Abstract

In this paper, we discuss the convergence of the finite element solution of the Stokes equations under slip boundary condition of friction type. The weak formulation of this problem is a variational inequality of second type for which it is documented that when finite element approximation is used for its approximation, the interpolation error on the slip zone is the main factor driven the reduced convergence rate observed. The approach in this work is different. The starting point is the introduction of a truncated (cut off) function, followed by the formulation of a truncated problem which is thoroughly analysed in its continuous and discrete formulation. We show linear convergence rate of the finite element solution by assuming standard regularity of the weak solution. This improves all previous results. Numerical experiments exhibited are in agreement with the theoretical findings provide a suitable choice of the truncation parameter.

Keywords: Stokes equations; Tresca friction law; variational inequality; cut off function; truncated problem; error estimates; finite element approximation; linear convergence; numerical simulations.

1 Introduction

After a brief introduction in the modelling of a Stokes with Tresca friction boundary condition, Sect 1.2 presents the main findings of this work which is optimal convergence for the finite element solution without imposing extra regularity of the solution on the slip zone.

1.1 Stokes Equations with Tresca friction boundary condition

Let $\Omega \subset \mathbb{R}^d$ (d=2,3) be an open bounded set with boundary $\partial\Omega$ assume to be regular enough. We consider the steady incompressible Stokes equations modeled by the equations

$$-2\mu \operatorname{div} D\boldsymbol{u} + \nabla p = \boldsymbol{f} \quad \text{in } \Omega, \tag{1.1}$$

$$\operatorname{div} \boldsymbol{u} = 0 \quad \text{in } \Omega , \qquad (1.2)$$

where u(x) is the velocity, the pressure is p(x) and f(x) is the external body force applied to the fluid, while μ is the kinematic viscosity and $2Du = \nabla u + (\nabla u)^T$ is the rate of deformation. These equations are complemented by boundary conditions. For that purpose, we assume that $\partial\Omega$ is made of two components S and Γ , such that $\overline{\partial\Omega} = \overline{S \cup \Gamma}$, with $S \cap \Gamma = \emptyset$. We assume the homogeneous Dirichlet condition on Γ , that is

$$\mathbf{u} = \mathbf{0} \quad \text{on } \Gamma . \tag{1.3}$$

On the other part of the boundary S, the velocity is decomposed following its normal and tangential part; that is

$$u = u_n + u_{\tau} = (u \cdot n)n + (u \cdot \tau)\tau$$

where n is the normal outward unit vector to S and τ is the tangent vector orthogonal to n. We assume the impermeability condition

$$\mathbf{u} \cdot \mathbf{n} = 0 \quad \text{on} \quad S. \tag{1.4}$$

The force within the fluid is the Cauchy stress tensor T given by the relation

$$T = 2\mu D\boldsymbol{u} - p\boldsymbol{I}$$
 on Ω ,

I being the identity tensor. Just like the velocity, the traction Tn on S is decomposed following its normal and tangential part; that is

$$Tn = (Tn \cdot n)n + (Tn \cdot \tau)\tau$$

= $(-p + 2\mu n \cdot Dun)n + 2\mu(\tau \cdot Dun)\tau$
= $(Tn)_n + (Tn)_{\tau}$.

Let $g: S \longrightarrow (0, \infty)$ be the threshold slip function. One considers the following constitutive relation on S (see [1,2]);

$$-(Tn)_{\tau} \in g\partial |u_{\tau}|, \tag{1.5}$$

with the pointwise Euclidean norm $|\boldsymbol{v}|^2 = \boldsymbol{v} \cdot \boldsymbol{v}$. Using the definition of the sub-differential, (1.5) is equivalent to;

for all vector
$$\mathbf{v} |g|\mathbf{v}_{\tau}| - g|\mathbf{u}_{\tau}| \ge -(T\mathbf{n})_{\tau} \cdot (\mathbf{v}_{\tau} - \mathbf{u}_{\tau})$$
 on S . (1.6)

When u_{τ} is not equal zero, one has

$$-(Tn)_{\tau} = g \frac{u_{\tau}}{|u_{\tau}|}.$$

Thus, (1.6) is equivalent to

$$\begin{array}{lll} \text{if} & |(\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}}| < g & \text{then} & \boldsymbol{u}_{\boldsymbol{\tau}} = \boldsymbol{0}, \\ \\ \text{if} & |(\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}}| = g & \text{then} & \boldsymbol{u}_{\boldsymbol{\tau}} \neq \boldsymbol{0} \;, \; \text{and} \; -(\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} = g\frac{\boldsymbol{u}_{\boldsymbol{\tau}}}{|\boldsymbol{u}_{\boldsymbol{\tau}}|} \end{array} \right\} \; \text{on} \quad S \; .$$

So, when the tangential part of the traction is below the threshold, the velocity of the fluid is zero. No motion is observed on S. But when the tangential part of the traction is the same as the threshold, then the flow takes place in the opposite direction as $(Tn)_{\tau}$. From the mathematical point of view the problems reads: Find $(\boldsymbol{u}, p) \in \{\boldsymbol{v} \in \boldsymbol{H}^1(\Omega) : \boldsymbol{v}|_{\Gamma} = 0$, $\boldsymbol{v} \cdot \boldsymbol{n}|_{S} = 0\} \times \{q \in L^2(\Omega), (q, 1) = 0\}$ such that

$$J(\boldsymbol{u},q) \leq J(\boldsymbol{u},p) \leq J(\boldsymbol{v},p) \text{ for all } (\boldsymbol{v},q) \text{ admissible functions}$$

$$J(\boldsymbol{v},q) = \mu \int_{\Omega} |D\boldsymbol{v}|^2 dx - \int_{\Omega} q \operatorname{div} \boldsymbol{v} dx - \int_{\Omega} \boldsymbol{f} \cdot \boldsymbol{v} dx + \int_{S} g |\boldsymbol{v}_{\tau}| d\sigma,$$
(1.7)

where $d\sigma$ is the surface measure associated to S. This problem has been studied mathematically by many authors [1–6], see also [7–15,19] for results pertaining to finite element approximations. It is worth mentioning at this juncture that another nonlinear slip boundary condition is formulated and analysed in [20], and numerical investigation of that model is carried out in [21,22].

1.2 Main results

If the velocity and the pressure are approximated by $\mathbb{P}_2^2 \times \mathbb{P}_1$, then the finite element approximation associated to (1.1),...,(1.5) is convergent with a convergence rate of 3/4 provided that (\boldsymbol{u},p) has the regularity $H^2(\Omega)^2 \times H^1(\Omega)$. This reduced rate is mainly due to the presence of the non differentiable function (see [8–10,19])

$$j(\boldsymbol{v}) = \int_{S} g|\boldsymbol{v_{\tau}}|d\sigma$$
.

It is worth noting that optimal convergence rate is obtained if the tangential velocity is required to be H^2 on the slip zone (see [23,24,26]), or if special procedures are considered on the slip boundary [10,23,24,26]. We should also mentioned that if DG-approximations are considered, then the same remedies are required (see [27,28]) if optimal convergence is what one wants to obtain. This work analyses the convergence of the finite element problem associated to (1.1),...,(1.5) by introducing a truncated problem whereby $(Tn)_{\tau}$ is approximated by $-\frac{1}{\varepsilon}\nu_{\varepsilon g}(u_{\varepsilon\tau})$ with ε a small positive parameter and $\nu_k: \mathbb{R}^d \longrightarrow \mathbb{R}^d$ the cut off given as follows

$$u_k(\boldsymbol{x}) = \begin{cases} & \boldsymbol{x} \text{ for } |\boldsymbol{x}| < k, \\ & k \frac{\boldsymbol{x}}{|\boldsymbol{x}|} \text{ for } |\boldsymbol{x}| \ge k. \end{cases}$$

With the intermediate (truncated) problem, it is manifest that the error is treated via the triangle's inequality, and beside the velocity and pressure, we also need to estimate the quantity $\frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}) - \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}^h)$. The treatment of the later term is basically the novelty of this work and has already been analysed by F. Chouly and P. Hild in [29,32] or I. Dione in [30,31] for different problems. This work does not only differ from the ones presented in [29–32] from the modeling aspect. In the previous analyses, the focus is on the quantity $\boldsymbol{u}-\boldsymbol{u}_{\varepsilon}^h$, whereas in our work, we want to estimate the quantity $\boldsymbol{u}-\boldsymbol{u}^h$, and $p-p^h$. Finally, the fact that we are analysing a system of equations add more difficulties in our work. Assuming that the velocity and pressure of (1.1),...,(1.5) are such that $\boldsymbol{u}\in\boldsymbol{H}^{3/2+r}(\Omega)$ with $r\in(0,1/2]$, and taking $(\boldsymbol{u}_{\varepsilon},p_{\varepsilon})$ the solution of the truncated problem (see below), then there exists c independent of ε such that

$$\|\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}\|_{1} + \|p - p_{\varepsilon}\| + \varepsilon^{1/2} \left\| (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \right\|_{S} \le c\varepsilon^{1/2+r} \|\boldsymbol{u}\|_{3/2+r}, \quad (1.8)$$

where $(\boldsymbol{Tn})_{\tau}$ is tangential part of the Cauchy stress expression given as follows $(\boldsymbol{Tn})_{\tau} = 2\mu(\boldsymbol{\tau} \cdot D\boldsymbol{un})\boldsymbol{\tau}$. (1.8) shows that the truncated problem is a "good" approximation of the continuous problem, and serves as a first step towards the convergence result. Here and throughout this work, h_K stands for the diameter of each element $K \in \mathcal{T}$ and the $h = \max_{K \in \mathcal{T}} h_K$ in the underlying regular triangulation \mathcal{T} into triangles or tetrahedra in the FEM. Just like (1.8), a direct analysis of the finite element problems reveal that for $-(\boldsymbol{T}^h\boldsymbol{n})_{\tau} \in g\partial |\boldsymbol{u}_{\varepsilon}^h|$,

$$\|\boldsymbol{u}^h - \boldsymbol{u}_{\varepsilon}^h\|_1 + \|p^h - p_{\varepsilon}^h\| + \varepsilon^{1/2} \left\| (\boldsymbol{T}^h \boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}^h) \right\|_{S} \le c \varepsilon^{1/2 + r} \|g\|_{L^{\infty}(S)}.$$
 (1.9)

Just like (1.8), (1.9) express the proximity between the finite element solution (\boldsymbol{u}^h, p^h) and its truncated counterpart $(\boldsymbol{u}_{\varepsilon}^h, p_{\varepsilon}^h)$. With (1.8) and (1.9) in place, it is now important to estimate the quantities $\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^h$ and $p_{\varepsilon} - p_{\varepsilon}^h$. Thus by considering any stable finite element pair for approximating the velocity and pressure, then the surprising result of this work states that

$$\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} + \|p_{\varepsilon} - p_{\varepsilon}^{h}\| + \left(\varepsilon^{1/2} - ch^{1/2}\right) \left\|\frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h})\right\|_{S}$$

$$\leq c \inf_{\boldsymbol{v}^{h} \in \mathbb{V}_{h}} \|\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}\|_{1} + c \inf_{q^{h} \in M_{h}} \|p_{\varepsilon} - q^{h}\|,$$

$$(1.10)$$

where V_h and M_h are finite element spaces approximating the velocity and pressure respectively, and c is independent of both ε and h. It is then manifest that for $\varepsilon = (c+1)^2 h$, and using standard interpolation for the velocity and pressure, on gets a linear convergence of h for $\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^h\|_1 + \|p_{\varepsilon} - p_{\varepsilon}^h\|$. Finally, from the triangle's inequality one also obtain a linear convergence for $\|\boldsymbol{u} - \boldsymbol{u}^h\|_1 + \|p - p^h\|$. This surprising result is confirmed in all the numerical experiments of this paper. This work presents a truncation approach as a way to obtain optimal convergence of finite element approximation for variational problems where non-differentiable term is present. This approach also open the door for future applications to problems in plasticity or Bingham flow.

