M. Quintard

Outline

- Introduction
- Multi-scale aspects
- Diffusion/dispersion
- One-Phase flow
- Heat Transfer
- Two-Phase flow
- Coupled transfers: reactive transport, phase change
- Conclusion

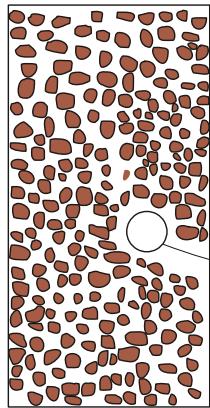

Introduction: multiple-scale analysis

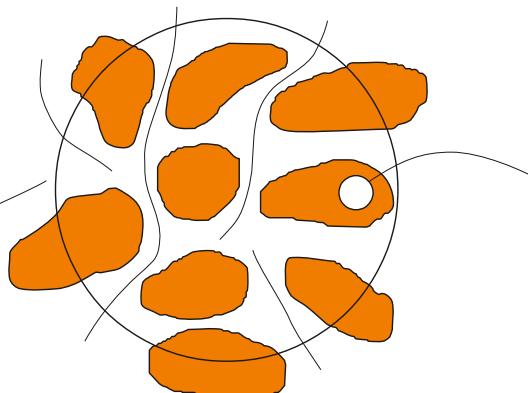

Example: Chal Engng Reactor, Heat Exchanger, ...

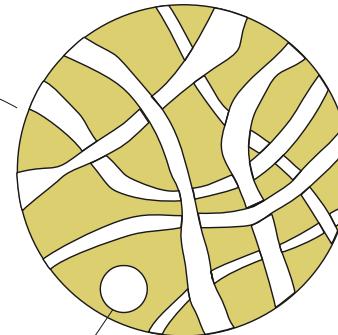

Packed Bed
Reactor

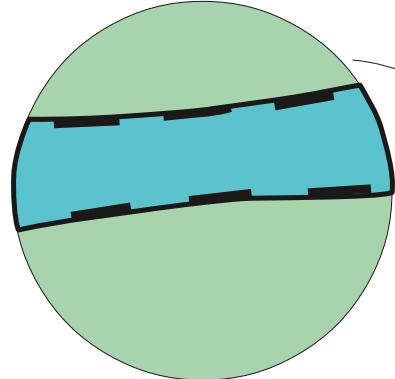

Porous Medium

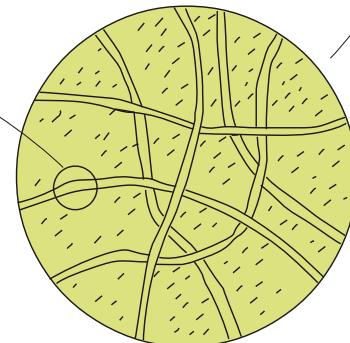

Macro Pores

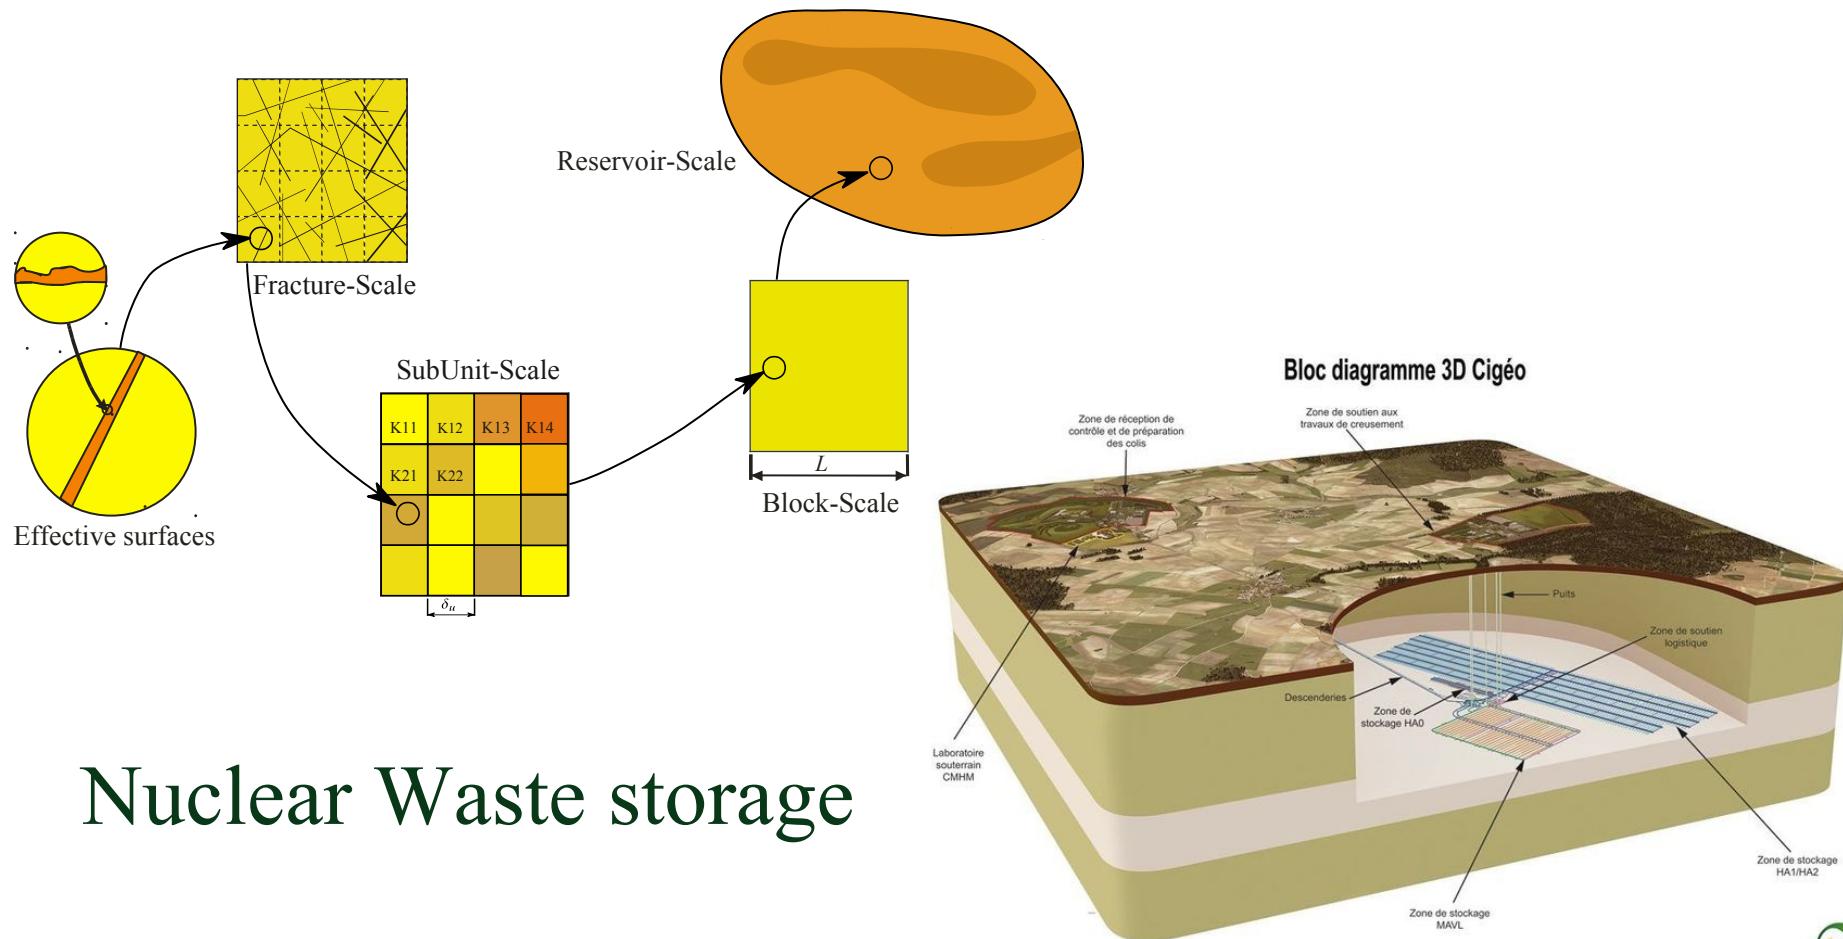

Adsorbed Islands

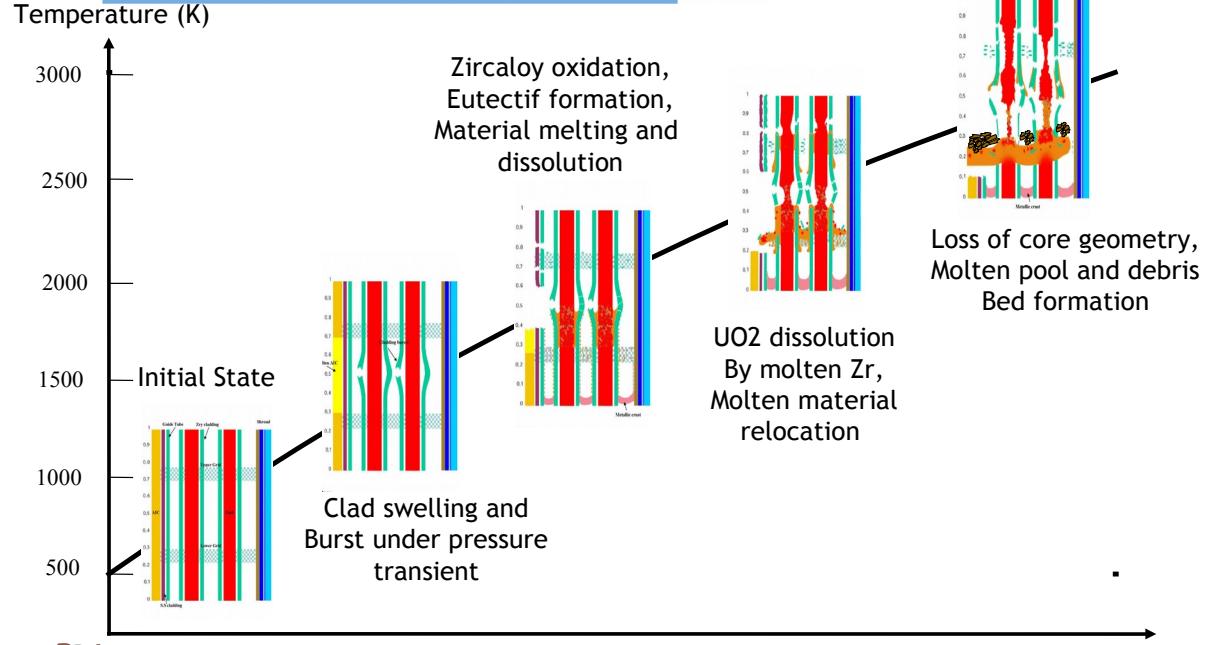

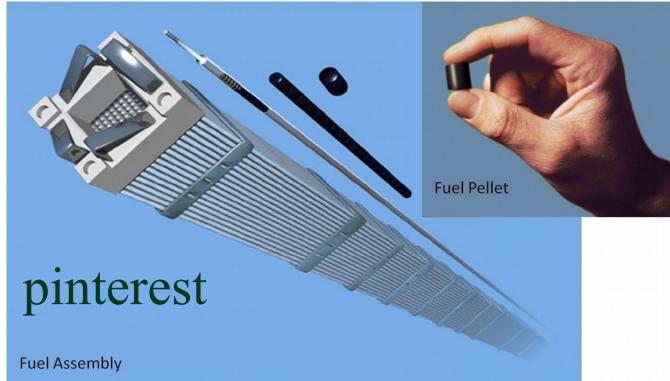

Micro Pores

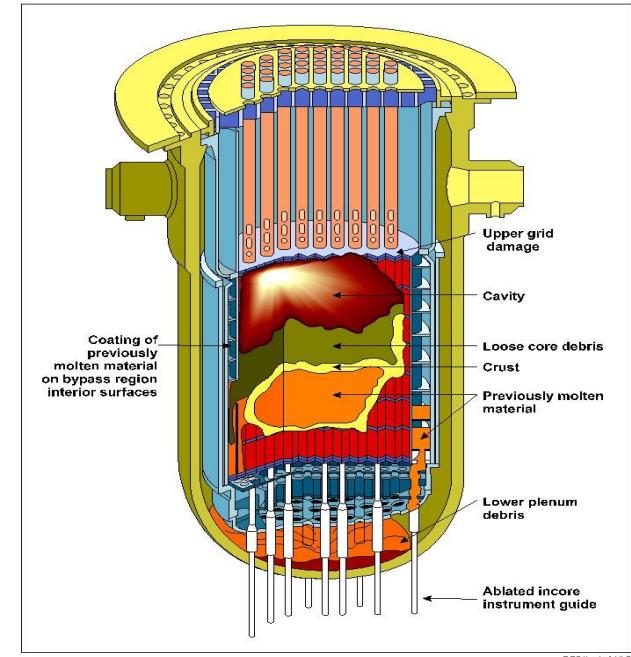

Example: geological formations

Example : Nuclear Reactor

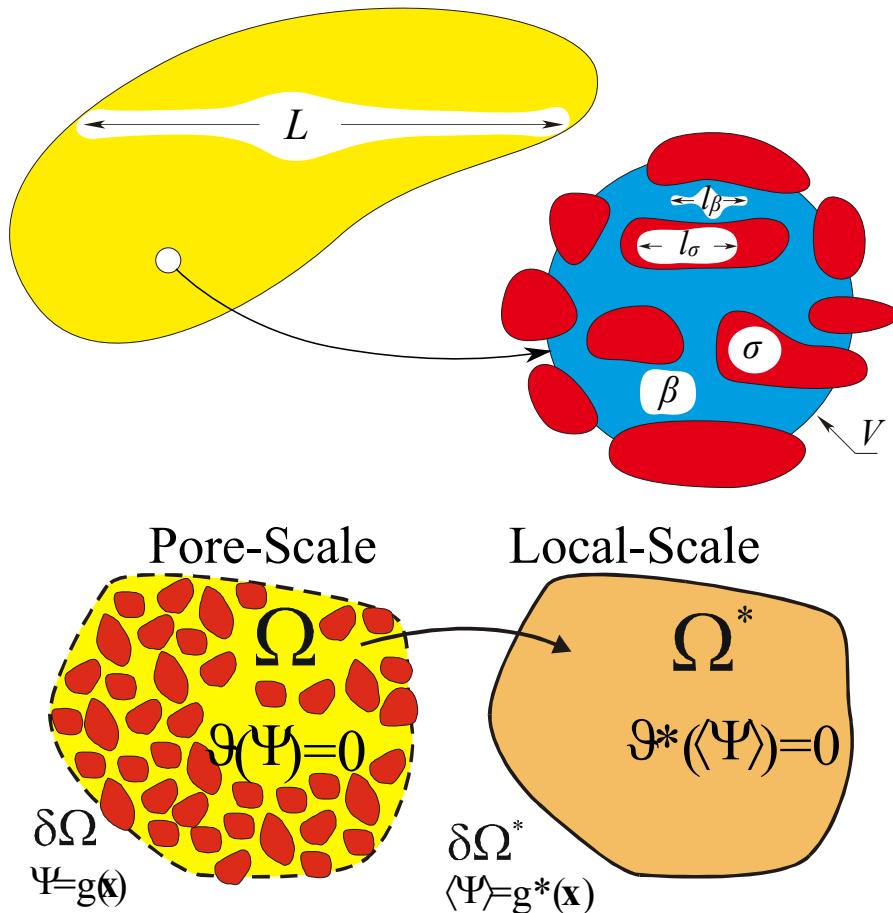

Undamaged reactor....
.... and after severe accident

TMI-2 vessel final state

Upscaling

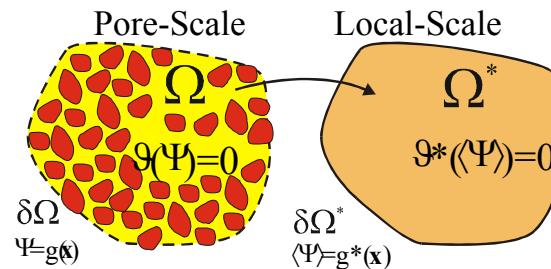

- **Separation of scales:**
 $l_\beta, l_\sigma \ll L$
- **Objectives of a macro-scale theory?**
 - Smoothing operator → macro-scale equations and BCs
 - Link between micro- and macro-scale
 - Effective properties

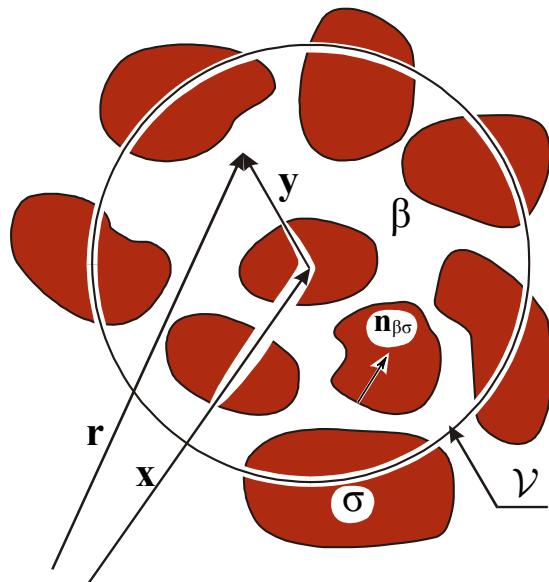

Upscaling: different points of view

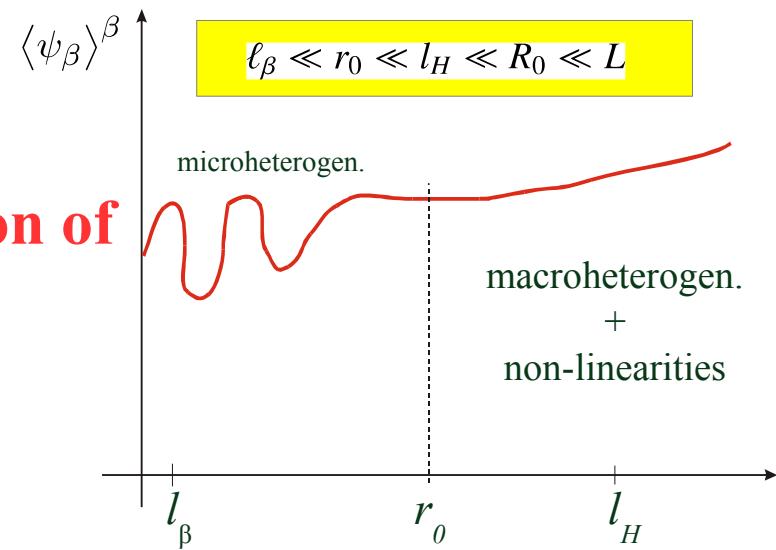

- Heuristic: Darcy's law (1856)!
- Upscaling with *closure*: homogenization theory (Sanchez-Palencia, Bensoussans et al.,...), volume averaging (Whitaker, ... and variants),
$$p_\beta = P_\beta + \tilde{p}_\beta \quad \tilde{p}_\beta \stackrel{?}{=} f(P_\beta, \nabla P_\beta, \dots)$$
- Stochastic theories (Matheron, Dagan, Gelhar, ...), ... $P_\beta = E(p_\beta)$
- Mixture theories: volume averaging + irreversible thermodynamics (Marle, Hassanizadeh and Gray, Bowen, ...)
- Other point of views...: dual-phase-lagging heat conduction (Wang et al., 2008; Vadasz, 2005...); mixed models; fractional derivatives (Néel,...); CTRW; ...

Macro-scale variables: Example of volume averaging

Need
separation of
scales!

- β-phase Volume Fraction $\varepsilon_\beta = \langle \gamma_\beta \rangle$
- $\langle \psi_\beta \rangle = \varepsilon_\beta \langle \psi_\beta \rangle^\beta$ Intrinsic phase average

Phase indicator: $\gamma_\beta = \begin{cases} 1 & M \in V_\beta \\ 0 & M \notin V_\beta \end{cases}$

Phase Indicator, Volume Fraction, Porosity, Saturation

- Phase Indicator

$$\gamma_\beta = \begin{cases} 1 & M \in V_\beta \\ 0 & M \notin V_\beta \end{cases}$$

- Saturation

$$\varepsilon_\beta = \varepsilon S_\beta \quad \sum_{i=1}^{i=N} S_i = 1$$

$$S_\beta \in [0, 1]$$

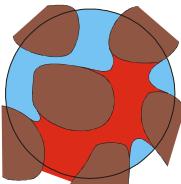

- Volume Fraction

$$\varepsilon_\beta = \left\langle \gamma_\beta \right\rangle \quad \sum_{i=1}^{i=N} \varepsilon_i = 1$$

- Intrinsic phase average

$$\left\langle \psi_\beta \right\rangle = \varepsilon_\beta \left\langle \psi_\beta \right\rangle^\beta$$

- Porosity: $\varepsilon = 1 - \varepsilon_\sigma$

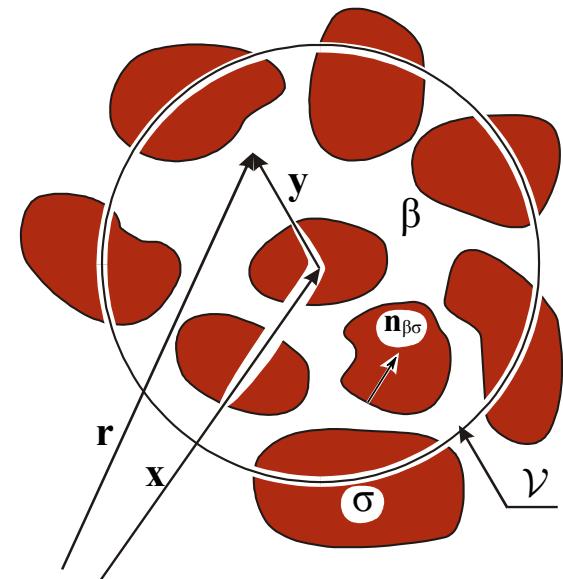

Theorems

$$\langle \nabla \psi_\beta \rangle = \nabla \langle \psi_\beta \rangle + \frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \psi_\beta dA$$

$$\langle \nabla \cdot \mathbf{A}_\beta \rangle = \nabla \cdot \langle \mathbf{A}_\beta \rangle + \frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot \mathbf{A}_\beta dA$$

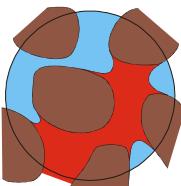

$$\left\langle \frac{\partial \psi_\beta}{\partial t} \right\rangle = \frac{\partial \langle \psi_\beta \rangle}{\partial t} - \frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot \mathbf{w}_{\beta\sigma} \psi_\beta dA$$

Interfacial Effects
(tortuosity,...)

