebra of the $\mathrm{SO}(4)$ group.

## 2. Setting the problem, commutation rules and useful identities

Formulating the problem requires loading the Physics package and its Library and Vectors subpackages, that contain additional manipulation commands; we set the imaginary unit to be represented by a lowercase Latin i letter instead of the default uppercase I.
> with(Physics): with(Library): with(Vectors): interface(imaginaryunit $=i$ ):
The context for this problem is Cartesian coordinates $X=(x, y, z)$ and a 3D Euclidean space where all of $\left\{\hbar, \kappa, m_{e}\right\}$ are real objects. We chose lowercase letters to represent tensor indices, the use of automatic simplification (i.e., automatically rewrite expressions in more compact ways by collecting variables and taking common factors).
$>$ Setup $\left(\right.$ coordinates $=$ cartesian, realobjects $=\left\{\hbar, \kappa, m_{e}\right\}$, automaticsimplification $=$ true, dimension $=3$, metric $=$ Euclidean, spacetimeindices $=$ lowercaselatin,quiet)
$[$ automaticsimplification $=$ true, coordinatesystems $=\{X\}$, dimension $=3$, metric $=\{(1,1)=1,(2,2)=1,(3,3)=1\}$, realobjects $=\left\{\hbar, \kappa, m_{e}, \phi, r, \rho, \theta, x, y, z\right\}$, spacetimeindices $=$ lowercaselatin $]$

Next, we set the quantum Hermitian operators (not $Z$, we derive that property for it further below) and related commutators:

- the dimensionless potential $V=\frac{1}{r}$ is assumed to commute with position, not with momentum - the commutation rule with $p_{k}$ is derived in Sec.3.2;
- the commutator rules between position $X_{n}$ on the one hand, and linear $p_{k}$ and angular momentum $L_{k}$ on the other hand, are the departure point, entered using the inert form of the Commutator command. Tensors are indexed using the standard Maple notation for indexation, [].
$>\operatorname{Setup}(q u a n t u m o p e r a t o r s=\{Z\}$, hermitianoperators $=\{V, H, L, X, p\}$, algebrarules $=\{\% \operatorname{Commutator}(p[k], p[l])=$ $0, \%$ Commutator $(X[k], p[l])=\mathrm{i} \hbar g_{-}[k, l], \%$ Commutator $(L[j], L[k])=\mathrm{i} \hbar$ LeviCivita $[j, k, n] L[n]$,
\%Commutator $(p[j], L[k])=\mathrm{i} \hbar$ LeviCivita $[j, k, n] p[n], \% \operatorname{Commutator}(X[j], L[k])=\mathrm{i} \hbar \operatorname{LeviCivita}[j, k, n] X[n]$,
\%Commutator $(X[k], V(X))=0\})$

$$
\begin{align*}
& {\left[\text { algebrarules }=\left\{\left[L_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} L_{n},\left[p_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} p_{n},\left[p_{k}, p_{l}\right]_{-}=0,\left[X_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} X_{n},\left[X_{k}, p_{l}\right]_{-}=\mathrm{i} \hbar g_{k l},\right.\right.}  \tag{2}\\
& \left.\left.\left[X_{k}, V(X)\right]_{-}=0\right\}, \text { hermitianoperators }=\{H, L, V, p, x, y, z\}, \text { quantumoperators }=\{H, L, V, Z, p, x, y, z\}\right]
\end{align*}
$$

Define the tensor quantum operators representing the linear momentum, angular momentum and the Runge-Lenz vectors
$>\operatorname{Define}(p[k], L[k], Z[k]$, quiet $)$

$$
\begin{equation*}
\left\{\gamma_{a}, L_{k}, \sigma_{a}, Z_{k}, \partial_{a}, g_{a b}, p_{k}, \epsilon_{a b c}, X_{a}\right\} \tag{3}
\end{equation*}
$$

For readability, avoid redundant display of functionality
> CompactDisplay $((V, G)(X))$

$$
\begin{align*}
& V(X) \text { will now be displayed as } V \\
& G(X) \text { will now be displayed as } G \tag{4}
\end{align*}
$$

The Hamiltonian for the hydrogen atom is entered as

$$
>H=\frac{p[l]^{2}}{2 \cdot m_{e}}-\kappa \cdot V(X)
$$

$$
\begin{equation*}
H=\frac{p_{l}^{2}}{2 m_{e}}-\kappa V \tag{5}
\end{equation*}
$$

where $p_{l}{ }^{2}=\|\vec{p}\|^{2}$.

### 2.1. Definition of $V(X)$ and related identities

We use the dimensionless potential $V(X)$
$>V(X)=\frac{1}{\left(X[l]^{2}\right)^{\frac{1}{2}}}$

$$
\begin{equation*}
V=\left(X_{l}^{2}\right)^{-\frac{1}{2}} \tag{6}
\end{equation*}
$$

The gradient of $V(X)$ is
>d_[n]((6))

$$
\begin{equation*}
\partial_{n}(V)=-\left(X_{l}^{2}\right)^{-\frac{3}{2}} X_{n} \tag{7}
\end{equation*}
$$

where we note that all these commands (including product and power), distribute over equations. So that $>\operatorname{subs}\left((r h s=l h s)\left((\mathbf{6})^{3}\right),(7)\right)$

$$
\begin{equation*}
\partial_{n}(V)=-V^{3} X_{n} \tag{8}
\end{equation*}
$$

Equivalently, from (6) one can deduce
$>(r h s=l h s)\left(\frac{V(X)^{3}}{(6)^{2}}\right)$

$$
\begin{equation*}
V^{3} X_{l}^{2}=V \tag{9}
\end{equation*}
$$

which will often be used afterwards.

### 2.2. The commutation rules between linear and angular momentum and of the potential $V(X)$

## By definition

$>L[q]=\operatorname{LeviCivita}[q, m, n] \cdot X[m] \cdot p[n]$

$$
\begin{equation*}
L_{q}=\epsilon_{m n q} X_{m} p_{n} \tag{10}
\end{equation*}
$$

so
> Commutator((10), $V(X)$ )

$$
\begin{equation*}
\left[L_{q}, V\right]_{-}=\epsilon_{m n q} X_{m}\left[p_{n}, V\right]_{-} \tag{11}
\end{equation*}
$$

The commutator on the right-hand side cannot be computed by the CAS until more information is provided. To derive the value of $\left[p_{n}, V\right]$-we set $p_{n}$ as a differentialoperator and introduce an arbitrary test function $G(X)$
$>\operatorname{Setup}($ differentialoperators $=\{[p[k],[x, y, z]]\})$

$$
\begin{equation*}
\text { [differentialoperators } \left.=\left\{\left[p_{k},[X]\right]\right\}\right] \tag{12}
\end{equation*}
$$

Apply now to $G(X)$ the differential operator $p_{n}$ found in the commutator of the right-hand side of (11) $>($ lhs $=$ ApplyProductsOfDifferentialOperators @rhs $)((\mathbf{1 1}) \cdot G(X))$

$$
\begin{equation*}
\left[L_{q}, V\right]_{-} G=\epsilon_{m n q} X_{m}\left(p_{n}(V G)-V p_{n}(G)\right) \tag{13}
\end{equation*}
$$

The result of $p_{n}(G(X))$ is not known to the system at this point. Define then an explicit representation for $p_{n}$ as the differential operator in configuration space $p_{n}=-i \hbar \partial_{n}$
$>p:=u \rightarrow-i \hbar \cdot d_{-}[$op $($procname $)](u)$

$$
\begin{equation*}
p:=u \mapsto-\mathrm{i} \hbar \partial_{\text {op(procname) }}(u) \tag{14}
\end{equation*}
$$

where in the above op(procname) represents the indices with which the differential operator $p_{n}$ is called.With this definition, the right-hand side of (13) automatically evaluates to $>$ (13)

$$
\begin{equation*}
\left[L_{q}, V\right]_{-} G=-\mathrm{i} \epsilon_{m n q} \hbar X_{m} \partial_{n}(V) G \tag{15}
\end{equation*}
$$

So that using $(\mathbf{8}) \equiv \partial_{n}(V)=-V^{3} X_{n}$ and multiplying by $G(X)^{-1}$,
$>$ SubstituteTensor ((8), (15)) $\cdot G(X)^{-1}$

$$
\begin{equation*}
\left[L_{q}, V\right]_{-}=\mathrm{i} \epsilon_{m n q} \hbar X_{m} V^{3} X_{n} \tag{16}
\end{equation*}
$$

from where we get the first commutation rule:
> Simplify((16))

$$
\begin{equation*}
\left[L_{q}, V\right]_{-}=0 \tag{17}
\end{equation*}
$$

Likewise, from the inert $=$ active form of $\left[p_{q}, V(X)\right]_{-}$
$>(\%$ Commutator $=$ Commutator $)(p[q], V(X))$

$$
\begin{equation*}
\left[p_{q}, V\right]_{-}=\left[p_{q}, V\right]_{-} \tag{18}
\end{equation*}
$$

by applying this equation to the test function $G(X)$ we get
$>($ lhs = ApplyProductsOfDifferentialOperators@rhs $)(\mathbf{( 1 8 )} \cdot G(X))$

$$
\begin{equation*}
\left[p_{q}, V\right]_{-} G=-\mathrm{i} \hbar \partial_{q}(V) G \tag{19}
\end{equation*}
$$