1.3 Outline of the paper

The rest of the paper is organised as follows.

- Section 2 is concerned with the variational formulations of the problem and existence theory.
- Section 3 introduces the truncated problem follow by thorough a priori analysis.
- Section 4 is devoted to the finite element formulation and its a priori analysis.
- Section 5 is about the formulation of the numerical scheme
- Section 6 is concerned with the implementation of the finite element solution, the verification of the theoretical results and some concluding remarks.

2 Variational formulations

We adopt the standard definitions [33] for the Sobolev spaces $H^s(D)$ and their associated inner products $(\cdot, \cdot)_{s,D}$, norms $\|\cdot\|_{s,D}$, and semi-norms $|\cdot|_{s,D}$ for $s \geq 0$. The space $H^0(D)$ coincides with $L^2(D)$, for which the norm and inner product are denoted as $\|\cdot\|_D$ and $(\cdot, \cdot)_D$, respectively. If $D = \Omega$, we drop D.

Throughout this work, boldface characters denote vector quantities, and $\mathbf{H}^1(\Omega) = H^1(\Omega)^d$ and $\mathbf{L}^2(\Omega) = L^2(\Omega)^d$.

In order to introduce the functions spaces for the analysis of the boundary value (1.1),...,(1.5), we take in a naive way the dot product between the equation (1.1) and u and integrate

the resulting equation over Ω . After utilization of the Green's formula and boundary conditions we arrived at

$$2\mu \int_{\Omega} |D\boldsymbol{u}|^2 dx + \int_{S} g|\boldsymbol{u}_{\tau}| d\sigma - \int_{\Omega} p \operatorname{div} \boldsymbol{u} dx = \langle \boldsymbol{f}, \boldsymbol{u} \rangle , \qquad (2.1)$$

with $d\sigma$ being the surface measure associated to S. In this work, we assume once and for all that $g \in L^{\infty}(S)$ and $\mathbf{f} \in L^{2}(\Omega)^{d}$. From (2.1), we introduce the following functions spaces

$$V = \{ \boldsymbol{u} \in H^1(\Omega)^d, \quad \boldsymbol{u}|_{\Gamma} = \boldsymbol{0} , \quad \boldsymbol{u} \cdot \boldsymbol{n}|_S = 0 \},$$

$$M = L_0^2(\Omega) = \left\{ v \in L^2(\Omega) \text{ with } \int_{\Omega} v(\boldsymbol{x}) dx = 0 \right\}.$$

 \mathbb{V} is a Hilbert space equipped with the standard H^1 -norm on each component, while M is a Banach space equipped with the L^2 -norm. With the spaces \mathbb{V} and M, one can introduce the weak formulation for (1.1),...,(1.5).

We multiply (1.2) by $q \in L^2(\Omega)$ and integrate over Ω . We take the dot product between (1.1) and $\boldsymbol{v} - \boldsymbol{u}$ with $\boldsymbol{v} \in \mathbb{V}$, integrate the resulting equation over Ω , apply Green's formula, and the boundary conditions (1.3), (1.4) and (1.5) we obtain:

Find
$$(\boldsymbol{u}, p) \in \mathbb{V} \times M$$
 such that for all $(\boldsymbol{v}, q) \in \mathbb{V} \times M$
 $a(\boldsymbol{u}, \boldsymbol{v} - \boldsymbol{u}) + b(\boldsymbol{v} - \boldsymbol{u}, p) + j(\boldsymbol{v}) - j(\boldsymbol{u}) \ge \ell(\boldsymbol{v} - \boldsymbol{u})$, (2.2)
 $b(\boldsymbol{u}, q) = 0$

with

$$a(\boldsymbol{u}, \boldsymbol{v}) = 2\mu \int_{\Omega} D\boldsymbol{u} : D\boldsymbol{v} \, dx , \quad b(\boldsymbol{v}, q) = -\int_{\Omega} q \operatorname{div} \boldsymbol{v} dx, \qquad (2.3)$$
$$j(\boldsymbol{v}) = \int_{S} g|\boldsymbol{v}_{\tau}| \, d\sigma , \qquad \ell(\boldsymbol{v}) = (\boldsymbol{f}, \boldsymbol{v}) ,$$

and $\mathbf{A}: \mathbf{B} = \sum_{1 \leq i,j \leq d} A_{ij} B_{ij}$. One easily proves that

Lemma 2.1 If (u, p) is the solution of (1.7) then (u, p) solves (2.2) and vice versa.

Note that the operators defined via (2.3) are well defined for $\boldsymbol{u}, \boldsymbol{v}$ in \mathbb{V} and $q \in L^2(\Omega)$. One readily verifies that $b(\cdot, \cdot)$ is continuous; that is

for all
$$(\boldsymbol{v},q) \in \mathbb{V} \times L^2(\Omega)$$
, $b(\boldsymbol{v},q) \leq ||\boldsymbol{v}||_1 ||q||_{L^2(\Omega)}$.

One of the crucial property when studying (2.2) is the following inf-sup condition: there exists β such that

$$\beta \|q\| \le \sup_{0 \neq \boldsymbol{v} \in \mathbb{V}} \frac{b(\boldsymbol{v}, q)}{\|\boldsymbol{v}\|_1} \quad \text{for all } q \in M.$$
 (2.4)

In fact (2.4) is obtained by observing that $\boldsymbol{H}_0^1(\Omega) \subset \mathbb{V}$ and the pair $(\boldsymbol{H}_0^1(\Omega), M)$ is inf-sup stable (see [34,35]), hence there exists γ such that

$$\text{for all } q \in M \ \ , \quad \sup_{0 \neq \boldsymbol{v} \in \mathbb{V}} \frac{b(\boldsymbol{v},q)}{\|\boldsymbol{v}\|_1} \geq \sup_{0 \neq \boldsymbol{v} \in \boldsymbol{H}_0^1(\Omega)} \frac{b(\boldsymbol{v},q)}{\|\boldsymbol{v}\|_1} \geq \gamma \|q\| \, .$$

At this point we recall that the Korn inequality reads: there is a constant c_K depending only on Ω such that

$$c_K \int_{\Omega} \nabla \boldsymbol{v} : \nabla \boldsymbol{v} \, dx \le \int_{\Omega} D\boldsymbol{v} : D\boldsymbol{v} \, dx \quad \text{for all } \boldsymbol{v} \in \mathbb{V} ,$$
 (2.5)

while the Poincaré-Friedreich inequality states that; there is constant c_{PF} depending only on the domain Ω such that

$$c_{\text{PF}} \int_{\Omega} |\boldsymbol{v}|^2 dx \le \int_{\Omega} \nabla \boldsymbol{v} : \nabla \boldsymbol{v} dx \quad \text{for all } \boldsymbol{v} \in \mathbb{V} .$$
 (2.6)

Thus it is manifest that the norms $\|\cdot\|_1$ and $\|\nabla\cdot\|$ are equivalent on \mathbb{V} . Thus with (2.6), one deduces that

$$2\mu c_K \|\boldsymbol{v}\|_1^2 \le a(\boldsymbol{v}, \boldsymbol{v}) \quad \text{for all} \quad \boldsymbol{v} \in \mathbb{V} .$$
 (2.7)

Next, the functional $j(\cdot)$ is convex and l.s.c (in fact even continuous) on \mathbb{V} . Thus we claim that

Proposition 2.1 If f is an element of $L^2(\Omega)^d$, and $g \in L^{\infty}(S)$, then the variational problem (2.2) has a unique solution $(\mathbf{u}, p) \in \mathbb{V} \times M$, and the following estimate hold

$$\|\boldsymbol{u}\|_1 + \|p\| < c(\Omega, \mu) \|\boldsymbol{f}\|$$
.

Moreover if S is of class C^3 and Γ of class C^2 , with $g \in H^1(S) \cap L^{\infty}(S)$, then Saito in [3] has shown that $(\mathbf{u}, p) \in \mathbf{H}^2(\Omega) \times H^1(\Omega)$, and enjoys the a priori estimate

$$\|\boldsymbol{u}\|_{2} + \|p\|_{1} \le c(\Omega, \mu)(\|\boldsymbol{f}\| + \|g\|_{1,S}).$$

Another equivalent model, is the three field formulation which reads:

Find
$$(\boldsymbol{u}, p, (\boldsymbol{T}\boldsymbol{n})_{\tau}) \in \mathbb{V} \times M \times H^{-1/2}(S)$$
 such that for all $(\boldsymbol{v}, q) \in \mathbb{V} \times M$

$$a(\boldsymbol{u}, \boldsymbol{v}) + b(\boldsymbol{v}, p) - \langle (\boldsymbol{T}\boldsymbol{n})_{\tau}, \boldsymbol{v}_{\tau} \rangle = \ell(\boldsymbol{v}) ,$$

$$b(\boldsymbol{u}, q) = 0 ,$$

$$-(\boldsymbol{T}\boldsymbol{n})_{\tau} \in g\partial |\boldsymbol{u}_{\tau}| \text{ a.e. on } S.$$

$$(2.8)$$

3 Truncated Problem

This section introduces the truncated problem and we provide a priori analysis associated to the problem.