Phase change,
dissolution , ...

Cf : Quintard & Whitaker (Chem. Eng. Science, 93; TiPM, 94)

Total mass balance (no source/sink)

$$\frac{\partial \rho_\beta}{\partial t} + \nabla \cdot (\rho_\beta \mathbf{v}_\beta) = 0 \quad \text{pore-scale}$$

$$\frac{\partial \langle \rho_\beta \rangle}{\partial t} + \nabla \cdot \langle \rho_\beta \mathbf{v}_\beta \rangle = -\frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot \rho_\beta (\mathbf{v}_\beta - \mathbf{w}_{\beta\sigma}) dA \quad \text{macro-scale}$$

- Macro-scale equation, no phase change :

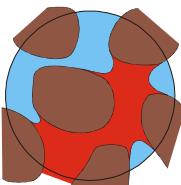

$$\mathbf{V}_\beta = \langle \mathbf{v}_\beta \rangle = \epsilon_\beta \mathbf{U}_\beta$$

$$\frac{\partial \epsilon_\beta \rho_\beta}{\partial t} + \nabla \cdot (\rho_\beta \mathbf{V}_\beta) = 0$$

- Constant density
- Constant porosity

$$\frac{\partial \epsilon_\beta}{\partial t} + \nabla \cdot \mathbf{V}_\beta = 0$$

$$\nabla \cdot \mathbf{V}_\beta = 0$$

General Structure of a macro-scale transport equation

- Pore-scale

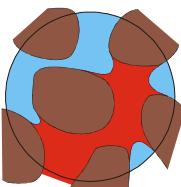

$$\frac{\partial \rho_\beta \omega_\beta}{\partial t} + \nabla \cdot (\rho_\beta \omega_\beta \mathbf{v}_\beta) = \nabla \cdot (\rho_\beta D_\beta \nabla \omega_\beta) - \underbrace{r_\beta(\omega_\beta)}_{\text{homogeneous reaction}}$$

B.C. 1 $\mathbf{n}_{\beta\sigma} \cdot (\rho_\beta \omega_\beta (\mathbf{v}_\beta - \mathbf{w}_{\beta\sigma}) - \rho_\beta D_\beta \nabla \omega_\beta) = \underbrace{f_\beta(\omega_\beta)}_{\text{heterogeneous reaction}}$

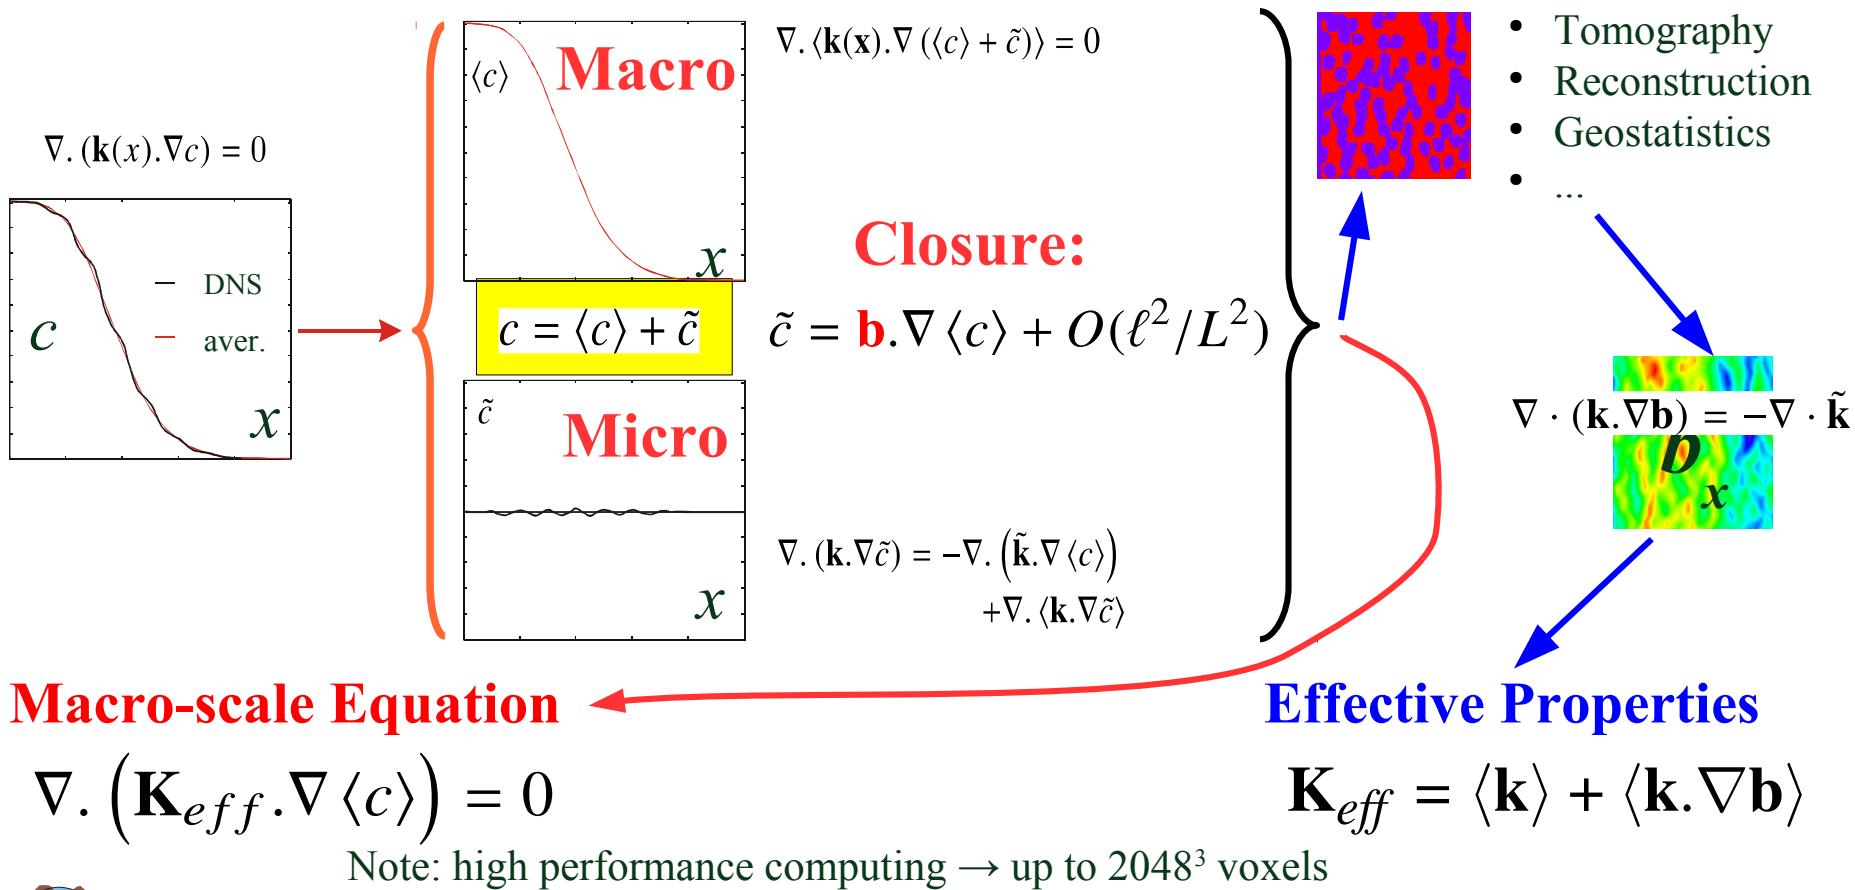

- Macro-scale

$$\frac{\partial \langle \rho_\beta \omega_\beta \rangle}{\partial t} + \nabla \cdot \langle \rho_\beta \omega_\beta \mathbf{v}_\beta \rangle = \nabla \cdot (\langle \rho_\beta D_\beta \nabla \omega_\beta \rangle) - \langle r_\beta \rangle - K_{\beta\sigma}$$

with $K_{\beta\sigma} = \frac{1}{\mathcal{V}} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot (\rho_\beta \omega_\beta (\mathbf{v}_\beta - \mathbf{w}_{\beta\sigma}) - \rho_\beta D_\beta \nabla \omega_\beta) dA$

Upscaling with *closure*: a schematic view for diffusion in a heterogeneous medium

Diffusion: coupled micro-macro eqs

- Pore-scale problem (tracer case)

$$\frac{\partial c_\beta}{\partial t} = \nabla \cdot (D_\beta \nabla c_\beta) \rightarrow \frac{\partial \tilde{c}_\beta}{\partial t} = \nabla \cdot (D_\beta \nabla \tilde{c}_\beta) - \nabla \cdot \left(\frac{D_\beta}{V_\beta} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \tilde{c}_\beta dA \right)$$

simplification with $\ell_\beta \ll L$

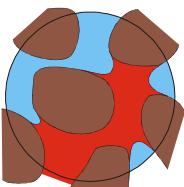

$$c_\beta = \langle c_\beta \rangle^\beta + \tilde{c}_\beta$$

$$\underbrace{\left(\frac{D_\beta}{V_\beta} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \tilde{c}_\beta dA \right)}_{\text{non-local effect}}$$

$$\text{B.C.1 } \mathbf{n}_{\beta\sigma} \cdot D_\beta \nabla c_\beta = 0 \rightarrow \text{B.C.1 } \mathbf{n}_{\beta\sigma} \cdot \nabla \tilde{c}_\beta = -\mathbf{n}_{\beta\sigma} \cdot \nabla \langle c_\beta \rangle^\beta \text{ at } A_{\beta\sigma}$$

- Averaged Equation

$$\frac{\partial \varepsilon_\beta \langle c_\beta \rangle^\beta}{\partial t} = \nabla \cdot \left(\varepsilon_\beta D_\beta \nabla \langle c_\beta \rangle^\beta + \underbrace{\frac{D_\beta}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \tilde{c}_\beta dA}_{\text{tortuosity}} \right)$$

Closure and Macro-scale equation

$$\tilde{c}_\beta = \mathbf{b}_\beta \cdot \nabla C_\beta + \dots \quad C_\beta = \langle c_\beta \rangle^\beta$$

- Local problem over representative UC

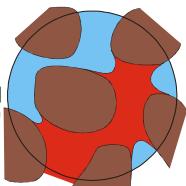

$$0 = \nabla^2 \mathbf{b}_\beta$$

B.C. 1 $\mathbf{n}_{\beta\sigma} \cdot \nabla \mathbf{b}_\beta = -\mathbf{n}_{\beta\sigma}$ at $A_{\beta\sigma}$

$$\mathbf{b}_\beta(\mathbf{r}) = \mathbf{b}_\beta(\mathbf{r} + \mathbf{l}_i)$$

$$\langle \mathbf{b}_\beta \rangle^\beta = 0$$

To be discussed

- Macro-scale Equation

$$\frac{\partial \varepsilon_\beta C_\beta}{\partial t} = \nabla \cdot (\varepsilon_\beta \mathbf{D}_\beta^* \cdot \nabla C_\beta)$$

$$\mathbf{J}_\beta^* = -\varepsilon_\beta \mathbf{D}_\beta^* \cdot \nabla C_\beta$$

macro-scale flux density

- Effective diffusion tensor

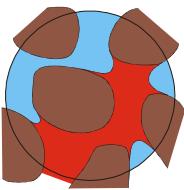

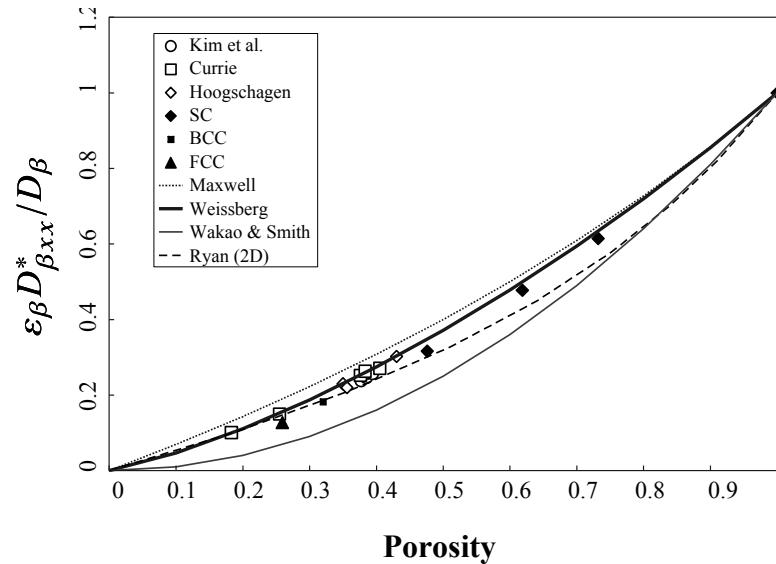

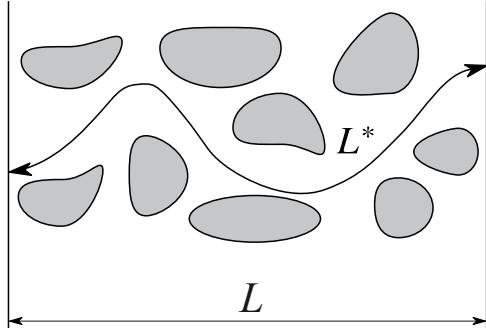

$$\mathbf{D}_\beta^* = D_\beta \left(\mathbf{I} + \frac{1}{\mathcal{V}_\beta} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \mathbf{b}_\beta dA \right)$$

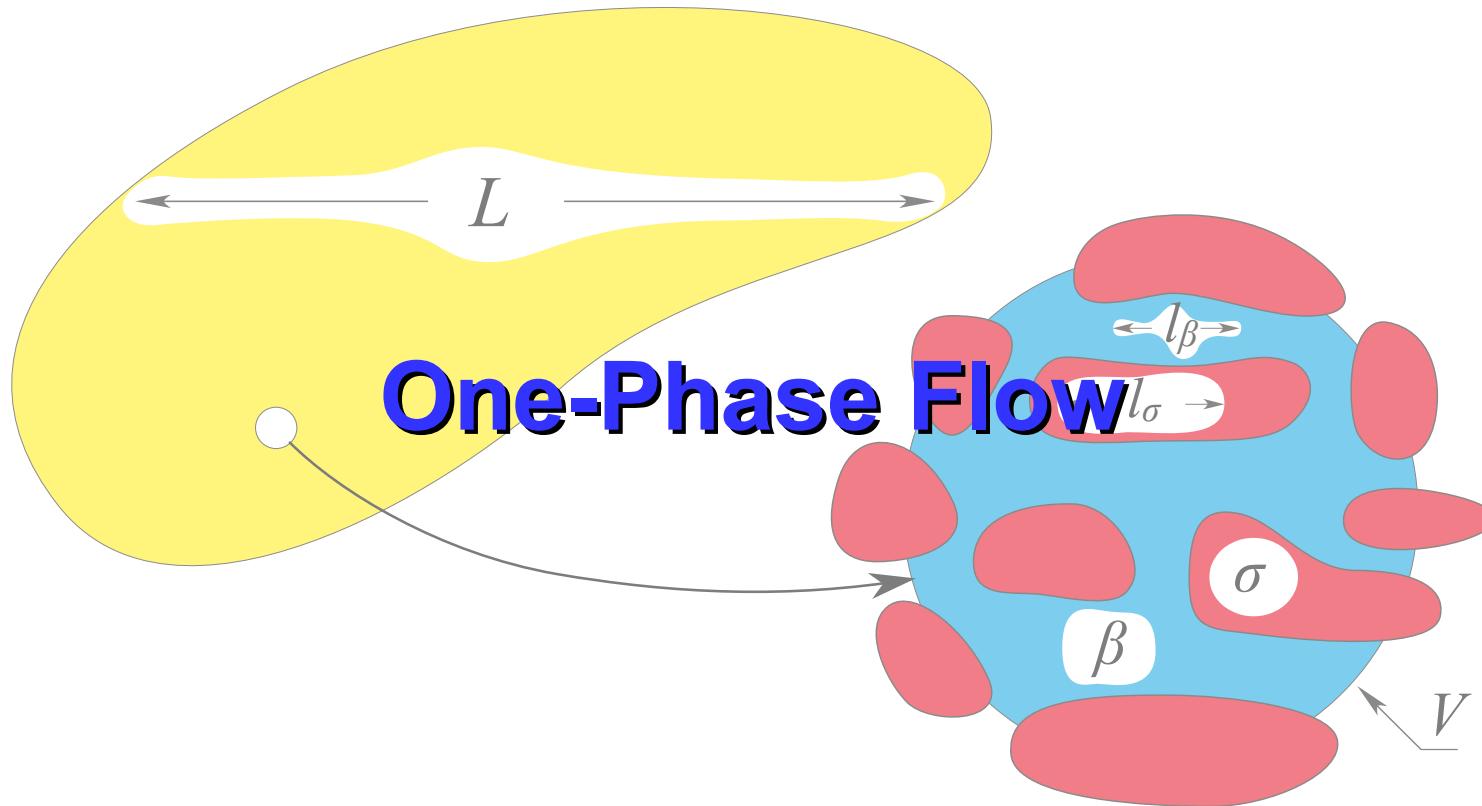

Tortuosity

$$\mathbf{D}_\beta^* = D_\beta \left(\mathbf{I} + \frac{1}{V_\beta} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \mathbf{b}_\beta \, dA \right)$$

- Effective diffusion depends on BC at $A_{\beta\sigma}$
- If isotropic : $\mathbf{D}_\beta^* = \frac{D_\beta}{\tau_\beta} \mathbf{I}$ tortuosity: $\tau_\beta \geq 1$
- Not a purely geometrical property

 : $\tau_\beta \neq \frac{L^*}{L}$

One-Phase Flow: Phenomenology

● Pore-scale equation $\nabla \cdot \mathbf{v}_\beta = 0$

$$\rho_\beta \frac{\partial \mathbf{v}_\beta}{\partial t} + \rho_\beta \mathbf{v}_\beta \cdot \nabla \mathbf{v}_\beta = -\nabla p_\beta + \rho_\beta \mathbf{g} + \mu_\beta \nabla^2 \mathbf{v}_\beta \quad \text{B.C.1 } \mathbf{v}_\beta = 0 \text{ at } A_{\beta\sigma}$$

$$\text{Re} = \frac{\rho_\beta U_r \ell_\beta}{\mu_\beta}; p_\beta^c = \frac{p_\beta \ell_\beta}{\mu_\beta U_r}; \text{Fr} = \frac{U_r}{\sqrt{\ell_\beta g}} \Rightarrow \text{Re} \left(\frac{\partial \mathbf{v}'_l}{\partial t'} + \mathbf{v}'_l \cdot \nabla' \mathbf{v}'_l \right) = -\nabla' p_l^c + \frac{\text{Re}}{\text{Fr}^2} \frac{\mathbf{g}}{g} + \nabla'^2 \mathbf{v}'_l$$

● Pore-Scale regimes

– Creeping ($\text{Re} \rightarrow 0$): leads to Darcy's law

– Laminar

– Turbulent

}

Various regimes and transitions

Upscaling One-Phase Flow

• Averaging

$$p_\beta = \langle p_\beta \rangle^\beta + \tilde{p}_\beta ; \quad \mathbf{v}_\beta = \langle \mathbf{v}_\beta \rangle^\beta + \tilde{\mathbf{v}}_\beta$$

$$\nabla \cdot \langle \mathbf{v}_\beta \rangle = 0$$

$$\text{B.C.1 } \tilde{\mathbf{v}}_\beta = -\langle \mathbf{v}_\beta \rangle^\beta \quad \text{at } A_{\beta\sigma}$$

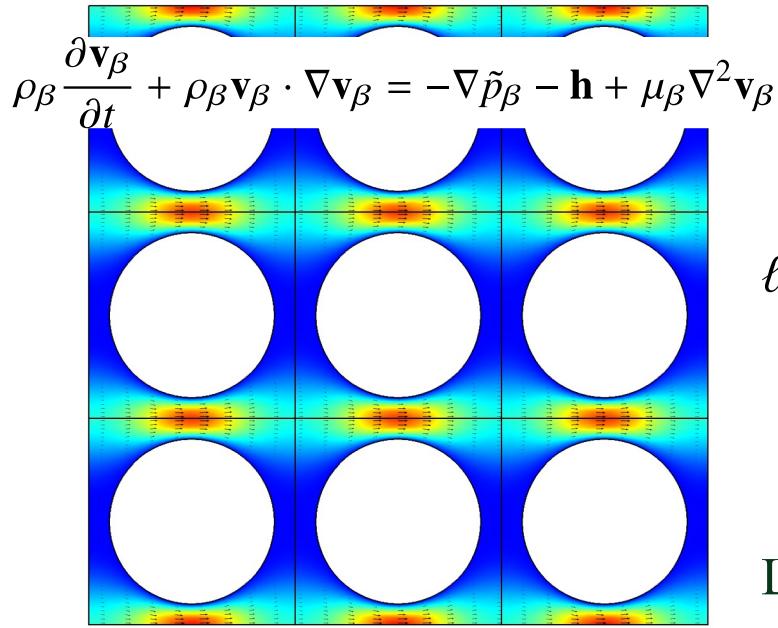

$$\begin{aligned} & \rho_\beta \frac{\partial \langle \mathbf{v}_\beta \rangle}{\partial t} + \rho_\beta \langle \mathbf{v}_\beta \rangle \cdot \nabla \langle \mathbf{v}_\beta \rangle^\beta + \nabla \cdot (\rho_\beta \langle \tilde{\mathbf{v}}_\beta \tilde{\mathbf{v}}_\beta \rangle) = \\ & -\varepsilon_\beta \nabla \langle p_\beta \rangle^\beta + \varepsilon_\beta \rho_\beta \mathbf{g} + \underbrace{\mu_\beta \nabla^2 \langle \mathbf{v}_\beta \rangle - \mu_\beta \nabla \varepsilon_\beta \cdot \nabla \langle \mathbf{v}_\beta \rangle^\beta}_{\text{Brinkman terms}} + \frac{1}{\mathcal{V}} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot (-\tilde{p}_\beta \mathbf{I} + \mu_\beta \nabla \tilde{\mathbf{v}}_\beta) dA \end{aligned}$$