>SubstituteTensor((8),(19)) $\cdot G(X)^{-1}$

$$
\begin{equation*}
\left[p_{q}, V\right]_{-}=\mathrm{i} \hbar V^{3} X_{q} \tag{20}
\end{equation*}
$$

In the same way, for $\left[p_{q}, V^{3}\right]_{-}$we get
$>(\%$ Commutator $=$ Commutator $)\left(p[q], V(X)^{3}\right)$

$$
\begin{equation*}
\left[p_{q}, V^{3}\right]_{-}=\left[p_{q}, V^{3}\right]_{-} \tag{21}
\end{equation*}
$$

$>($ lhs $=$ ApplyProductsOfDifferentialOperators @ rhs $)((\mathbf{2 1}) \cdot G(X))$

$$
\begin{equation*}
\left[p_{q}, V^{3}\right]_{-} G=-\mathrm{i} \hbar\left(\partial_{q}(V) V^{2}+V \partial_{q}(V) V+V^{2} \partial_{q}(V)\right) G \tag{22}
\end{equation*}
$$

$>$ SubstituteTensor $\left(\mathbf{( 8 ) , ( 2 2 ) )} \cdot G(X)^{-1}\right.$

$$
\begin{equation*}
\left[p_{q}, V^{3}\right]_{-}=\mathrm{i} \hbar\left(V^{3} X_{q} V^{2}+V^{4} X_{q} V+V^{5} X_{q}\right) \tag{23}
\end{equation*}
$$

$>($ lhs = Simplify@rhs)((23))

$$
\begin{equation*}
\left[p_{q}, V^{3}\right]_{-}=3 \mathrm{i} \hbar V^{5} X_{q} \tag{24}
\end{equation*}
$$

Adding now these new commutation rules to the setup of the problem, they will be taken into account in subsequent uses of Simplify
$>$ (17), (20), (24)

$$
\begin{equation*}
\left[L_{q}, V\right]_{-}=0,\left[p_{q}, V\right]_{-}=\mathrm{i} \hbar V^{3} X_{q},\left[p_{q}, V^{3}\right]_{-}=3 \mathrm{i} \hbar V^{5} X_{q} \tag{25}
\end{equation*}
$$

$>\operatorname{Setup}((\mathbf{2 5}))$

$$
\begin{align*}
& \text { [algebrarules }=\left\{\left[L_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} L_{n},\left[L_{q}, V\right]_{-}=0,\left[p_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} p_{n},\left[p_{k}, p_{l}\right]_{-}=0,\left[p_{q}, V\right]_{-}=\mathrm{i} \hbar V^{3} X_{q},\right.  \tag{26}\\
& \left.\left.\left[p_{q}, V^{3}\right]_{-}=3 \mathrm{i} \hbar V^{5} X_{q},\left[X_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} X_{n},\left[X_{k}, p_{l}\right]_{-}=\mathrm{i} \hbar g_{k l},\left[X_{k}, V\right]_{-}=0\right\}\right]
\end{align*}
$$

Undo differentialoperators to work using two different approaches, with and without them.

## Commutation rules between the Hamiltonian and each of the angular momentum and Runge-Lenz tensors

Departing from the Hamiltonian (5) $\equiv H=\frac{p_{l}^{2}}{2 m_{e}}-\kappa V$ and the definition of angular momentum (10) $\equiv L_{q}=\epsilon_{m n q} X_{m} p_{n}$, by taking their commutator we get
$>\operatorname{Commutator}(\mathbf{5}),(\mathbf{1 0})$ )

$$
\begin{equation*}
\left[H, L_{q}\right]_{-}=\frac{-\mathrm{i} \epsilon_{m n q} \hbar\left(-X_{m} V^{3} X_{n} \kappa m_{e}+p_{l} p_{n} g_{l m}\right)}{m_{e}} \tag{28}
\end{equation*}
$$

> Simplify((28))

$$
\begin{equation*}
\left[H, L_{q}\right]_{-}=0 \tag{29}
\end{equation*}
$$

2.3. The commutator between the Hamiltonian and Runge-Lenz tensor: algebraic approach

Start from the definition of the quantum Runge-Lenz tensor

$$
\begin{array}{r}
>Z[k]=\frac{1}{2 m_{e}} \cdot \text { LeviCivita }[a, b, k] \cdot(L[a] \cdot p[b]-p[a] \cdot L[b])+\kappa \cdot V(X) \cdot X[k] \\
Z_{k}=\frac{\epsilon_{a b k}\left(L_{a} p_{b}-p_{a} L_{b}\right)}{2 m_{e}}+\kappa V X_{k} \tag{30}
\end{array}
$$

This tensor is Hermitian
$>(\mathbf{3 0})-\operatorname{Dagger}(\mathbf{( 3 0 )})$

$$
\begin{equation*}
Z_{k}-Z_{k}^{\dagger}=\frac{2 \kappa V X_{k} m_{e}-2 \kappa X_{k} V m_{e}+\epsilon_{a b k}\left(L_{a} p_{b}+L_{b} p_{a}-p_{a} L_{b}-p_{b} L_{a}\right)}{2 m_{e}} \tag{31}
\end{equation*}
$$

> Simplify ((31))

$$
\begin{equation*}
Z_{k}-Z_{k}^{\dagger}=0 \tag{32}
\end{equation*}
$$

Since the system knows about the commutation rule between linear and angular momentum, $>(\%$ Commutator $=$ Commutator $)(L[a], p[b])$

$$
\begin{equation*}
\left[L_{a}, p_{b}\right]_{-}=\mathrm{i} \hbar \epsilon_{a b n} p_{n} \tag{33}
\end{equation*}
$$

the expression (30) for $Z_{k}$ can be simplified
> Simplify((30))

$$
\begin{equation*}
Z_{k}=\frac{\mathrm{i} \hbar p_{k}}{m_{e}}+\kappa V X_{k}-\frac{\epsilon_{a b k} p_{a} L_{b}}{m_{e}} \tag{34}
\end{equation*}
$$

and the angular momentum removed from the the right-hand side using $\mathbf{( 1 0 )} \equiv L_{q}=\epsilon_{m n q} X_{m} p_{n}$, so that $Z_{k}$ gets expressed entirely in terms of $p_{k}, X$ and $V$
>Simplify(SubstituteTensor((10), (34)))

$$
\begin{equation*}
Z_{k}=\frac{-\mathrm{i} \hbar p_{k}+\kappa V X_{k} m_{e}-X_{k} p_{m}^{2}+X_{m} p_{k} p_{m}}{m_{e}} \tag{35}
\end{equation*}
$$

Taking the commutator between $\mathbf{( 5 )} \equiv H=\frac{p_{l}^{2}}{2 m_{e}}-\kappa V$, and this expression for $Z_{k}$ we have the starting point towards showing that $\left[H, Z_{k}\right]_{-}=0$
$>\frac{2 m_{e}}{\kappa \hbar} \operatorname{Simplify}(\operatorname{Commutator}(\mathbf{( 5 )},(\mathbf{3 5})))$

$$
\begin{equation*}
\frac{2 m_{e}\left[H, Z_{k}\right]_{-}}{\kappa \hbar}=\hbar V^{3} X_{k}+\hbar V^{5} X_{a}^{2} X_{k}+2 \mathrm{i} X_{a}^{2} p_{k} V^{3}+2 \mathrm{i} V X_{a} X_{k} p_{a} V^{2}-2 \mathrm{i} X_{a} X_{k} p_{a} V^{3}-2 \mathrm{i} p_{k} V \tag{36}
\end{equation*}
$$

In order to use the identities
$>(9), V(X)^{2}$. (9)

$$
\begin{equation*}
V^{3} X_{l}^{2}=V, V^{5} X_{l}^{2}=V^{3} \tag{37}
\end{equation*}
$$

we sort the products using the ordering shown in the left-hand sides
> SortProducts((36), $\left.\left[V(X)^{5}, V(X)^{3}, X[a]^{2}\right]\right)$

$$
\begin{equation*}
\frac{2 m_{e}\left[H, Z_{k}\right]_{-}}{\kappa \hbar}=\hbar V^{3} X_{k}-5 \hbar V^{5} X_{a}^{2} X_{k}+2 \mathrm{i} V^{3} X_{a}^{2} p_{k}+2 \mathrm{i} V X_{a} X_{k} p_{a} V^{2}-2 \mathrm{i} X_{a} X_{k} p_{a} V^{3}-2 \mathrm{i} p_{k} V \tag{38}
\end{equation*}
$$

>SubstituteTensor((37),(38))

$$
\begin{equation*}
\frac{2 m_{e}\left[H, Z_{k}\right]_{-}}{\kappa \hbar}=-4 \hbar V^{3} X_{k}+2 \mathrm{i} V p_{k}+2 \mathrm{i} V X_{a} X_{k} p_{a} V^{2}-2 \mathrm{i} X_{a} X_{k} p_{a} V^{3}-2 \mathrm{i} p_{k} V \tag{39}
\end{equation*}
$$

> Simplify((39))

$$
\begin{equation*}
\frac{2 m_{e}\left[H, Z_{k}\right]_{-}}{\kappa \hbar}=-2 \hbar\left(V^{3} X_{k}-V^{5} X_{a}{ }^{2} X_{k}\right) \tag{40}
\end{equation*}
$$

$>\frac{\kappa \hbar}{2 m_{e}} \operatorname{SubstituteTensor}((\mathbf{3 7}),(40))$

$$
\begin{equation*}
\left[H, Z_{k}\right]_{-}=0 \tag{41}
\end{equation*}
$$

and this is the result we wanted to prove.