3.1 Some preliminaries

With the cut-off function $\nu_k(\cdot)$ introduces, we check easily that for all x, y elements of \mathbb{R}^d

$$(\nu_k(\boldsymbol{x}) - \nu_k(\boldsymbol{y})) \cdot (\boldsymbol{x} - \boldsymbol{y}) \ge 0,$$

$$|\nu_k(\boldsymbol{x}) - \nu_k(\boldsymbol{y})| \le |\boldsymbol{x} - \boldsymbol{y}|.$$
 (3.1)

The truncated problem reads:

$$\begin{cases}
\operatorname{Find} (\boldsymbol{u}_{\varepsilon}, p_{\varepsilon}) \in \mathbb{V} \times M & \text{such that for all } (\boldsymbol{v}, q) \in \mathbb{V} \times M, \\
a(\boldsymbol{u}_{\varepsilon}, \boldsymbol{v}) + b(\boldsymbol{v}, p_{\varepsilon}) + \frac{1}{\varepsilon} \int_{S} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \cdot \boldsymbol{v}_{\tau} d\sigma = \ell(\boldsymbol{v}), \\
b(\boldsymbol{u}_{\varepsilon}, q) = 0.
\end{cases}$$
(3.2)

Using the Green's formula, one can show that the truncated problem (3.2) is associated to the following in the sense of distribution

$$-2\mu \operatorname{div} \varepsilon(\boldsymbol{u}_{\varepsilon}) + \nabla p_{\varepsilon} = \boldsymbol{f} \quad \text{in } \Omega ,$$

$$\operatorname{div} \boldsymbol{u}_{\varepsilon} = 0 \quad \text{in } \Omega ,$$

$$(\boldsymbol{T}(\boldsymbol{u}_{\varepsilon}, p_{\varepsilon})\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) = 0 \quad \text{on } S ,$$

$$\boldsymbol{u}_{\varepsilon}|_{\Gamma} = 0 , \quad \boldsymbol{u}_{\varepsilon} \cdot \boldsymbol{n}|_{S} = 0.$$

$$(3.3)$$

Remark 3.1 One observes that $-\frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\boldsymbol{\tau}})\approx (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}}.$

3.2 Analysis of the truncated problem

About the qualitative analysis of (3.2), we state that

Proposition 3.1 The truncated problem (3.2) has a unique solution $(\mathbf{u}_{\varepsilon}, p_{\varepsilon}) \in \mathbb{V} \times M$ and the following hold

$$\|\boldsymbol{u}_{\varepsilon}\|_{1} + \|p_{\varepsilon}\| < c(\mu)\|\boldsymbol{f}\|$$
.

Proof. The variational problem (3.2) is nonlinear monotone elliptic problem, and its existence theory is well known in the literature (see [36], Theorem 2.1, p. 171). The a priori estimate is a consequence of the coercivity of $a(\cdot, \cdot)$ and the inf-sup condition on $b(\cdot, \cdot)$.

The next result is important and prepare for the convergence result between the solution $(\boldsymbol{u}_{\varepsilon}, p_{\varepsilon})$ and (\boldsymbol{u}, p) . It is a result similar to Lemma 3.9 in [29], or theorem 2.1 in [30]. We claim that

Lemma 3.1 Let $\Omega \subset \mathbb{R}^d$, d = 2,3 be a bounded domain with polygonal boundary. let $(\boldsymbol{u}_{\varepsilon}, p_{\varepsilon})$ be the solution of (3.2) and (\boldsymbol{u}, p) the solution of (2.2). Assume that \boldsymbol{u} is in $\boldsymbol{H}^{3/2+r}(\Omega)$ with $r \in (0, 1/2]$, then the following holds

$$\left\| (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}) \right\|_{-r,S} \leq c \left(\varepsilon^{r} \left\| (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}) \right\|_{S} + \mu \varepsilon^{r-\frac{1}{2}} \left(1 + \frac{\gamma}{\beta} \right) \|\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}\|_{1} \right),$$

with c a positive constant independent of both ε and \mathbf{u} , and γ is positive given in (3.10).

Before starting its proof, it is important to recall some preliminaries introduce by [29]. Since the domain Ω is at least polygonal, we have

$$\overline{\Omega} = \bigcup_{i=1}^{N} K_i.$$

We denote by $T_{\varepsilon} = \{K\}$, a regular triangulation of Ω with the mesh size ε . Next, we define the fictitious space \mathbb{V}_{ε} given by

$$\mathbb{V}_{\varepsilon} = \{ \boldsymbol{v}_{\varepsilon} \in \mathcal{C}(\overline{\Omega})^d : \ \boldsymbol{v}_{\varepsilon}|_T \in \mathbb{P}_2(T)^d \ , \ \forall \ T \in \mathcal{T}_{\varepsilon}, \ \boldsymbol{v}_{\varepsilon}|_{\Gamma} = \boldsymbol{0} \ , \ \boldsymbol{v}_{\varepsilon} \cdot \boldsymbol{n}|_S = 0 \} \ .$$

The space of tangential traces on S for the elements in V_{ε} is

$$\mathbb{W}_{\varepsilon}(S) = \left\{ w_{\varepsilon} \in \mathcal{C}(\overline{S}) : \exists \boldsymbol{v}_{\varepsilon} \in \mathbb{V}_{\varepsilon} , \boldsymbol{v}_{\varepsilon} \cdot \boldsymbol{\tau} = \boldsymbol{w}_{\varepsilon} \text{ on } S \right\}.$$

We also introduce the $L^2(S)$ projection, $\mathcal{P}_{\varepsilon}: L^2(S) \longrightarrow \mathbb{W}_{\varepsilon}(S)$ and we assume that the triangulation $\mathcal{T}_{\varepsilon}$ on \overline{S} is quasi-uniform (in the sense defined in the context of finite element). Then for $s \in [0,1]$ and $\mathbf{v} \in \mathbf{H}^s(S)$, there exists c independent of ε such that

$$\|\mathcal{P}_{\varepsilon}\boldsymbol{v}\|_{s,S} \le c\|\boldsymbol{v}\|_{s,S} ,$$

$$\|\mathcal{P}_{\varepsilon}\boldsymbol{v} - \boldsymbol{v}\|_{S} \le c\varepsilon^{s}\|\boldsymbol{v}\|_{s,S} .$$
 (3.4)

Finally assuming that the mesh on \overline{S} is quasi-uniform, then there exists an extension operator $\mathcal{E}_{\varepsilon}: \mathbb{W}_{\varepsilon}(S) \longrightarrow \mathbb{V}_{\varepsilon}$ and c independent of ε such that

$$\mathcal{E}_{\varepsilon}(\boldsymbol{v}_{\varepsilon})|_{S} \cdot \boldsymbol{\tau} = \boldsymbol{v}_{\varepsilon}, \quad \|\mathcal{E}_{\varepsilon}\boldsymbol{v}_{\varepsilon}\|_{1,\Omega} \leq c\|\boldsymbol{v}\|_{\frac{1}{2},S}, \quad \text{for all} \quad \boldsymbol{v}_{\varepsilon} \in \mathbb{W}_{\varepsilon}(S).$$
 (3.5)

Proof of Lemma 3.1. By definition

$$\left\| (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}) \right\|_{-r,S} = \sup_{\boldsymbol{w} \in H^r(S)} \frac{\langle (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}), \boldsymbol{w} \rangle_S}{\|\boldsymbol{w}\|_{r,S}}$$

But from the representation $\boldsymbol{w} = \boldsymbol{w} - \mathcal{P}_{\varepsilon} \boldsymbol{w} + \mathcal{P}_{\varepsilon} \boldsymbol{w}$, one deduces that

$$\left\| (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}) \right\|_{-r,S}$$

$$\leq \sup_{\boldsymbol{w}\in H^{r}(S)} \frac{\left| \langle (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}), \boldsymbol{w} - \mathcal{P}_{\varepsilon}\boldsymbol{w} \rangle_{S} \right|}{\|\boldsymbol{w}\|_{r,S}} + \sup_{\boldsymbol{w}\in H^{r}(S)} \frac{\left| \langle (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}), \mathcal{P}_{\varepsilon}\boldsymbol{w} \rangle_{S} \right|}{\|\boldsymbol{w}\|_{r,S}}$$

$$\leq \left\| (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}) \right\|_{S} \sup_{\boldsymbol{w}\in H^{r}(S)} \frac{\|\boldsymbol{w} - \mathcal{P}_{\varepsilon}\boldsymbol{w}\|_{S}}{\|\boldsymbol{w}\|_{r,S}} + \sup_{\boldsymbol{w}\in H^{r}(S)} \frac{\left| \langle (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}), \mathcal{P}_{\varepsilon}\boldsymbol{w} \rangle_{S} \right|}{\|\boldsymbol{w}\|_{r,S}}$$

$$\leq c\varepsilon^{r} \left\| (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}) \right\|_{S} + \sup_{\boldsymbol{w}\in H^{r}(S)} \frac{\left| \langle (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}), \mathcal{P}_{\varepsilon}\boldsymbol{w} \rangle_{S} \right|}{\|\boldsymbol{w}\|_{r,S}}.$$

$$(3.6)$$

One readily get that for $v \in \mathbb{V}$ and $u \in H^{3/2+r}(\Omega)$, one has $(Tn)_{\tau} \in H^{r}(S)$, and

$$a(\boldsymbol{u}, \boldsymbol{v}) + b(\boldsymbol{v}, p) - \int_{S} (\boldsymbol{T} \boldsymbol{n})_{\tau} \cdot \boldsymbol{v}_{\tau} d\sigma = \ell(\boldsymbol{v})$$

$$a(\boldsymbol{u}_{\varepsilon}, \boldsymbol{v}) + b(\boldsymbol{v}, p_{\varepsilon}) + \frac{1}{\varepsilon} \int_{S} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \cdot \boldsymbol{v}_{\tau} d\sigma = \ell(\boldsymbol{v}) ,$$
(3.7)

from which we deduce that

$$\int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \right) \cdot \boldsymbol{v}_{\tau} d\sigma = a(\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}, \boldsymbol{v}) + b(\boldsymbol{v}, p - p_{\varepsilon}) \quad . \tag{3.8}$$

Thus for $\boldsymbol{v}|_S = \mathcal{P}_{\varepsilon}\boldsymbol{w}$, one obtains

$$\int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}) \right) \cdot \mathcal{P}_{\varepsilon} \boldsymbol{w} d\sigma
= a(\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}, \mathcal{E}_{\varepsilon} \mathcal{P}_{\varepsilon} \boldsymbol{w}) + b(\mathcal{E}_{\varepsilon} \mathcal{P}_{\varepsilon} \boldsymbol{w}, p - p_{\varepsilon})
\leq 2\mu \|\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}\|_{1} \|\mathcal{E}_{\varepsilon} \mathcal{P}_{\varepsilon} \boldsymbol{w}\|_{1} + \|p - p_{\varepsilon}\| \|\mathcal{E}_{\varepsilon} \mathcal{P}_{\varepsilon} \boldsymbol{w}\|_{1}
\leq c \left(2\mu \|\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}\|_{1} + \|p - p_{\varepsilon}\|\right) \|\mathcal{P}_{\varepsilon} \boldsymbol{w}\|_{\frac{1}{2}, S}
\leq c \varepsilon^{r - \frac{1}{2}} \left(2\mu \|\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}\|_{1} + \|p - p_{\varepsilon}\|\right) \|\mathcal{P}_{\varepsilon} \boldsymbol{w}\|_{r, S}.$$
(3.9)

It is apparent to close the inequality (3.9), we need to estimate $||p - p_{\varepsilon}||$. Let \boldsymbol{v} such that $\boldsymbol{v}|_{\partial\Omega} = 0$. Then from (3.7) one finds

$$b(\boldsymbol{v}, p_{\varepsilon} - p) = a(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}, \boldsymbol{v}) ,$$

which together with (2.4) gives

$$||p_{\varepsilon} - p|| \le \frac{\gamma \mu}{\beta} ||\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}||_{1} , \qquad (3.10)$$

where γ is positive and will be made precise later. Returning to (3.9) with (3.10) one has

$$\int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \right) \cdot \mathcal{P}_{\varepsilon} \boldsymbol{w} d\sigma \leq c\mu \varepsilon^{r - \frac{1}{2}} \left(1 + \frac{\gamma}{\beta} \right) \|\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}\|_{1} \|\mathcal{P}_{\varepsilon} \boldsymbol{w}\|_{r,S}.$$
 (3.11)

Finally (3.11) and (3.6) lead to the desired inequality and the proof is complete.