Remark: $\tilde{\mathbf{v}}_\beta \sim \langle \mathbf{v}_\beta \rangle^\beta$

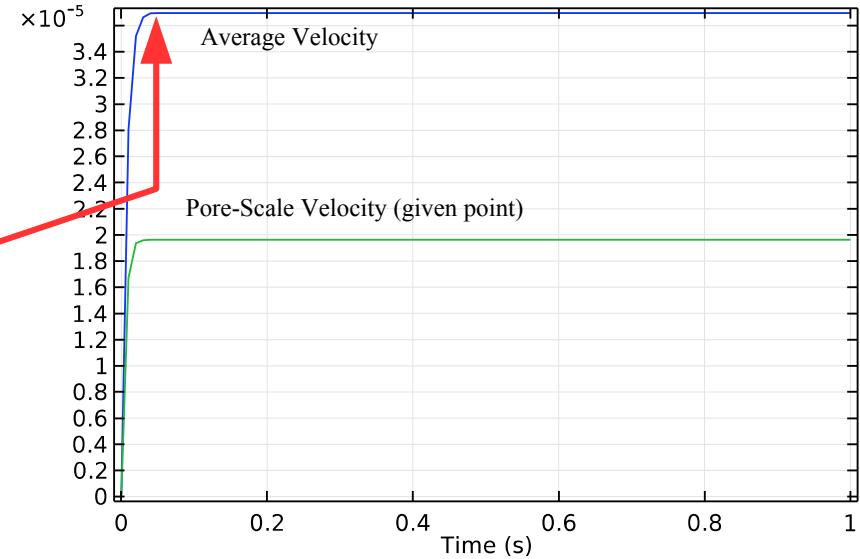

Various Regimes: Creeping

Re~0

$$\ell^2 / v_\beta$$

Linear relationship between average velocity and pressure drop!

$$0 = -\varepsilon_\beta \nabla \langle p_\beta \rangle^\beta + \varepsilon_\beta \rho_\beta \mathbf{g} + \mu_\beta \nabla^2 \langle \mathbf{v}_\beta \rangle - \mu_\beta \nabla \varepsilon_\beta \nabla \langle \mathbf{v}_\beta \rangle^\beta$$

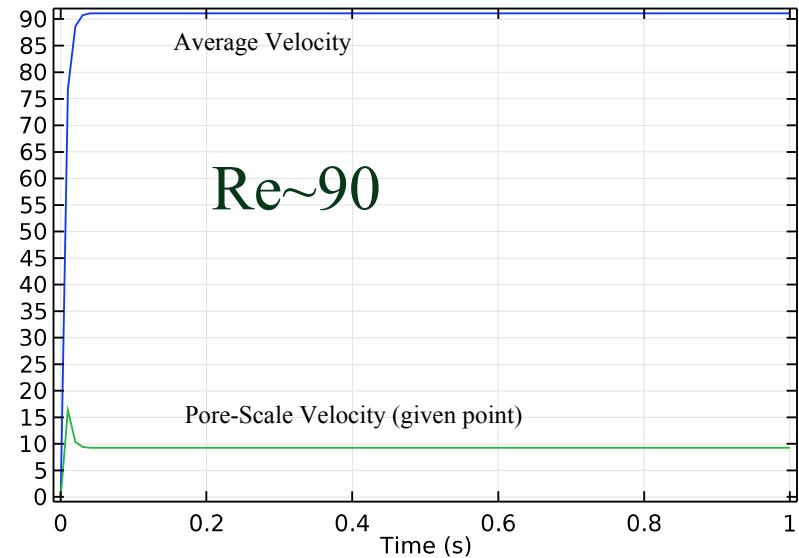

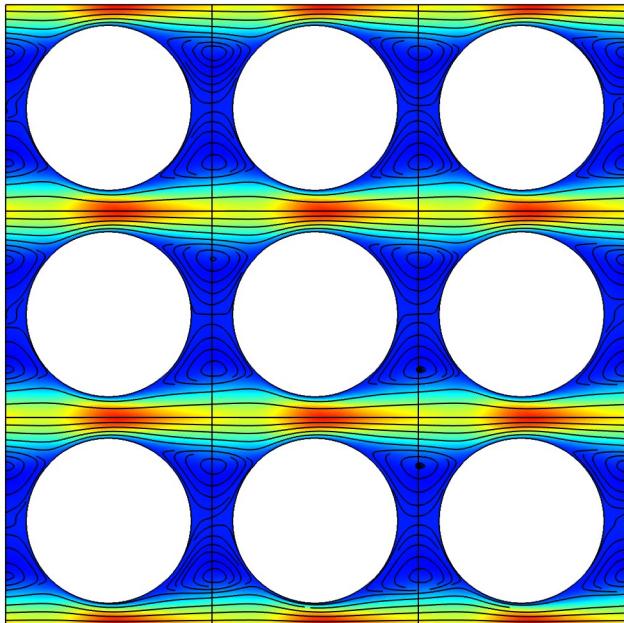

$$+ \frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot (-\tilde{p}_\beta \mathbf{I} + \mu_\beta \nabla \tilde{\mathbf{v}}_\beta) dA$$

$$O\left(\frac{\langle v_\beta \rangle^\beta}{\ell^2}\right)$$

$$O\left(\frac{\langle v_\beta \rangle^\beta}{L^2}\right)$$

Various Regimes: Laminar Inertial

Still

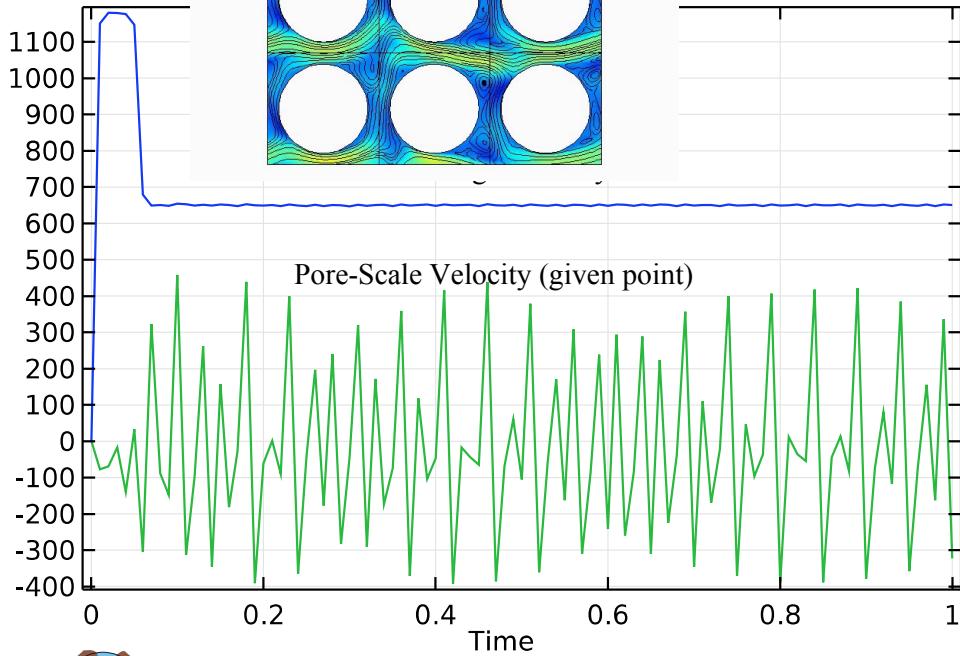

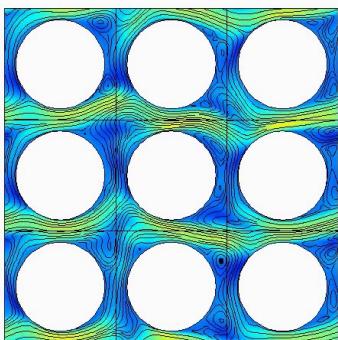

$$0 = -\varepsilon_\beta \nabla \langle p_\beta \rangle^\beta + \varepsilon_\beta \rho_\beta \mathbf{g} + \frac{1}{\mathcal{V}} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot (-\tilde{p}_\beta \mathbf{I} + \mu_\beta \nabla \tilde{\mathbf{v}}_\beta) \, dA$$

But non-linear relationship between average velocity and pressure drop!

Various Regimes: towards turbulence

- $\langle v \rangle = \text{steady-state}$

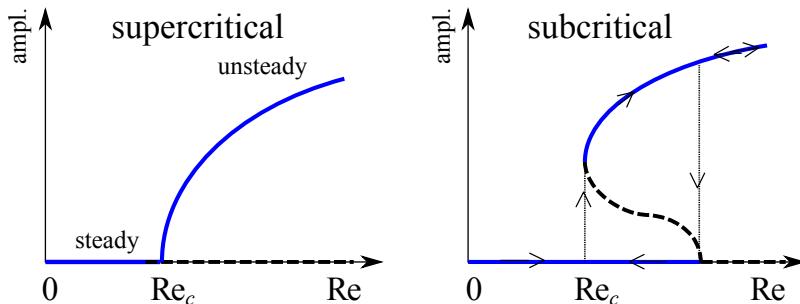

- Macro-Scale Turbulence? (see Jin et al., 2015, DNS)

- Localized turbulence (nearly periodic over N-UC) need $\overline{\langle v_\beta \rangle}$
- Macro-scale turbulence? Ex.: entrance regions (D'Hueppe et al., ...)

More...

- NS → Various types of bifurcations:

Ex.: array of cylinders – not same
 Re_c for flow // or \perp to axis

- Bifurcations depends on Re and number of UC (Agnaou et al., 2016)...and topology! → REV size = $f(\langle v_\beta \rangle^\beta)$
- Difficult to estimate order of magnitude when fully non-linear → rely on DNS
- RESULT: $(\nabla \langle p_\beta \rangle^\beta - \rho_\beta g)$ and $\langle v_\beta \rangle$ nearly constant over REV!

and up to localized turbulence one has

$$\overline{(\nabla \langle p_\beta \rangle^\beta - \rho_\beta g)} \text{ and } \overline{\langle v_\beta \rangle} \text{ nearly constant over REV!}$$

Closure: Darcy regime (Stokes problem=creeping flow)

Re~0

- PDEs for deviations

$$0 = -\nabla \tilde{p}_\beta + \mu_\beta \nabla^2 \tilde{\mathbf{v}} - \varepsilon_\beta^{-1} \frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot (-\tilde{p}_\beta \mathbf{I} + \mu_\beta \nabla \tilde{\mathbf{v}}_\beta) dA$$

$$\nabla \cdot (\tilde{\mathbf{v}}_\beta) = -\nabla \cdot \langle \mathbf{v}_\beta \rangle^\beta \approx 0 \quad \text{B.C. 1} \quad \tilde{\mathbf{v}} = -\langle \mathbf{v}_\beta \rangle^\beta \text{ at } A_{\beta\sigma}$$

- Closure in the linear case (3 elementary solutions for \mathbf{e}_i)

$$\tilde{p}_\beta = \mu_\beta \mathbf{b} \cdot \langle \mathbf{v}_\beta \rangle^\beta + \dots ; \tilde{\mathbf{v}} = \mathbf{B} \cdot \langle \mathbf{v}_\beta \rangle^\beta + \dots$$

Closure and Macro-Scale Equation (Darcy regime)

$$\nabla \cdot \mathbf{B} = 0$$

$$-\nabla \mathbf{b} + \nabla^2 \mathbf{B} = \varepsilon_{\beta}^{-1} \frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot (-\mathbf{I}\mathbf{b} + \nabla \mathbf{B}) \ dA$$

$$\mathbf{B} = -\mathbf{I} \quad \text{at } A_{\beta\sigma}, \langle \mathbf{b} \rangle^{\beta} = 0$$

$$\mathbf{b}(\mathbf{r} + \mathbf{l}_i) = \mathbf{b}(\mathbf{r})$$

$$\mathbf{B}(\mathbf{r} + \mathbf{l}_i) = \mathbf{B}(\mathbf{r})$$

$$\langle \mathbf{v}_{\beta} \rangle = -\frac{1}{\mu_{\beta}} \mathbf{K} \cdot \left(\nabla \langle p_{\beta} \rangle^{\beta} - \rho_{\beta} \mathbf{g} \right)$$

$$\mathbf{K}^{-1} = -\varepsilon_{\beta}^{-2} \frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot (-\mathbf{I}\mathbf{b} + \nabla \mathbf{B}) \ dA$$

\mathbf{K} intrinsic permeability

See Sanchez-Palencia (homogenization), Whitaker, ...

Other version of closure: permeameter-like problems

Note: also suitable for non-linear problems (non-newtonian flows, etc...)

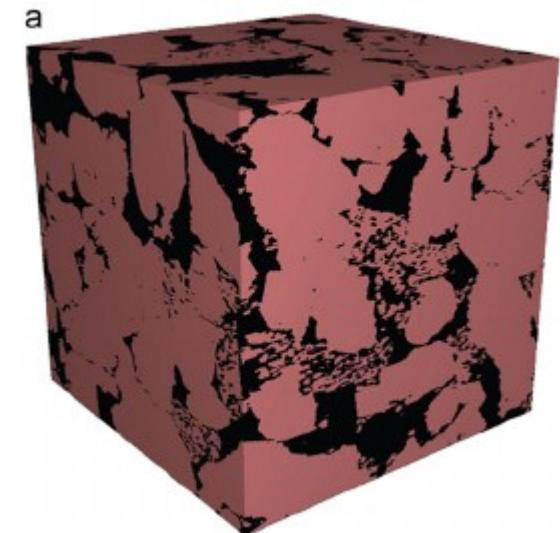

$$\rho_\beta \mathbf{v}_\beta \cdot \nabla \tilde{\mathbf{v}}_\beta = -\nabla \tilde{p}_\beta + \nabla \cdot (\mu_\beta (\nabla \tilde{\mathbf{v}}_\beta + \nabla \tilde{\mathbf{v}}_\beta^T)) - (\nabla \langle p_\beta \rangle^\beta - \rho_\beta \mathbf{g})$$

$\underbrace{\phantom{\rho_\beta \mathbf{v}_\beta \cdot \nabla \tilde{\mathbf{v}}_\beta = -\nabla \tilde{p}_\beta + \nabla \cdot (\mu_\beta (\nabla \tilde{\mathbf{v}}_\beta + \nabla \tilde{\mathbf{v}}_\beta^T)) - (\nabla \langle p_\beta \rangle^\beta - \rho_\beta \mathbf{g})}}$

=0, Darcy regime $\nabla \cdot (\tilde{\mathbf{v}}_\beta) = 0$ $\tilde{\mathbf{v}} = -\langle \mathbf{v}_\beta \rangle^\beta$ at $A_{\beta\sigma}$

BCs (see Guibert et al., 2016)?

- Periodicity conditions: good for anisotropic media, but percolation problem if “periodized” media
- Permeameter (various types: classical, Bamberger, ...)
- Bordering media: fluid or porous layer, ...

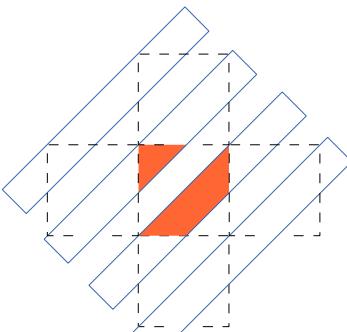

Calculation of the permeability

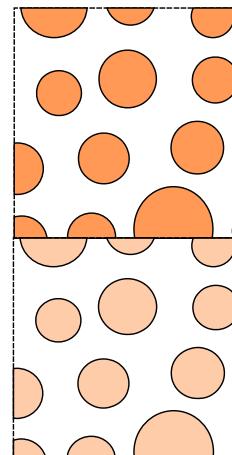

Case of “diffusion” problem: e.g., permeability, effective diffusion

- Periodicity : good for anisotropy
- Making image periodic?
 - I: Percolation problem
 - II: Loss of anisotropy
 - III: potentially various bias

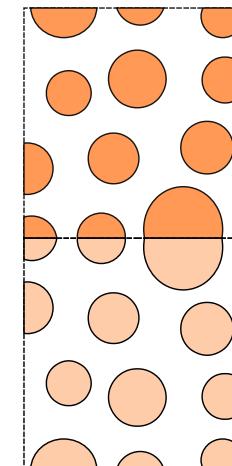

See discussion in Guibert et al., 2015

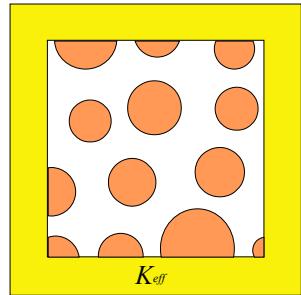

$$K_{eff} = \varepsilon_\beta K_\beta + \varepsilon_\sigma K_\sigma + \frac{\varepsilon_\beta \varepsilon_\sigma (K_\beta - K_\sigma) \cdot ii \cdot (K_\sigma - K_\beta)}{i \cdot (\varepsilon_\beta K_\sigma + \varepsilon_\sigma K_\beta) \cdot i}$$

I

II

- thin layers
- Eff.
- Medium
- III

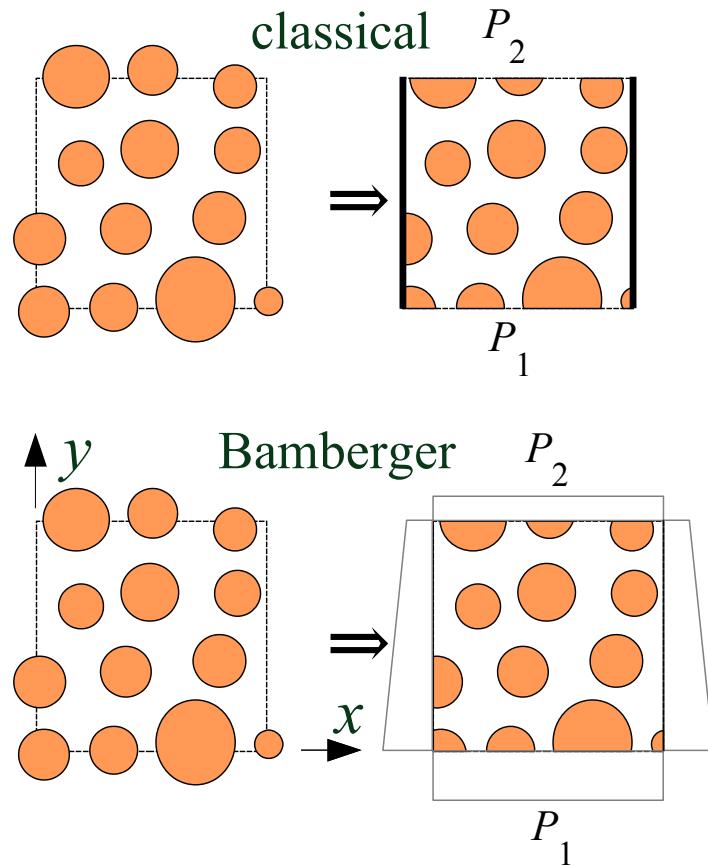

Calculations over non-periodic images (cont.)

- “permeameters”
 - All methods have bias
 - $\langle v_x \rangle \beta \neq 0$
 - $K_{xy} \neq K_{yx}$

Note: minimal bias if large sample and anisotropy along the axis

See discussion in: Manwart et al. 2002; Piller et al. 2009; Guibert et al., 2015; ...

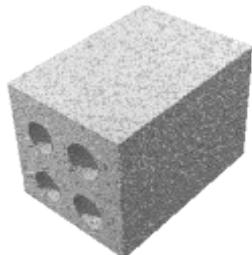

Permeability : $K \sim d_p^2$, 1 Darcy = 10^{-12} m^2

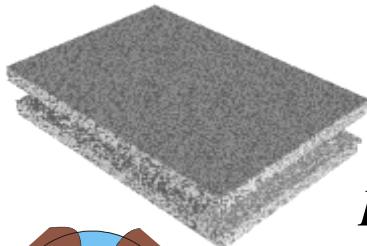

Rocks : shale sandstone

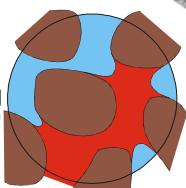

Soils: clay silt sand gravel

$$K = \varepsilon \frac{d^2}{32} \text{capillary}$$

$$K = \varepsilon \frac{b^2}{12} \quad \text{Hele Shaw}$$

$$a_v = \frac{1}{\mathcal{V}} \int_{A_{\beta\sigma}} dA = \frac{A_{\beta\sigma}}{\mathcal{V}} : \text{specific area}$$

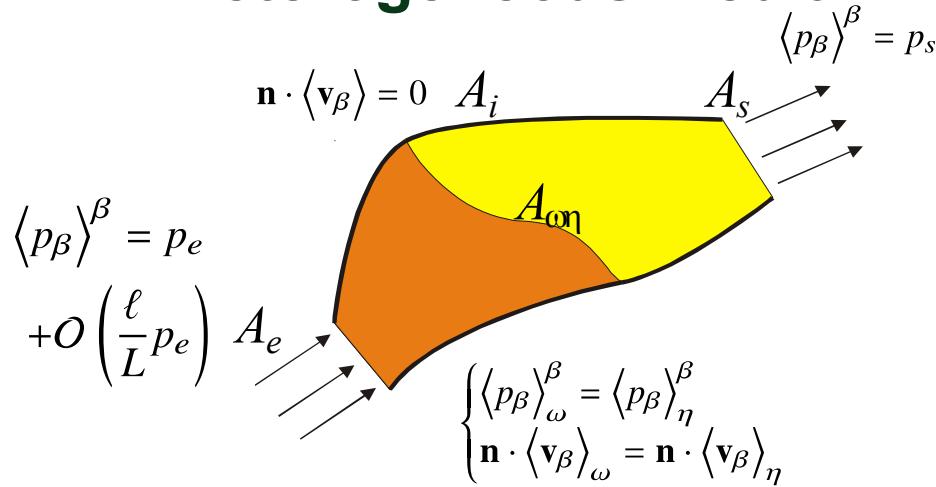

- Kozeny-Carman (Carman, 1937)

$$K = \frac{\varepsilon^3 d_K^2}{h_K (1 - \varepsilon)^2} \quad a_{vs} = \frac{a_v}{1 - \varepsilon}$$

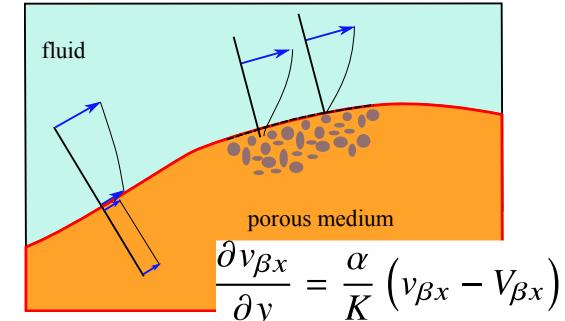

$$d_K = d_{St} = \frac{6}{a_{vs}} \text{ Sauter diam.}$$

Boundary Conditions

- **Heterogeneous media**

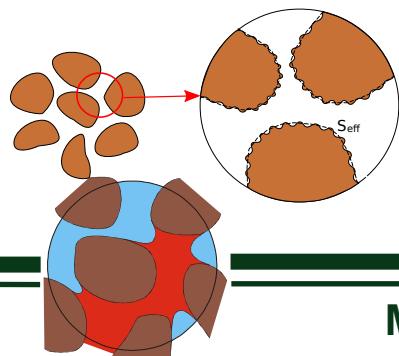

- **fluid/porous medium**

$$\mathbf{n} \cdot \left(-p_\beta \mathbf{I} + \mu_\beta \left(\nabla \mathbf{v}_\beta + (\nabla \mathbf{v}_\beta)^T \right) \right) \cdot (\mathbf{I} - \mathbf{n} \mathbf{n}) = \left(\alpha \mu_\beta \sqrt{3} / \sqrt{\text{tr}(\mathbf{K})} \right) (\mathbf{v}_\beta - \mathbf{V}_\beta) \cdot (\mathbf{I} - \mathbf{n} \mathbf{n})$$

Beavers & Joseph...+ many variants
(Ochoa-Tapia, Le Bars, ...)

$$\mathbf{v}_\beta \cdot (\mathbf{I} - \mathbf{n} \mathbf{n}) = 0 ; \quad \text{Da} = \frac{K}{L^2} \rightarrow 0$$

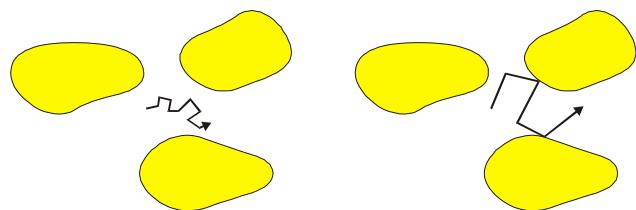

$$\mathbf{U}_0 = \mathbf{M} \cdot [\mathbf{n} \cdot (\nabla \mathbf{U}_0 + (\nabla \mathbf{U}_0)^T) \cdot (\mathbf{I} - \mathbf{n} \mathbf{n})]$$

General Navier BC

M. Quintard

Transport in Porous Media

Klinkenberg Effect (1941)

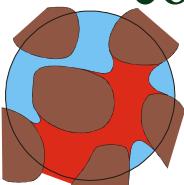

$$K = K_\infty \left(1 + \frac{b}{P_\beta} \right)$$

where b (Klinkenberg factor) depends on media.

