Acute and chronic radiation cystitis

Population concerned

Pelvic
Radiotherapy

Days- months

Acute complications
40% of patients
Acute radiation cystitis

6 months - 20 years

Chronic complications
5 - 10 % of patients
Chronic radiation cystitis

Mithal et al., 1993
Rigaud et al., 2004

Symptoms and treatment of chronic radiation cystitis

Incontinence

Pain

Hematuria

Decrease the quality of life

No curative treatment
Only symptomatic treatments (hyperbaric oxygen therapy, oral and intra-vesical agents)

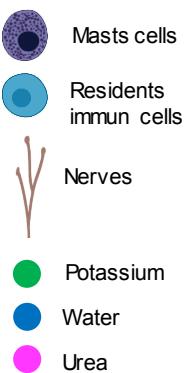

Transient effects that may induce serious complications

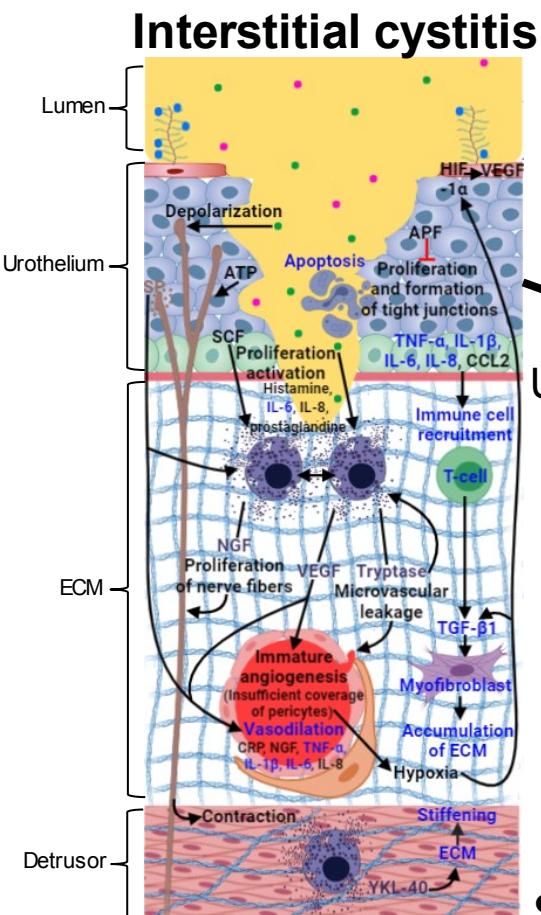

Few studies on chronic radiation cystitis
Little known molecular mechanisms

Preclinical research to develop innovative treatments

Similar pathology

Grade 0 asymptomatique

Grade 1

Dysurie : légère

Hématurie : microscopique

Fréquence : / 2 h

Grade 2

Dysurie : modérée

Hématurie : intermittente

Fréquence : / 1 h

Grade 3

Dysurie : sévère

Hématurie : fréquente

chirurgie mineure e.g. coagulation

Fréquence : / 0,5 h

Capacité vésicale : réduction, 150 cc

Grade 4

Hématurie : cystite hémorragique sévère

Capacité vésicale : vessie rétractée (< 100 cc)

Grade of hemorrhagic cystitis

Table 1 | RTOG/EORTC grading of hematuria events

Hematuria morbidity	Grade 1	Grade 2	Grade 3	Grade 4	Grade 5
Acute hemorrhagic radiation cystitis (RTOG scale)	NA	NA	Gross hematuria with or without clot passage	Hematuria requiring transfusion	Death from uncontrolled hematuria
Late hemorrhagic radiation cystitis (RTOG/EORTC scale)	Minor telangiectasia (microscopic hematuria)	Generalized telangiectasia (macroscopic hematuria)	Severe generalized telangiectasia (macroscopic hematuria)	Severe hemorrhagic cystitis	Death from uncontrolled hematuria

Abbreviations: EORTC, European Organisation for Research and Treatment of Cancer; RTOG, Radiation Therapy Oncology Group.

Traitemet:

Intravesical instillation :

- Aluminium
- Formalin
- Alun
- Pentosan polysulfate

Traitemet hyper bar

Smit SG, Heyns CF. [Management of radiation cystitis](#). Nat Rev Urol. 2010 Apr;7(4):206-14.
doi: 10.1038/nrurol.2010.23. Epub 2010 Mar 9. Review. PubMed PMID: 20212517.

Introduction: Side effects and treatment

Treatments :

Oral or parenteral agents

- Sodium pentosan polysulfate
- Tetrachlorodecaoxide
- Pentoxifylline

Hematuria

Low and very short-term effects

Cystoscopy

- Fulguration
- Botulinum toxin

Hematuria

Low and very short-term effects

Intravesical installation

- Aluminum salts
- Silver nitrate
- Formalin

Hematuria

Pain

No effect after stopping treatment

Treatment :

Hyperbaric oxygen therapy (HBOT)

