HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A computationally-based approach to the understanding of child's phonological development

- Data.** CoLaJE (1) is an open access French database made up of 7 child spoken language monthly *in vivo* videorecordings. There are around thirty longitudinal samples per child, each child counts approx 7000 sentences and 28'000 words. IPA transcriptions of *pho*, *mod* and orthographic for CHI.

Loc	Ts	Te	Transcription L: 990 - 988 - 997 T: (-) P: - 0:00:09
CHI	0:24:03	0:24:13	«regarde celui-là il a trois essuie-glace !
<i>pho</i>			«vogas sũila la il a kwa sysygas»
<i>mod</i>			«əgəvəd sũila la il a tʁwa esũiglas»
FAT	0:24:13	0:24:14	il a trois essuie-glace .
CHI	0:24:14	0:24:15	oui !
<i>pho</i>			wi
<i>mod</i>			wi
FAT	0:24:14	0:24:16	essuie-glace Adrien , comment tu dis ?
FAT	0:24:16	0:24:19	tu dis essuie-glace ?
CHI	0:24:19	0:24:21	«celui-là il en a deux !
<i>pho</i>			ʁeuli la ã n a dœ

- HP** Phonetic and phonological variations are not random, they rather follow and underlying logic made up of constraints and tendencies. Comparisons between similarly sampled children could give us a way to outline common preferential learning patterns
- METHODS/1** We first use PHON to align *pho* and *mod* lines, then we set an algorithm able to calculate the SPVR (Sentence Phonetic Variation Rate). We use CHAID χ^2 (2), a decision tree technique conceived to overcome in a non parametric way the problem of multiple comparisons. Three steps: merging, splitting and stopping.

- CONCLUSIONS** Broadly speaking, FLA and phonological theories, such as the three pillars of Clements' « Theory of traits », can be quickly confirmed by using these two ways of representing massive longitudinal datasets. Despite so, particular learning paths for a given consonantal cluster are hard to study because of the high variability between children. Here an example of the paradigmatic case of plosive-liquids :

- /gR/ → /dR/ ; /dR/ → /gR/
- /tR/ → /kR/ ; /kR/ → /tR/
- « 52 Q : ben attends, on essaie de/ de l'trouver, si on le trouve pas ze/ ben c'est pas grave hein, ça c'est un gros euh c'est bien.. si on le krouve pas, alors c'est pas grave donc. . » (4)