Example: Sampath and Keighin (1982), N_2

$$b(\text{Pa}) = 0.0955 (K_\infty / \varepsilon)^{-0.53}$$

Generalization: See literature on upscaling with slip condition : $\mathbf{v}_\beta = -\ell_\beta (\mathbf{I} - \mathbf{n}_{\beta\sigma} \mathbf{n}_{\beta\sigma}) \cdot (\mathbf{n}_{\beta\sigma} \cdot \mu_\beta (\nabla \mathbf{v}_\beta + \nabla \mathbf{v}_\beta^T))$

Non Darcian regimes (Re>1)

- Heuristic: Forchheimer, Ergun, ...

$$0 = -\nabla P_\beta + \rho_\beta \mathbf{g} - \mu_\beta K^{-1} \mathbf{V}_\beta - \rho_\beta \eta^{-1} \|\mathbf{V}_\beta\| \mathbf{V}_\beta \quad \text{with } \mathbf{V}_\beta = \langle \mathbf{v}_\beta \rangle ; P_\beta = \langle p_\beta \rangle^\beta$$

$$K = \frac{\varepsilon^3 d^2}{h_K (1 - \varepsilon)^2} \quad ; \quad \eta = \frac{\varepsilon^3 d}{h_\eta (1 - \varepsilon)}$$

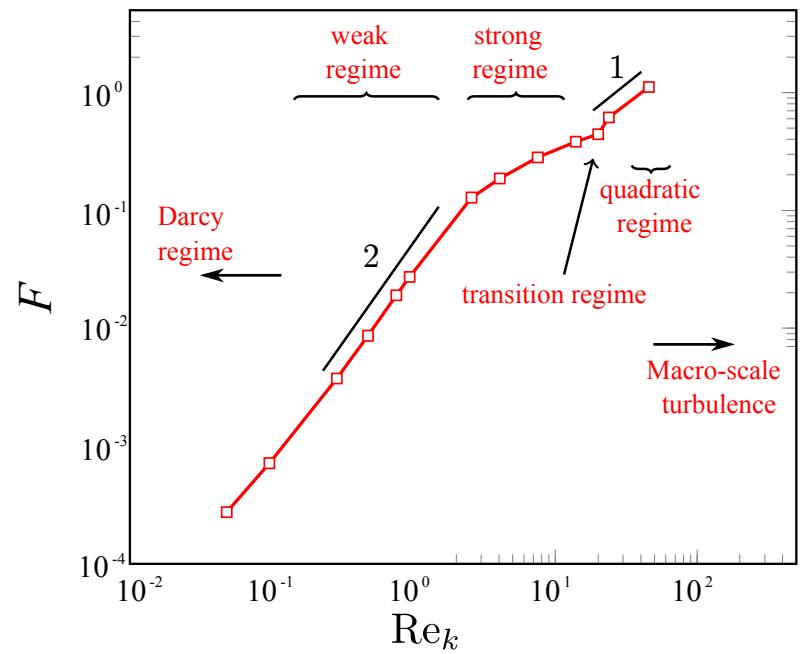

(passability)

- Upscaling?

$$0 = -\nabla \langle p_\beta \rangle^\beta + \rho_\beta \mathbf{g} - \mu_\beta \mathbf{K}_{app}^{-1} \cdot \langle \mathbf{v}_\beta \rangle$$

↓

$$0 = -\nabla \langle p_\beta \rangle^\beta + \rho_\beta \mathbf{g} - \mu_\beta \mathbf{K}^{-1} \cdot \langle \mathbf{v}_\beta \rangle - \mathbf{F}(\langle \mathbf{v}_\beta \rangle) \cdot \langle \mathbf{v}_\beta \rangle$$

Non Darcian regimes (Re>1)

- laminar inertia effects: theory → generalized Forchheimer equation

$$0 = -\nabla \left\langle p_\beta \right\rangle^\beta + \rho_\beta \mathbf{g} - \mu_\beta \mathbf{K}^{-1} \cdot \left\langle \mathbf{v}_\beta \right\rangle - \mathbf{F} \left(\left\langle \mathbf{v}_\beta \right\rangle \right) \cdot \left\langle \mathbf{v}_\beta \right\rangle$$

- Re → 0: Darcy, F=0
- Re ~ 0: weak inertia, $F \cdot \langle v_\beta \rangle \sim \langle v_\beta \rangle^3$ (Levy, Mei & Auriault, Firdauss, ...)
- Re > 0: strong inertia, $F \cdot \langle v_\beta \rangle \sim \langle v_\beta \rangle^2$ (Whitaker, 1996; Lasseux et al., 2011;...)

Weak Inertia

- Solution following asymptotic expansions in Re

$$\mathbf{v}^* = \frac{\tilde{\mathbf{v}}_\beta}{\nu} + \lambda, \quad p^* = \ell_\beta \frac{\tilde{p}_\beta}{\mu_\beta \nu}$$

$$\delta = \frac{\ell}{\nu_\beta} \nu = \text{Re}$$

$$\mathbf{v}^* = \mathbf{v}_0^* + \delta \mathbf{v}_1^* + \delta^2 \mathbf{v}_2^* + O(\delta^3)$$

$$p^* = p_0^* + \delta p_1^* + \delta^2 p_2^* + O(\delta^3)$$

- 1st correction?

- Periodic media: $F_{\parallel} \sim \nu^2$

- Periodic media+reversibility: $F_{\parallel}^{(1)} = F_{\perp}^{(1)} = 0$

Wodié et Lévy, 1991; Mei et Auriault, 1991; Firdaouss et al., 1997
..... revisited by Pauthenet et al., 2017

Strong Inertia

• Solution for

$$\nabla \langle p_\beta \rangle^\beta - \rho_\beta \mathbf{g} \Rightarrow (\tilde{p}_\beta, \mathbf{v}_\beta) \Rightarrow \langle \mathbf{v}_\beta \rangle^\beta = v \lambda$$

$$0 = -\nabla \langle p_\beta \rangle^\beta + \rho_\beta \mathbf{g} - \mu_\beta \mathbf{K}_{app}^{-1} \cdot \langle \mathbf{v}_\beta \rangle$$

$$0 = -\nabla \langle p_\beta \rangle^\beta + \rho_\beta \mathbf{g} - \mu_\beta (\mathbf{I} + F \mathbf{P}) \cdot \mathbf{K}^{-1} \cdot \langle \mathbf{v}_\beta \rangle$$

$$\text{or } \nabla \langle p_\beta \rangle^\beta - \rho_\beta \mathbf{g} = -\varepsilon_\beta \mu_\beta (\mathbf{K}_D^{-1} \cdot \lambda + \mathbf{f}) v$$

P: rotation

F: non-linear scaling

$$\mathbf{f} = K_\lambda^{-1} (F_{\parallel} \lambda + F_{\perp} (\cos(\omega) \mathbf{n}_1 + \sin(\omega) \mathbf{n}_2))$$

$$\mathbf{n}_1 \times \mathbf{n}_2 = \lambda \quad F_{\parallel} = \frac{\lambda \cdot \mathbf{f}}{K_\lambda^{-1}} \quad K_\lambda^{-1} = ||\mathbf{K}_D^{-1} \cdot \lambda||$$

$$F_{\perp} = ||(\mathbf{I} - \lambda \lambda) \cdot \frac{\mathbf{f}}{K_\lambda^{-1}}|| \quad \omega = \left((\mathbf{I} - \lambda \lambda) \cdot \frac{\nabla \langle p_\beta \rangle^\beta - \rho_\beta \mathbf{g}}{\varepsilon_\beta \mu_\beta K_\lambda^{-1} v}, \mathbf{n}_1 \right)$$

Transition to inertia regimes: which Re number?

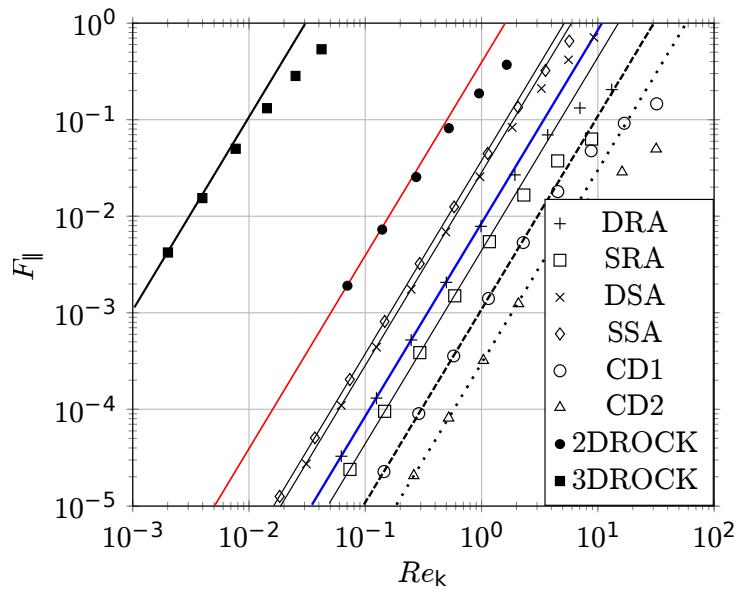

$$\text{Re} = \frac{\langle v_\beta \rangle^\beta \ell}{\nu_\beta}$$

- Literature discussion (see polemic in Lage et Antohe, 2000; etc...)
- $\ell = \sqrt{K}$?
 - $K = \varepsilon d^2 / 32$ for a bundle of tubes (transition would change with porosity!) → better
- Topological problem: array of cylinders → transition depends on the orientation → need a topological information!

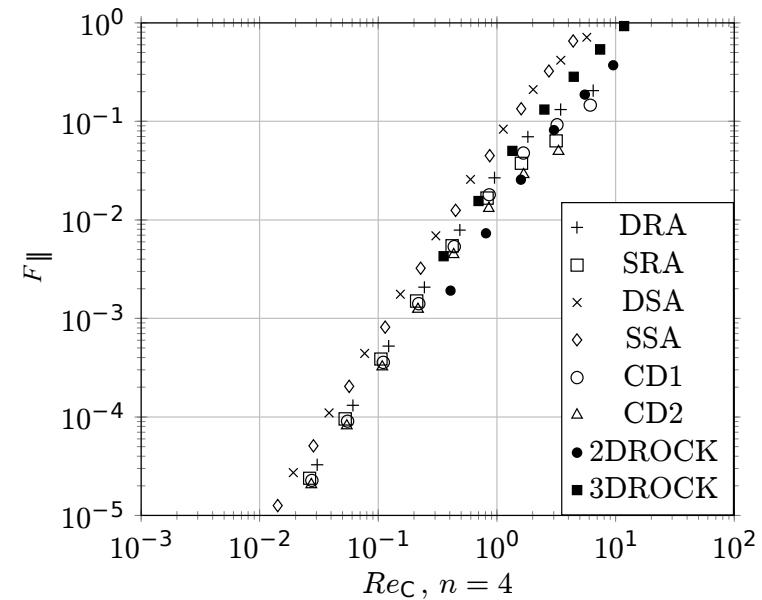

Transition to inertia effect: effect of topology (Pauthenet et al., 2017)

- If Re_k

(various media, rocks, ...:
Muljadi et al., 2016; etc...)

- Re_C

$$Re_C = \frac{\nu}{\nu_\beta} \sqrt{\frac{K_\lambda}{\varepsilon_\beta}} C_\lambda$$

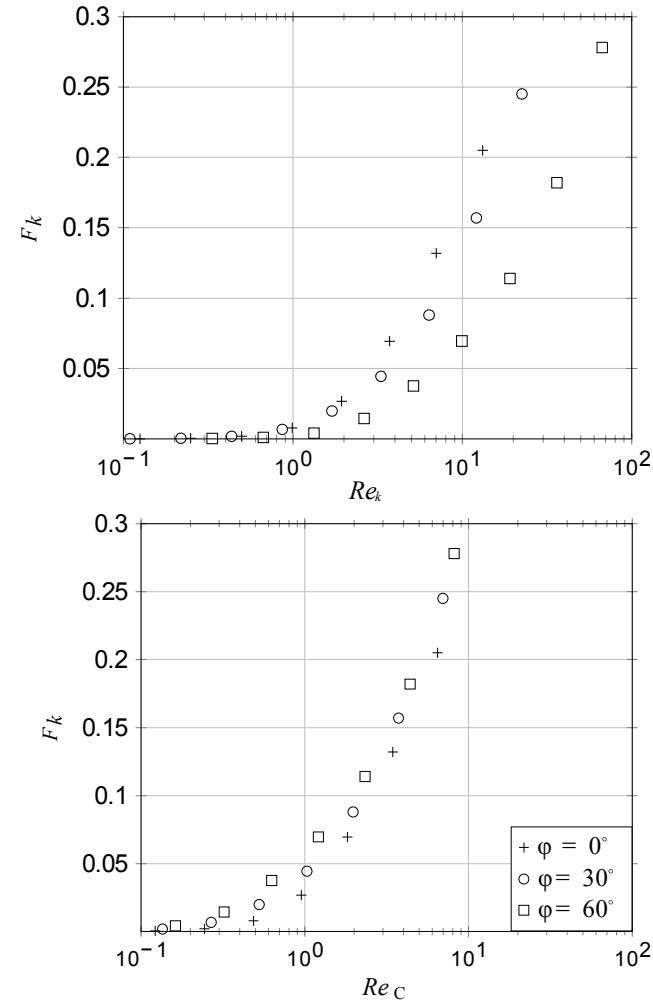

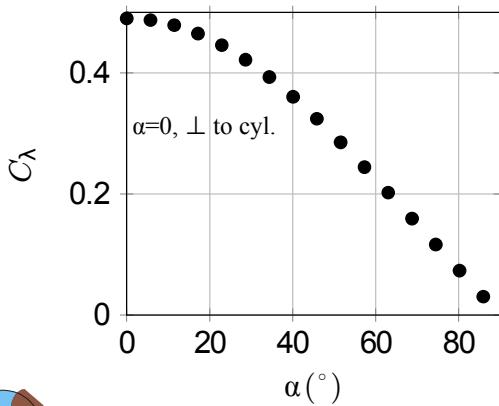

Topology effect (Ex.: array of Cylinder)

- Tentative (open question)

from Darcy closure

$$C_\lambda = \frac{\zeta(\mathbf{v}_0^* \cdot \nabla^* \mathbf{v}_0^*)}{\sqrt{\langle \nabla^* \mathbf{v}_0^* : T \nabla^* \mathbf{v}_0^* \rangle^\beta}} \sqrt{\frac{\lambda \cdot \mathbf{K}_D^{-1} \cdot \lambda}{K_\lambda^{-1}}}$$

$$\zeta(\mathbf{v}_0^* \cdot \nabla^* \mathbf{v}_0^*) = \langle ||\mathbf{v}_0^* \cdot \nabla^* \mathbf{v}_0^*||^n \rangle^{\beta^{1/n}}$$

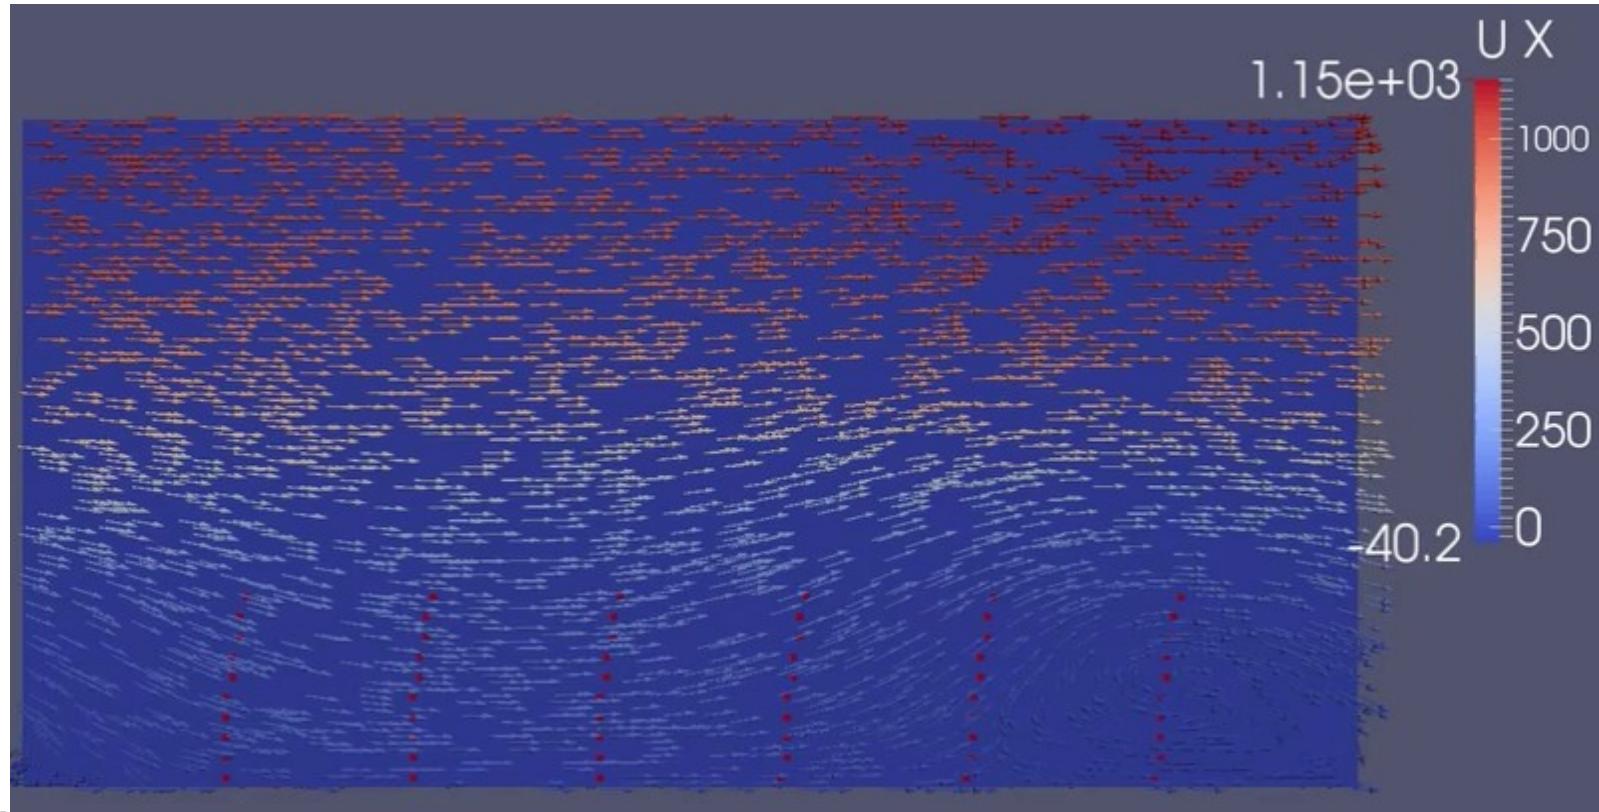

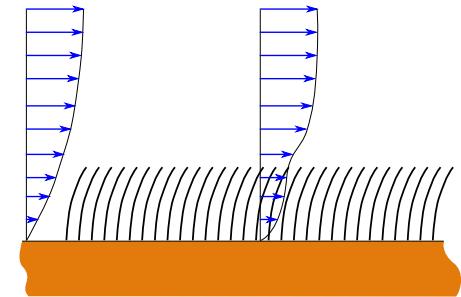

Example: canopy flow

Honami generation

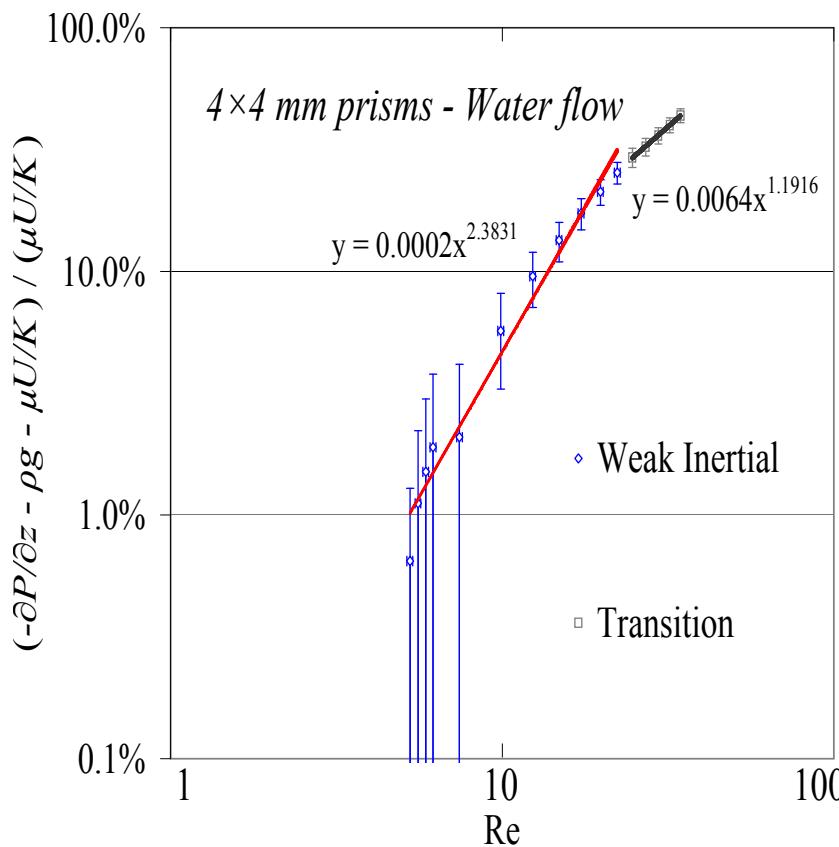

(Pauthenet, 2017)