### 2.4. The commutator between the Hamiltonian and Runge-Lenz tensor: alternative derivation using differential operators

As done in the previous section when deriving the commutators between linear and angular momentum, on the one hand, and the central potential $V$ on the other hand, the idea here is again to use differential operators taking advantage of the ability to compute with them as operands of a product, that get applied only when it appears convenient for us $>$ Setup $($ differentialoperators $=\{[p[k],[x, y, z]]\})$

$$
\begin{equation*}
\left[\text { differentialoperators }=\left\{\left[p_{k},[X]\right]\right\}\right] \tag{42}
\end{equation*}
$$

So take the starting point (36)
$>$ (36)

$$
\begin{equation*}
\frac{2 m_{e}\left[H, Z_{k}\right]_{-}}{\kappa \hbar}=\hbar V^{3} X_{k}+\hbar V^{5} X_{a}^{2} X_{k}+2 \mathrm{i} X_{a}^{2} p_{k} V^{3}+2 \mathrm{i} V X_{a} X_{k} p_{a} V^{2}-2 \mathrm{i} X_{a} X_{k} p_{a} V^{3}-2 \mathrm{i} p_{k} V \tag{43}
\end{equation*}
$$

and to show that the right-hand side is equal to 0 , multiply by a generic function $G(X)$ followed by transforming the products involving $p_{n}$ into the application of this differential operator $p_{n}=-i \hbar \partial_{n}$ $>(\mathbf{3 6}) \cdot G(X)$

$$
\begin{equation*}
\frac{2 m_{e}\left[H, Z_{k}\right]_{-} G}{\kappa \hbar}=\left(\hbar V^{3} X_{k}+\hbar V^{5} X_{a}^{2} X_{k}+2 \mathrm{i} X_{a}^{2} p_{k} V^{3}+2 \mathrm{i} V X_{a} X_{k} p_{a} V^{2}-2 \mathrm{i} X_{a} X_{k} p_{a} V^{3}-2 \mathrm{i} p_{k} V\right) G \tag{44}
\end{equation*}
$$

[^1]\[

$$
\begin{align*}
\frac{2 m_{e}\left[H, Z_{k}\right]_{-} G}{\kappa \hbar}= & -2 \hbar X_{a} X_{k}\left(\left(\partial_{a}(V) V^{2}+V \partial_{a}(V) V+V^{2} \partial_{a}(V)\right) G+V^{3} \partial_{a}(G)\right)-2 \hbar V \partial_{k}(G) \\
& -2 \hbar \partial_{k}(V) G+2 \hbar X_{a}^{2}\left(\left(\partial_{k}(V) V^{2}+V \partial_{k}(V) V+V^{2} \partial_{k}(V)\right) G+V^{3} \partial_{k}(G)\right)  \tag{45}\\
& +2 \hbar V X_{a} X_{k}\left(\left(\partial_{a}(V) V+V \partial_{a}(V)\right) G+V^{2} \partial_{a}(G)\right)+\hbar V^{3} X_{k} G+\hbar V^{5} X_{a}^{2} X_{k} G
\end{align*}
$$
\]

$>\frac{1}{\hbar} \operatorname{Simplify}(\mathbf{( 4 5 )})$

$$
\begin{align*}
\frac{2 m_{e}\left[H, Z_{k}\right]_{-} G}{\hbar^{2} \kappa}= & 2 V X_{a}^{2} \partial_{k}(V) G V+2 V^{2} X_{a}{ }^{2} \partial_{k}(V) G+G V^{5} X_{a}{ }^{2} X_{k}+2 V^{3} X_{a}{ }^{2} \partial_{k}(G)  \tag{46}\\
& -2 V \partial_{k}(G)-2 \partial_{k}(V) G+G V^{3} X_{k}+2 X_{a}{ }^{2} \partial_{k}(V) G V^{2}-2 X_{a} X_{k} \partial_{a}(V) G V^{2}
\end{align*}
$$

In addition, consider the application of $p_{l}$ to the test function $G(X)$ $>p[l] G(X)$

$$
\begin{equation*}
p_{l} G \tag{47}
\end{equation*}
$$

$>$ (47) $=$ ApplyProductsOfDifferentialOperators((47))

$$
\begin{equation*}
p_{l} G=-\mathrm{i} \hbar \partial_{l}(G) \tag{48}
\end{equation*}
$$

> isolate $\left((\mathbf{4 8}), \partial_{l}(G(X))\right)$

$$
\begin{equation*}
\partial_{l}(G)=\frac{\mathrm{i} p_{l} G}{\hbar} \tag{49}
\end{equation*}
$$

Using this identity (49) together with the derived identity (8), followed by multiplying by $G(X)^{-1}$ to remove the test function from the equation, we get
$>$ Simplify(SubstituteTensor((8), (49), (46)) $\left.\cdot G(X)^{-1}\right)$

$$
\begin{equation*}
\frac{2 m_{e}\left[H, Z_{k}\right]_{-}}{\hbar^{2} \kappa}=-3 V^{5} X_{a}^{2} X_{k}+\frac{2 \mathrm{i} V^{3} X_{a}^{2} p_{k}}{\hbar}-\frac{2 \mathrm{i} V p_{k}}{\hbar}+3 V^{3} X_{k} \tag{50}
\end{equation*}
$$

Applying (37) $\equiv V^{3} X_{l}^{2}=V, V^{5} X_{l}^{2}=V^{3}$
$>\frac{\hbar^{2} \kappa}{2 m_{e}}$ SubstituteTensor((37), (50))

$$
\begin{equation*}
\left[H, Z_{k}\right]_{-}=0 \tag{51}
\end{equation*}
$$

Add to the setup these derived commutation rules between the Hamiltonian, angular momentum and Runge-Lenz tensors
$>$ (29), (51)

$$
\begin{equation*}
\left[H, L_{q}\right]_{-}=0,\left[H, Z_{k}\right]_{-}=0 \tag{52}
\end{equation*}
$$

$>\operatorname{Setup}(\mathbf{5 2 )})$

$$
\begin{align*}
& {\left[\text { algebrarules }=\left\{\left[H, L_{q}\right]_{-}=0,\left[H, Z_{k}\right]_{-}=0,\left[L_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} L_{n},\left[L_{q}, V\right]_{-}=0,\left[p_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} p_{n},\left[p_{k}, p_{l}\right]_{-}=0,\right.\right.} \\
& \left.\left.\left[p_{q}, V\right]_{-}=\mathrm{i} \hbar V^{3} X_{q},\left[p_{q}, V^{3}\right]_{-}=3 \mathrm{i} \hbar V^{5} X_{q},\left[X_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} X_{n},\left[X_{k}, p_{l}\right]_{-}=\mathrm{i} \hbar g_{k l},\left[X_{k}, V\right]_{-}=0\right\}\right] \tag{53}
\end{align*}
$$

Reset differentialoperators in order to proceed to the next section working without them
>Setup(differentialoperators $=$ none)

$$
\begin{equation*}
\text { [differentialoperators }=\text { none }] \tag{54}
\end{equation*}
$$

## 3. Commutation rules between the angular momentum and the Runge-Lenz tensors

Departing from the definition of these tensors, introduced in the previous sections
> (10); (35)

$$
\begin{gather*}
L_{q}=\epsilon_{m n q} X_{m} p_{n} \\
Z_{k}=\frac{-\mathrm{i} \hbar p_{k}+\kappa V X_{k} m_{e}-X_{k} p_{m}^{2}+X_{m} p_{k} p_{m}}{m_{e}} \tag{55}
\end{gather*}
$$

the left-hand side of the identity to be proved is the left-hand side of the commutator of these two equations $>m_{e}$ Commutator ((10), (35))

$$
\begin{array}{r}
m_{e}\left[L_{q}, Z_{k}\right]_{-}=\epsilon_{m n q} \hbar\left(\mathrm{i} X_{m}\left(-g_{k n} V+V^{3} X_{n} X_{k}\right) \kappa m_{e}+\hbar g_{k m} p_{n}-2 \mathrm{i} X_{k} p_{a} p_{n} g_{a m}-\mathrm{i} X_{m} p_{k} p_{a} g_{a n}+\mathrm{i} X_{m} p_{a}{ }^{2} g_{k n}\right.  \tag{56}\\
\left.+\mathrm{i} X_{a}\left(g_{a m} p_{k}+g_{k m} p_{a}\right) p_{n}\right)
\end{array}
$$