Remark 3.2 *If* r = 1/2, then from (3.8)

$$\left\| (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}) \right\|_{-1/2.S} \leq 2\mu \|\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}\|_{1} + \|\boldsymbol{p} - \boldsymbol{p}_{\varepsilon}\|.$$

The solution (\boldsymbol{u}, p) is closer to $(\boldsymbol{u}_{\varepsilon}, p_{\varepsilon})$ in the following way

Proposition 3.2 Let (\mathbf{u}, p) be the weak solution of (1.1), ..., (1.5) such that $\mathbf{u} \in \mathbf{H}^{3/2+r}(\Omega)$ with $r \in (0, 1/2]$. Let $(\mathbf{u}_{\varepsilon}, p_{\varepsilon})$ be the truncated solution defined via (3.2). Then there exists c independent of ε such that

$$\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}\|_{1} + \|p - p_{\varepsilon}\| + \varepsilon^{1/2} \|(\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{g\varepsilon}(\boldsymbol{u}_{\varepsilon\tau})\|_{S} \le c\varepsilon^{\frac{1+2r}{2}} \|\boldsymbol{u}\|_{r+3/2}.$$

Proof. Let $\boldsymbol{u} \in \boldsymbol{H}^{r+3/2}(\Omega)$ with $r \in (0, 1/2]$. Then $(\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} \in \boldsymbol{H}^r(S)$. So for $(\boldsymbol{v}, q) \in \mathbb{V} \times M$, one gets

$$a(\boldsymbol{u}, \boldsymbol{v}) + b(\boldsymbol{v}, p) - \langle (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}}, \boldsymbol{v}_{\boldsymbol{\tau}} \rangle_{S} = \ell(\boldsymbol{v})$$

$$a(\boldsymbol{u}_{\varepsilon}, \boldsymbol{v}) + b(\boldsymbol{v}, p_{\varepsilon}) + \frac{1}{\varepsilon} \int_{S} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}) \cdot \boldsymbol{v}_{\boldsymbol{\tau}} d\sigma = \ell(\boldsymbol{v}) , \qquad (3.12)$$

$$b(\boldsymbol{u}_{\varepsilon}, q) = 0 , \quad b(\boldsymbol{u}, q) = 0 .$$

From (3.12) and the coercivity of $a(\cdot, \cdot)$, one has

$$2\mu c_{K} \| \boldsymbol{u}_{\varepsilon} - \boldsymbol{u} \|_{1}^{2} \leq a(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}, \boldsymbol{u}_{\varepsilon} - \boldsymbol{u})$$

$$= a(\boldsymbol{u}_{\varepsilon}, \boldsymbol{u}_{\varepsilon} - \boldsymbol{u}) - a(\boldsymbol{u}, \boldsymbol{u}_{\varepsilon} - \boldsymbol{u})$$

$$= b(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}, p - p_{\varepsilon}) + \int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \right) \cdot (\boldsymbol{u}_{\tau} - \boldsymbol{u}_{\varepsilon \tau}) d\sigma$$

$$\leq \| \boldsymbol{u}_{\varepsilon} - \boldsymbol{u} \|_{1} \| p - p_{\varepsilon} \| + \int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \right) \cdot \boldsymbol{u}_{\tau} d\sigma$$

$$- \int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \right) \cdot \boldsymbol{u}_{\varepsilon \tau} d\sigma$$

$$\leq \frac{\mu \gamma}{\beta} \| \boldsymbol{u}_{\varepsilon} - \boldsymbol{u} \|_{1}^{2} + \int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \right) \cdot \boldsymbol{u}_{\tau} d\sigma$$

$$- \int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \right) \cdot \boldsymbol{u}_{\varepsilon \tau} d\sigma,$$

$$(3.13)$$

where we have used (3.10) in the last inequality. Note that for $|(\boldsymbol{T}\boldsymbol{n})_{\tau}| < g$, then $\boldsymbol{u}_{\tau} = \mathbf{0}$ and $((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau})) \cdot \boldsymbol{u}_{\tau} = 0$ for $|(\boldsymbol{T}\boldsymbol{n})_{\tau}| = g$. Thus from the definition of $\nu_{\varepsilon g}$, one has

$$\left((\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}) \right) \cdot \boldsymbol{u}_{\boldsymbol{\tau}} = -g|\boldsymbol{u}_{\boldsymbol{\tau}}| + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}) \cdot \boldsymbol{u}_{\boldsymbol{\tau}} \leq -g|\boldsymbol{u}_{\boldsymbol{\tau}}| + \frac{1}{\varepsilon} |\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}})| |\boldsymbol{u}_{\boldsymbol{\tau}}| \leq 0.$$

We take γ such that

$$\gamma < c_K \beta. \tag{3.14}$$

Thus (3.13) imply that

$$\mu \underbrace{\left(c_{K} - \frac{\gamma}{\beta}\right)}_{\geq 0} \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}\|_{1}^{2} \leq -\int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau})\right) \cdot \boldsymbol{u}_{\varepsilon\tau} d\sigma$$

$$\leq -\int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau})\right) \cdot \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}) d\sigma$$

$$\leq -\varepsilon \int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau})\right) \cdot \left(-(\boldsymbol{T}\boldsymbol{n})_{\tau} + (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau})\right) d\sigma$$

$$\leq -\varepsilon \left\|(\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau})\right\|_{S}^{2} + \varepsilon \int_{S} \left((\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau})\right) \cdot (\boldsymbol{T}\boldsymbol{n})_{\tau} d\sigma,$$

which can be re-written with the help of Cauchy-Shawrz and Holder inequality as follows

$$\mu\left(c_{K} - \frac{\gamma}{\beta}\right) \qquad \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}\|_{1}^{2} + \varepsilon \left\| (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\boldsymbol{\tau}}) \right\|_{S}^{2}$$

$$\leq \varepsilon^{a} \left\| (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\boldsymbol{\tau}}) \right\|_{-r,S} \varepsilon^{1-a} \|(\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}}\|_{r,S}$$

$$\leq \frac{\varepsilon^{2a}}{2\alpha} \left\| (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\boldsymbol{\tau}}) \right\|_{-r,S}^{2} + c\mu^{2}\varepsilon^{2-2a}\frac{\alpha}{2} \|\boldsymbol{u}\|_{r+3/2}^{2}, \quad (3.15)$$

with a and α positive constants that will be made precise later. We Insert in (3.15), Lemma 3.1 and obtain the following

$$\mu\left(c_{K} - \frac{\gamma}{\beta}\right) \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}\|_{1}^{2} + \varepsilon \left\|(\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau})\right\|_{S}^{2} \leq c\mu^{2}\varepsilon^{2-2a}\frac{\alpha}{2}\|\boldsymbol{u}\|_{r+3/2}^{2}$$
$$+ c\frac{\varepsilon^{2a}}{2\alpha} \left(\varepsilon^{2r} \left\|(\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau})\right\|_{S}^{2} + \mu^{2}\varepsilon^{2r-1} \left(1 + \frac{\gamma}{\beta}\right)^{2} \|\boldsymbol{u} - \boldsymbol{u}_{\varepsilon}\|_{1}^{2}\right),$$

which for $a = \frac{1}{2} - r$, gives

$$\mu \left[\left(c_{K} - \frac{\gamma}{\beta} \right) - \frac{c\mu}{\alpha} \left(1 + \frac{\gamma}{\beta} \right)^{2} \right] \| \boldsymbol{u} - \boldsymbol{u}_{\varepsilon} \|_{1}^{2} + \varepsilon \left(1 - \frac{c}{\alpha} \right) \| (\boldsymbol{T}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}) \|_{S}^{2}$$

$$\leq c\mu^{2} \varepsilon^{1 + 2r} \frac{\alpha}{2} \| \boldsymbol{u} \|_{r + 3/2}^{2}.$$
(3.16)

Finally for $\alpha \ge \max\left(c, \frac{c\mu(1+\gamma/\beta)^2}{c_K-\gamma/\beta}\right)$, we deduce that there is c independent of ε such that

$$\|oldsymbol{u}_{arepsilon} - oldsymbol{u}\|_1^2 + arepsilon \left\| (oldsymbol{T}oldsymbol{n})_{oldsymbol{ au}} + rac{1}{arepsilon}
u_{arepsilon g}(oldsymbol{u}_{arepsilon au})
ight\|_S^2 \leq c arepsilon^{1+2r} \|oldsymbol{u}\|_{r+3/2}^2 \,,$$

which is the desired result.

Remark 3.3 From lemma 3.1 and Proposition 3.2, we deduce that

$$\left\| (\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}) \right\|_{-r,S} \le c \varepsilon^{2r} \|\boldsymbol{u}\|_{r+3/2}.$$
(3.17)

4 Finite element Analysis

This section introduces notation pertinent to finite element discretization. We prove (1.9) and (1.10), which together with (1.8) gives an estimation for $\|\boldsymbol{u} - \boldsymbol{u}^h\|_1 + \|\boldsymbol{p} - \boldsymbol{p}^h\|$.

4.1 Preliminaries

The domain $\Omega \subset \mathbb{R}^d$ is assumed to be polygonal and convex. In order to approximate the variational formulations presented above, we introduce a regular family (\mathcal{T} of triangulations of Ω by closed triangles if d=2 or tetrahedra for d=3, in the sense that (see [37])

(a)
$$\overline{\Omega} = \bigcup_{1 \le n \le N} K_n$$
.

- (b) the intersection of two different elements is either empty, a corner, or a whole edge of both elements.
- (c) The ratio of the diameter h_K of an element K in \mathcal{T} to the diameter of its inscribed circle or sphere is bounded by a constant independent of K and h.