...need K_{app} for all fiber directions and V_β

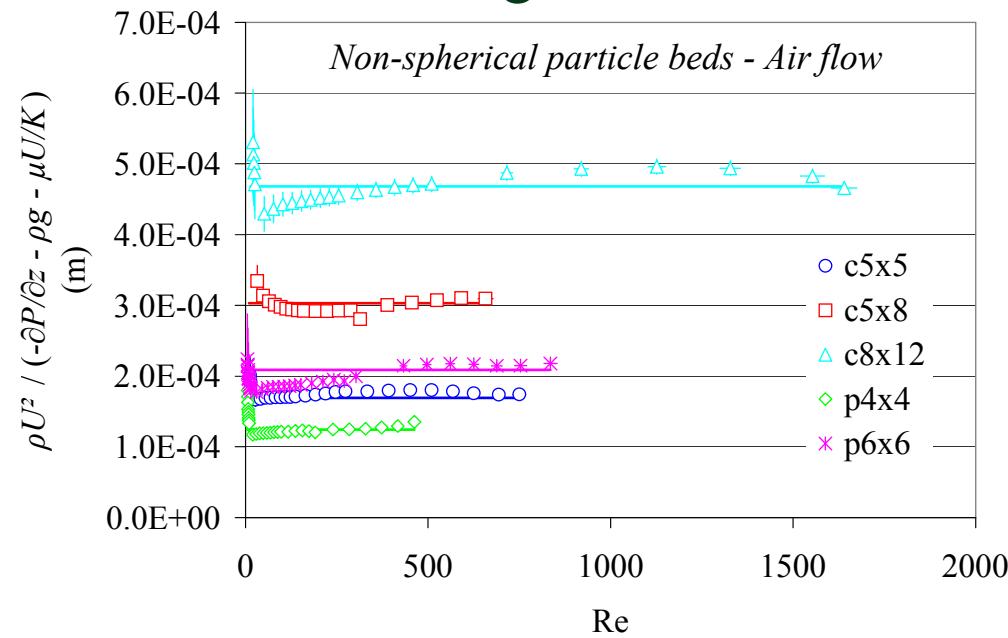

Experimental Evidence: inertia regime

Weak inertia

Strong inertia

Clavier et al., 2014

Note the importance of transition regimes!

Turbulent flows in porous media ($Re \gg 1$)

- Turbulence: time and spatial averaging (see book De Lemos, 2006; ...)
 - Time and spatial averaging commute!
 - However: not necessarily the same result if sequential closure!?

$$\text{I. } \mathbf{v}_\beta \rightarrow \langle \mathbf{v}_\beta \rangle \rightarrow \overline{\langle \mathbf{v}_\beta \rangle}$$

$$\text{II. } \mathbf{v}_\beta \rightarrow \overline{\mathbf{v}_\beta} (\text{RANS, ...}) \rightarrow \langle \overline{\mathbf{v}_\beta} \rangle$$

– For one-phase flow: scheme “II” seems preferable: contrary to Antohe & Lage (1997), Getachew et al. (2000), see discussion in Nakayama & Kuwahara (1999), Pedras and de Lemos (2001), etc...

- Open: Simultaneous closure over $[R^3 \times R^t]$? More complex sequential closures ($t \rightarrow x \rightarrow t \rightarrow \dots$) depending on the hierarchy of scales?
- Open question for multiphase flow?

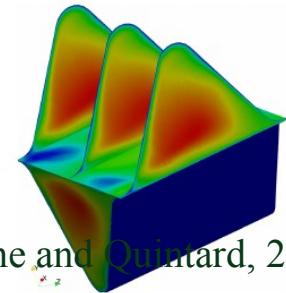

Turbulent flows in porous media (continued)

- Localized Turbulence: i.e., nearly periodic (see Jin et al., 2015 for DNS results)
 - Slow unsteady **flows** → generalized Forchheimer for time averaged pressure and velocity $\langle v_\beta \rangle$ or $\langle \bar{v}_\beta \rangle$
 - Spatial averaging of RANS models → generalized Forchheimer equation, F not necessarily $\sim \langle v_\beta \rangle$ or $\langle v_\beta \rangle^2$

Example: structured packings

$$K_{yy}^* = \frac{K_0}{1 + \gamma_l \sqrt{Re}} \text{ (laminar)} \quad ; \quad K_{yy}^* = \frac{K_1}{1 + \beta_t Re} \text{ (turbulent)}$$

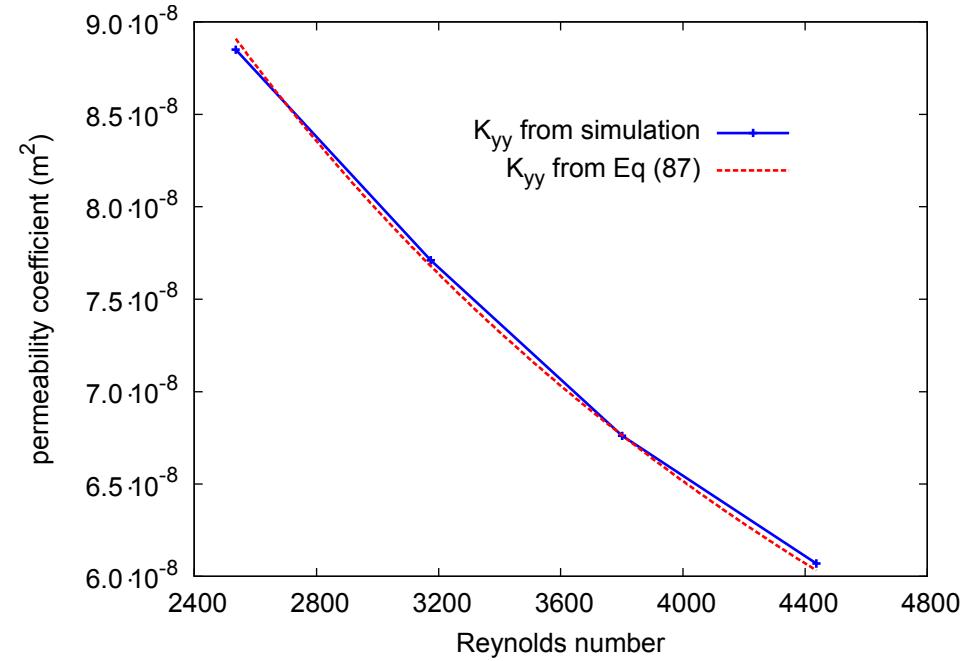

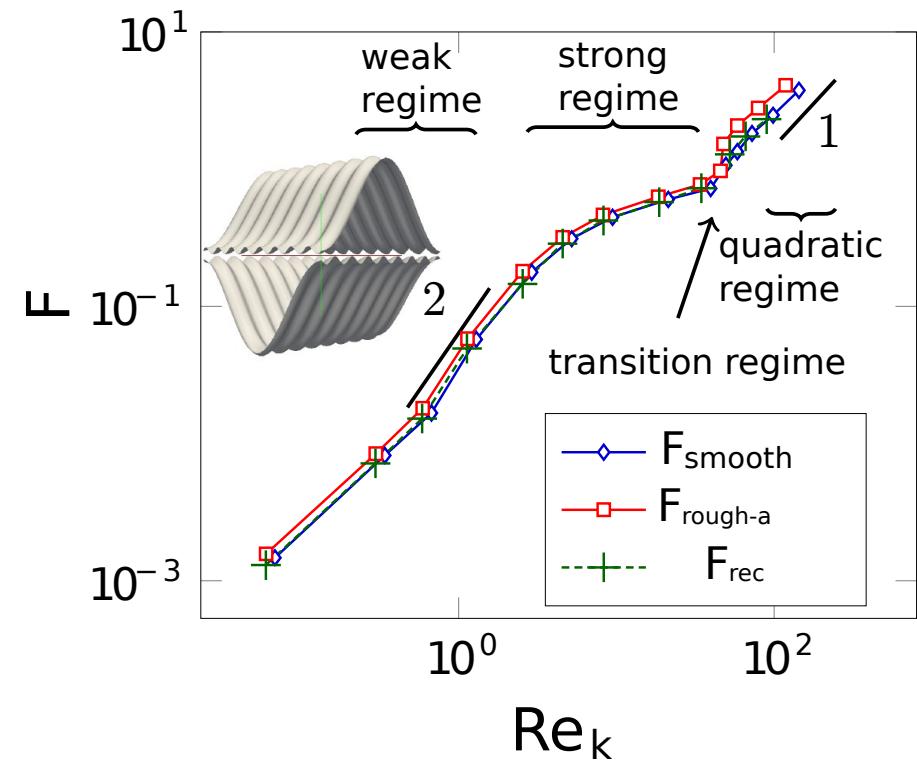

Soulaine and Quintard, 2014

- Porous media turbulence models (**beyond the scope of the lecture**)?
 - Pedras & De Lemos, Masuoka & Takatsu (1996), Nakayama & Kuwahara (1999), ...
 - note: useful for fluid/porous medium interface (D'Hueppe et al., 2012), deep inside the p.m. one may recover Darcy-Forchheimer regimes

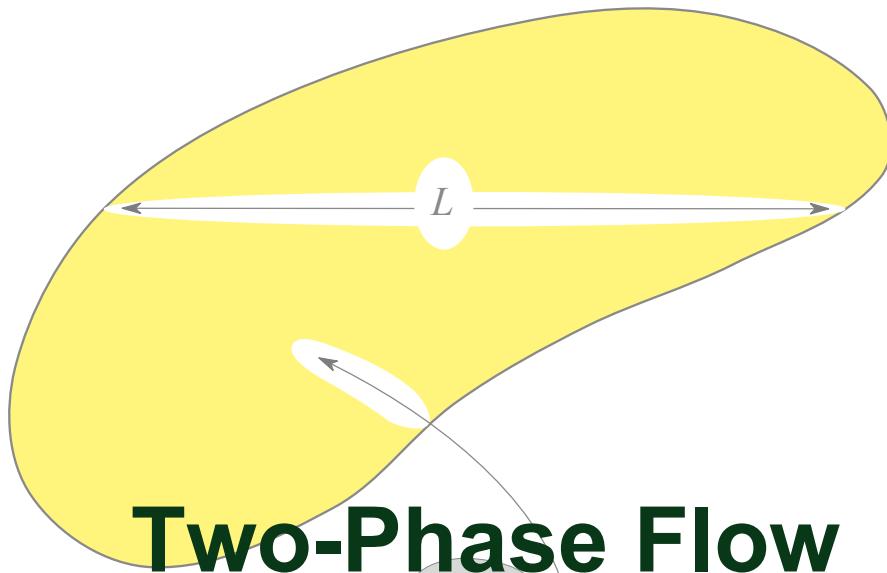

Example : (Structured Packings)

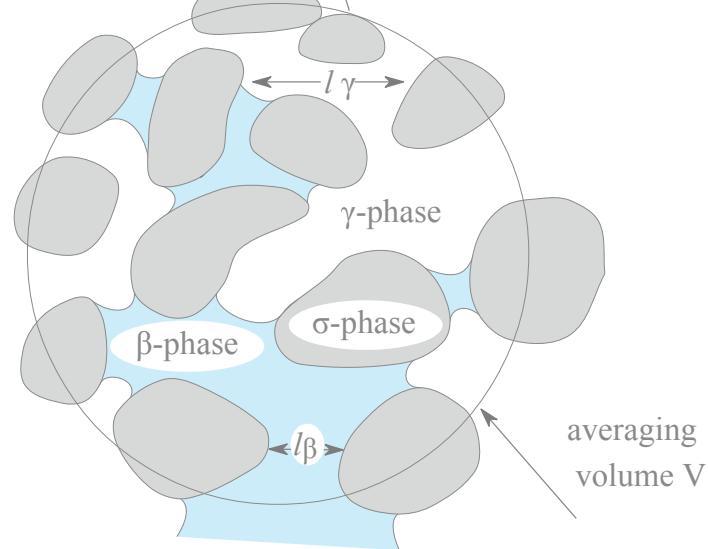

$$\mathbf{K}^*(Re, \theta) \approx \begin{pmatrix} \frac{K_0}{1 + \beta_l Re} & 0 & 0 \\ 0 & \frac{K_0}{1 + \beta_l Re} & 0 \\ 0 & 0 & 0 \end{pmatrix}.$$

Two-Phase Flow

Two-Phase Flow

- Pore-scale

$$\frac{\partial \rho_\alpha \mathbf{v}_\alpha}{\partial t} + \nabla \cdot (\rho_\alpha \mathbf{v}_\alpha \mathbf{v}_\alpha) = -\nabla p_\alpha + \rho_\alpha \mathbf{g} + \mu_\alpha \nabla^2 \mathbf{v}_\alpha \text{ in } V_\alpha \quad \alpha = \beta, \gamma$$

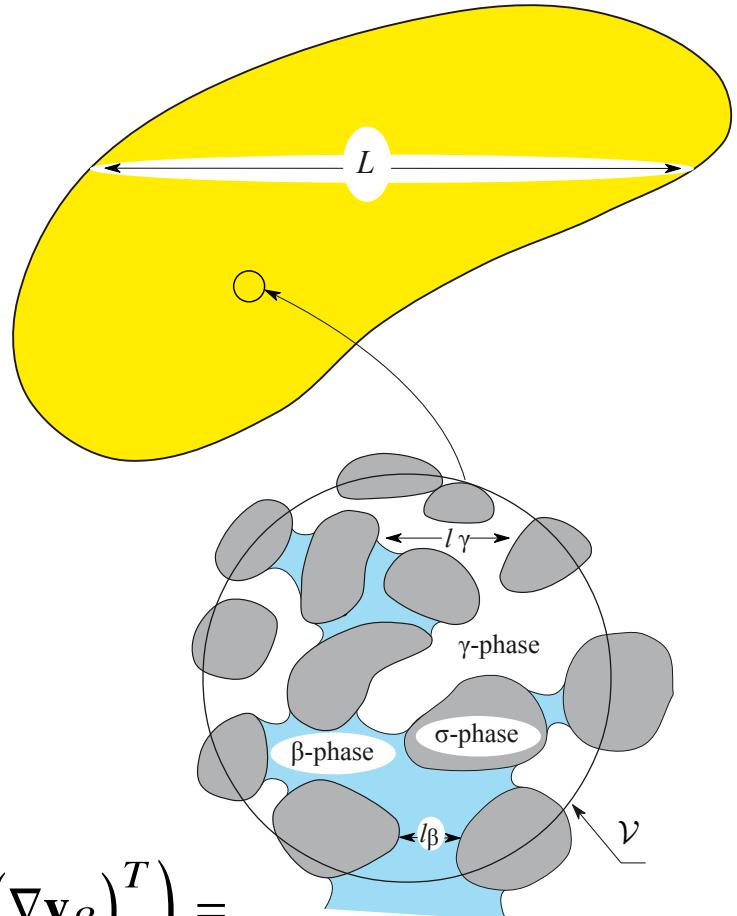

B.C. 1 $\mathbf{v}_\beta = 0$ at $A_{\beta\sigma}(t)$

B.C. 2 $\mathbf{v}_\gamma = 0$ at $A_{\gamma\sigma}(t)$

B.C. 3 $\mathbf{v}_\beta = \mathbf{v}_\gamma$ at $A_{\beta\gamma}(t)$

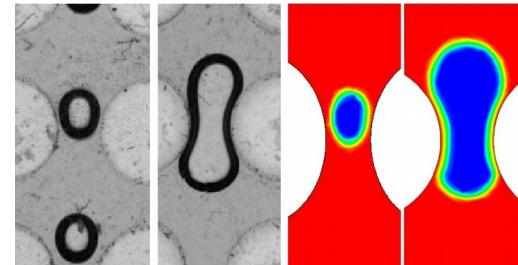

B.C. 4

$$-\mathbf{n}_{\beta\gamma} p_\beta + \mu_\beta \mathbf{n}_{\beta\gamma} \cdot \left(\nabla \mathbf{v}_\beta + (\nabla \mathbf{v}_\beta)^T \right) = -\mathbf{n}_{\beta\gamma} p_\gamma + \mu_\gamma \mathbf{n}_{\beta\gamma} \cdot \left(\nabla \mathbf{v}_\gamma + (\nabla \mathbf{v}_\gamma)^T \right) + 2\sigma H_{\beta\gamma} \mathbf{n}_{\beta\gamma} \text{ at } A_{\beta\gamma}(t)$$

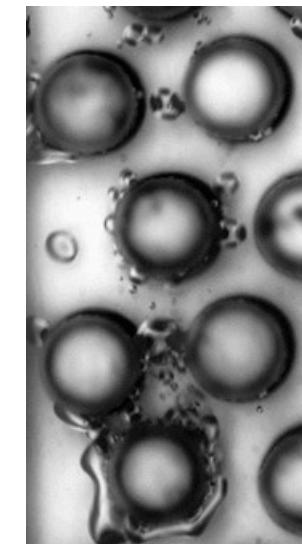

Note: complex and transient pore-scale flows

- Front propagation is in general time dependent!
- Specific features: Haines jumps, snap-off, ...
- Boiling, condensation

Horgue et al.

- Common practice: quasi-static approximation... $\langle \phi \rangle$ and not $\overline{\langle \phi \rangle}$
Justification: Ergodicity (not validated)?

See paper
Gourbil et al.

Sapin et al., 2016

DNS

- VOF, LBM, Cahn-Hilliard, SPH,: spurious velocities & convergence for high density and viscosity ratios, problems with wettability and Capillary number.
- Penalization (work with a phase indicator for the solid phase also; Raeni et al., 2012; Horgue et al., 2012)...
- Achieving numerical convergence is very difficult, though averages (e.g. effective properties) may be good for statistical reasons (one phase flow: Romeu & Noetinger, 1995...)
- Need large computational resources
- Alternative to DNS?
 - Macro-scale models (various types)
 - PNM (pore network models), dynamic PNM, Hybrid PNM

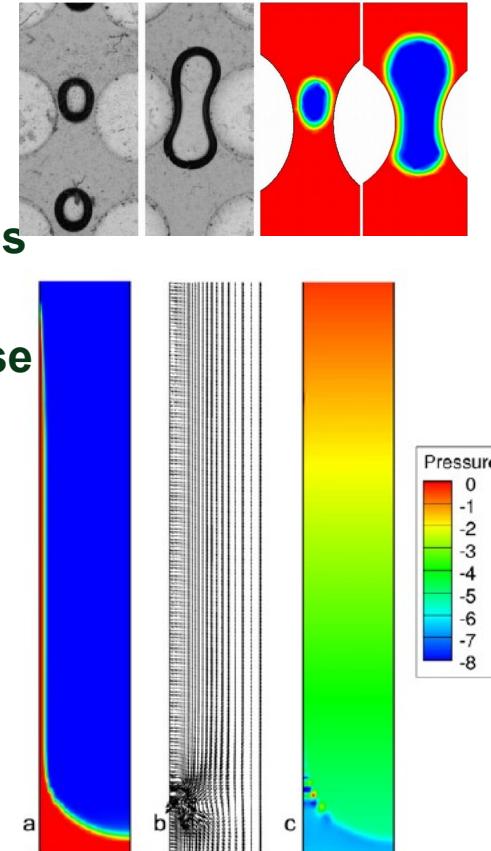

Fig. 6. Simulation of drainage with spurious currents along the meniscus curvature ($HRIC$, $Co = 1.00$, $Ca = 0.03$), (a) volume fraction, (b) velocity profile, (c) pressure distribution.

Horgue et al., 2012

Upscaling: quasi-static theory

... ; Whitaker, 1986; Auriault, 1987; Lasseux et al., 1996; ...

• Example: Case of B.C. 4

$$\begin{aligned} \mathbf{n}_{\beta\gamma} \left(P_\gamma \Big|_{\mathbf{x}} - P_\beta \Big|_{\mathbf{x}} \right) + \mathbf{n}_{\beta\gamma} \mathbf{y} \cdot \left(\left(\nabla P_\gamma \Big|_{\mathbf{x}} - \rho_\gamma \mathbf{g} \right) - \left(\nabla P_\beta \Big|_{\mathbf{x}} - \rho_\beta \mathbf{g} \right) \right) \\ + \mathbf{n}_{\beta\gamma} \mathbf{y} \cdot (\rho_\gamma - \rho_\beta) \mathbf{g} + \dots = -\mathbf{n}_{\beta\gamma} (\tilde{p}_\gamma - \tilde{p}_\beta) \\ + \mu_\gamma \mathbf{n}_{\beta\gamma} \cdot \left(\nabla \mathbf{v}_\gamma + (\nabla \mathbf{v}_\gamma)^T \right) - \mu_\beta \mathbf{n}_{\beta\gamma} \cdot \left(\nabla \mathbf{v}_\beta + (\nabla \mathbf{v}_\beta)^T \right) \\ + 2\sigma H_{\beta\gamma} \mathbf{n}_{\beta\gamma} \text{ at } A_{\beta\gamma} \end{aligned}$$

$$Ca = \frac{\mu_r U_r}{\sigma}$$

$$Bo = \frac{|(\rho_\beta - \rho_\gamma) g| r_0^2}{\sigma}$$

+ Re, (We=Re×Ca) numbers
+ Dynamic Bond number

If ≈ 0 ⇒

$$P_\gamma \Big|_{\mathbf{x}} - P_\beta \Big|_{\mathbf{x}} = 2\sigma H_{\beta\gamma}$$

$H_{\beta\gamma}$ = Constant over REV
i.e., the classical capillary pressure theory!