> Simplify((56))

$$
\begin{equation*}
m_{e}\left[L_{q}, Z_{k}\right]_{-}=-\hbar\left(\mathrm{i} V X_{a} \kappa m_{e}+\hbar p_{a}-\mathrm{i} X_{a} p_{m}^{2}+\mathrm{i} X_{m} p_{a} p_{m}\right) \epsilon_{a k q} \tag{57}
\end{equation*}
$$

By eye, the right-hand side of (57) is similar to the right-hand side of the definition of $Z_{k}$ in (55), so introduce this definition directly into the right-hand side of (57). For that purpose, isolate $X_{k} p_{m}{ }^{2}$
$>$ isolate ( $\left.(\mathbf{5 5}), X[k] \cdot p[m]^{2}\right)$

$$
\begin{equation*}
X_{k} p_{m}^{2}=-Z_{k} m_{e}-\mathrm{i} \hbar p_{k}+\kappa V X_{k} m_{e}+X_{m} p_{k} p_{m} \tag{58}
\end{equation*}
$$

> SubstituteTensor((58), (57))

$$
\begin{equation*}
m_{e}\left[L_{q}, Z_{k}\right]_{-}=\mathrm{i} \hbar\left(-Z_{a} m_{e}+X_{b} p_{a} p_{b}-X_{m} p_{a} p_{m}\right) \epsilon_{a k q} \tag{59}
\end{equation*}
$$

Simplifying, we get the desired result, and we substitute the active by the inert form of Commutator for later use of this formula without having the Commutator automatically executed.
> Simplify ((59))

$$
\begin{equation*}
m_{e}\left[L_{q}, Z_{k}\right]_{-}=-\mathrm{i} \hbar Z_{a} m_{e} \epsilon_{a k q} \tag{60}
\end{equation*}
$$

$>\frac{1}{m_{e}} \operatorname{subs}($ Commutator $=\%$ Commutator,$(\mathbf{6 0}))$

$$
\begin{equation*}
\left[L_{q}, Z_{k}\right]_{-}=-\mathrm{i} \hbar \epsilon_{a k q} Z_{a} \tag{61}
\end{equation*}
$$

Set now this algebra rule to be available to the system when convenient
$>\operatorname{Setup}(\mathbf{( 6 1 )})$
$\left[\right.$ algebrarules $=\left\{\left[H, L_{q}\right]_{-}=0,\left[H, Z_{k}\right]_{-}=0,\left[L_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} L_{n},\left[L_{q}, Z_{k}\right]_{-}=-\mathrm{i} \hbar \epsilon_{a k q} Z_{a},\left[L_{q}, V\right]_{-}=0,\left[p_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} p_{n}\right.$, $\left.\left.\left[p_{k}, p_{l}\right]_{-}=0,\left[p_{q}, V\right]_{-}=\mathrm{i} \hbar V^{3} X_{q},\left[p_{q}, V^{3}\right]_{-}=3 \mathrm{i} \hbar V^{5} X_{q},\left[X_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} X_{n},\left[X_{k}, p_{l}\right]_{-}=\mathrm{i} \hbar g_{k l},\left[X_{k}, V\right]_{-}=0\right\}\right]$

### 3.1. The scalar product between the quantized angular momentum and the Runge-Lenz tensors

Classically, the orbital momentum is perpendicular to the plane of motion, while the Runge-Lenz vector lies in that plane, so that $\vec{L}_{\text {Classical }} \cdot \vec{Z}_{\text {Classical }}=0$. In quantum mechanics, from (61) $\equiv\left[L_{q}, Z_{k}\right]_{-} \neq 0$ but $\vec{L} \cdot \vec{Z}=\vec{Z} \cdot \vec{L}=0$ still holds. To verify that, take the definition (30) of the quantum Runge-Lenz vector and multiply it by $L_{k}$ $>(\mathbf{3 0}) . L[k]$

$$
\begin{equation*}
L_{k} Z_{k}=\frac{\epsilon_{a b k}\left(L_{a} p_{b} L_{k}-p_{a} L_{b} L_{k}\right)}{2 m_{e}}+\kappa V X_{k} L_{k} \tag{63}
\end{equation*}
$$

> Simplify((63))

$$
\begin{equation*}
L_{k} Z_{k}=\kappa L_{a} V X_{a} \tag{64}
\end{equation*}
$$

$\operatorname{Using}(\mathbf{1 0}) \equiv L_{q}=\epsilon_{m n q} X_{m} p_{n}$,
$>\operatorname{lhs}((\mathbf{6 4}))=$ SubstituteTensor $(\mathbf{( 1 0 )}), \operatorname{rhs}((\mathbf{6 4})))$

$$
\begin{equation*}
L_{k} Z_{k}=\kappa \epsilon_{a m n} X_{m} p_{n} V X_{a} \tag{65}
\end{equation*}
$$

>Simplify((65))

$$
\begin{equation*}
L_{k} Z_{k}=0 \tag{66}
\end{equation*}
$$

and due to $(\mathbf{6 1}) \equiv\left[L_{q}, Z_{k}\right]_{-}=-\hbar \mathrm{i} Z_{a} \epsilon_{a k q}$, reversing the order in the product,
>SortProducts((66), [Z[k], L[k]])

$$
\begin{equation*}
Z_{k} L_{k}=0 \tag{67}
\end{equation*}
$$

## 4. Commutation rules between the components of the Runge-Lenz tensor

Here again the starting point is (35), the definition of the quantum Runge-Lenz tensor >SubstituteTensorIndices( $k=q,(\mathbf{3 5 )})$

$$
\begin{equation*}
Z_{q}=\frac{-\mathrm{i} \hbar p_{q}+\kappa V X_{q} m_{e}+X_{m} p_{q} p_{m}-X_{q} p_{m}^{2}}{m_{e}} \tag{68}
\end{equation*}
$$

The commutator $\left[Z_{k}, Z_{q}\right]_{\text {_is }}$ computed via $>m_{e}^{2}(l h s=$ Expand @ rhs $)(\operatorname{Commutator}((\mathbf{3 5}),(68)))$

$$
\begin{array}{r}
m_{e}^{2}\left[Z_{k}, Z_{q}\right]_{-}=\hbar\left(-\left(g_{a k} p_{a} p_{q}-g_{m q} p_{k} p_{m}-g_{k q}\left(p_{a}{ }^{2}-p_{m}{ }^{2}\right)\right) \hbar+\mathrm{i} g_{m q} X_{m} p_{a}{ }^{2} p_{k}+\mathrm{i} g_{a m} X_{a} p_{k} p_{m} p_{q}+\mathrm{i} g_{k q} X_{m} p_{a}{ }^{2} p_{m}+\mathrm{i} g_{m q} X_{a} p_{a} p_{k} p_{m}\right. \\
-\mathrm{i} g_{a k} X_{m} p_{a} p_{m} p_{q}-\mathrm{i} g_{a m} X_{m} p_{a} p_{k} p_{q}-2 \mathrm{i} g_{a m} X_{q} p_{a} p_{k} p_{m}-2 \mathrm{i} g_{m q} X_{k} p_{a}{ }^{2} p_{m}+2 \mathrm{i} g_{a k} X_{q} p_{m}{ }^{2} p_{a}-\mathrm{i} g_{a k} X_{a} p_{m}{ }^{2} p_{q} \\
-\mathrm{i} g_{k q} X_{a} p_{m}{ }^{2} p_{a}+2 \mathrm{i} g_{a m} X_{k} p_{a} p_{m} p_{q}+\mathrm{i} V^{3} X_{k} X_{m} X_{q} p_{m} \kappa m_{e}+3 \hbar V^{5} X_{a}{ }^{2} X_{k} X_{q} K m_{e}-3 \hbar V^{5} X_{m}{ }^{2} X_{k} X_{q} \kappa m_{e} \\
-2 \mathrm{i} X_{k} p_{m} V^{3} X_{m} X_{q} K m_{e}-\mathrm{i} X_{a} p_{q} V^{3} X_{a} X_{k} K m_{e}-\mathrm{i} V^{3} X_{a} X_{q} p_{a} X_{k} K m_{e}+2 \mathrm{i} X_{q} p_{a} V^{3} X_{a} X_{k} K m_{e} \\
+\mathrm{i} X_{m} p_{k} V^{3} X_{m} X_{q} K m_{e}+2 \mathrm{i} V X_{k} p_{m} K m_{e} g_{m q}-\mathrm{i} X_{m} p_{k} V K m_{e} g_{m q}-\mathrm{i} V X_{m} p_{m} K m_{e} g_{k q}-2 \mathrm{i} V X_{q} p_{a} K m_{e} g_{a k} \\
\left.+\mathrm{i} V X_{a} p_{q} K m_{e} g_{a k}+\mathrm{i} V X_{a} p_{a} K m_{e} g_{k q}\right) \tag{69}
\end{array}
$$

$>\frac{\mathrm{i}}{\hbar} \operatorname{Simplify}((\mathbf{6 9 )})$

$$
\begin{align*}
\frac{\mathrm{i} m_{e}^{2}\left[Z_{k}, Z_{q}\right]_{-}}{\hbar}= & -X_{a}{ }^{2} X_{q} p_{k} V^{3} \kappa m_{e}+X_{a}{ }^{2} X_{k} p_{q} V^{3} \kappa m_{e}-3 X_{k} p_{q} V \kappa m_{e}+3 X_{q} p_{k} V \kappa m_{e}  \tag{70}\\
& -X_{m} p_{a}{ }^{2} p_{m} g_{k q}+X_{a} p_{m}{ }^{2} p_{a} g_{k q}+X_{k} p_{a}{ }^{2} p_{q}-X_{q} p_{a}{ }^{2} p_{k}
\end{align*}
$$