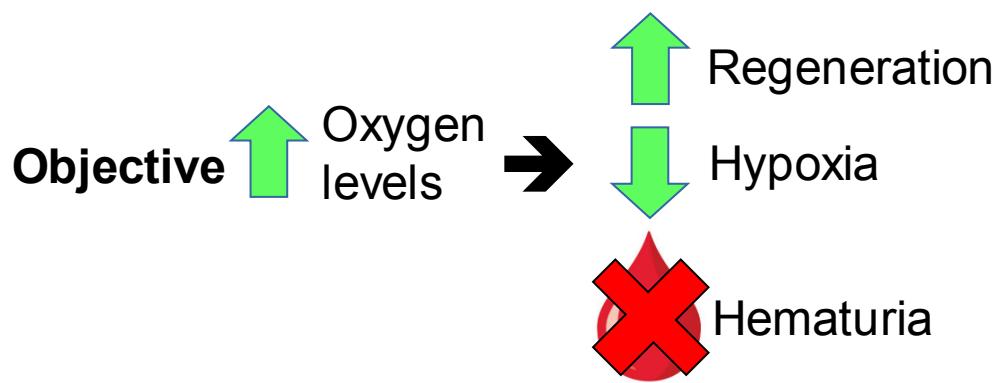

Figure 1 Hyperbaric oxygen chambers

a | Newly delivered hyperbaric chamber prior to installation. b | Hyperbaric oxygen chamber with control panel.

Smit and Heyns, 2010

Disadvantage

- Long, adequate and rare equipment, patient monitoring
- Not very effective, effects over a few months, year

30–40 sessions, 100% oxygen, for 80–90 min, 2 months

75% improvement within 6 months

Need for a relevant model and curative treatments

Method of irradiation: Local bladder irradiation

Objective:

- Creation of a model of chronic radiation cystitis in rats
 - New method of irradiation using SARRP
- Irradiator for small animals (similar characteristic to clinical models)