Macro-Scale Models : Quasi-Static

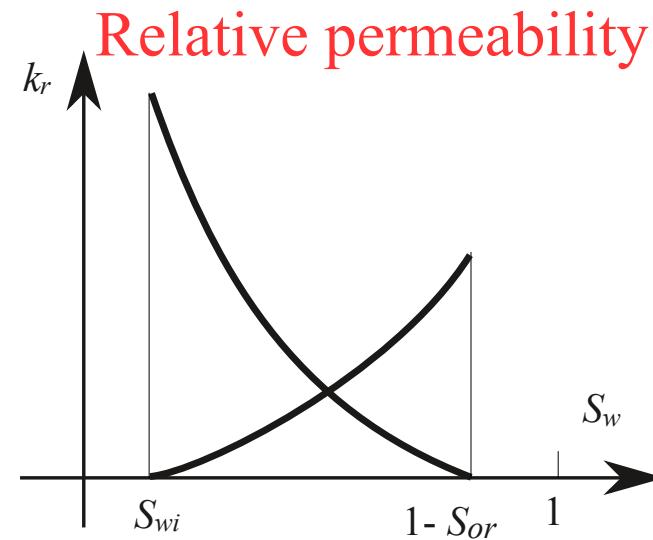

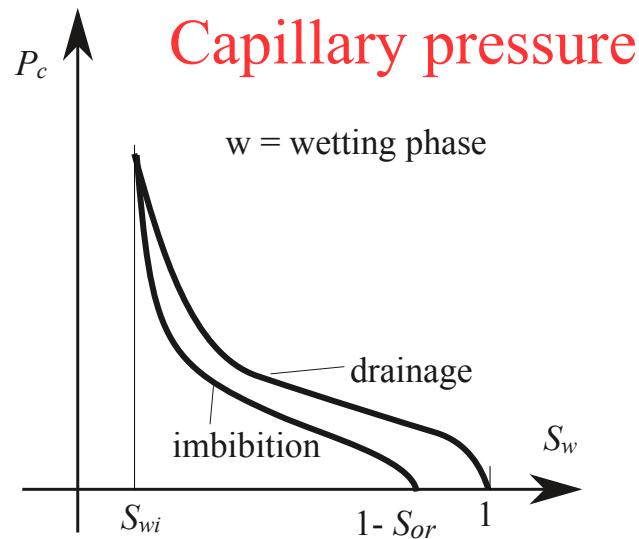

$$\mathbf{V}_\alpha = \langle \mathbf{v}_\alpha \rangle ; P_\alpha = \langle p_\alpha \rangle^\alpha ; \varepsilon_\alpha = \varepsilon S_\alpha \quad \alpha = \beta, \gamma$$

- Heuristic (Muskat): generalized Darcy's laws

$$\frac{\partial \varepsilon S_\alpha}{\partial t} + \nabla \cdot \mathbf{V}_\alpha = 0 ; \mathbf{V}_\alpha = -\frac{1}{\mu_\alpha} \mathbf{K}_\alpha \cdot (\nabla P_\alpha - \rho_\alpha \mathbf{g})$$

$$P_\gamma - P_\beta = P_c(S_\beta)$$

$$\mathbf{K}_\gamma = \mathbf{K} k_{r\gamma}(S_\gamma)$$

Macro-Scale Models : Quasi-Static

- Model with viscous coupling (upscaling, heuristic,...)

(Ex. : Whitaker, 1986)

$$\left| \begin{array}{l} \tilde{\mathbf{v}}_\alpha = \mathbf{A}_{\alpha\beta} \cdot \langle \mathbf{v}_\beta \rangle^\beta + \mathbf{A}_{\alpha\gamma} \cdot \langle \mathbf{v}_\gamma \rangle^\gamma \\ \tilde{p}_\alpha = \left(\mathbf{a}_\alpha \cdot \langle \mathbf{v}_\beta \rangle^\beta + \mathbf{a}_\gamma \cdot \langle \mathbf{v}_\gamma \rangle^\gamma \right) \end{array} \right. \quad \alpha = \beta, \gamma$$

$$\mathbf{V}_\alpha = -\frac{1}{\mu_\alpha} \mathbf{K}_\alpha \cdot (\nabla P_\alpha - \rho_\alpha \mathbf{g}) + \mathbf{K}_{\alpha\kappa} \cdot \mathbf{V}_\kappa \quad \alpha, \kappa = \beta, \gamma \quad \alpha \neq \kappa$$

Phase interaction 

Ex. : Two-Phase Poiseuille Flow

$$K_{ll} \approx K \alpha^2$$

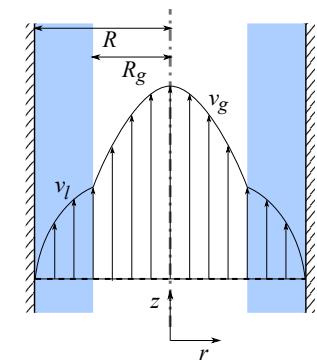

$$K_{gg} \approx K \alpha^2$$

$$K_{lg} \approx \frac{\mu_g}{\mu_l} \frac{(1-\alpha)^2}{\alpha}$$

$$K_{gl} \approx \frac{\alpha}{1-\alpha}$$

$$\frac{\mu_g}{\mu_l} \rightarrow 0$$

$$\alpha = S_\gamma$$

Inertia Effects

- Ergun (Heuristic): no-phase interaction terms

$$0 = -\nabla P_\beta + \rho_\beta \mathbf{g} - \mu_\beta \frac{1}{K k_{r\beta}} \mathbf{V}_\beta - \frac{\rho_\beta}{\eta \eta_\beta} \|\mathbf{V}_\beta\| \mathbf{V}_\beta$$

Ergun, Fourar,
Lenormand, ...

- Schulenberg and Muler (1987) (Heuristic and 

Similar to theory for fluidized beds

$$0 = -\nabla P_\beta + \rho_\beta \mathbf{g} - \mu_\beta \frac{1}{K k_{r\beta}} \mathbf{V}_\beta - \frac{\rho_\beta}{\eta \eta_\beta} \|\mathbf{V}_\beta\| \mathbf{V}_\beta + \frac{\mathbf{F}_{\beta\gamma}^S}{S_\beta}$$

- Upscaling (Lasseux et al., 2008)

$$\begin{aligned} \mathbf{V}_\alpha &= -\frac{1}{\mu_\alpha} \mathbf{K}_\alpha \cdot (\nabla P_\alpha - \rho_\alpha \mathbf{g}) - \mathbf{F}_{\alpha\alpha} \cdot \mathbf{V}_\alpha \\ &\quad + \mathbf{K}_{\alpha\kappa} \cdot \mathbf{V}_\kappa - \mathbf{F}_{\alpha\kappa} \cdot \mathbf{V}_\kappa \quad \alpha, \kappa = \beta, \gamma \quad \alpha \neq \kappa \end{aligned}$$

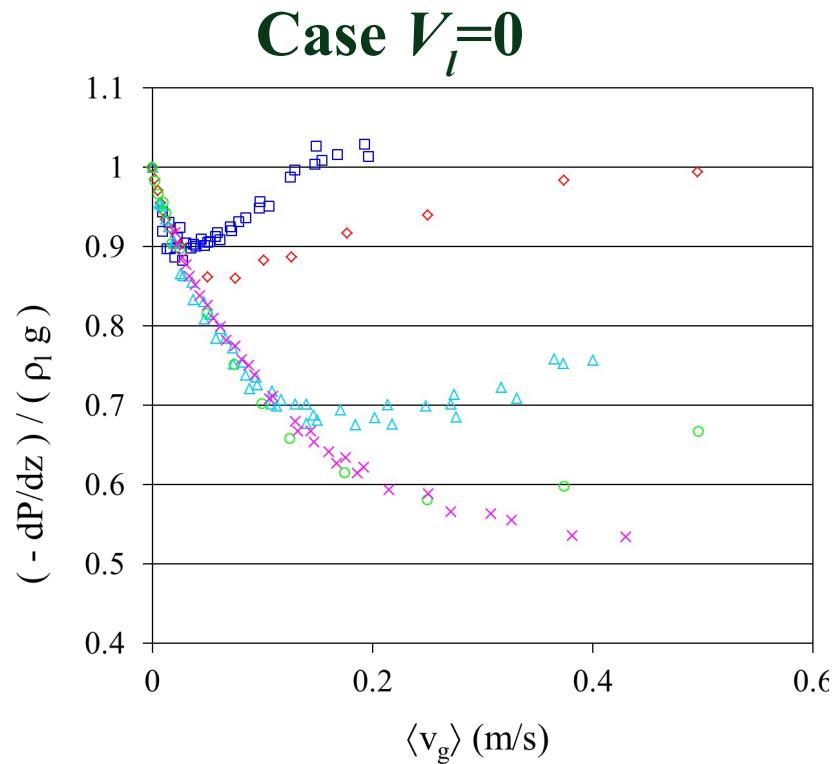

Importance of Cross-Terms, and Non-Linear Effects

from Clavier et al. (2015)

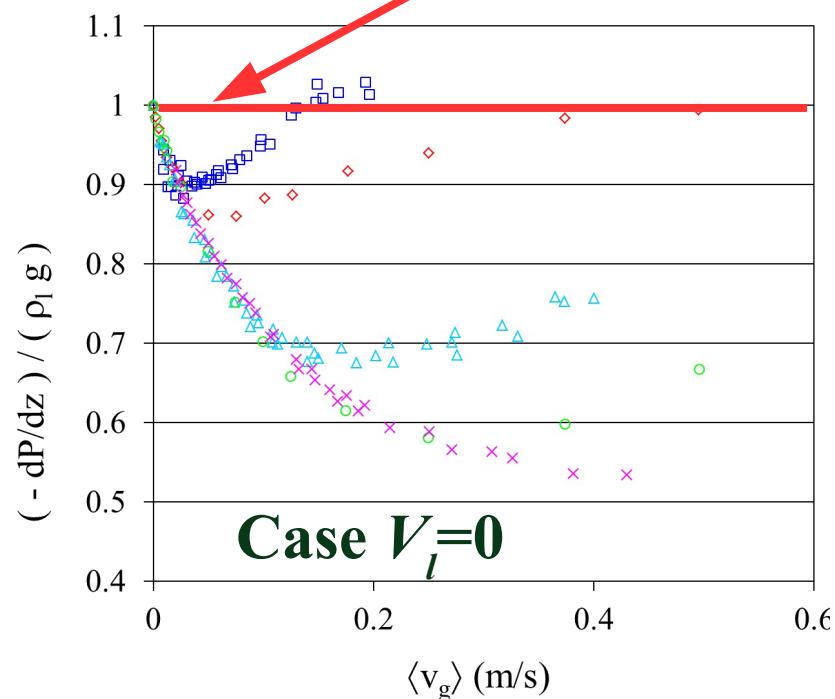

(IRSN: context of nuclear reactor severe accident)

See also Taherzadeh & Saidi (2015)

Importance of Cross-Terms, and Non-Linear Effects

Models without cross-terms

$t \rightarrow \infty$

$$\left(\frac{\partial P_\beta}{\partial z} - \rho_\beta \mathbf{g} \cdot \mathbf{e}_z \right) = -\mu_\beta K_\beta^{-1} (1 + F_{\beta\beta}) V_\beta + \mu_\beta K_\beta^{-1} K_{\beta\gamma} (1 - K_{\beta\gamma}^{-1} F_{\beta\gamma}) V_\gamma$$

$$\left(\frac{\partial P_\gamma}{\partial z} - \rho_\gamma \mathbf{g} \cdot \mathbf{e}_z \right) = -\mu_\gamma K_\gamma^{-1} (1 + F_{\gamma\gamma}) V_\gamma + \mu_\gamma K_\gamma^{-1} K_{\gamma\beta} (1 - K_{\gamma\beta}^{-1} F_{\gamma\beta}) V_\beta$$

Case $V_\beta=0$:

$$\left(\frac{\partial P_\beta}{\partial z} - \rho_\beta \mathbf{g} \cdot \mathbf{e}_z \right) = +\mu_\beta K_\beta^{-1} K_{\beta\gamma} (1 - K_{\beta\gamma}^{-1} F_{\beta\gamma}) V_\gamma$$

from Clavier et al. (2015), Chikhi et al. (2016)

see also Taherzadeh & Saidi (2015) using Tutu et al. experiments

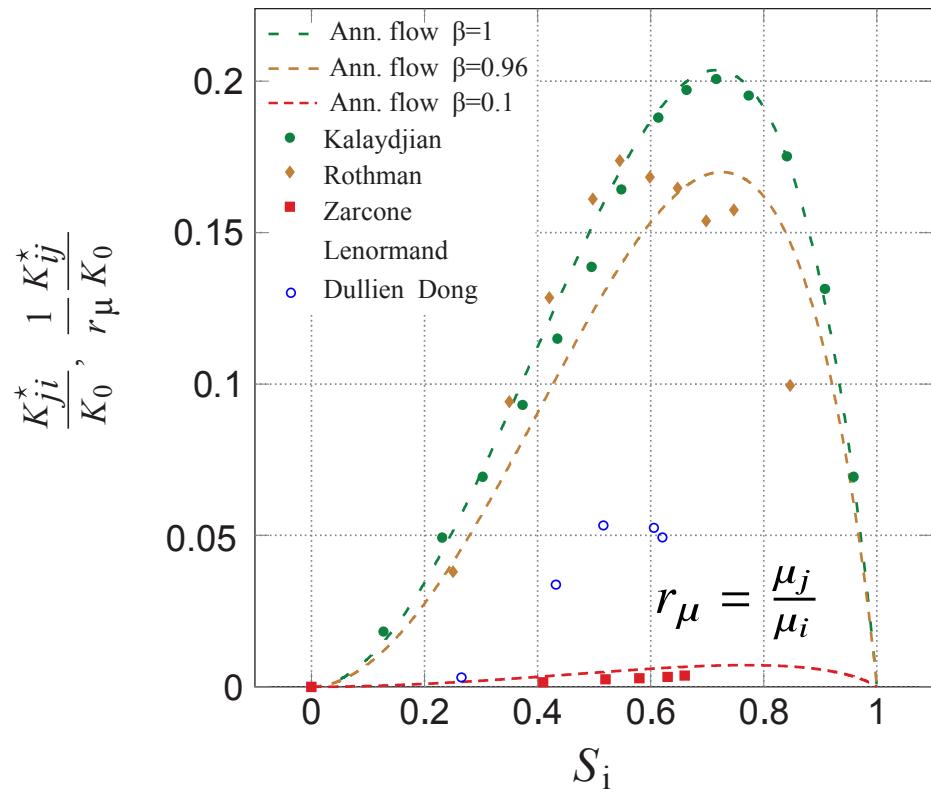

Impact of K_0

(Pasquier et al., 2017)

$K_{ij} = \beta K_{ij}$ (annular 2-phase flow)

(Pasquier et al., 2017)

$$\begin{pmatrix} U_i \\ U_j \end{pmatrix} + \mathcal{K}^\star \begin{pmatrix} \frac{\partial P}{\partial x} - \rho_i g \\ \frac{\partial P}{\partial x} - \rho_j g \end{pmatrix} = 0$$

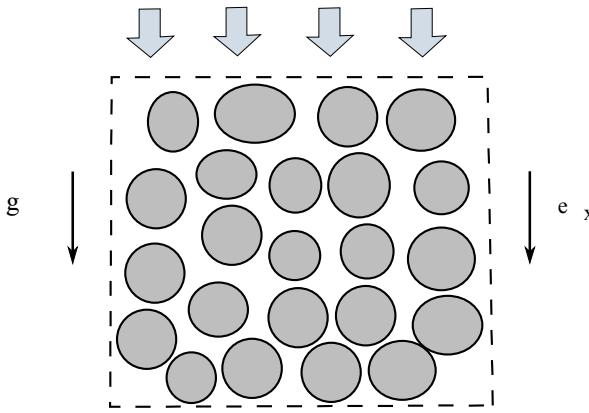

$$\begin{aligned} \mathcal{K}^\star &= \begin{pmatrix} K_{ii}^\star/\mu_i & K_{ij}^\star/\mu_j \\ K_{ji}^\star/\mu_i & K_{jj}^\star/\mu_j \end{pmatrix} \\ &= \frac{1}{1 - K_{ij}K_{ji}} \begin{pmatrix} K_{ii}/\mu_i & K_{jj}K_{ij}/\mu_j \\ K_{ii}K_{ji}/\mu_i & K_{jj}/\mu_j \end{pmatrix} \end{aligned}$$

$$N_g = \frac{K_0 (\rho_i - \rho_j) g}{U \mu_i} \quad \text{Gravity number}$$

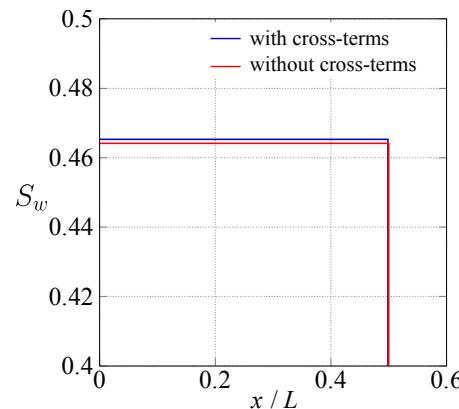

Effect of cross terms on the flow dynamic

$$\frac{\partial S_l}{\partial t} + \frac{\partial \mathcal{F}_l}{\partial S_l} \frac{\partial S_l}{\partial x} = 0$$

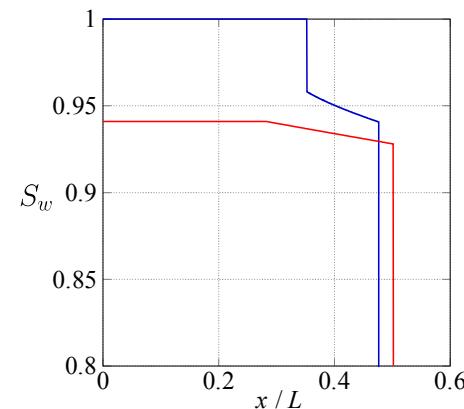

(a) Configuration 1: Imbibition

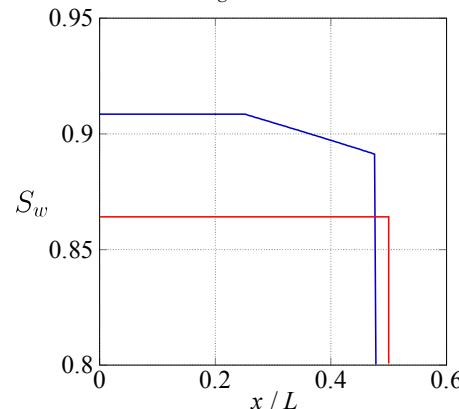

adapted Buckley-
Leverett theory
(*Pasquier et al., 2017*)