In order to use (9) $\equiv V^{3} X_{l}^{2}=V$, sort the products in (70) using the ordering $V^{3} X_{a}{ }^{2}$
$>\operatorname{Normal}\left(\operatorname{SortProducts}\left((\mathbf{7 0}),\left[V(X)^{3}, X[a]^{2}\right]\right)\right)$

$$
\begin{align*}
\frac{\mathrm{i} m_{e}^{2}\left[Z_{k}, Z_{q}\right]}{\hbar}= & V^{3} X_{a}^{2} X_{k} p_{q} \kappa m_{e}-V^{3} X_{a}^{2} X_{q} p_{k} \kappa m_{e}-3 X_{k} p_{q} V \kappa m_{e}+3 X_{q} p_{k} V \kappa m_{e}  \tag{71}\\
& -X_{m} p_{a}^{2} p_{m} g_{k q}+X_{a} p_{m}^{2} p_{a} g_{k q}+X_{k} p_{a}^{2} p_{q}-X_{q} p_{a}^{2} p_{k}
\end{align*}
$$

>SubstituteTensor((9), (71))
$\frac{\mathrm{i} m_{e}^{2}\left[Z_{k}, Z_{q}\right]_{-}}{\hbar}=V X_{k} p_{q} \kappa m_{e}-\kappa m_{e} V X_{q} p_{k}-3 X_{k} p_{q} V \kappa m_{e}+3 X_{q} p_{k} V \kappa m_{e}-X_{m} p_{a}^{2} p_{m} g_{k q}+X_{a} p_{m}{ }^{2} p_{a} g_{k q}+X_{k} p_{a}^{2} p_{q}-X_{q} p_{a}^{2} p_{k}$

Regarding the quadratic term in the momentum, from the expression for the Hamiltonian (5) $\equiv H=\frac{p_{l}{ }^{2}}{2 m_{e}}-\kappa V$, > isolate ((5), $p[l]^{2}$ )

$$
\begin{equation*}
p_{l}^{2}=2(\kappa V+H) m_{e} \tag{73}
\end{equation*}
$$

In order to use this equation (73) to substitute $p_{l}{ }^{2}$ into the expression (72) for $\left[Z_{k}, Z_{q}\right]_{-}$and not receive noncommutative products with $H$ in between the position $X_{k}$ and momentum $p_{q}$ operators (that would require further using, afterwards, the commutator between $H$ and $p_{q}$ ), sort first the products in (72) positioning all square of momentums $p^{2}$ to the right of occurrences of $p$
$>\operatorname{SortProducts}\left(\mathbf{( 7 2 )},\left[p[a], p[k], p[m], p[q], p[a]^{2}, p[m]^{2}\right]\right)$
$\frac{\mathrm{i} m_{e}^{2}\left[Z_{k}, Z_{q}\right]_{-}}{\hbar}=V X_{k} p_{q} \kappa m_{e}-\kappa m_{e} V X_{q} p_{k}-3 X_{k} p_{q} V \kappa m_{e}+3 X_{q} p_{k} V \kappa m_{e}-X_{m} p_{m} p_{a}^{2} g_{k q}+X_{a} p_{a} p_{m}^{2} g_{k q}+X_{k} p_{q} p_{a}^{2}-X_{q} p_{k} p_{a}^{2}$
>SubstituteTensor((73), (74))

$$
\begin{align*}
\frac{\mathrm{i} m_{e}^{2}\left[Z_{k}, Z_{q}\right]_{-}}{\hbar}= & V X_{k} p_{q} \kappa m_{e}-\kappa m_{e} V X_{q} p_{k}-3 X_{k} p_{q} V \kappa m_{e}+3 X_{q} p_{k} V \kappa m_{e}-X_{m} p_{m} 2(\kappa V+H) m_{e} g_{k q}  \tag{75}\\
& +X_{a} p_{a} 2(\kappa V+H) m_{e} g_{k q}+X_{k} p_{q} 2(\kappa V+H) m_{e}-X_{q} p_{k} 2(\kappa V+H) m_{e}
\end{align*}
$$

$>\frac{\hbar}{\mathrm{i} m_{e}^{2}} \operatorname{Simplify}((\mathbf{7 5}))$

$$
\begin{equation*}
\left[Z_{k}, Z_{q}\right]_{-}=\frac{2 \mathrm{i} \hbar\left(-X_{k} p_{q} H+X_{q} p_{k} H\right)}{m_{e}} \tag{76}
\end{equation*}
$$

Finally, from the definition of the angular momentum $\mathbf{( 1 0 )} \equiv L_{q}=\epsilon_{m n q} X_{m} p_{n}$, multiplying by $\epsilon_{a b c}$ we can construct an expression for $X_{a} p_{b} H-X_{b} p_{a} H$ in terms of $L_{q}$
$>$ LeviCivita $[a, b, q] \cdot(\mathbf{1 0})$

$$
\begin{equation*}
\epsilon_{a b q} L_{q}=\epsilon_{a b q} \epsilon_{m n q} X_{m} p_{n} \tag{77}
\end{equation*}
$$

$>$ Simplify $((r h s=\operatorname{lh} s)((77)))$

$$
\begin{equation*}
X_{a} p_{b}-X_{b} p_{a}=\epsilon_{a b q} L_{q} \tag{78}
\end{equation*}
$$

$>\operatorname{Expand}((\mathbf{7 8}) \cdot H)$

$$
\begin{equation*}
X_{a} p_{b} H-X_{b} p_{a} H=\epsilon_{a b q} H L_{q} \tag{79}
\end{equation*}
$$

> SubstituteTensor((79), (76))

$$
\begin{equation*}
\left[Z_{k}, Z_{q}\right]_{-}=\frac{-2 \mathrm{i} \hbar \epsilon_{c k q} H L_{c}}{m_{e}} \tag{80}
\end{equation*}
$$

which is the identity we wanted to prove.

### 4.1. Alternative derivation using differential operators

Set again the differentialoperator representation for the momentum operator $p_{k}$
$>\operatorname{Setup}($ differentialoperators $=\{[p[k],[x, y, z]]\})$

$$
\begin{equation*}
\text { [differentialoperators } \left.=\left\{\left[p_{k},[X]\right]\right\}\right] \tag{81}
\end{equation*}
$$

and apply the expression (69) for $\left[Z_{k}, Z_{q}\right]_{-}$to the test function $G(X)$
> ApplyProductsOfDifferentialOperators((69) $\cdot G(X)$ )

$$
\begin{array}{r}

\end{equation*}
$$

This expression can be factored
> Factor((88))

$$
\begin{equation*}
\frac{m_{e}^{2}\left[Z_{k}, Z_{q}\right]_{-}}{\hbar}=-\mathrm{i}\left(-3 V \kappa m_{e}+p_{d}^{2}+\kappa m_{e} V^{3} X_{d}^{2}\right)\left(-X_{q} p_{k}+X_{k} p_{q}\right) \tag{89}
\end{equation*}
$$

Using the identity (9) $\equiv V^{3} X_{l}^{2}=V$ for the potential
$>\frac{\hbar}{m_{e}^{2}} \operatorname{SubstituteTensor}(\mathbf{( 9 )}, \mathbf{( 8 9 )})$

$$
\begin{equation*}
\left[Z_{k}, Z_{q}\right]_{-}=\frac{-\mathrm{i} \hbar\left(-2 V \kappa m_{e}+p_{d}^{2}\right)\left(-X_{q} p_{k}+X_{k} p_{q}\right)}{m_{e}^{2}} \tag{90}
\end{equation*}
$$

Next using
$>$ (73), (78)

$$
\begin{equation*}
p_{l}^{2}=2(\kappa V+H) m_{e}, X_{a} p_{b}-X_{b} p_{a}=\epsilon_{a b q} L_{q} \tag{91}
\end{equation*}
$$

> SubstituteTensor((91), (90))

$$
\begin{equation*}
\left[Z_{k}, Z_{q}\right]_{-}=\frac{-2 \mathrm{i} \hbar \epsilon_{c k q} H L_{c}}{m_{e}} \tag{92}
\end{equation*}
$$

which is the expected result. Set now differential operators to none.
>Setup(differentialoperators $=$ none)

$$
\begin{equation*}
\text { [differentialoperators }=\text { none }] \tag{93}
\end{equation*}
$$

## 5. The square of the norm of the Runge-Lenz vector

Taking the square of the definition of $Z_{k}$ and simplifying $>(\mathbf{3 0})^{2}$

$$
\begin{equation*}
Z_{k}^{2}=\left(\frac{\epsilon_{a b k}\left(L_{a} p_{b}-p_{a} L_{b}\right)}{2 m_{e}}+\kappa V X_{k}\right)\left(\frac{\epsilon_{c d k}\left(L_{c} p_{d}-p_{c} L_{d}\right)}{2 m_{e}}+\kappa V X_{k}\right) \tag{94}
\end{equation*}
$$