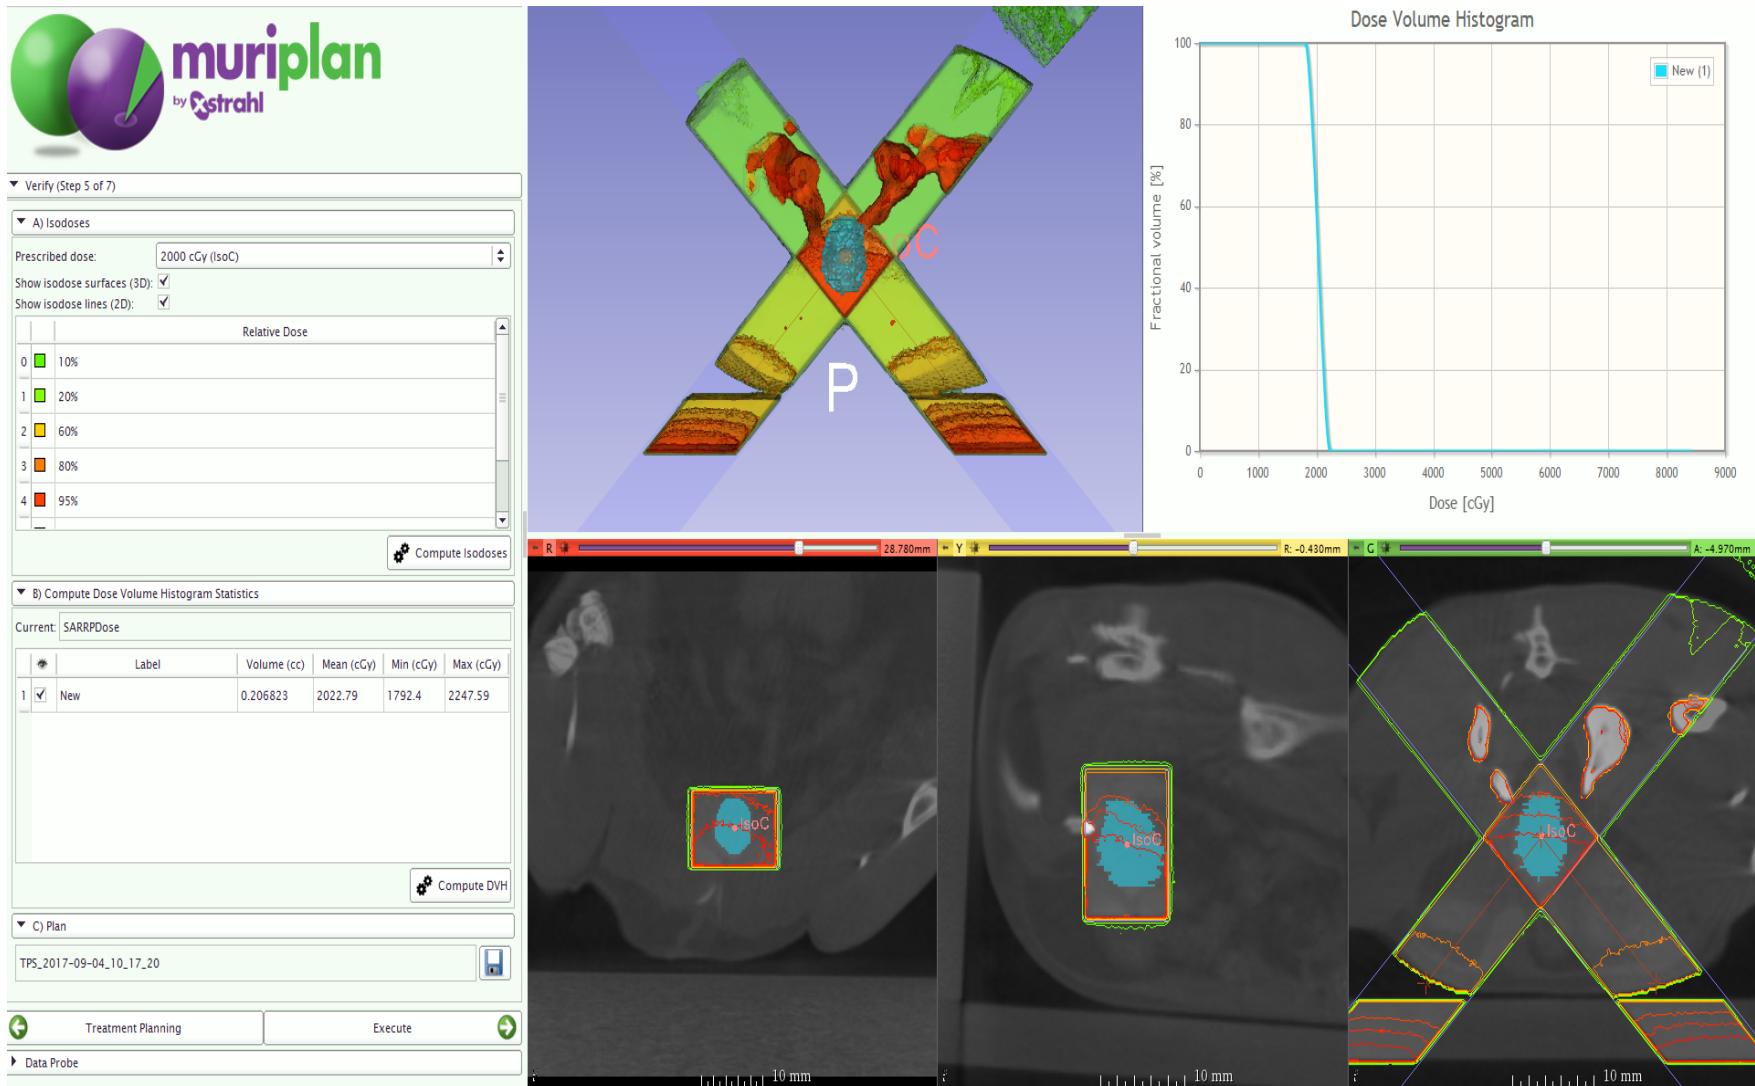

SARRP

- Small Animal Radiation Research Platform (SARRP, Xstrahl)
- Single or multi beam(s)
- Combined with scanner imaging and treatment plan software (MuriPlan) => stereotaxy
- 4 available field sizes: **10x10 mm²**, 7x7 mm², 3x3 mm² and Ø 1 mm

Picture of SARRP
Dr M. Dos Santos, LRAcc

Method of irradiation: Local bladder irradiation

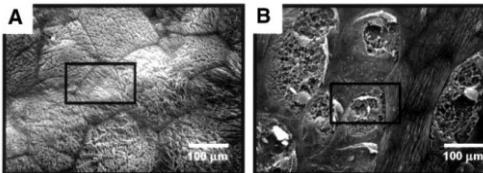

- 2 irradiation beams
- Maximized the dose on the bladder and minimized the dose on surrounding tissues

Pre-clinical model of CRC

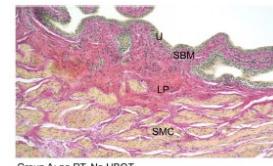

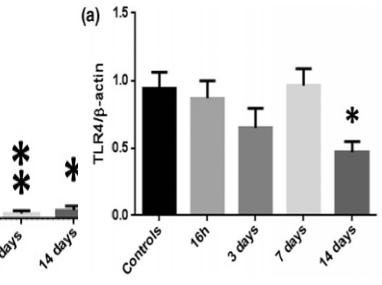

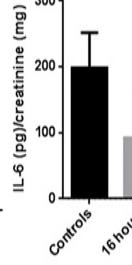

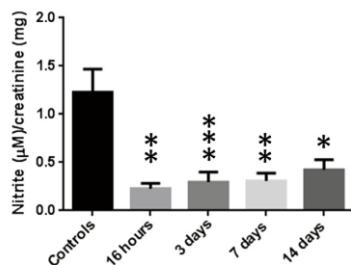

In Rats receiving (irradiation totale vessie)

- ✓ 35 Gy, Urothelium damage 48h (Kanai et Eperly 2002)
- ✓ 20 Gy killed 16 h to 14 days later (Giglio et al. 2012)
 - Bladder irradiation increased the expression of IL-1 and collagen in the bladder, while TLR4 and IL-6 expressions were decreased in the urothelium concomitantly with a decrease in mast cells in the submucosa and urine levels of IL-6 and nitrite.
- ✓ 20 Gy all 29 days (Oscarsson 2017)
 - Bladder irradiation increased the expression of 8-OHdG, SOD2, HO-1, NRF α , IL-10, TNF and tended to increase TGF- β
- ✓ 20Gy killed 1,5 and 3 months (Soler 2011)
 - 1,5 month vascular abnormalities
 - 3 months collagen deposition
- ✓ 20 Gy all exhibited small and contracted bladders 6 months after treatment (Vale JA 1993)