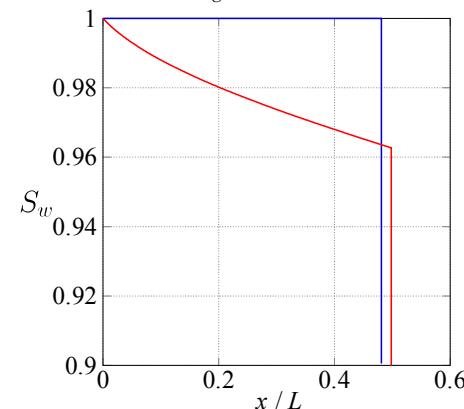

(b) $\frac{1}{N_g} = 0$

(f) $\frac{1}{N_g} = 0$

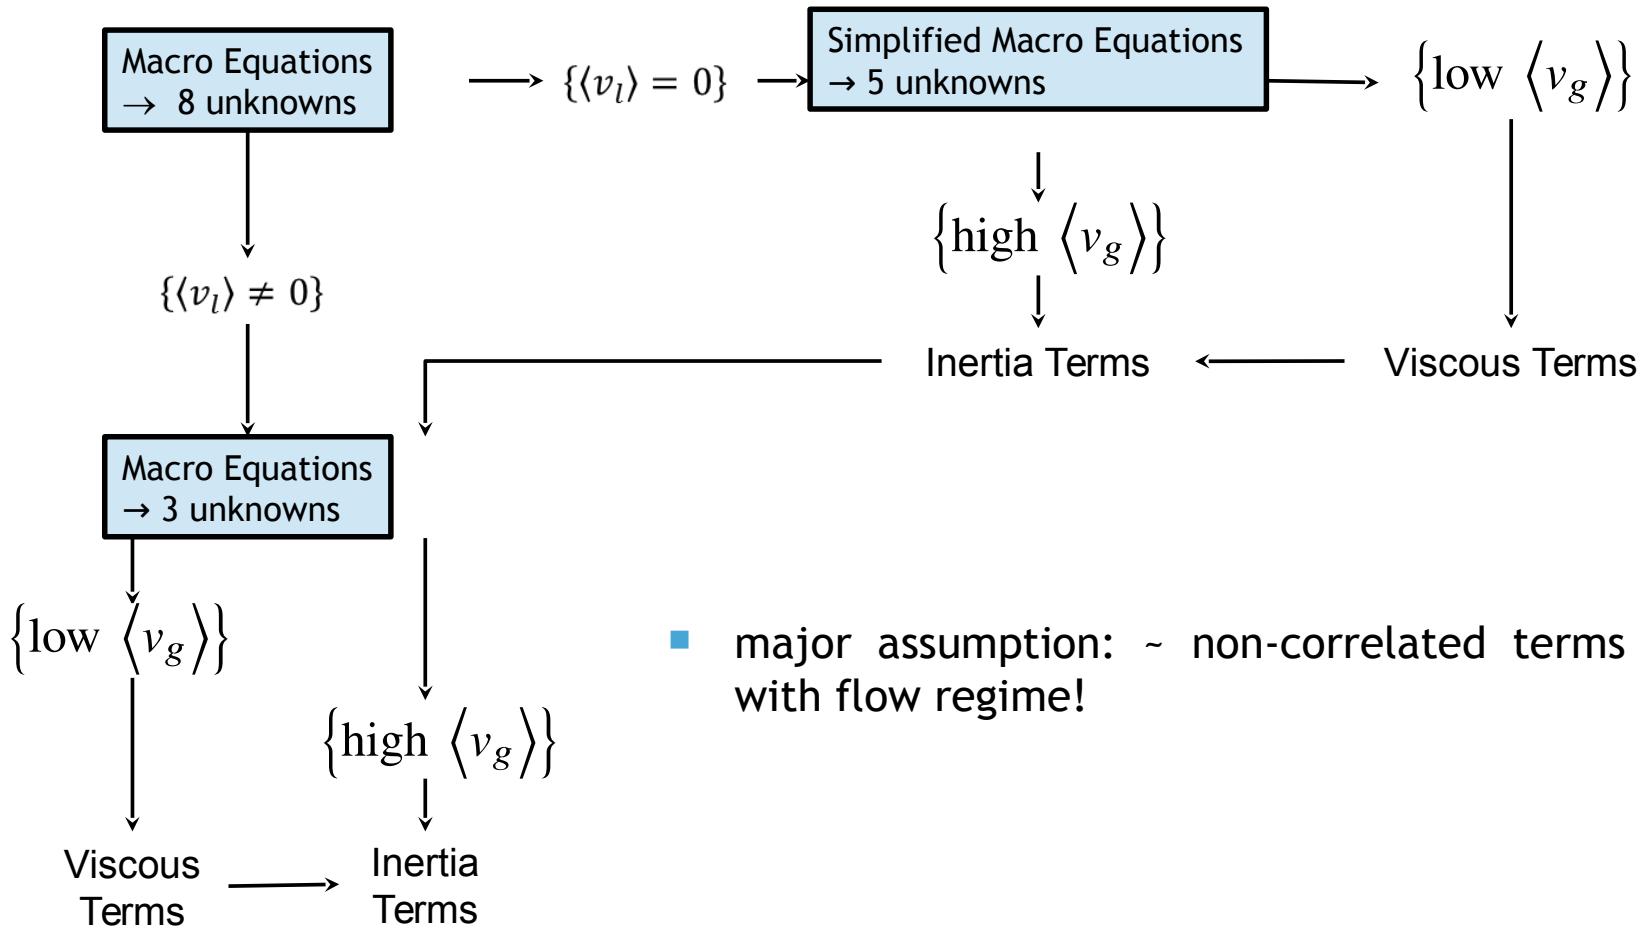

(d) $\frac{1}{N_g} = 0$

(h) $\frac{1}{N_g} = 1.1$

Estimation of multiphase parameters? Ex. from IRSN experiments

Obtained correlations

$$K_{ll} = K (1 - \alpha)^3$$

$$F_{ll} = \frac{\rho_l}{\mu_l} \frac{K}{\eta} \langle v_l \rangle$$

$$K_{gg} = K \alpha^4$$

$$F_{gg} = \frac{\rho_g}{\mu_g} \frac{K}{\eta} \langle v_g \rangle$$

$$K_{lg} = k_{lg} \frac{\mu_g}{\mu_l} \frac{(1 - \alpha)^2}{\alpha}$$

$$F_{lg} = K_{lg} f_{lg}$$

$$K_{gl} = \frac{\mu_l}{\mu_g} \frac{K_{gg} K_{lg}}{K_{ll}}$$

$$F_{gl} = f_{lg} \alpha^6$$

- Usefulness for highly permeable media?

PNM (Pore Network Model) : quasi-static

(reviews: Dullien, 1992;...; Jockar-Niasar & Hassanzadeh, 2012)

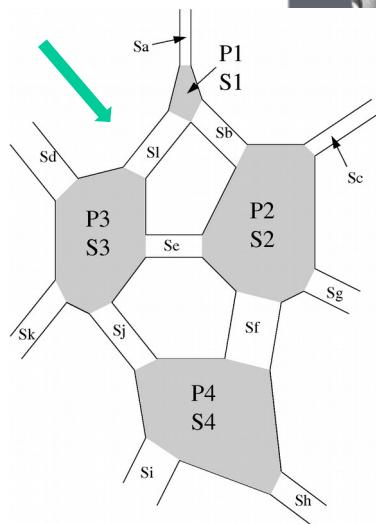

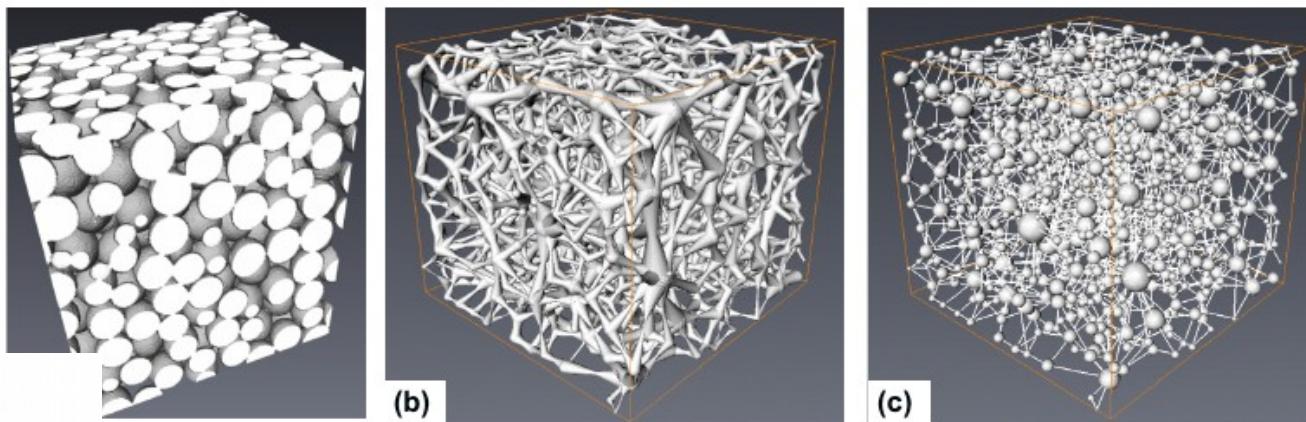

Phase repartition according
to capillary equilibrium

- Quasi-static rules → **Percolation theory**: vast literature and important results about flow patterns, etc.
- Used also to estimate k_r , P_c
- Drawback: structural properties are lost for other phases (e.g. solid phase)

PNM - Dynamic

(See review: Jockar-Niasar & Hassanizadeh, 2012)

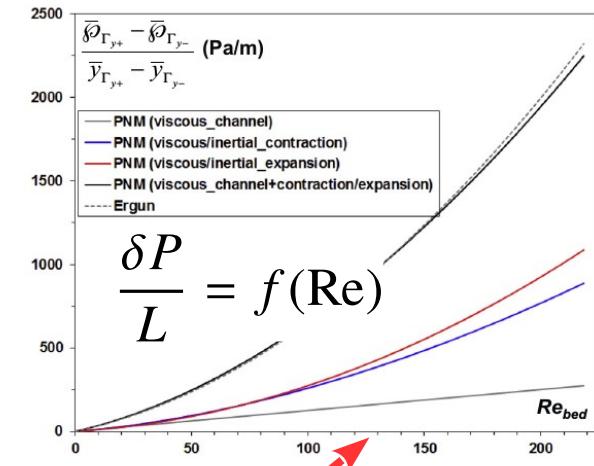

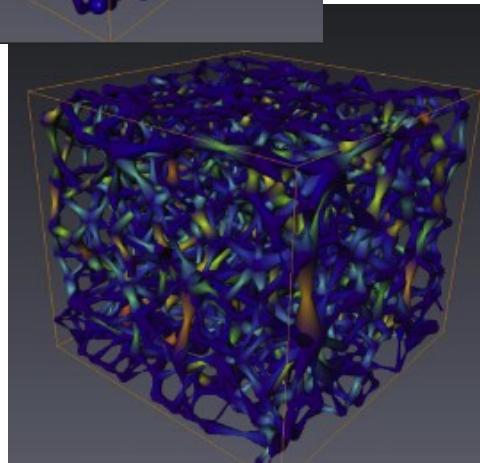

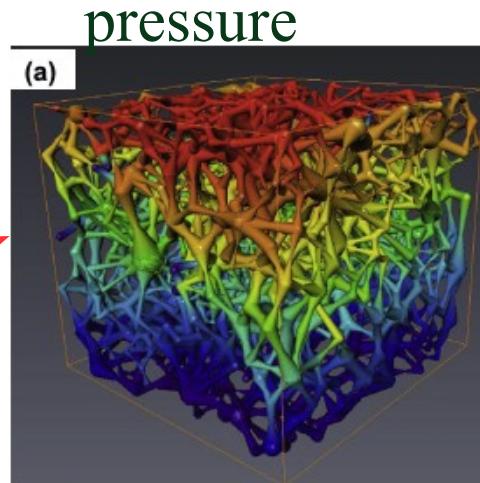

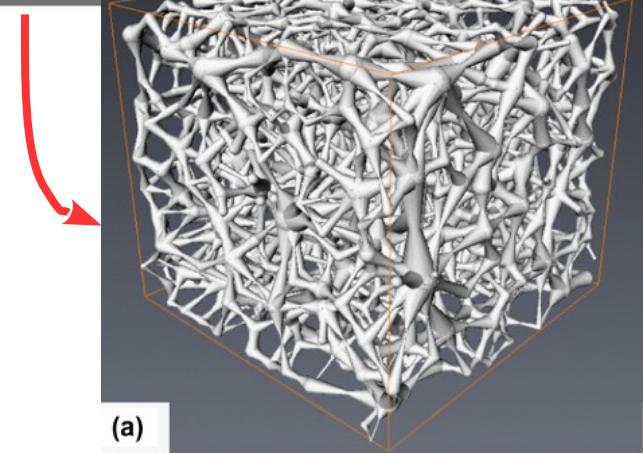

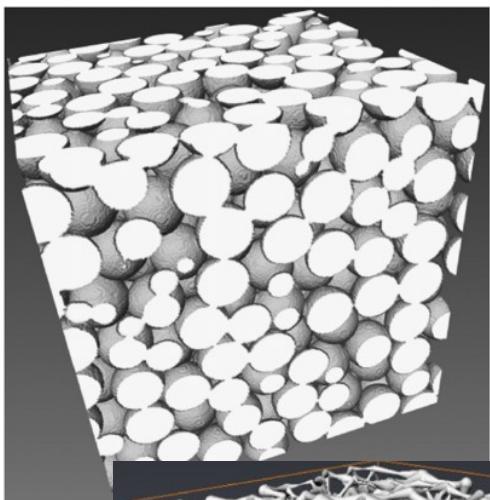

Pore-scale rules
(analytical: e.g. Poiseuille)

- Time dependent solution, solve for pressure field with approximate solutions for describing flow in connections
- Used to estimate k_r , P_c and other relations (hysteresis)

Example: application to the interpretation of tomographic images in the inertia regime

Larachi et al., 2014

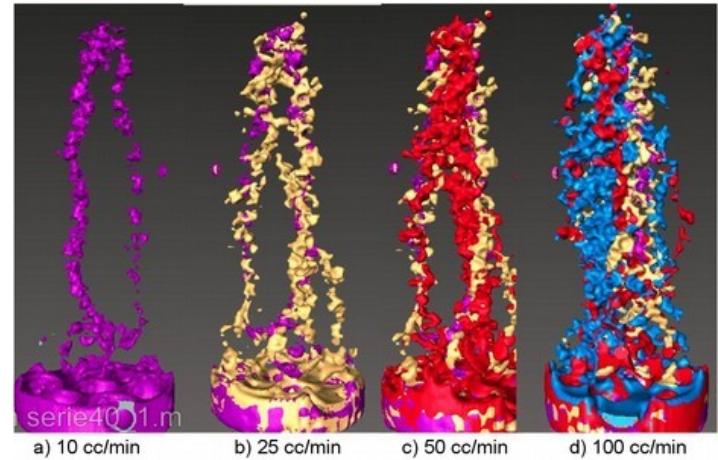

Mixed or Hybrid Models

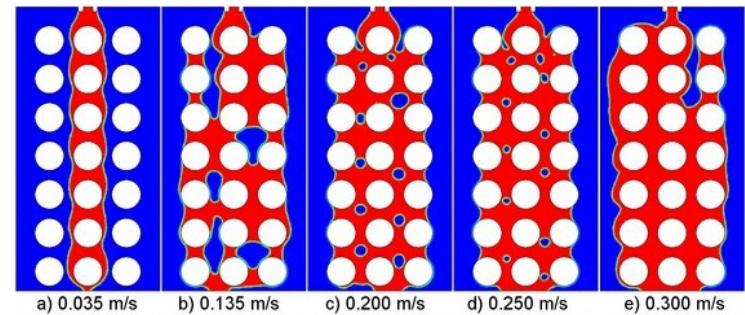

- Network models → a meso-scale representation!
- If low Re , Ca , Bo → percolation theory
- Otherwise: Coupling network model and Dynamic rules (which may come from local VOF simulations)

Melli & Scriven, 1991; Horgue et al. (PhD CIFRE/IFP/IMFT), 2012

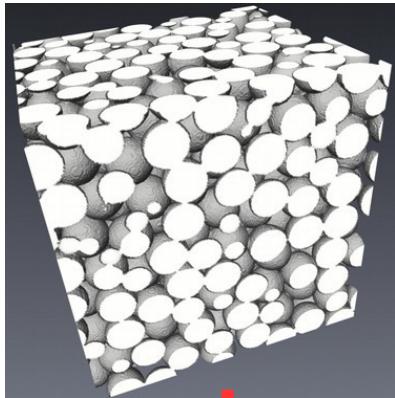

Trickle Bed (X-ray, IFP)

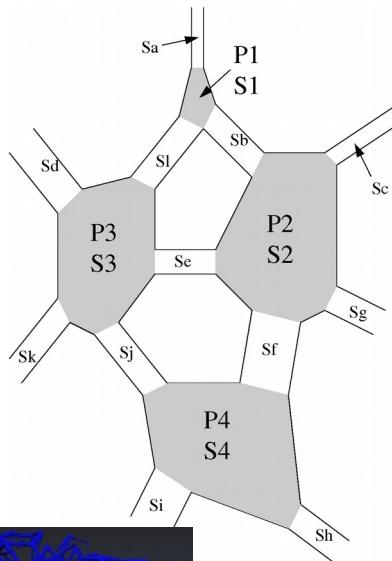

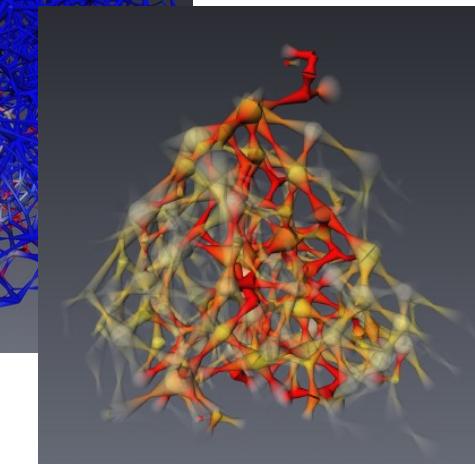

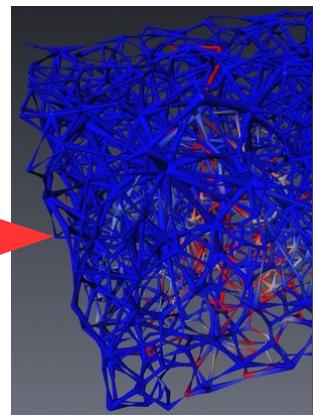

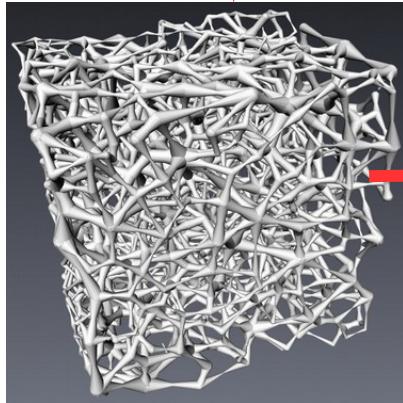

Micromodel experiments

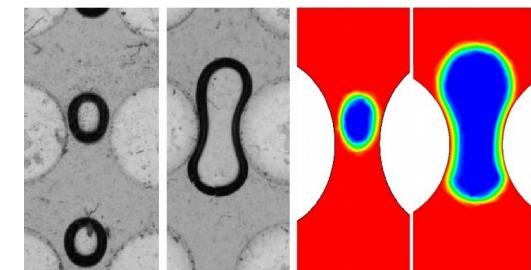

Mixed or Hybrid Models

Horgue
et al.,
2012

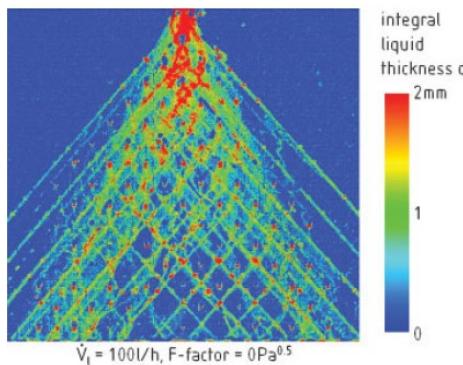

- 1.) Mass and momentum balance for the network
- 2.) Dynamic rules coming from local VOF simulations (or from experiments)

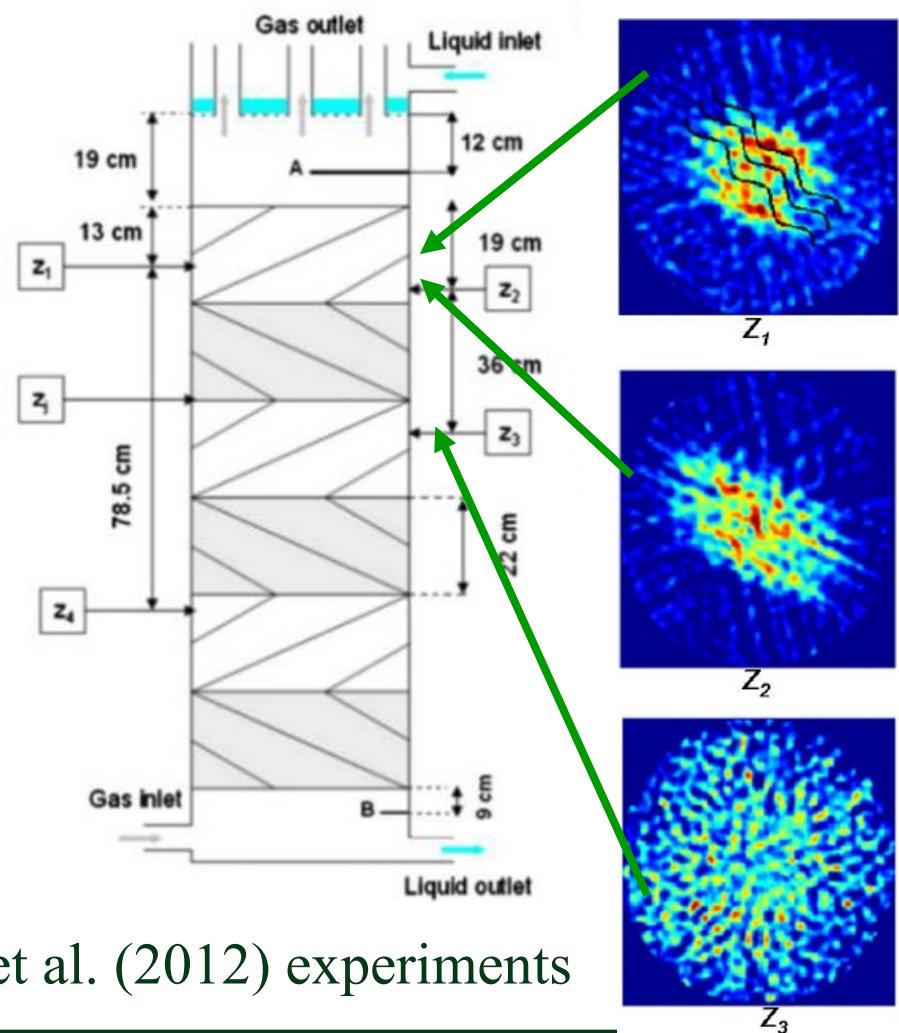

Macro-Scale Models with Phase “Splitting”

- Example: Flow through Structured Media

Mahr and Mewes (2007)

MellaPak (Sulzer Chemtech)

Fourati et al. (2012) experiments

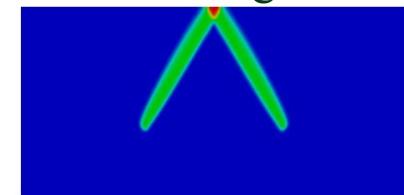

Macro-Scale Models with Phase “Splitting”

