Figure S 1 – Additional cryo TEM images of a 0.5 wt% G-C18:1 solution (pH 8) containing Fe^{2+} and Al^{3+} metal ions at a molecular ratio [$\text{[Fe}^{2+}]$]/[G-C18:1] = 1.4 and [Al^{3+}]/[G-C18:1] = 0.34. Both samples are constituted of a dense and extensive network of wormlike micelles. Spheroidal aggregates are, on the contrary, typical artefacts due to due cryo-fixation (Friedrich *et al.* Imaging of Self-Assembled Structures: Interpretation of TEM and Cryo-TEM Images. *Angew. Chemie - Int. Ed.* 2010, 49, 7850).

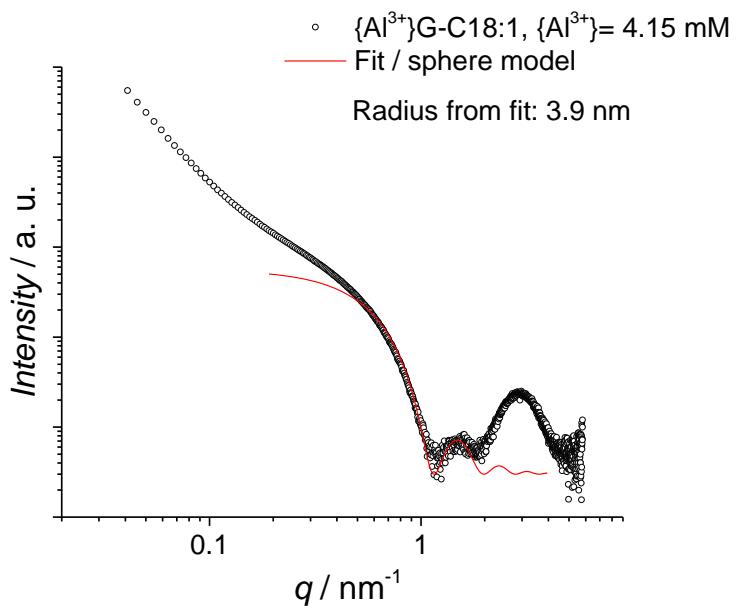

Figure S 2– Fit of a typical SAXS profile corresponding to the $\{\text{Al}^{3+}\}\text{G-C18:1}$ system studied in Figure 6 of the main text. The fit is performed using a simple sphere model in the software Sasview 3.1.2.

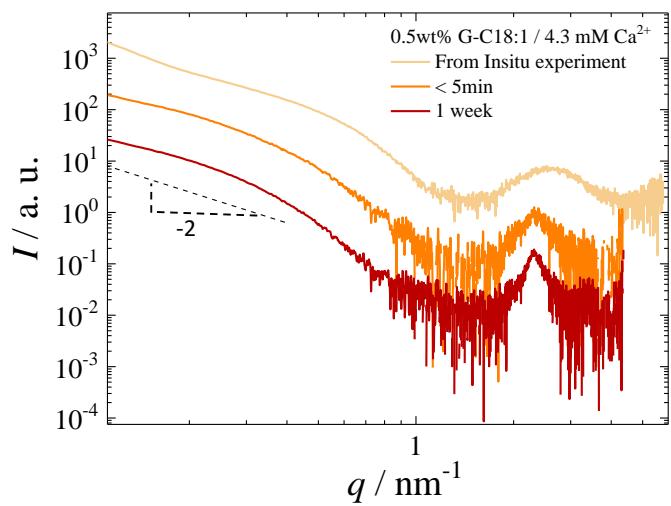

Figure S 3 – SAXS spectra of {Ca²⁺}G-C18:1 solution at a molar ratio 0.4 (C_{G-C18:1}= 0.5 wt%) at different preparation time marked in the caption.