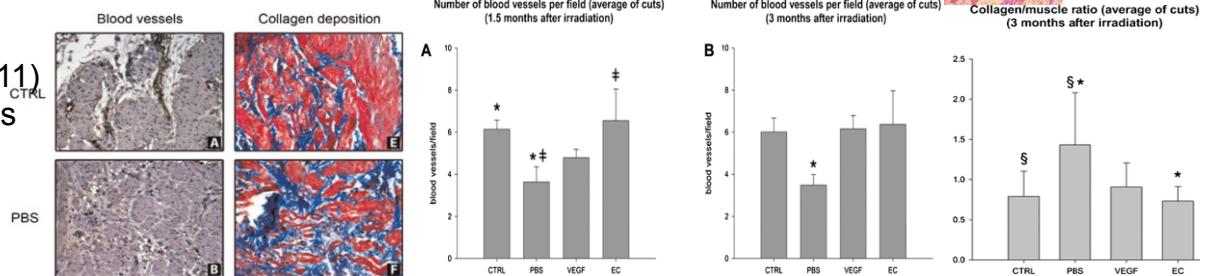

Jurado-Bruggeman et al.; 2017

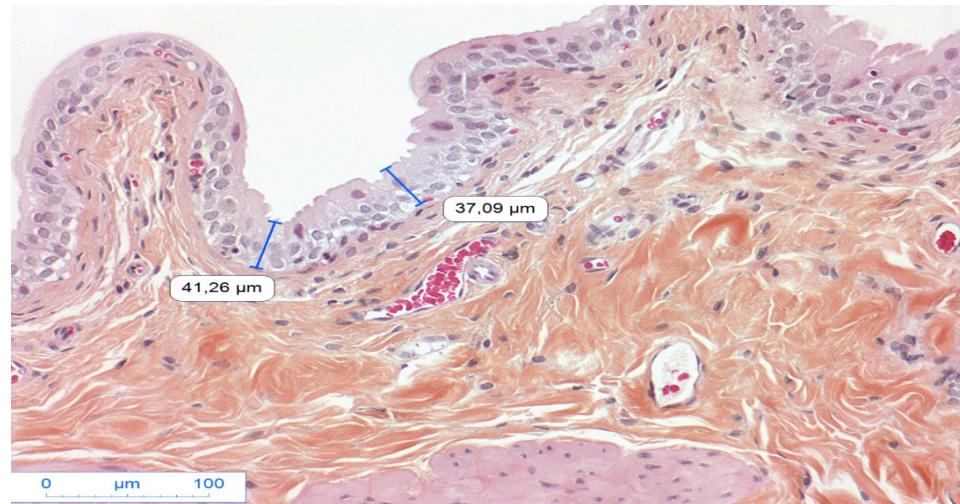

29 days Urothelium, SBM=Submucosa,
LP=Lamina Propria, SMC=Smooth
Muscle Cell layer

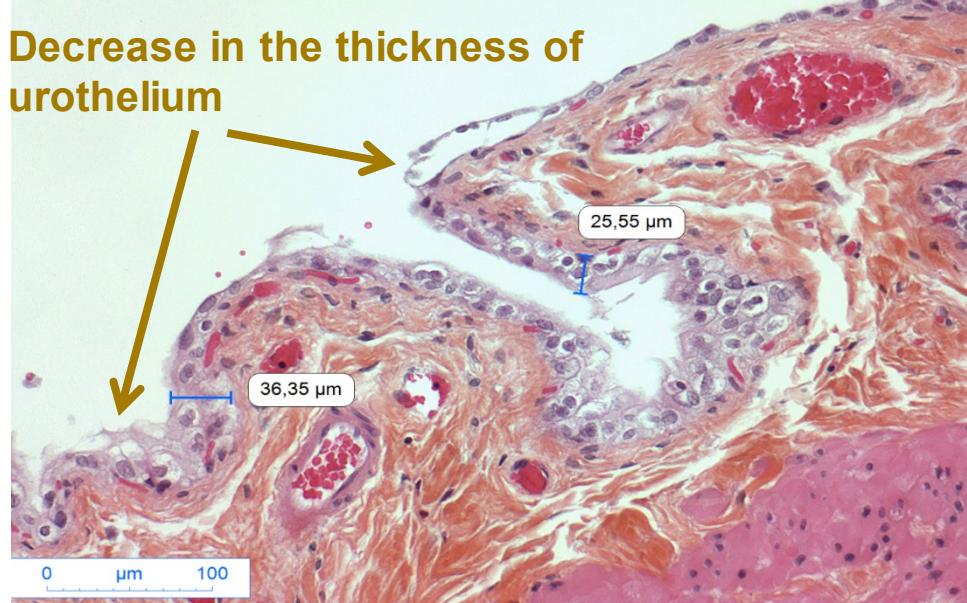

No significant macro or microscopically changes in the urinary bladder could be observed by bladder irradiation