$>2 m_{e}^{2} \operatorname{Simplify}((\mathbf{9 4}))$

$$
\begin{equation*}
2 m_{e}^{2} Z_{k}^{2}=2 \kappa \hbar^{2} V^{3} X_{a}^{2} m_{e}-6 \kappa \hbar^{2} V m_{e}+2 \kappa^{2} V^{2} X_{a}^{2} m_{e}^{2}-4 \epsilon_{a b c} X_{a} p_{b} L_{c} V \kappa m_{e}-p_{a} p_{b} L_{b} L_{a}+2 p_{a}^{2} L_{b}^{2}-p_{a} L_{b} L_{a} p_{b} \tag{95}
\end{equation*}
$$

Using the algebraic properties of the potential
$>(9), V(X)^{-1} \cdot(9)$

$$
\begin{equation*}
V^{3} X_{l}^{2}=V, V^{2} X_{l}^{2}=1 \tag{96}
\end{equation*}
$$

the expression (95) for $Z_{k}{ }^{2}$ becomes
> SubstituteTensor((96), (95))

$$
\begin{equation*}
2 m_{e}^{2} Z_{k}^{2}=-4 \kappa \hbar^{2} V m_{e}+2 \kappa^{2} m_{e}^{2}-4 \epsilon_{a b c} X_{a} p_{b} L_{c} V \kappa m_{e}-p_{a} p_{b} L_{b} L_{a}+2 p_{a}^{2} L_{b}^{2}-p_{a} L_{b} L_{a} p_{b} \tag{97}
\end{equation*}
$$

The term having $\epsilon_{a b c}$ can be simplified using the expression of the momentum operator $>(r h s=l h s)((\mathbf{1 0}))$

$$
\begin{equation*}
\epsilon_{m n q} X_{m} p_{n}=L_{q} \tag{98}
\end{equation*}
$$

$>(\mathbf{9 8}) \cdot L[q] \cdot V(X)$

$$
\begin{equation*}
\epsilon_{m n q} X_{m} p_{n} L_{q} V=L_{q}{ }^{2} V \tag{99}
\end{equation*}
$$

> SubstituteTensor((99), (97))

$$
\begin{equation*}
2 m_{e}^{2} Z_{k}^{2}=-4 \kappa \hbar^{2} V m_{e}+2 \kappa^{2} m_{e}^{2}-4 L_{c}^{2} V \kappa m_{e}-p_{a} p_{b} L_{b} L_{a}+2 p_{a}^{2} L_{b}^{2}-p_{a} L_{b} L_{a} p_{b} \tag{100}
\end{equation*}
$$

Reordering (100) to have the two terms with four operators sorted as $p_{a} p_{b} L_{a} L_{b}$
$>\operatorname{Simplify}(\operatorname{SortProducts}((\mathbf{1 0 0}),[p[a], p[b], L[a], L[b]]))$

$$
\begin{equation*}
2 m_{e}^{2} Z_{k}^{2}=-4 \kappa \hbar^{2} V m_{e}+2 \kappa^{2} m_{e}^{2}-4 L_{a}^{2} V \kappa m_{e}-2 p_{a} p_{b} L_{a} L_{b}+2 p_{a}^{2} L_{b}^{2}+2 \hbar^{2} p_{a}^{2} \tag{101}
\end{equation*}
$$

Considering now the resulting single term $p_{a} p_{b} L_{a} L_{b}$, it can be shown it is equal to zero using the definition (10) $\equiv L_{q}=\epsilon_{m n q} X_{m} p_{n}$
$>p[a] p[b] L[a] L[b]$

$$
\begin{equation*}
p_{a} p_{b} L_{a} L_{b} \tag{102}
\end{equation*}
$$

$>(\mathbf{1 0 2})=$ SubstituteTensor((10),(102))

$$
\begin{equation*}
p_{a} p_{b} L_{a} L_{b}=\epsilon_{a m n} \epsilon_{b e f} p_{a} p_{b} X_{m} p_{n} X_{e} p_{f} \tag{103}
\end{equation*}
$$

> Simplify $((\mathbf{1 0 3}))$

$$
\begin{equation*}
p_{a} p_{b} L_{a} L_{b}=0 \tag{104}
\end{equation*}
$$

Taking this result into account, we have, for $Z_{k}^{2}$
> subs((104), (101))

$$
\begin{equation*}
2 m_{e}^{2} Z_{k}^{2}=-4 \kappa \hbar^{2} V m_{e}+2 \kappa^{2} m_{e}^{2}-4 L_{a}^{2} V \kappa m_{e}+2 p_{a}^{2} L_{b}^{2}+2 \hbar^{2} p_{a}^{2} \tag{105}
\end{equation*}
$$

Substituting now (73) $\equiv p_{l}^{2}=2(\kappa V+H) m_{e}$
$>\frac{1}{2 m_{e}^{2}}$ SubstituteTensor((73), (105))

$$
\begin{equation*}
Z_{k}{ }^{2}=\frac{2 \hbar^{2} H m_{e}+\kappa^{2} m_{e}^{2}-2 L_{a}{ }^{2} V \kappa m_{e}+2(\kappa V+H) m_{e} L_{b}{ }^{2}}{m_{e}^{2}} \tag{106}
\end{equation*}
$$

Equalizing the repeated indices, the right-hand side can be factored $>($ lhs $=$ Factor@rhs $)\left(\right.$ EqualizeRepeatedIndices $\left.((\mathbf{1 0 6}))-\kappa^{2}\right)+\kappa^{2}$

$$
\begin{equation*}
Z_{k}^{2}=\frac{2 H\left(\hbar^{2}+L_{a}^{2}\right)}{m_{e}}+\kappa^{2} \tag{107}
\end{equation*}
$$

which is the result we wanted to demonstrate.

## 6. The atomic hydrogen spectrum

We now have all the algebra to reconstruct the hydrogen spectrum. Following the literature, this approach is limited to the bound states for which the energy is negative. Assuming an eigenstate of $H$ with negative eigenvalue $E$, we replace the Hamiltonian $H$ by $E$, and look for the possible values of $E$. Another way to state the same thing is that the analysis is restricted to the subspace of energy $E$. The operator $M_{n}=\sqrt{-\frac{m_{e}}{2 E}} Z_{n}$, is introduced as mentioned in Sec.1. The operators $J$ and $K$, to be used soon after, are added to the formulation of the problem $>$ Setup(hermitianoperators $=\{M, J, K\}$ )

$$
\begin{equation*}
[\text { hermitianoperators }=\{H, J, K, L, M, V, p, x, y, z\}] \tag{108}
\end{equation*}
$$

>Define $(M[n], J[n], K[n], q u i e t)$

$$
\begin{equation*}
\left\{\gamma_{a}, J_{n}, K_{n}, L_{k}, M_{n}, \sigma_{a}, Z_{k}, \partial_{a}, g_{a b}, p_{k}, \epsilon_{a b c}, X_{a}\right\} \tag{109}
\end{equation*}
$$

The domain for $m_{e}$ and $E$ is set via
$>\operatorname{Assume}\left(m_{e}>0, E<0\right)$

$$
\begin{equation*}
\{E::(-\infty, 0)\},\left\{m_{e}::(0, \infty)\right\} \tag{110}
\end{equation*}
$$

from where
$>M[n]=\sqrt{-\frac{m_{e}}{2 E}} Z[n]$

$$
\begin{equation*}
M_{n}=\frac{\sqrt{-\frac{2 m_{e}}{E}} Z_{n}}{2} \tag{111}
\end{equation*}
$$

> simplify(isolate((111), Z[n]))

$$
\begin{equation*}
Z_{n}=\frac{M_{n} \sqrt{2} \sqrt{-E}}{\sqrt{m_{e}}} \tag{112}
\end{equation*}
$$

Recalling the commutation rules $(\mathbf{9 2}) \equiv\left[Z_{k}, Z_{q}\right]_{-}=-\frac{2 \mathrm{i} \hbar \epsilon_{a k q} H L_{a}}{m_{e}}$ and (112) above with $E$ replacing $H$ $>\operatorname{SubstituteTensor}(H=E$,(112),(92))

$$
\begin{equation*}
\left[\frac{M_{k} \sqrt{2} \sqrt{-E}}{\sqrt{m_{e}}}, \frac{M_{q} \sqrt{2} \sqrt{-E}}{\sqrt{m_{e}}}\right]_{-}=\frac{-2 \mathrm{i} \hbar \epsilon_{c k q} E L_{c}}{m_{e}} \tag{113}
\end{equation*}
$$

>Simplify ((113))

$$
\begin{equation*}
-\frac{2 E\left[M_{k}, M_{q}\right]_{-}}{m_{e}}=\frac{-2 \mathrm{i} \hbar \epsilon_{c k q} E L_{c}}{m_{e}} \tag{114}
\end{equation*}
$$

Isolating the commutator, the expression (92) for $\left[Z_{k}, Z_{q}\right]$-appears rewritten in terms of the $M_{k}$ as > isolate((114), Commutator ( $M[k], M[q])$ )

$$
\begin{equation*}
\left[M_{k}, M_{q}\right]_{-}=\mathrm{i} \hbar \epsilon_{c k q} L_{c} \tag{115}
\end{equation*}
$$