As standard, h stands for the maximum of the diameters of the elements of \mathcal{T} . For each non-negative integer n and any K in \mathcal{T} , $\mathbb{P}_l(K)$ is the space of restrictions to K of polynomials with two variables and total degree less than or equal to l. We have chosen to work with the Taylor-Hood finite elements [34,35], thus the discrete spaces of velocities and pressures are defined by

$$\mathbb{V}_h = \{ \boldsymbol{v}^h \in \mathcal{C}(\overline{\Omega})^d \cap \mathbb{V} : \text{ for all } K \in \mathcal{T}, \ \boldsymbol{v}^h|_K \in \mathbb{P}_2(K)^d \} ,$$
$$M_h = \{ q^h \in M \cap \mathcal{C}(\overline{\Omega}), \text{ for all } K \in \mathcal{T}, \ q^h|_K \in \mathbb{P}_1(K) \} .$$

It is noted that the couple velcity/pressure is inf-sup stable that is; there exists c independent of h such that

$$c\|q^h\| \le \sup_{0 \neq \boldsymbol{v}^h \in \mathbb{V}_h} \frac{b(\boldsymbol{v}^h, q^h)}{\|\boldsymbol{v}^h\|_1} \quad \text{for all } q^h \in M_h.$$
 (4.1)

Remark 4.1 It should be made clear that other choice of elements for the couple velocity/pressure can be adopted as long as the compatibility condition (4.1) is satisfied. The reader may consult [34,35] for a thorough mathematical discussion of the inf-sup condition (4.1), its implications and elements that satisfied the "test".

We also introduce $W_h(S)$, the space of traces on S for discrete functions in \mathbb{V}_h :

$$W_h(S) = \{ \alpha^h \in \mathcal{C}(\overline{S}); \exists v^h \in V_h, v^h \cdot \tau = \alpha^h \text{ on } S \}.$$

We assume that the mesh on S is the one induced by \mathcal{T} . Hence the mesh of S is locally quasi-uniform. We also introduce the $L^2(S)$ projection, $\mathcal{P}_h: L^2(S) \longrightarrow \mathbb{W}_h(S)$ and because the triangulation \mathcal{T} on \overline{S} is quasi-uniform, then for $s \in [0,1]$ and $\mathbf{v} \in \mathbf{H}^s(S)$, there exists c independent of h such that [29]

$$\|\mathcal{P}_{h}\boldsymbol{v}\|_{s,S} \leq c\|\boldsymbol{v}\|_{s,S} ,$$

$$\|\mathcal{P}_{h}\boldsymbol{v} - \boldsymbol{v}\|_{S} \leq ch^{s}\|\boldsymbol{v}\|_{s,S} .$$
 (4.2)

Finally assuming that the mesh on \overline{S} is quasi-uniform, then there exists an extension operator $\mathcal{E}_h : \mathbb{W}_h(S) \longrightarrow \mathbb{V}_h$ and c independent of h such that [29]

$$\mathcal{E}_h(\boldsymbol{v}^h)|_{S} \cdot \boldsymbol{\tau} = \boldsymbol{v}^h, \quad \left\| \mathcal{E}_h \boldsymbol{v}^h \right\|_{1,\Omega} \le c \|\boldsymbol{v}^h\|_{\frac{1}{2},S}, \quad \text{for all} \quad \boldsymbol{v}^h \in \mathbb{W}_h(S).$$
 (4.3)

The finite element solution associated to the truncated problem (3.2) is defined as follows:

$$\begin{cases}
\operatorname{Find} (\boldsymbol{u}_{\varepsilon}^{h}, p_{\varepsilon}^{h}) \in \mathbb{V}_{h} \times M_{h} \text{ such that for all } (\boldsymbol{v}, q) \in \mathbb{V}_{h} \times M_{h} , \\
a(\boldsymbol{u}_{\varepsilon}^{h}, \boldsymbol{v}) + b(\boldsymbol{v}, p_{\varepsilon}^{h}) + \frac{1}{\varepsilon} \int_{S} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}^{h}) \cdot \boldsymbol{v}_{\boldsymbol{\tau}} d\sigma = \ell(\boldsymbol{v}) , \\
b(\boldsymbol{u}_{\varepsilon}^{h}, q) = 0 .
\end{cases}$$
(4.4)

We recall that (\boldsymbol{u}^h, p^h) is the solution of the finite element problem

hat
$$(\boldsymbol{u}^{h}, p^{h})$$
 is the solution of the finite element problem
$$\begin{cases}
\operatorname{Find} (\boldsymbol{u}^{h}, p^{h}) \in \mathbb{V}_{h} \times M_{h} \text{ such that for all } (\boldsymbol{v}, q) \in \mathbb{V}_{h} \times M_{h} ,\\
a(\boldsymbol{u}^{h}, \boldsymbol{v}) + b(\boldsymbol{v}, p^{h}) - \langle (\boldsymbol{T}^{h}\boldsymbol{n})_{\boldsymbol{\tau}}, \boldsymbol{v}_{\boldsymbol{\tau}} \rangle = \ell(\boldsymbol{v}) ,\\
-(\boldsymbol{T}^{h}\boldsymbol{n})_{\boldsymbol{\tau}} \in g\partial |\boldsymbol{u}_{\boldsymbol{\tau}, h}| \quad \text{on } S,\\
b(\boldsymbol{u}^{h}, q) = 0 .
\end{cases} \tag{4.5}$$

4.2 Error estimates

The analog of lemma 3.1 is

Lemma 4.1 Let $\Omega \subset \mathbb{R}^d$, be a bounded domain with polygonal boundary. let $(\mathbf{u}_{\varepsilon}^h, p_{\varepsilon}^h)$ be the solution of (4.4) and (\mathbf{u}^h, p^h) the solution of (4.5). Then the following holds

$$\left\| \left(\boldsymbol{T}^h \boldsymbol{n} \right)_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}^h) \right\|_{-r,S} \leq c \left(\varepsilon^r \left\| \left(\boldsymbol{T}^h \boldsymbol{n} \right)_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}^h) \right\|_{S} + \mu \varepsilon^{r - \frac{1}{2}} \left(1 + \frac{\gamma}{\beta} \right) \| \boldsymbol{u}^h - \boldsymbol{u}_{\varepsilon}^h \|_{1} \right) ,$$

with c positive constant independent of both ε and h.

The proof is the same as the proof of lemma 3.1. Next, the analog of proposition 3.2 reads

Proposition 4.1 Let (\mathbf{u}^h, p^h) be the solution of (4.5). Let $(\mathbf{u}^h_{\varepsilon}, p^h_{\varepsilon})$ the truncated finite element solution defined via (4.4). Then there exists c independent of both h and ε such that

$$\|\boldsymbol{u}_{\varepsilon}^{h}-\boldsymbol{u}^{h}\|_{1}+\|p^{h}-p_{\varepsilon}^{h}\|+\varepsilon^{1/2}\left\|\left(\boldsymbol{T}^{h}\boldsymbol{n}\right)_{\boldsymbol{\tau}}+\frac{1}{\varepsilon}\nu_{g\varepsilon}(\boldsymbol{u}_{\varepsilon\boldsymbol{\tau}}^{h})\right\|_{S}\leq c\varepsilon^{\frac{1+2r}{2}}\|g\|_{L^{\infty}(S)}.$$

Proof. We follow the proof of proposition 3.2. First the inequality (3.13) in this context reads

$$2\mu c_{K} \|\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}^{h}\|_{1}^{2} \leq \frac{\mu \gamma}{\beta_{h}} \|\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}^{h}\|_{1}^{2} + \int_{S} \left((\boldsymbol{T}^{h} \boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}^{h}) \right) \cdot \boldsymbol{u}_{\tau}^{h} d\sigma$$
$$- \int_{S} \left((\boldsymbol{T}^{h} \boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}^{h}) \right) \cdot \boldsymbol{u}_{\varepsilon \tau}^{h} d\sigma , \qquad (4.6)$$

where we have used the discrete version of (3.10), that is

$$||p_{\varepsilon}^{h} - p^{h}|| \le \frac{\gamma \mu}{\beta_{h}} ||\mathbf{u}_{\varepsilon}^{h} - \mathbf{u}^{h}||_{1}$$

$$(4.7)$$

with β_h the constant from the discrete inf-sup condition, independent of h and ε . The second relation in (4.5) together with the definition of $\nu_{\varepsilon q}(\boldsymbol{u}_{\varepsilon \tau}^h)$ imply that

$$\int_{S} \left((\boldsymbol{T}^{h} \boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}^{h}) \right) \cdot \boldsymbol{u}_{\tau}^{h} d\sigma \leq - \int_{S} g |\boldsymbol{u}_{\tau}^{h}| d\sigma + \int_{S} \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}^{h}) \cdot \boldsymbol{u}_{\tau}^{h} d\sigma \leq 0,$$

$$- \int_{S} \left((\boldsymbol{T}^{h} \boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}^{h}) \right) \cdot \boldsymbol{u}_{\varepsilon \tau}^{h} d\sigma \leq - \int_{S} \left((\boldsymbol{T}^{h} \boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}^{h}) \right) \cdot \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}^{h}) d\sigma.$$

We take γ such that $\gamma < c_K \beta_h$. Thus (4.6) imply that (see the derivation of (3.15))

$$\mu\left(c_{K} - \frac{\gamma}{\beta_{h}}\right) \|\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}^{h}\|_{1}^{2} + \varepsilon \left\| (\boldsymbol{T}^{h}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}^{h}) \right\|_{S}^{2}$$

$$\leq \frac{\varepsilon^{2a}}{2\alpha} \left\| (\boldsymbol{T}^{h}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}^{h}) \right\|_{-r,S}^{2} + \varepsilon^{2-2a} \frac{\alpha}{2} \|(\boldsymbol{T}^{h}\boldsymbol{n})_{\tau}\|_{r,S}^{2}.$$

$$(4.8)$$

with a and α positive constants that will be made precise later. We Insert in (4.8), Lemma 4.1 and obtain the following

$$\mu\left(c_{K} - \frac{\gamma}{\beta}\right) \|\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}^{h}\|_{1}^{2} + \varepsilon \left\| (\boldsymbol{T}^{h}\boldsymbol{n})_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}^{h}) \right\|_{S}^{2} \leq \varepsilon^{2-2a} \frac{\alpha}{2} \|(\boldsymbol{T}^{h}\boldsymbol{n})_{\tau}\|_{r,S}^{2}$$
$$+ c\frac{\varepsilon^{2a}}{2\alpha} \left(\varepsilon^{2r} \left\| \left(\boldsymbol{T}^{h}\boldsymbol{n}\right)_{\tau} + \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon\tau}^{h}) \right\|_{S}^{2} + \mu^{2}\varepsilon^{2r-1} \left(1 + \frac{\gamma}{\beta_{h}}\right)^{2} \|\boldsymbol{u}^{h} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1}^{2}\right),$$