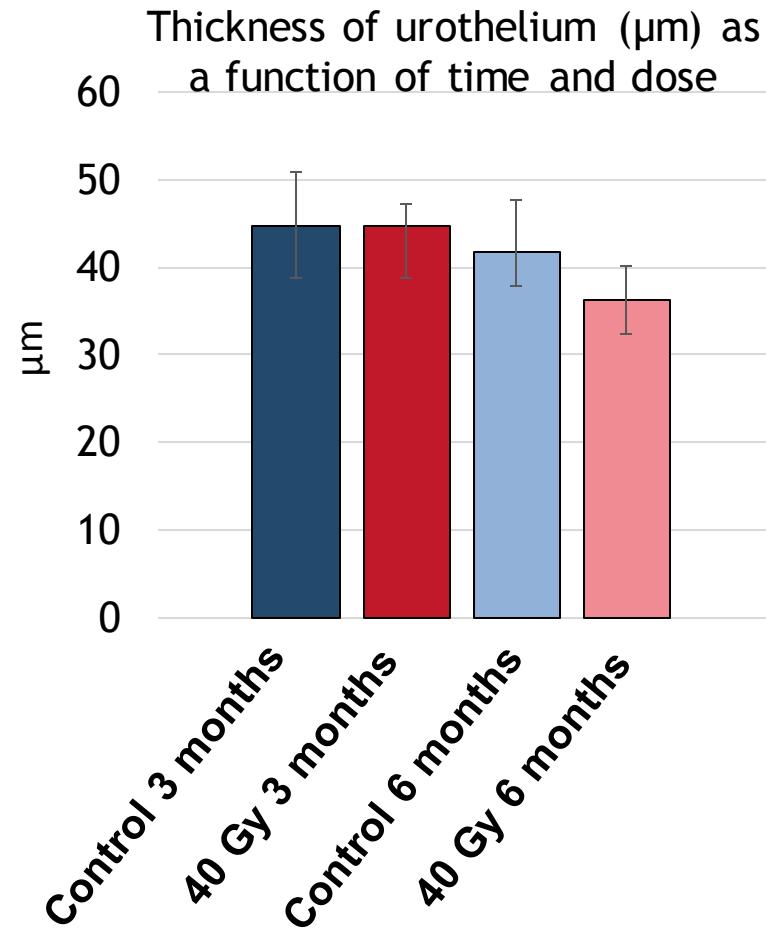

Tissue study: urothelium damages (HES)

