**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

## Open Archive Toulouse Archive Ouverte

OATAO is an open access repository that collects the work of Toulouse researchers and makes it freely available over the web where possible

This is an author's version published in:

## CONTEXT

Most software and system processes contain tasks that can be performed by multiple actors, known as **collaborative tasks**.

- When it is executed, a collaborative task is deployed with many **instances**, each one is performed by one actor.
- There are various **strategies** describing relations between instances of a collaborative task (sequence-based, parallel-based).

Process Management Systems (**PMS**) provide functionalities to control task instances' evolution at execution time.

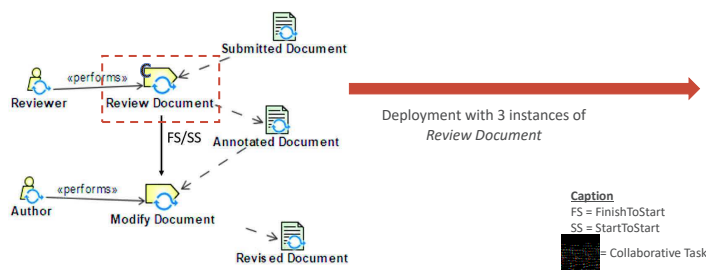

Fig.1: Example of a process with a collaborative task (Review Document).

## MOTIVATION

Existing process modeling languages lack a clear semantics on how to instantiate and execute a collaborative task.

- Execution of collaborative tasks is not yet finely controlled in PMS
- Existing PMS do not support selecting different strategies to instantiate and execute a collaborative task.
- Execution of collaborative tasks is not flexible

Fig.2: Sequential strategy of the collaborative task Review Document

## WORK SUMMARY

Fig.3: Overview of our approach

## RESULTS

- A set of **Collaboration Patterns** allowing representing different strategies that can be used at execution to perform a collaborative task. These patterns describe the possible control flows (sequential, parallel) and the way of sharing work products among instances of a collaborative task.
- A **Process Modeling Language** to express collaborative concepts.
- A prototype of a **Collaborative Process Engine** allowing to instantiate and execute collaborative tasks based on chosen strategies.

## CONCLUSION

- We propose a flexible way to enact collaborative tasks,
- For a more intelligent assistance in selecting an execution strategy for a collaborative task, we are investigating :
  - A language of definition of context elements,
  - An algorithm of pattern recommendation based on context elements values.