which for $a = \frac{1}{2} - r$, gives

$$\mu \left[\left(c_{K} - \frac{\gamma}{\beta_{h}} \right) - \frac{c\mu}{\alpha} \left(1 + \frac{\gamma}{\beta_{h}} \right)^{2} \right] \| \boldsymbol{u}^{h} - \boldsymbol{u}_{\varepsilon}^{h} \|_{1}^{2} + \varepsilon \left(1 - \frac{c}{\alpha} \right) \left\| (\boldsymbol{T}^{h} \boldsymbol{n})_{\tau} + \frac{1}{\varepsilon} \nu_{\varepsilon g} (\boldsymbol{u}_{\varepsilon \tau}^{h}) \right\|_{S}^{2}$$

$$\leq \varepsilon^{2r+1} \frac{\alpha}{2} \| (\boldsymbol{T}^{h} \boldsymbol{n})_{\tau} \|_{r,S}^{2}.$$

$$(4.9)$$

Finally for $\alpha \ge \max\left(c, \frac{c\mu(1+\gamma/\beta_h)^2}{c_K-\gamma/\beta_h}\right)$, we deduce that there is c independent of ε and h such that

$$\|\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}^{h}\|_{1}^{2} + \varepsilon \left\| \left(\boldsymbol{T}^{h} \boldsymbol{n} \right)_{\boldsymbol{\tau}} + \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}^{h}) \right\|_{S}^{2} \leq \varepsilon^{2r+1} \frac{\alpha}{2} \| (\boldsymbol{T}^{h} \boldsymbol{n})_{\boldsymbol{\tau}} \|_{r,S}^{2}.$$
 (4.10)

From the second equation of (4.5) and the triangle's inequality one has

for all
$$\boldsymbol{v}^h \in \mathbb{V}_h$$
, $-\langle (\boldsymbol{T}^h \boldsymbol{n})_{\boldsymbol{\tau}}, \boldsymbol{v}_{\boldsymbol{\tau}}^h - \boldsymbol{u}_{\boldsymbol{\tau}}^h \rangle \leq \int_S g |\boldsymbol{v}_{\boldsymbol{\tau}}^h| d\sigma - \int_S g |\boldsymbol{u}_{\boldsymbol{\tau}}^h| d\sigma$

$$\leq \int_S g |\boldsymbol{v}_{\boldsymbol{\tau}}^h - \boldsymbol{u}_{\boldsymbol{\tau}}^h| d\sigma$$

$$\leq c \|g\|_{L^{\infty}(S)} \|\boldsymbol{v}_{\boldsymbol{\tau}}^h - \boldsymbol{u}_{\boldsymbol{\tau}}^h\|_{s,S}, \text{ with } r^{-1} + s^{-1} = 1.$$

Thus

$$\|(\boldsymbol{T}^h\boldsymbol{n})_{\boldsymbol{\tau}}\|_{r,S} \le c\|g\|_{L^{\infty}(S)},$$

which together with (4.10) gives the desired result.

We discuss next the a priori error estimates for the solution (\boldsymbol{u},p) of (2.2) with the regularity $\boldsymbol{u} \in \boldsymbol{H}^{3/2+r}(\Omega)$, $r \in (0,1/2]$, and its finite elements counterpart (\boldsymbol{u}^h,p^h) given by (4.5). The main result on this paragraph is stated as follows

Theorem 4.1 Let $(\mathbf{u}_{\varepsilon}^h, p_{\varepsilon}^h)$ be the solution of (4.4), and $(\mathbf{u}_{\varepsilon}, p_{\varepsilon})$ the solution of (3.2). Then there exists c independent of h, ε such that for all $(\mathbf{v}^h, q^h) \in \mathbb{V}_h \times M_h$,

$$\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} + \|p_{\varepsilon} - p_{\varepsilon}^{h}\| + \left(\varepsilon^{1/2} - ch^{1/2}\right) \left\|\frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon}\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h})\right\|_{S} \leq c\|\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}\|_{1} + c\|p_{\varepsilon} - q^{h}\|_{S}$$

Proof. We recall that $(\boldsymbol{u}_{\varepsilon}, p_{\varepsilon})$ solves

$$\begin{cases} \text{for all } (\boldsymbol{v}, q) \in \mathbb{V} \times M , \\ a(\boldsymbol{u}_{\varepsilon}, \boldsymbol{v}) + b(\boldsymbol{v}, p_{\varepsilon}) + \frac{1}{\varepsilon} \int_{S} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) \cdot \boldsymbol{v}_{\tau} d\sigma = \ell(\boldsymbol{v}) , \\ b(\boldsymbol{u}_{\varepsilon}, q) = 0 , \end{cases}$$

and $(\boldsymbol{u}_{\varepsilon}^h, p_{\varepsilon}^h)$ solves

$$\begin{cases} \text{for all } (\boldsymbol{v}^h, q^h) \in \mathbb{V}_h \times M_h \ , \\ a(\boldsymbol{u}_{\varepsilon}^h, \boldsymbol{v}^h) + b(\boldsymbol{v}^h, p_{\varepsilon}^h) + \frac{1}{\varepsilon} \int_S \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}^h) \cdot \boldsymbol{v}_{\boldsymbol{\tau}}^h d\sigma = \ell(\boldsymbol{v}^h) \ , \\ b(\boldsymbol{u}_{\varepsilon}^h, q^h) = 0 \ . \end{cases}$$

Since $\mathbb{V}_h \subset \mathbb{V}$ and $M_h \subset M$, we deduce that

$$\begin{cases}
\text{for all } (\boldsymbol{v}^h, q^h) \in \mathbb{V}_h \times M_h, \\
a(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^h, \boldsymbol{v}^h) + b(\boldsymbol{v}^h, p_{\varepsilon} - p_{\varepsilon}^h) + \frac{1}{\varepsilon} \int_{S} \left(\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}) - \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}^h) \right) \cdot \boldsymbol{v}_{\tau}^h d\sigma = 0, \\
b(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^h, q^h) = 0.
\end{cases} (4.11)$$

Step1: Inf-sup condition on $b(\cdot, \cdot)$. Let $q^h \in M_h$, the inf-sup condition on $b(\cdot, \cdot)$ and the first equation in (4.11) imply the existence of β independent of h and ε such that

$$\beta \| p_{\varepsilon}^{h} - q^{h} \| \leq \sup_{\boldsymbol{v}^{h} \in H_{0}^{1}(\Omega)} \frac{b(\boldsymbol{v}^{h}, p_{\varepsilon}^{h} - q^{h})}{\|\boldsymbol{v}^{h}\|_{1}}$$

$$\leq \sup_{\boldsymbol{v}^{h} \in H_{0}^{1}(\Omega)} \frac{b(\boldsymbol{v}^{h}, p_{\varepsilon}^{h} - p_{\varepsilon}) + b(\boldsymbol{v}^{h}, p_{\varepsilon} - q^{h})}{\|\boldsymbol{v}^{h}\|_{1}}$$

$$\leq \sup_{\boldsymbol{v}^{h} \in H_{0}^{1}(\Omega)} \frac{a(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}, \boldsymbol{v}^{h}) + b(\boldsymbol{v}^{h}, p_{\varepsilon} - q^{h})}{\|\boldsymbol{v}^{h}\|_{1}}$$

$$\leq 2\mu \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} + \|p_{\varepsilon} - q^{h}\|.$$

Thus,

$$\|p_{\varepsilon} - p_{\varepsilon}^{h}\| \le \left(1 + \frac{1}{\beta}\right) \|p_{\varepsilon} - q^{h}\| + \frac{2\mu}{\beta} \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1}. \tag{4.12}$$

Step2: coercivity on $a(\cdot, \cdot)$. Let $\mathbf{v}^h \in \mathbb{V}_h$

$$2\mu c_K \|\boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}^h\|_1^2 \le a(\boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}^h, \boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}^h)$$
$$= a(\boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}, \boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}^h) + a(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^h, \boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}^h).$$

In (4.11) we replace \boldsymbol{v}^h by $\boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}^h$, compute $a(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^h, \boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}^h)$. Then one obtains the following

$$2\mu c_{K} \| \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h} \|_{1}^{2} \leq a(\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}, \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h}) + b(\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{v}^{h}, p_{\varepsilon} - p_{\varepsilon}^{h})$$

$$+ \frac{1}{\varepsilon} \int_{S} \left(\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{v}^{h} \right) d\sigma$$

$$= a(\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}, \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h}) + b(\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}_{\varepsilon}, p_{\varepsilon} - q^{h}) + b(\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}_{\varepsilon}, q^{h} - p_{\varepsilon}^{h})$$

$$+ b(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}, p_{\varepsilon} - p_{\varepsilon}^{h}) + \frac{1}{\varepsilon} \int_{S} \left(\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{v}^{h} \right) d\sigma$$

$$= a(\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}, \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h}) + b(\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}_{\varepsilon}, p_{\varepsilon} - q^{h})$$

$$+ b(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}, p_{\varepsilon} - p_{\varepsilon}^{h}) + \frac{1}{\varepsilon} \int_{S} \left(\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{v}^{h} \right) d\sigma$$

$$(4.13)$$

where we have used the second relation in (4.11). We re-write (4.13) as follows

$$2\mu c_{K} \|\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1}^{2} + \frac{1}{\varepsilon} \int_{S} \left(\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h})\right) \cdot \left(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\right) d\sigma$$

$$\leq a(\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}, \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h}) + b(\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}_{\varepsilon}, p_{\varepsilon} - q^{h}) + b(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}, p_{\varepsilon} - p_{\varepsilon}^{h})$$

$$+ \frac{1}{\varepsilon} \int_{S} \left(\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h})\right) \cdot \left(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\right) d\sigma.$$

$$(4.14)$$

It is manifest that in order to close the inequality (4.14), we need to bound from below $\frac{1}{\varepsilon} \int_{S} \left(\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h} \right) d\sigma$ and from above $\frac{1}{\varepsilon} \int_{S} \left(\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \right) d\sigma$. We follow [31] (theorem 4, or theorem 5). First, from the definition of $\nu_{\varepsilon g}$, we have

$$\frac{1}{\varepsilon} \int_{S} \left(\nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h} \right) d\sigma = \varepsilon \int_{S} \left(\frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\frac{1}{\varepsilon} \boldsymbol{u}_{\varepsilon} - \frac{1}{\varepsilon} \boldsymbol{u}_{\varepsilon}^{h} \right) d\sigma \\
\geq \varepsilon \left\| \frac{1}{\varepsilon} \boldsymbol{u}_{\varepsilon} - \frac{1}{\varepsilon} \boldsymbol{u}_{\varepsilon}^{h} \right\|_{S}^{2} \\
\geq \varepsilon \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S}^{2}, \tag{4.15}$$

where the continuity of $\nu_{\varepsilon g}(\cdot)$ has been used. Next,

$$I = \int_{S} \left(\frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \right) d\sigma$$

$$= \int_{S} \left(\frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} - \mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}) \right) d\sigma$$

$$+ \int_{S} \left(\frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}) \right) d\sigma$$

$$\leq \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S} \left\| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} - \mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}) \right\|_{S}$$

$$+ \int_{S} \left(\frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}) \right) d\sigma$$

$$\leq ch^{1/2} \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S} \left\| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \right\|_{1}$$

$$+ \int_{S} \left(\frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}) \right) d\sigma.$$

$$(4.16)$$

From the lighting operator \mathcal{E}_h and the first equation in (4.11), one has

$$\int_{S} \left(\frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}) \right) d\sigma$$

$$= \int_{S} \left(\frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right) \cdot \left(\mathcal{E}_{h} \mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}) \right) d\sigma$$

$$= -a(\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}, \mathcal{E}_{h} \mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h})) - b(\mathcal{E}_{h} \mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}), p_{\varepsilon} - p_{\varepsilon}^{h})$$

$$\leq 2\mu \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} \|\mathcal{E}_{h} \mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h})\|_{1} + \|\mathcal{E}_{h} \mathcal{P}_{h}(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h})\|_{1} \|p_{\varepsilon} - p_{\varepsilon}^{h}\|$$

$$\leq c\mu \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\|_{1} + c\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\|_{1} \|p_{\varepsilon} - p_{\varepsilon}^{h}\|.$$
(4.17)