Unirradiated bladder, 6 months, X 200

Bladder irradiated at 40 Gy, 6 months, X 200

Degradation of the urothelium structure

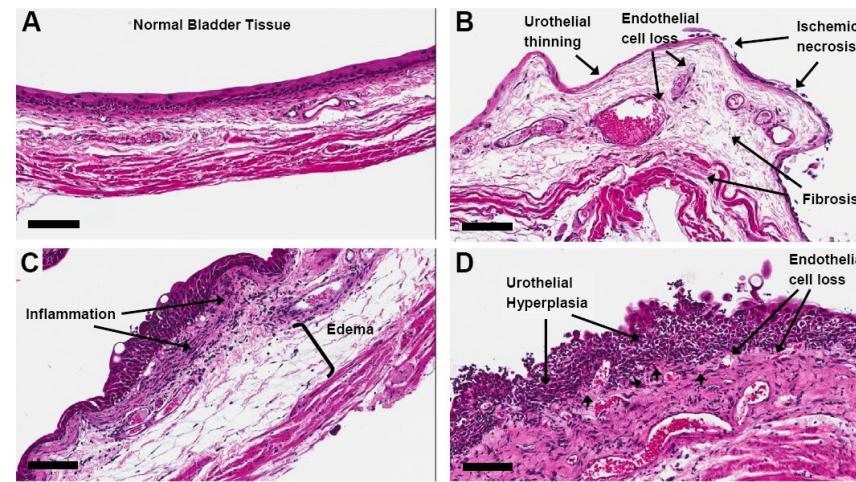

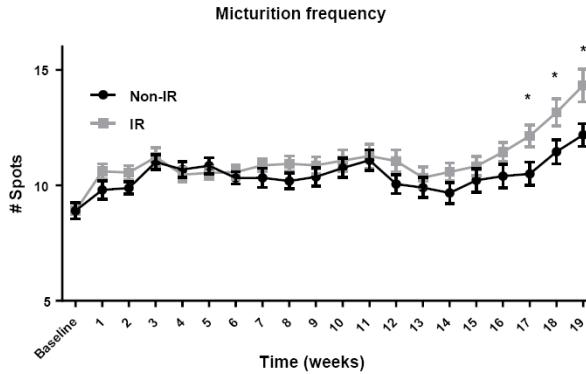

Pre-clinical model of CRC

In mice receiving

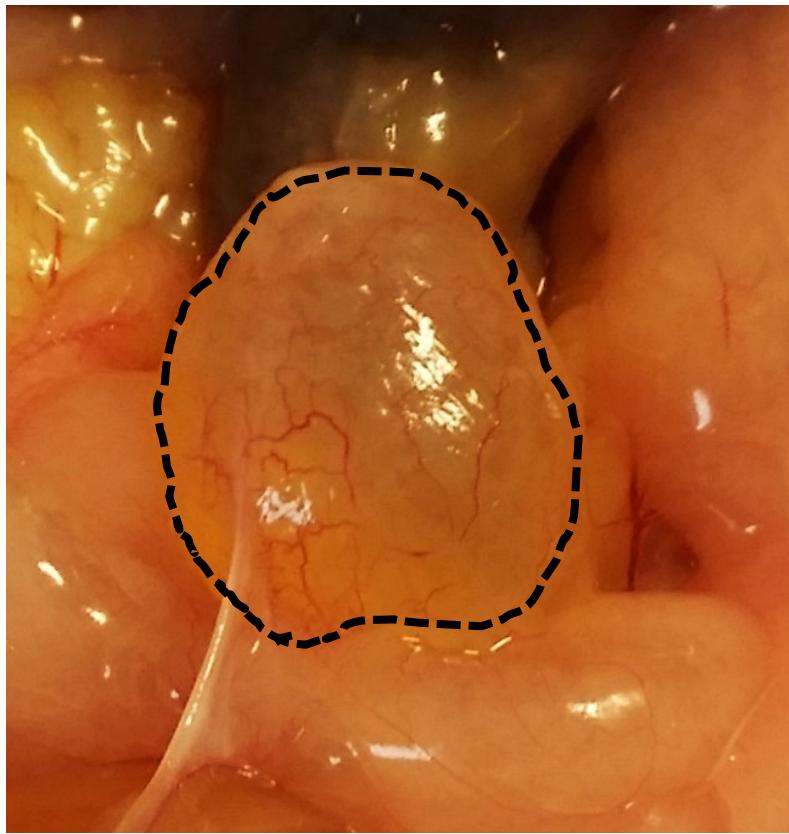

- ✓ 15 Gy , 20% developed fibrotic bladders,
- ✓ 15–20 Gy exhibited increased frequency and decreased bladder volume (Stewart 1991).

- ✓ 20 Gy SARP 2 faisceaux ((Zwaans et al. 2016)

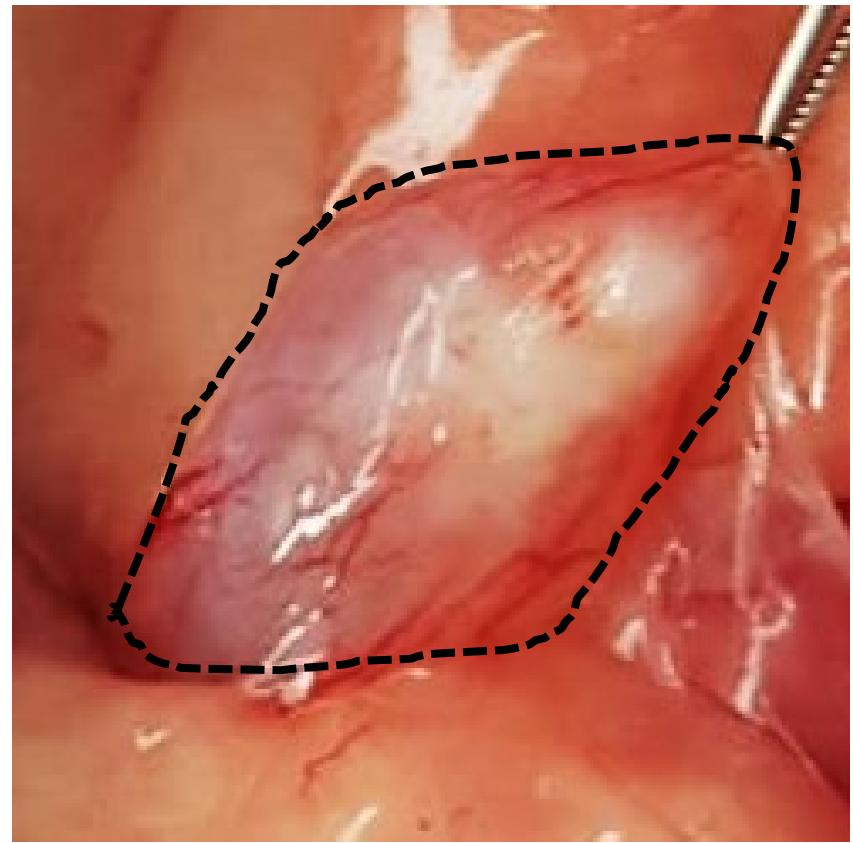

- Starting at 17 weeks after treatment, micturition frequency was significantly higher
- Pathological changes include fibrosis, inflammation, urothelial thinning, and necrosis.
- At a site of severe insult, we observed telangiectasia, absence of uroplakin-3 and E-cadherin relocalization

Conclusions:

