HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

25 26	Highlights:
27	• The case of a patient with varicella zoster gastritis complicated with severe upper
28	gastrointestinal bleeding and hemorrhagic shock is reported.
29	Gastric manifestations of varicella zoster infections in non-immunocompromised patients
30	have been scarcely described.
31	• A high clinical index of suspicion with prompt treatment is needed because of the severity of
32	varicella zoster gastritis
33 34 35 36	Key words:
37	Varicella-zoster virus (VZV), gastritis, hemorrhagic shock, non-immunocompromised patient

An 82-year-old woman was admitted to the intensive care unit with hemorrhagic shock due to a severe upper gastrointestinal bleeding. Her medical history was unremarkable except for an old breast cancer. One week before, she had developed papulovesicular eruptions of the face, trunk and extremities, together with abdominal pain and vomiting. She had been diagnosed with varicella with gastrointestinal involvement. After initial resuscitation, requiring fluid infusion, massive blood mechanical transfusion, high dose vasopressors and ventilation, an emergency esophagogastroduodenoscopy was performed (fig. 1A) and revealed a large blood clot covering the entire gastric area (fig. 1A, upper panel), together with an active bleeding (fig. 1A, lower panel), which were treated by local epinephrine injection. The cause of bleeding was not identified and gastric biopsies were not obtainable. A follow-up endoscopy performed 24 hours later showed multiple small erosions and ulcerations, with slightly raised erythematous margins, involving the greater tuberosity (fig.1B, upper and lower panels). The patient declared she had not previously been infected with VZV. VZV-IgG antibodies were detectable in serum specimens and qualitative VZV polymerase chain reaction was positive. A diagnosis of varicella zoster gastritis was retained. Antiviral therapy with Aciclovir was started. By day 10 after admission, our patient had fully recovered and was transferred to the medical ward. Varicella zoster gastritis, although rare (1), requires a high clinical index of suspicion with prompt treatment because of its severity (2,3).