We replace (4.17) in (4.16) and obtain

$$I = ch^{1/2} \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S} \left\| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \right\|_{1} + c\mu \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\|_{1}$$

$$+ c\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\|_{1} \|p_{\varepsilon} - p_{\varepsilon}^{h}\|_{1}.$$

$$(4.18)$$

We insert (4.18) and (4.15) in (4.14) and obtain

$$2\mu c_{K} \| \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h} \|_{1}^{2} + \varepsilon \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S}^{2}$$

$$\leq a(\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}, \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h}) + b(\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{u}_{\varepsilon}, p_{\varepsilon} - q^{h}) + b(\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}, p_{\varepsilon} - p_{\varepsilon}^{h})$$

$$+ ch^{1/2} \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S} \left\| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \right\|_{1} + c\mu \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\|_{1} + c\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\|_{1} \|\boldsymbol{p}_{\varepsilon} - p_{\varepsilon}^{h}\|_{1}$$

$$\leq 2\mu \|\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}\|_{1} \|\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} + \|\boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{v}^{h}\|_{1} \|\boldsymbol{p}_{\varepsilon} - q^{h}\| + \|\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}\|_{1} \|\boldsymbol{p}_{\varepsilon} - q^{h}\| + \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\|_{1} \|\boldsymbol{p}_{\varepsilon} - p_{\varepsilon}^{h}\|_{1}$$

$$+ ch^{1/2} \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S} \left\| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \right\|_{1} + c\mu \left(\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\|_{1} + \|\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} \right) \|\boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h}\|_{1},$$

which with (4.12) gives

$$2\mu c_{K} \| \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h} \|_{1}^{2} + \varepsilon \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S}^{2}$$

$$\leq 2\mu \| \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon} \|_{1} \| \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h} \|_{1} + \| \boldsymbol{u}_{\varepsilon}^{h} - \boldsymbol{v}^{h} \|_{1} \| p_{\varepsilon} - q^{h} \| + \| \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon} \|_{1} \| p_{\varepsilon} - q^{h} \|$$

$$+ \| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \|_{1} \left(\left(1 + \frac{1}{\beta} \right) \| p_{\varepsilon} - q^{h} \| + \frac{2\mu}{\beta} \| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \|_{1} + \frac{2\mu}{\beta} \| \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h} \|_{1} \right)$$

$$+ ch^{1/2} \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S} \left\| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \right\|_{1} + c\mu \left(\| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \|_{1} + \| \boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}^{h} \|_{1} \right) \| \boldsymbol{u}_{\varepsilon} - \boldsymbol{v}^{h} \|_{1}.$$

$$(4.19)$$

Finally, the application of Young's inequality leads to

$$\|\boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}^h\|_1^2 + (\varepsilon - ch) \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^h) \right\|_S^2 \le c \|\boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}\|_1^2 + c \|p_{\varepsilon} - q^h\|^2$$

which is re-written as follows

$$\|\boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}^h\|_1^2 + \varepsilon \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^h) \right\|_S^2 \le ch \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^h) \right\|_S^2 + c\|\boldsymbol{v}^h - \boldsymbol{u}_{\varepsilon}\|_1^2 + c\|\boldsymbol{p}_{\varepsilon} - \boldsymbol{q}^h\|^2.$$

We take the square root on both sides, use triangle's inequality and (4.12) and one obtains the desired result.

Remark 4.2 If $\varepsilon(h) = (c+1)^2 h$, then one has

$$\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} + \|p_{\varepsilon} - p_{\varepsilon}^{h}\| + ch^{1/2} \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S} \leq c \|\boldsymbol{v}^{h} - \boldsymbol{u}_{\varepsilon}\|_{1} + c \|p_{\varepsilon} - q^{h}\|.$$

For the estimation of the interpolation error, we consider the Lagrange interpolant operator \mathcal{I}_h for the velocity and the projection operator \mathcal{S}_h for the pressure (see [34, 35]). The following is well known for all $p \in H^{\frac{1}{2}+r}(\Omega)$, $u \in H^{\frac{3}{2}+r}(\Omega)$ and $-\frac{1}{2} \leq r \leq \frac{1}{2}$

$$\|\boldsymbol{u} - \mathcal{I}_h \boldsymbol{u}\|_1 \le ch^{\frac{1}{2}+r} \|\boldsymbol{u}\|_{\frac{3}{2}+r} \quad , \qquad \|p - \mathcal{S}_h p\| \le ch^{\frac{1}{2}+r} \|p\|_{\frac{1}{2}+r} \, .$$

Thus

$$\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^{h}\|_{1} + \|p_{\varepsilon} - p_{\varepsilon}^{h}\| + ch^{1/2} \left\| \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}) - \frac{1}{\varepsilon} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon}^{h}) \right\|_{S} \leq ch^{1/2+r} \left(\|\boldsymbol{u}_{\varepsilon}\|_{3/2+r} + \|p_{\varepsilon}\|_{1/2+r} \right).$$

Thus one obtains optimal convergence if r = 1/2.

Remark 4.3 Having in mind proposition 4.1, proposition 3.2 and theorem 4.1, we have for ε given as before and r = 1/2,

$$\|\boldsymbol{u} - \boldsymbol{u}^h\|_1 + \|p - p^h\| \le ch$$
.

Remark 4.4 Contrary to some analyses in which the error estimates for finite element approximation of variational inequalities of second kind is dominated by the interpolation estimate on the dissipation zone (see [9, 10, 24, 26] just to cited a few), our result is different. Indeed we need the interpolation estimate on the entire domain and an appropriate choice of ε . We also note that the regularity of the solution on the slip/dissipation zone is not needed at all.

5 Numerical algorithm

This section is devoted to the formulation of the numerical scheme for the Stokes equations under Tresca's boundary condition. We recall that because we are interested in rate of convergence of the finite element solution, and in the previous section it is observed that $\|\boldsymbol{u}_{\varepsilon} - \boldsymbol{u}_{\varepsilon}^h\|_1 + \|p_{\varepsilon} - p_{\varepsilon}^h\|$ and $\|\boldsymbol{u} - \boldsymbol{u}^h\|_1 + \|p - p^h\|$ have the same convergence rate for $\varepsilon = ch$, we will compute the solution for $\varepsilon = ch$ of the truncated finite element problem

$$\begin{cases}
\text{for all } (\boldsymbol{v}^h, q^h) \in \mathbb{V}_h \times M_h, \\
a(\boldsymbol{u}_{\varepsilon}^h, \boldsymbol{v}^h) + b(\boldsymbol{v}^h, p_{\varepsilon}^h) + \frac{1}{\varepsilon} \int_S \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \tau}^h) \cdot \boldsymbol{v}_{\tau}^h d\sigma = \ell(\boldsymbol{v}^h), \\
b(\boldsymbol{u}_{\varepsilon}^h, q^h) = 0.
\end{cases} (5.1)$$

(5.1) is a nonlinear system of equations, hence for its resolution an incremental or iterative method is needed. In the lines that follows, we propose a Newton type algorithm. The Gateaux-derivative of the projection (cut off) function

$$u_k(oldsymbol{x}) = \left\{ egin{array}{ll} oldsymbol{x} & ext{for } |oldsymbol{x}| < k, \ rac{oldsymbol{x}}{|oldsymbol{x}|} & ext{for } |oldsymbol{x}| \geq k. \end{array}
ight.$$

is given by

$$\nu_k'(\boldsymbol{x})\boldsymbol{y} = \left\{ \begin{array}{ll} \boldsymbol{y} & \text{for } |\boldsymbol{x}| < k, \\ k\left(\frac{\boldsymbol{y}}{|\boldsymbol{x}|} - \frac{(\boldsymbol{x} \cdot \boldsymbol{y})\boldsymbol{x}}{|\boldsymbol{x}|^3}\right) & \text{for } |\boldsymbol{x}| \ge k. \end{array} \right.$$

We then propose the following method for solving the nonlinear equation (5.1), described in Algorithm 1.