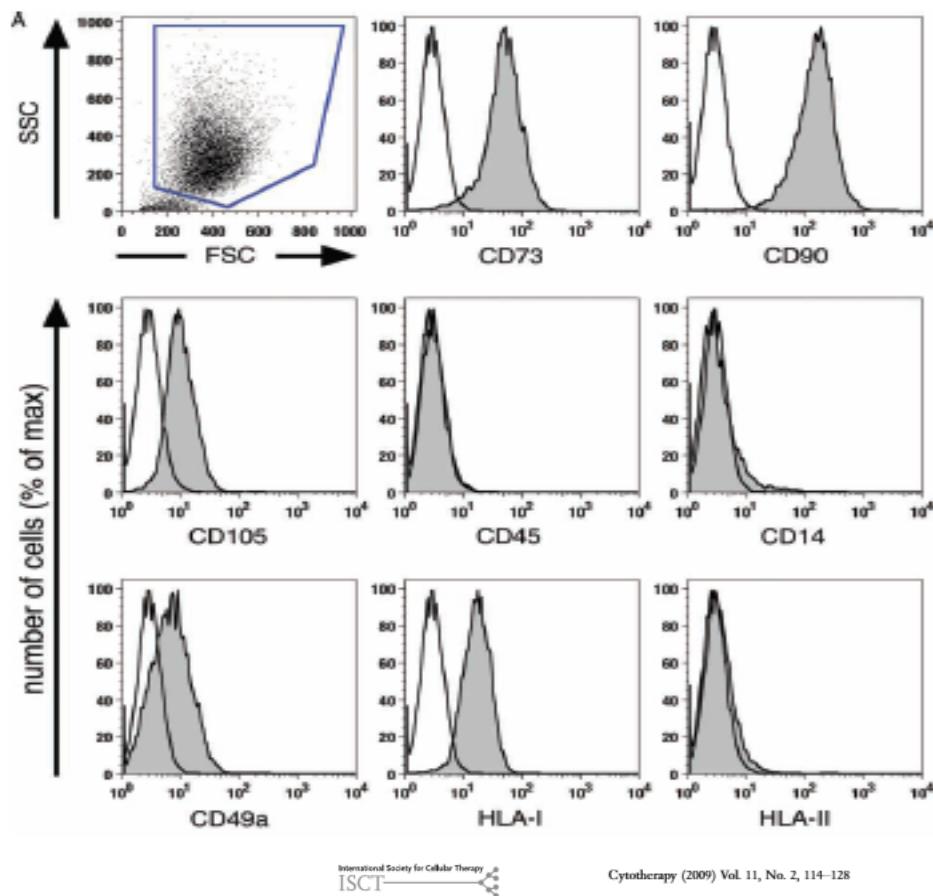

Unirradiated bladder, 10 months

Irradiated bladder, 40Gy 10 months

At 10 months, onset of apparent fibrosis in a few rats 40 Gy

Matériel :

- Milieu MSCs : MEM α , SVF 20%, PS, Glut
- Milieu PBS, SVF 10%
- Collagénase type I (Sigma C0130-1g)
- 6 tubes 50ml avec collagénase à 0.1% dans du milieu de digestion : MEM α , PS, Glut
- Boite de pétri en verre

• Prélèvement de la graisse

La graisse est prélevée au-dessus de la patte entre la peau et le péritoine, mise dans 5mL de PBS 1X.

• Digestion (x3)

On coupe la graisse en petits morceaux, que l'on met dans du MEM α + collagénase à 0,1% (x2 tubes/digestion). Incubation **pdt 30 min à 37°C** avec agitation.

On récupère les cellules avec une filtration 100µm, la graisse non digérée est remise en MEM α + collagénase à 0,1%.

Sur les cellules filtrées, on ajoute du milieu contenant du SVF pour diluer la collagénase.

On effectue une centrifugation pour rassembler toutes les cellules, filtration sur 40µm et ensuite numération.
(4ml au 5^e en bleu acétique)

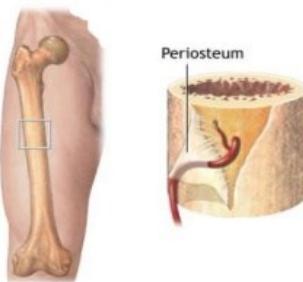

• Culture

P0 1000 c/cm^2 soit $0,150 \cdot 10^6 \text{c}/150\text{cm}^2$ en milieu MSCs

PG, SPARC, tsp, TN...

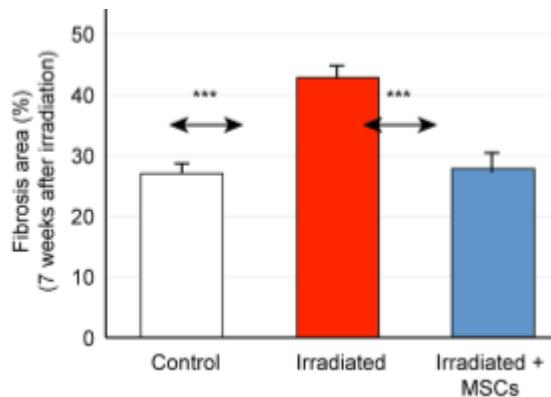

Protocol of intravenous injection:

- 5 millions of MSCs significantly improve the epithelial injury score
- Iterative injections in established radiation-induced lesions restore mucosal damages.