Likewise, inserting (112) $\equiv Z_{n}=M_{n} \frac{\sqrt{2} \sqrt{-E}}{\sqrt{m_{e}}}$ into the expression $\mathbf{( 6 1 )} \equiv\left[L_{q}, Z_{k}\right]_{-}=-\hbar \mathbf{i} \epsilon_{a k q} Z_{a}$, we get it rewritten in terms of $L_{q}, M_{k}$
>Simplify(SubstituteTensor((112),(61)))

$$
\begin{equation*}
\frac{\sqrt{2} \sqrt{-E}\left[L_{q}, M_{k}\right]_{-}}{\sqrt{m_{e}}}=\frac{-\mathrm{i} \hbar \epsilon_{a k q} M_{a} \sqrt{2} \sqrt{-E}}{\sqrt{m_{e}}} \tag{116}
\end{equation*}
$$

> isolate ((116), Commutator $(L[q], M[k]))$

$$
\begin{equation*}
\left[L_{q}, M_{k}\right]_{-}=-\mathrm{i} \hbar \epsilon_{a k q} M_{a} \tag{117}
\end{equation*}
$$

Add these two newly derived commutators to the setup
$>\operatorname{Setup}((115),(117))$

$$
\begin{align*}
& {\left[\text { algebrarules }=\left\{\left[H, L_{q}\right]_{-}=0,\left[H, Z_{k}\right]_{-}=0,\left[L_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} L_{n},\left[L_{q}, M_{k}\right]_{-}=-\mathrm{i} \hbar \epsilon_{a k q} M_{a},\left[L_{q}, Z_{k}\right]_{-}=-\mathrm{i} \hbar \epsilon_{a k k} Z_{a},\right.\right.} \\
& {\left[L_{q}, V\right]_{-}=0,\left[M_{k}, M_{q}\right]_{-}=\mathrm{i} \hbar \epsilon_{c k q} L_{c},\left[p_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} p_{n},\left[p_{k}, p_{l}\right]_{-}=0,\left[p_{q}, V\right]_{-}=\mathrm{i} \hbar V^{3} X_{q},\left[p_{q}, V^{3}\right]_{-}=3 \mathrm{i} \hbar V^{5} X_{q},} \\
& \left.\left.\left[X_{j}, L_{k}\right]_{-}=\mathrm{i} \hbar \epsilon_{j k n} X_{n},\left[X_{k}, p_{l}\right]_{-}=\mathrm{i} \hbar g_{k l},\left[X_{k}, V\right]_{-}=0\right\}\right] \tag{118}
\end{align*}
$$

These commutators (117), (115), together with the departing commutator
$>(\%$ Commutator $=$ Commutator $)(L[m], L[n])$

$$
\begin{equation*}
\left[L_{m}, L_{n}\right]_{-}=\mathrm{i} \hbar \epsilon_{a m n} L_{a} \tag{119}
\end{equation*}
$$

constitute a closed form, the algebra of the $\mathrm{SO}(4)$ group, that is, the rotation group in dimension 4.
We now define the two operators $J$ and $K$ as follows
$>J[m]=\frac{1}{2} \cdot(L[m]+M[m])$

$$
\begin{equation*}
J_{m}=\frac{L_{m}}{2}+\frac{M_{m}}{2} \tag{120}
\end{equation*}
$$

$>K[m]=\frac{1}{2} \cdot(L[m]-M[m])$

$$
\begin{equation*}
K_{m}=\frac{L_{m}}{2}-\frac{M_{m}}{2} \tag{121}
\end{equation*}
$$

Because $M$ and $L$ both commute with $H$ (since $M$ is proportional to $Z$ up-to a commutative factor), it is straightforward to see that $J$ and $K$ also commute with $H$. They are therefore constants of the motion. Additionally, because at this point (see (118)) the system already knows about the commutators (115) $\equiv\left[M_{k}, M_{q}\right]_{-}$and (117) $\equiv\left[L_{q}, M_{k}\right]_{-}$, the commutator between the components of $J_{m}$ results in
$>$ Commutator $((\mathbf{1 2 0})$, SubstituteTensorIndices $(m=n,(\mathbf{1 2 0})))$

$$
\begin{equation*}
\left[J_{m}, J_{n}\right]_{-}=\frac{\mathrm{i}}{4}\left(\left(L_{a}+2 M_{a}\right) \epsilon_{a m n}+\epsilon_{c m n} L_{c}\right) \hbar \tag{122}
\end{equation*}
$$

>Simplify ((122))

$$
\begin{equation*}
\left[J_{m}, J_{n}\right]_{-}=\frac{\mathrm{i}}{2} \epsilon_{a m n} \hbar\left(L_{a}+M_{a}\right) \tag{123}
\end{equation*}
$$

>SubstituteTensor $((r h s=l h s)((\mathbf{1 2 0})),(\mathbf{1 2 3}))$

$$
\begin{equation*}
\left[J_{m}, J_{n}\right]_{-}=\mathrm{i} \epsilon_{a m n} \hbar J_{a} \tag{124}
\end{equation*}
$$

In a similar manner
$>$ Commutator $((\mathbf{1 2 1})$, SubstituteTensorIndices $(m=n,(\mathbf{1 2 1})))$

$$
\begin{equation*}
\left[K_{m}, K_{n}\right]_{-}=\frac{\mathrm{i}}{4}\left(\left(L_{a}-2 M_{a}\right) \epsilon_{a m n}+\epsilon_{c m n} L_{c}\right) \hbar \tag{125}
\end{equation*}
$$

## > Simplify((125))

$$
\begin{equation*}
\left[K_{m}, K_{n}\right]_{-}=\frac{\mathrm{i}}{2} \epsilon_{a m n} \hbar\left(L_{a}-M_{a}\right) \tag{126}
\end{equation*}
$$

$>$ SubstituteTensor $((r h s=l h s)((\mathbf{1 2 1})),(\mathbf{1 2 6}))$

$$
\begin{equation*}
\left[K_{m}, K_{n}\right]_{-}=\mathrm{i} \epsilon_{a m n} \hbar K_{a} \tag{127}
\end{equation*}
$$

Also
$>\operatorname{Commutator}((\mathbf{1 2 0}), \operatorname{subs}(m=n,(\mathbf{1 2 1})))$

$$
\begin{equation*}
\left[J_{m}, K_{n}\right]_{-}=\frac{\mathrm{i}}{4} \hbar\left(\epsilon_{a m n} L_{a}-\epsilon_{c m n} L_{c}\right) \tag{128}
\end{equation*}
$$

>Simplify $((\mathbf{1 2 8}))$

$$
\begin{equation*}
\left[J_{m}, K_{n}\right]_{-}=0 \tag{129}
\end{equation*}
$$

Both $J$ and $K$ have the symmetry of a rotation operator in two independent 3 dimension spaces. $H$ then has the symmetry of the group $\mathrm{SO}(3) \otimes \mathrm{SO}(3)$. Furthermore, one knows that the possible eigenvalues for the rotation operators $J$ and $K$ are $j(j+1) \hbar^{2}$ and $k(k+1) \hbar^{2}$, with $j, k \in\left\{0, \frac{1}{2}, 1, \frac{3}{2}, 2, \ldots\right\}$. Computing now $J^{2}$
$>\operatorname{Expand}\left((\mathbf{1 2 0})^{2}\right)$

$$
\begin{equation*}
J_{m}{ }^{2}=\frac{L_{m}{ }^{2}}{4}+\frac{L_{m} M_{m}}{2}+\frac{M_{m}{ }^{2}}{4} \tag{130}
\end{equation*}
$$

Recalling (66) $\equiv L_{k} Z_{k}=0$, and considering that $M$ is proportional to $Z$, we have that $L_{m} M_{m}=0$ $>\operatorname{subs}(L[m] M[m]=0,(\mathbf{1 3 0}))$

$$
\begin{equation*}
J_{m}{ }^{2}=\frac{L_{m}{ }^{2}}{4}+\frac{M_{m}{ }^{2}}{4} \tag{131}
\end{equation*}
$$

Likewise, for $K^{2}$, from $(\mathbf{1 2 1}) \equiv K_{m}=\frac{L_{m}}{2}-\frac{M_{m}}{2}$
$>\operatorname{Expand}\left((\mathbf{1 2 1})^{2}\right)$

$$
\begin{equation*}
K_{m}{ }^{2}=\frac{L_{m}{ }^{2}}{4}-\frac{L_{m} M_{m}}{2}+\frac{M_{m}{ }^{2}}{4} \tag{132}
\end{equation*}
$$

$>\operatorname{subs}(L[m] M[m]=0,(\mathbf{1 3 2}))$

$$
\begin{equation*}
K_{m}{ }^{2}=\frac{L_{m}{ }^{2}}{4}+\frac{M_{m}{ }^{2}}{4} \tag{133}
\end{equation*}
$$