Algorithm 1 Newton-Raphson algorithm for (5.1)

$$\overline{k=0.\ (\boldsymbol{u}_{\varepsilon}^{0},p_{\varepsilon}^{0})\in\mathbb{V}_{h}\times M_{h}}$$

 $k \geq 0$. Assuming $(\boldsymbol{u}_{\varepsilon}^{k}, p_{\varepsilon}^{k})$ is known, compute $(\boldsymbol{u}_{\varepsilon}^{k+1}, p_{\varepsilon}^{k+1})$ as follows

1. Compute $(\tilde{\boldsymbol{u}}_{\varepsilon}^k, \tilde{p}_{\varepsilon}^k) \in \mathbb{V}_h \times M_h$ such that

$$a(\tilde{\boldsymbol{u}}_{\varepsilon}^{k}, \boldsymbol{v}^{h}) + b(\boldsymbol{v}^{h}, \tilde{p}_{\varepsilon}^{k}) + \frac{1}{\varepsilon} \int_{S} \nu_{\varepsilon g}'(\boldsymbol{u}_{\varepsilon \tau}^{k}) \tilde{\boldsymbol{u}}_{\varepsilon \tau}^{k} \cdot \boldsymbol{v}_{\tau}^{h} d\sigma = \ell(\boldsymbol{v}^{h}) - \tilde{\ell}(\boldsymbol{v}^{h}), (5.2)$$

$$b(\tilde{\boldsymbol{u}}_{\varepsilon}^{k}, q^{h}) = -b(\boldsymbol{u}_{\varepsilon}^{k}, q^{h}), \quad (5.3)$$

where

$$\tilde{\ell}(\boldsymbol{v}^h) = a(\boldsymbol{u}_{\varepsilon}^k, \boldsymbol{v}^h) + b(\boldsymbol{v}^h, p_{\varepsilon}^k) + \frac{1}{\varepsilon} \int_{S} \nu_{\varepsilon g}(\boldsymbol{u}_{\varepsilon \boldsymbol{\tau}}^k) \cdot \boldsymbol{v}_{\boldsymbol{\tau}}^h d\sigma.$$

$$2. \ \boldsymbol{u}_{\varepsilon}^{k+1} = \boldsymbol{u}_{\varepsilon}^{k} + \tilde{\boldsymbol{u}}_{\varepsilon}^{k}, \, p_{\varepsilon}^{k+1} = p_{\varepsilon}^{k} + \tilde{p}_{\varepsilon}^{k}$$

Remark 5.1 It should be noted that $(\tilde{\boldsymbol{u}}_{\varepsilon}^{k}, \tilde{p}_{\varepsilon}^{k}) \in \mathbb{V}_{h} \times M_{h}$ given in (5.2) and (5.3) is well defined by a direct application of Babuska-Brezzi's theorem for mixed formulations. Thus, knowing $(\boldsymbol{u}_{\varepsilon}^{k}, p_{\varepsilon}^{k})$ one can always compute $(\boldsymbol{u}_{\varepsilon}^{k+1}, p_{\varepsilon}^{k+1})$. The convergence analysis of the sequence $(\boldsymbol{u}_{\varepsilon}^{k}, p_{\varepsilon}^{k})_{k}$ may be done following similar analysis in [25, 34].

6 Numerical experiments

We now study the numerical behavior of the Newton-Raphson algorithm described in the previous section. We have implemented Algorithm 1, using vectorized assembling functions and the mesh generator provided in [16–18], on a computer running Linux (Ubuntu 16.04) with 3.00GHz clock frequency and 32GB RAM. We use some classical tests problems to evaluate the behavior of Algorithm 1 with the stoppting criterion

$$\|\tilde{\boldsymbol{u}}_{\varepsilon}^{k}\|_{L^{2}(\Omega)}^{2} + \|\tilde{p}_{\varepsilon}^{k}\|_{L^{2}(\Omega)}^{2} < 10^{-10} \left(\|\boldsymbol{u}_{\varepsilon}^{k}\|_{L^{2}(\Omega)}^{2} + \|p_{\varepsilon}^{k}\|_{L^{2}(\Omega)}^{2} \right).$$

6.1 2D Driven cavity

This problem has been considered by many authors [8–10, 13, 19, 21]. We set $\Omega = (0, 1)^2$ and we assume that its boundary consists of two portions Γ_D and S defined as follows

$$\Gamma_D = \{0\} \times (0, 1) \cup (0, 1) \times \{0\}$$

 $S = S_1 \cup S_2, \quad S_1 = (0, 1) \times \{1\}, \quad S_2 = \{1\} \times (0, 1).$

The right-hand side is

$$\mathbf{f} = -2\mu \operatorname{div} \varepsilon(\mathbf{u}) + \nabla p$$

where (\boldsymbol{u}, p) is given by

$$u_1(x,y) = -x^2y(x-1)(3y-2),$$
 (6.1)

$$u_2(x,y) = xy^2(y-1)(3x-2),$$
 (6.2)

$$p(x,y) = (2x-1)(2y-1). (6.3)$$

In [22], it is shown that

$$(\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} = -4\mu x^2(x-1)\begin{bmatrix} 1\\0 \end{bmatrix}, \text{ on } S_1$$

 $(\boldsymbol{T}\boldsymbol{n})_{\boldsymbol{\tau}} = -4\mu y^2(y-1)\begin{bmatrix} 0\\-1 \end{bmatrix} \text{ on } S_2$

For $\mu = 1$, a straightforward calculation reveals that

$$\max_{S} |(\mathbf{T}\mathbf{n})_{\tau}| = 4\mu \max_{x \in S_1} x^2(x-1) = 4\mu \max_{x \in S_2} y^2(y-1) = 0.59.$$

Then for an appropriate choice of g, both, slip and stick zones can appear on S. We first run our code with h=1/32, $\varepsilon=h$ and two values of g. Figures 1-2 show the velocity fields and the streamlines obtained, using Algorithm 1. We can notice that for $g=0.25<\max_{S}|(\boldsymbol{T}\boldsymbol{n})_{\tau}|$ a non-trivial slip occurs, while for $g=1>\max_{S}|(\boldsymbol{T}\boldsymbol{n})_{\tau}|$ the solution is such that $\boldsymbol{u}_{\tau}=0$ on S.

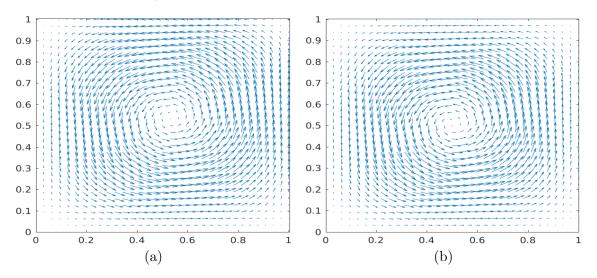

Figure 1: Velocity fields for the driven cavity problem (a): g = 0.25, (b): g = 1

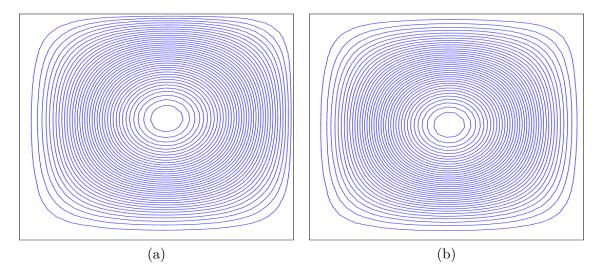

Figure 2: Streamlines for the driven cavity problem (a): g = 0.25, (b): g = 1

We evaluate the accuracy and the behavior of Algorithm 1 by calculating the error between approximate solution and the exact solution. Since we do not know the exact solution explicitly, we use an approximate solution on a finer mesh of size h = 1/124 as

the reference solution. The convergence errors are computed as follows

$$e_1 := e_h(\boldsymbol{u}) = \| \boldsymbol{u}_h - \boldsymbol{u}_* \|_{L^2}$$

 $e_2 := e_h(\boldsymbol{u}, p) = \| \boldsymbol{u}_h - \boldsymbol{u}_* \|_{H^1} + \| p_h - p_* \|_{L^2}$

where (u_*, p_*) is the reference solution. Note that Algorithm 1 always converges for $\varepsilon = h$. For $\varepsilon << h$, a suitable initialization is needed for the friction case since large values of $1/\varepsilon$ imply $u_{\tau} \approx 0$. In our code to compute the solution for $\varepsilon = h/10$, we start with $\varepsilon = h$ and after convergence we adjust ε to compute the adequate solution.

We report in Table 1-2 the number of iterations, the CPU times (in Seconds) and the convergence rates for g=0.25 and g=1. For the stick case (g=0.25) the best convergence rates are obtained with $\varepsilon=h/10$. For $\varepsilon=h$ the convergence rates are less good than expected but the convergence of the Newton-Raphson algorithm is very fast. For the stick case (g=1) the convergence rates are less good than expected (for the standard Stokes equation) for both choices of ε . This can be explained by the fact that the penalization term $1/\varepsilon$ in (5.1) is not large enough to enforce $\boldsymbol{u}_{\tau}^k \approx 0$.

		arepsilon = h				$\varepsilon = h/10$			
h	Iter.	CPU	Rate e_1	Rate e_2	Iter.	CPU	Rate e_1	Rate e_2	
1/16	7	0.05			22	0.13

Table 2: Performances and accuracy of Algorithm 1 on the 2D driven cavity for g=1

6.2 3D lid-driven cavity

This problem has already been considered in [21] for Stokes and Navier Stokes. The geometry consists of a cubic cavity $\Omega = (0,1)^3$ with a moving wall at $\Gamma = \{z=1\}$, and $\mathbf{u}|_{\Gamma} = (4x_2(1-x_2),0,0)$. The remaining part of the boundary is $S = \partial \Omega \setminus \Gamma$ where the slip takes place and we take $\mu = 1$. Figure 3 shows the velocity fields and the magnitude of its tangential component $\parallel \mathbf{u}_{\tau} \parallel$ at the walls for g = 0.25 and g = 2. In [21], numerical

experiments show that, for this 3D lid-driven cavity, the friction always occurs. Table 3 summarizes the performances of Algorithm 1 in terms of the number of iterations and the CPU times (in Seconds), with various values of g. We can notice that the proposed Newton-Raphson algorithm is virtually independent of the mesh size, for a fixed parameter ε . Moreover, the convergence of the Newton-Raphson algorithm is fast.

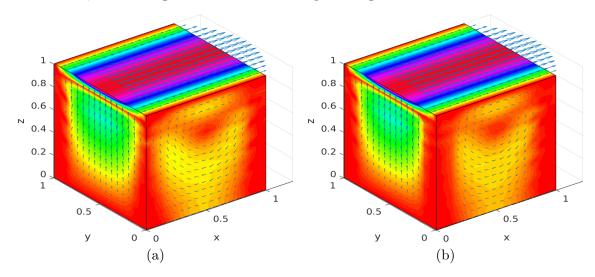

Figure 3: Velocity field and $\| u_{\tau} \|$ for the 3D lid-driven cavity (a): g = 0.25, (b): g = 2

	g =	0.25	g =	= 1	g=2		
	$\varepsilon = h$	$\varepsilon = h/10$	$\varepsilon = h$	$\varepsilon = h/10$	$\varepsilon = h$	$\varepsilon = h/10$	
h	Iter. / CPU	Iter. / CPU	Iter. / CPU	Iter. / CPU	Iter. / CPU	Iter. / CPU	
1/4	4 / 0.07	6 / 0.08	2 / 0.02	5 / 0.04	2 / 0.02	4 / 0.03

6.3 Concluding remarks

We have studied, theoretically and numerically a new approach based on a cut off function for the numerical approximation of the Stokes equation under Tresca friction boundary condition. Numerical experiments have shown that optimal rates of convergence can be obtained for the friction case. For the 3D lid-driven cavity studied, the proposed method proved to be fast since the friction always occurs. Then, the proposed algorithm can be useful for pure friction problem in 2D or 3D. However, with the proposed approach, the tangential stress must be computed at the end of the algorithm while for the Lagrange multiplier based approach (e.g., [21, 22]), the tangential stress is available as a Lagrange multiplier.