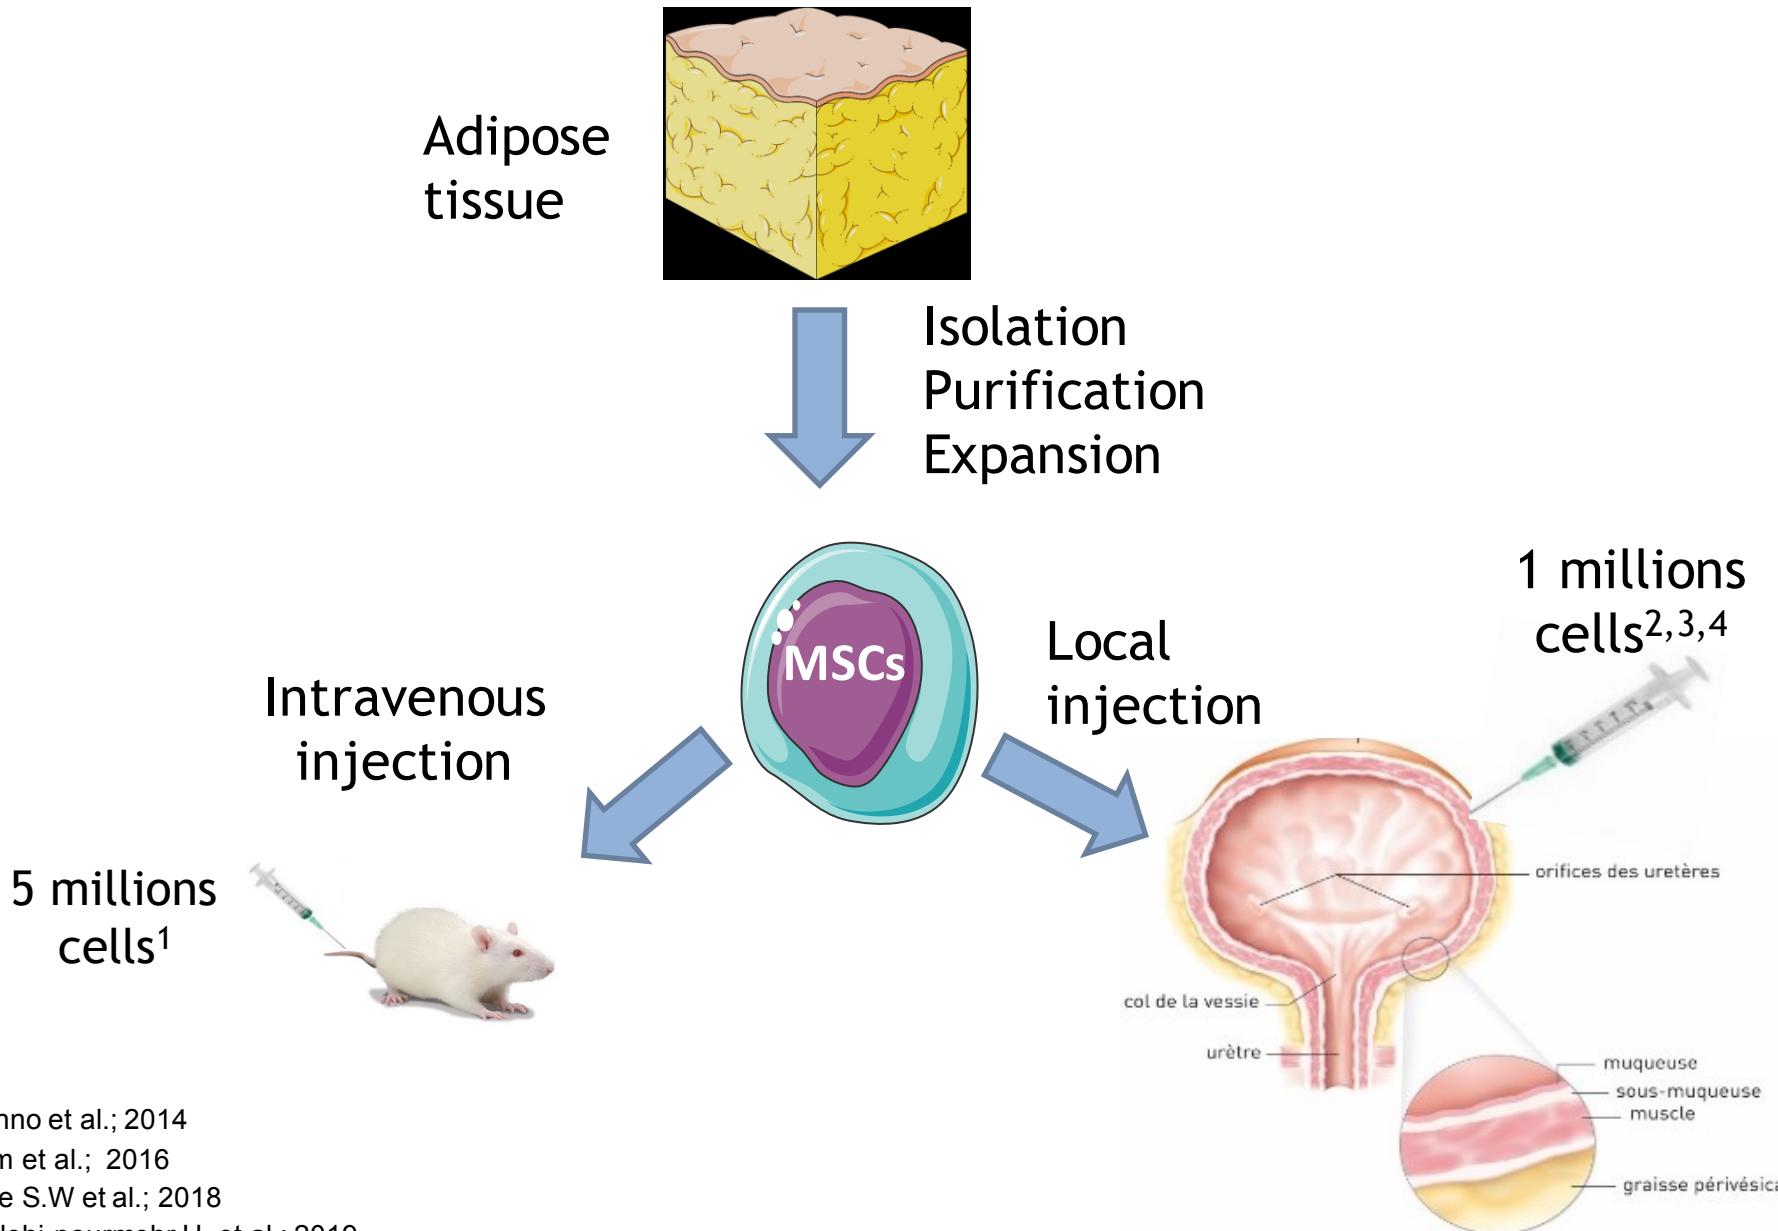

- Injection frequency \geq 1 week
- MSCs injections are more effective during the initiation phase of fibrosis