So that
$>(131)-(133)$

$$
\begin{equation*}
J_{m}{ }^{2}-K_{m}{ }^{2}=0 \tag{134}
\end{equation*}
$$

That is, $J_{m}{ }^{2}=K_{m}{ }^{2}$, which means they share the same eigenvalues, say $j(j+1) \hbar^{2}$ for a given eigenstate of $H$ with the considered eigenvalue $E$. Next, inserting (112) $\equiv Z_{n}=M_{n} \frac{\sqrt{2} \sqrt{-E}}{\sqrt{m_{e}}}$ into (107) $\equiv Z_{k}{ }^{2}=\frac{2 H\left(\hbar^{2}+L_{a}{ }^{2}\right)}{m_{e}}+\kappa^{2}$ we get an expression for $M_{k}{ }^{2}$
$>\operatorname{SubstituteTensor}(H=E,(112),(107))$

$$
\begin{equation*}
-\frac{2 E M_{k}^{2}}{m_{e}}=\frac{2 E\left(\hbar^{2}+L_{a}^{2}\right)}{m_{e}}+\kappa^{2} \tag{135}
\end{equation*}
$$

$>-\frac{m_{e}}{2 E}(\mathbf{1 3 5})$

$$
\begin{equation*}
M_{k}^{2}=-\frac{2 \hbar^{2} E+2 E L_{a}^{2}+\kappa^{2} m_{e}}{2 E} \tag{136}
\end{equation*}
$$

Substituting this result into (131) $\equiv J_{m}{ }^{2}=\frac{L_{m}{ }^{2}}{4}+\frac{M_{m}{ }^{2}}{4}$ and simplifying we get
> Simplify(SubstituteTensor((136), (131)))

$$
\begin{equation*}
J_{m}{ }^{2}=-\frac{\hbar^{2}}{4}-\frac{\kappa^{2} m_{e}}{8 E} \tag{137}
\end{equation*}
$$

Taking the average value of $J_{m}{ }^{2}$ over an eigenvector, $J_{m}{ }^{2}$ can be replaced by its eigenvalue $j(j+1) \hbar^{2}$ $>\operatorname{subs}\left(J[m]^{2}=j(j+1) \hbar^{2},(137)\right)$

$$
\begin{equation*}
j(j+1) \hbar^{2}=-\frac{\hbar^{2}}{4}-\frac{\kappa^{2} m_{e}}{8 E} \tag{138}
\end{equation*}
$$

from where the possible values of the energy are
> isolate((138), E)

$$
\begin{equation*}
E=-\frac{\kappa^{2} m_{e}}{2 \hbar^{2}(2 j+1)^{2}} \tag{139}
\end{equation*}
$$

Assuming $n=2 j+1$, a positive integer and $j \in\left\{0, \frac{1}{2}, 1, \frac{3}{2}, 2, \ldots\right\}$, the spectrum for a spinless hydrogen atom is thus $>\operatorname{subs}(\{2 j+1=n, E=E(n)\},(\mathbf{1 3 9}))$

$$
\begin{equation*}
E(n)=-\frac{\kappa^{2} m_{e}}{2 \hbar^{2} n^{2}} \tag{140}
\end{equation*}
$$

## 7. Conclusions

In this presentation, we derived, step-by-step, the $\mathrm{SO}(4)$ symmetry of the hydrogen atom and its spectrum using the computer algebra Maple system. The derivation was performed without departing from the results, entering only the main definition formulas in eqs. (1), (2) and (5), followed by using a few simplification commands - mainly Simplify, SortProducts and SubstituteTensor - and a handful of Maple basic commands, subs, lhs, rhs and isolate. The computational path that was used to get the results of sections 2 to 8 is not unique. Instead of searching for the shortest path, we prioritized clarity and illustration of the techniques that can be used to work on problems like this one.

This problem is mainly about simplifying expressions using two different techniques. First, expressions with noncommutative operands in products need reduction with respect to the commutator algebra rules that have been set. Second, products of tensorial operators require simplification using the sum rule for repeated indices and the symmetries of tensorial subexpressions. Those techniques, which are part of the Maple Physics simplifier, together with the SortProducts and SubstituteTensor commands for sorting the operands in products to apply tensorial identities, sufficed. The derivations were performed in a reasonably small number of steps.

Two different computational strategies - with and without differential operators - were used in sections 3 and 5, showing a way to verify results, a relevant issue in general when performing complicated algebraic manipulations. The Maple Physics' ability to handle differential operators as noncommutative operands in products (as frequently done in paper and pencil computations) facilitates readability and ease in entering the computations. The complexity of those operations is then handled by one Physics:-Library command, ApplyProductsOfDifferentialOperators (see eqs. (45) and (82)).

It is interesting to note: a) the ability of the system to factor expressions involving products of noncommutative operands (see eqs. (89) and (107)) and b) the adaptation of the algorithms for simplifying tensorial expressions [6] to the noncommutativity domain, used throughout this presentation.

Also worth mentioning, the use of equation labels can reduce the whole computation to entering the main definitions, followed by applying a few commands to equation labels. That approach helps to reduce the chance of typographical errors to a very strict minimum. Likewise, the fact that commands and equations distribute over each other allows cumbersome manipulations to be performed in simple ways, as done, for instance, in eqs. (8), (9) and (13). Additionally, it was helpful to have the display of each intermediate result automatically expressed using standard mathematical physics notation.

Finally, if this work focused on a well-known case, the employed tools can be used to tackle a wide range of hot topics research in the quantum mechanics field, and beyond. To give but a few examples, recently (work in progress - see related Mapleprimes post [7]), we reproduced the calculus performed in [8]. This paper evaluates the constraints of magnetostatic traps for neutral cold atoms and Bose Einstein condensates. Besides, the overall possibilities includes the general framework of periodically driven systems, notably requiring Taylor development to approximate commutators [9]. The calculus could be extended to Lie superalgebra in the field of Anderson localization for disordered media, see [10] and supplemental material. Note that the present calculus is performed using an Euclidean metric. This feature could however easily be extended to any arbitrary metric, opening-up a wide range of possibilities to what can now be done with a computer, replacing pencil and paper.

## Acknowledgements

The Authors acknowledge Nina Cheb-Terrab for making the abstract's figure, figure 1. This work was partly supported by the French Ministry of Higher Education and Research, Hauts-de-France Regional Council and European Regional Development Fund (ERDF) through the Contrat de Projets Etat-Region (CPER Photonics for Society, P4S).

## Appendix

In this presentation, the input lines are preceded by a prompt > and the commands used are of three kinds: some basic Maple manipulation commands, the main Physics package commands to set the context of a formulation and simplify expressions, and two commands of the Physics:-Library to perform specialized operations in expressions.

## The basic Maple commands used

- interface is used once at the beginning to set the letter used to represent the imaginary unit (default is I but we used i).
- isolate is used in several places to isolate a variable in an expression, for example isolating $x$ in $a x+b=0$ results in $x=-\frac{b}{a}$.
- lhs and $r h s$ respectively get the left-hand side $A$ and right-hand side $B$ of an equation $A=B$.
- subs substitutes the left-hand side of an equation by the right-hand side in a given target, for example $\operatorname{subs}(A=$ $B, A+C$ ) results in $B+C$.
- @ is used to compose commands. So $(A @ B)(x)=(A \circ B)(x)$ is the same as $A(B(x))$. This command is useful to express an abstract combo of manipulations, for example as in (107) $\equiv($ lhs $=$ Factor $\circ r h s)$.

## The Physics commands used

- Setup is used to set algebra rules as well as the dimension of space, type of metric, and conventions such as the kind of letter used to represent indices.
- Commutator computes the commutator between two objects using the algebra rules set using Setup. If no rules are known to the system, it outputs a representation for the commutator whose basic mathematical properties (expansion, differentiation and simplification) are known by the system.
- CompactDisplay is used to avoid redundant display of the functionality of a function.
- The input $d_{-}[n]$ represents the $\partial_{n}$ tensorial differential operator.
- Define is used to define tensors, with or without specifying its components.
- Dagger computes the Hermitian transpose of an expression.
- Normal, Expand, Factor respectively normalizes, expands and factorizes expressions that involve products of noncommutative operands.
- Simplify performs simplification of tensorial expressions involving products of noncommutative factors taking into account Einstein's sum rule for repeated indices, symmetries of the indices of tensorial subexpressions and custom commutator algebra rules.
- SortProducts uses the commutation rules set using Setup to sort the non-commutative operands of a product in an indicated ordering.
- SubstituteTensor substitutes the left-hand side of a tensorial equation, possibly a sum or a product of tensors, by its right-hand side, in a target tensorial expression. The substitution is performed taking the indices as parameters and automatically resolving potential collisions of free or repeated indices.
- SubstituteTensorIndices substitutes tensor indices (represented by letters of some kind) by other tensor indices in a tensorial expression, taking care of not substituting occurrences of those same letters when they appear in the expression not as tensor indices.

## The Physics:-Library commands used

- Library:-ApplyProductsOfDifferentialOperators applies the differential operators found in a product to the product operands that appear to its right. For example, applying this command to $p V(X) m_{e}$ results in $m_{e} \cdot p(V(X))$
- Library:-EqualizeRepeatedIndices equalizes the repeated indices in the terms of a sum, so for instance applying this command to $L_{a}{ }^{2}+L_{b}{ }^{2}$ results in $2 \cdot L_{a}{ }^{2}$