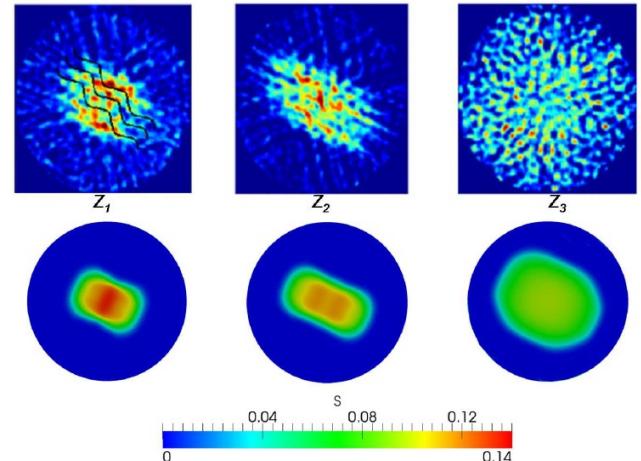

- $\varepsilon \frac{\partial S_\gamma}{\partial t} + \nabla \cdot \mathbf{U}_\gamma = 0,$
 $\varepsilon \frac{\partial S_{\beta_1}}{\partial t} + \nabla \cdot \mathbf{U}_{\beta_1} = \dot{m},$
 $\varepsilon \frac{\partial S_{\beta_2}}{\partial t} + \nabla \cdot \mathbf{U}_{\beta_2} = -\dot{m}.$

momentum
equations

Model with liquid
phase splitting, no-
exchange

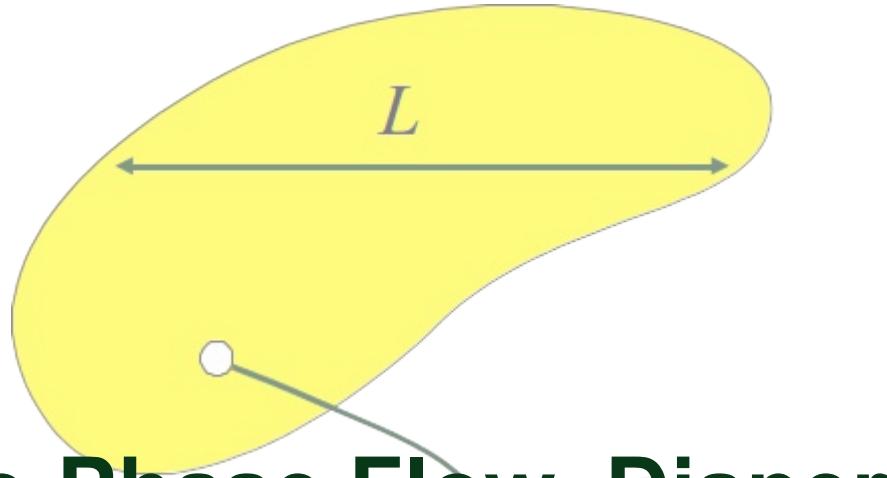

(b) $t = 1$ s

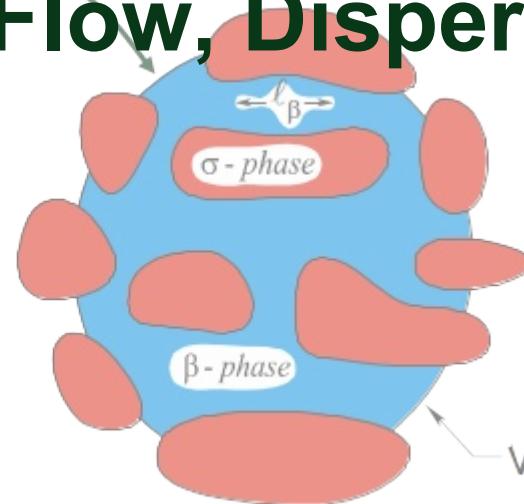

- Comparison with Fourati et al. (2012) experiments (Soulaine et al. 2014) → calibration of exchange term on the 1st stack

One-Phase Flow, Dispersion

Phenomenology

• Pore-Scale problem

$$\nabla \cdot \mathbf{v}_\beta = 0$$

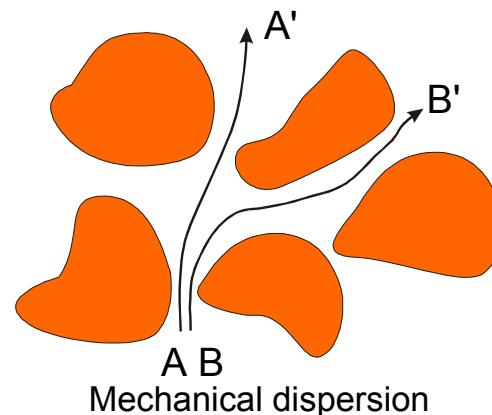

$$\frac{\partial c_\beta}{\partial t} + \nabla \cdot (c_\beta \mathbf{v}_\beta) = \nabla \cdot (D_\beta \nabla c_\beta)$$

B.C.1 $\mathbf{n}_{\beta\sigma} \cdot D_\beta \nabla c_\beta = 0$ at $A_{\beta\sigma}$ passive dispersion

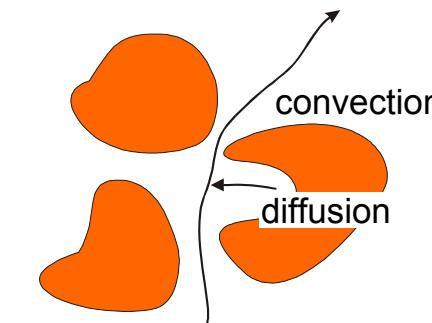

or B.C.1 $\mathbf{n}_{\beta\sigma} \cdot D_\beta \nabla c_\beta = f(c_\beta)$, at $A_{\beta\sigma}$ active dispersion

Taylor dispersion

Mechanical dispersion

Retardation due to dead-end pores

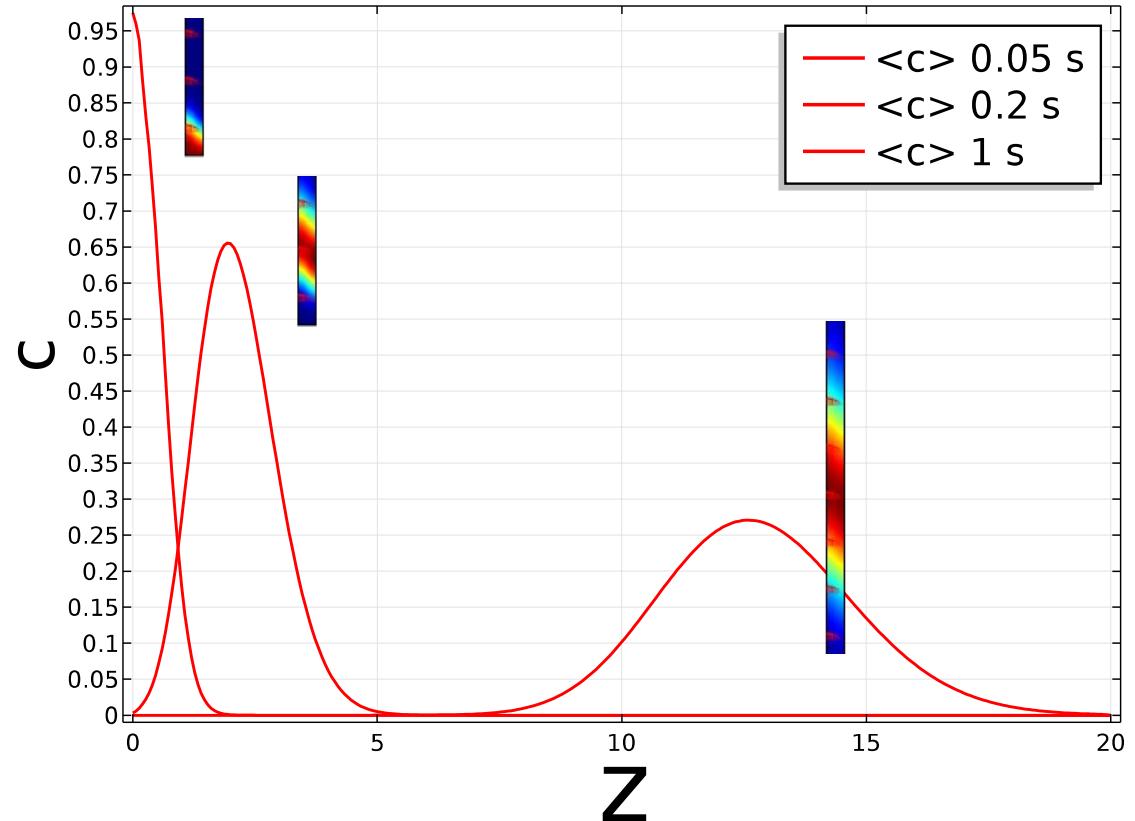

Taylor dispersion

$$\frac{\partial c_\beta}{\partial t} + \nabla \cdot (c_\beta \mathbf{v}_\beta) = \nabla \cdot (D_\beta \nabla c_\beta)$$

$$\text{B.C.1} \quad \mathbf{n}_{\beta\sigma} \cdot D_\beta \nabla c_\beta = 0 \quad \text{at } A_{\beta\sigma}$$

Which equation
for :

$$\langle c \rangle = \frac{1}{A} \int_A c \, dA ?$$

Macro-Scale Equations (tracer)

$$\nabla \cdot (\varepsilon_\beta \mathbf{U}_\beta) = \nabla \cdot (\mathbf{V}_\beta) = 0$$

$$\frac{\partial \varepsilon_\beta C_\beta}{\partial t} + \nabla \cdot (\varepsilon_\beta C_\beta \mathbf{U}_\beta) = \nabla \cdot (\varepsilon_\beta \mathbf{D}_\beta^* \cdot \nabla C_\beta)$$

Taylor dispersion : Tube : $D_\beta^* = D_\beta \left(1 + \frac{1}{192} \text{Pe}^2 \right)$ with $\text{Pe} = \frac{U_0 d}{D_\beta}$

Hele Shaw : $D_\beta^* = D_\beta \left(1 + \frac{1}{210} \text{Pe}^2 \right)$ with $\text{Pe} = \frac{U_0 b}{D_\beta}$

Linear dispersion :

$$\mathbf{D}_\beta^* = \mathbf{D}_0 + \alpha_T \|\mathbf{U}_\beta\| \mathbf{I} + (\alpha_L - \alpha_T) \frac{\mathbf{U}_\beta \mathbf{U}_\beta}{\|\mathbf{U}_\beta\|}$$

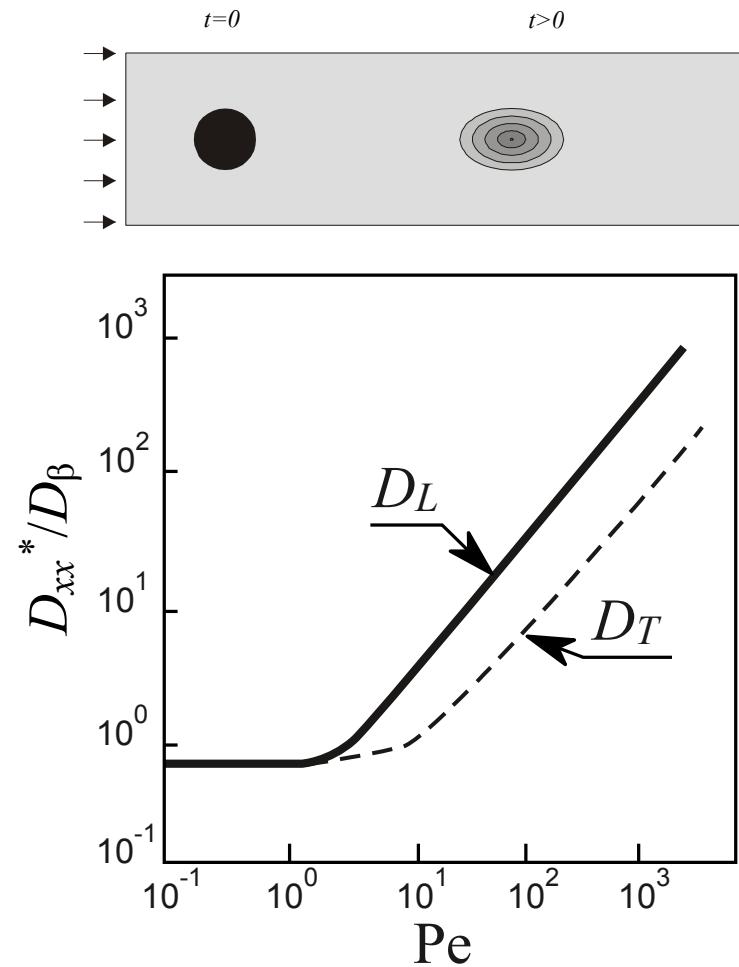

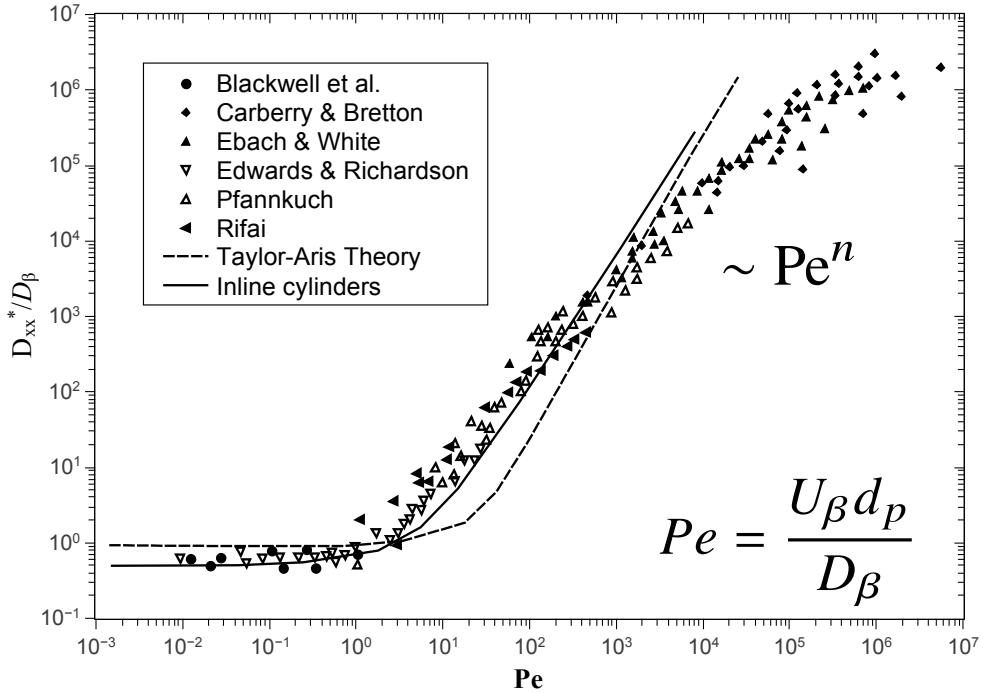

Longitudinal and transversal dispersivity

case $\mathbf{U} = U_0 \mathbf{e}_1$

$$\mathbf{D}_\beta^* = \begin{bmatrix} \frac{D_\beta}{\tau} + \alpha_L U_0 & 0 & 0 \\ 0 & \frac{D_\beta}{\tau} + \alpha_T U_0 & 0 \\ 0 & 0 & \frac{D_\beta}{\tau} + \alpha_T U_0 \end{bmatrix}$$

Passive Dispersion

- $n=2$: Taylor dispersion
- $2>n>1$: from simple unit cells to highly disordered media

Active dispersion

- Homogeneous source

$$\frac{\partial c_\beta}{\partial t} + \nabla \cdot (c_\beta \mathbf{v}_\beta) = \nabla \cdot (D_\beta \nabla c_\beta) - k_\beta c_\beta$$

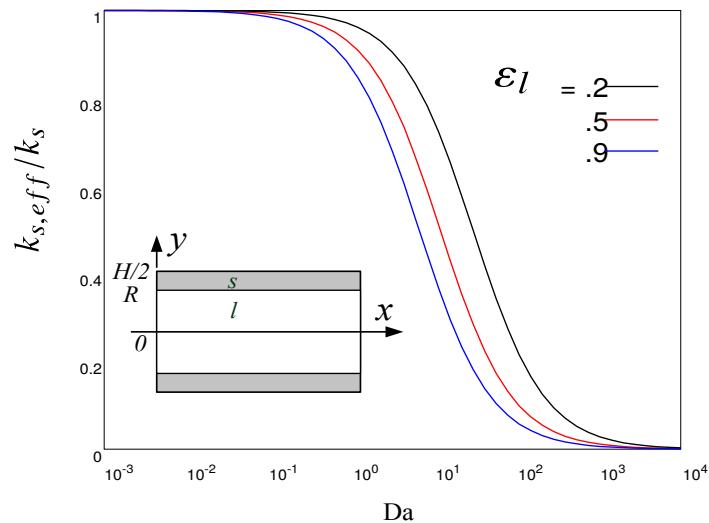

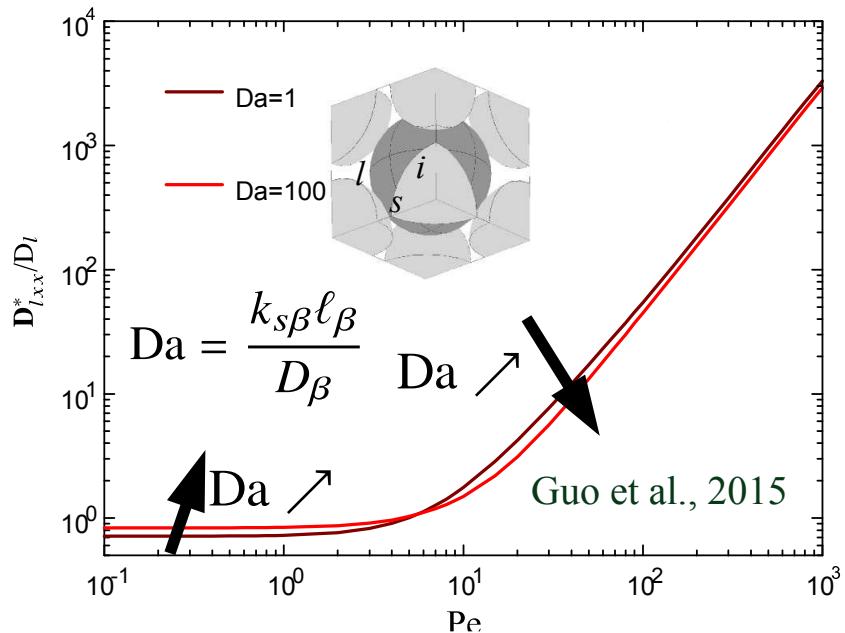

$$\Rightarrow \frac{\partial \varepsilon_\beta C_\beta}{\partial t} + \nabla \cdot (C_\beta \mathbf{V}_\beta) = \nabla \cdot (\varepsilon_\beta \mathbf{D}_\beta^* \cdot \nabla C_\beta) - \varepsilon_\beta k_\beta C_\beta$$

- Heterogeneous source

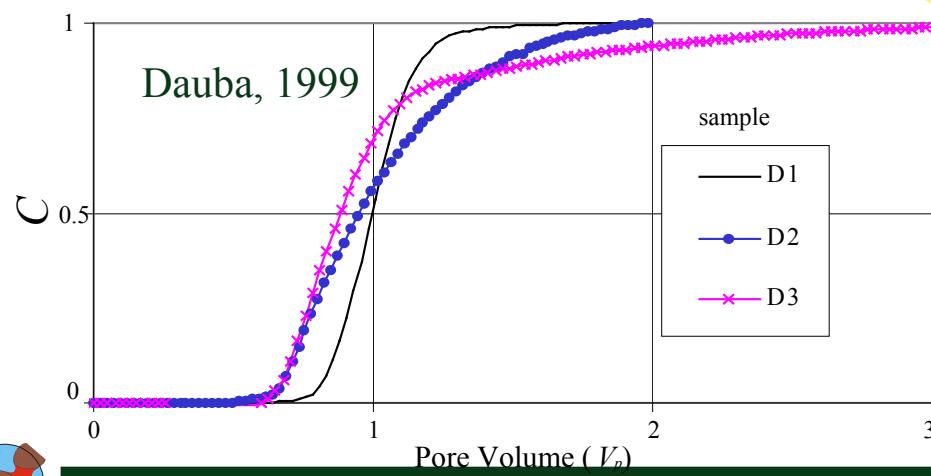

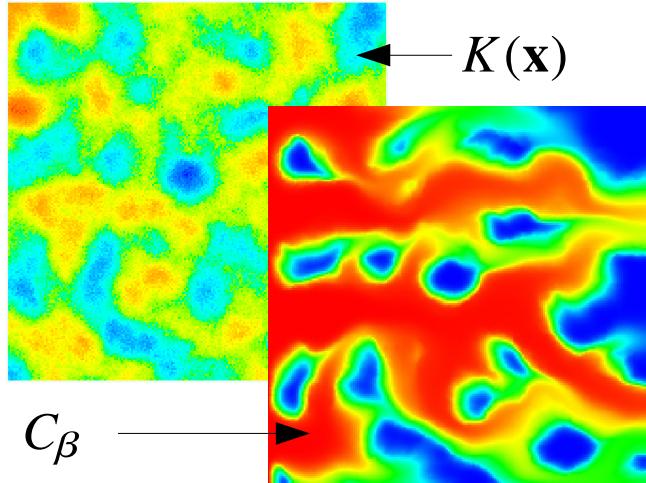

B.C. 1 $\mathbf{n}_{\beta\sigma} \cdot (D_\beta \nabla c_\beta) = -k_{s\beta} c_\beta$ at $A_{\beta\sigma}$

$$\frac{\partial \varepsilon_\beta C_\beta}{\partial t} + \nabla \cdot (C_\beta \mathbf{V}_\beta + \dots) = \nabla \cdot (\varepsilon_\beta \mathbf{D}_\beta^* \cdot \nabla C_\beta) - K_{\beta\sigma}$$

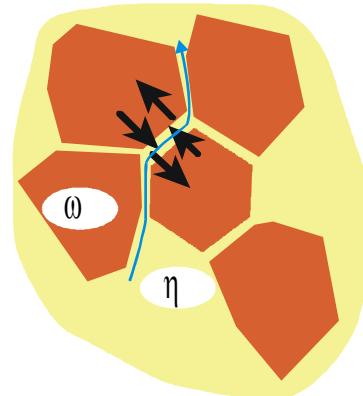

$$K_{\beta\sigma} = \frac{1}{\mathcal{V}} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot (-D_\beta \nabla c_\beta) dA = a_v k_{s\beta,eff}$$

Abnormal dispersion, double-porosity models, ...

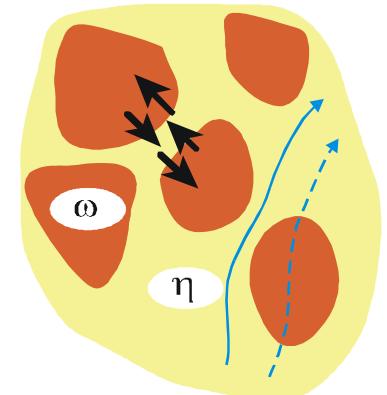

Fractured media

macro-porosity/micro-porosity

mobile/immobile
or
mobile/mobile

Non-Locality: a Simple Example

- Heterogeneous diffusion: Coupled micro-macro problem

$$\left\{ \begin{array}{l} \frac{\partial \tilde{T}}{\partial t} = \nabla \cdot (k \nabla \tilde{T}) + \nabla \cdot (\tilde{k} \nabla \langle T \rangle) - \nabla \cdot \langle k \nabla \tilde{T} \rangle \quad \text{micro} \\ \frac{\partial \langle T \rangle}{\partial t} = \nabla \cdot (\langle k \rangle \nabla \langle T \rangle + \langle k \nabla \tilde{T} \rangle) \quad \text{macro} \end{array} \right.$$

- Solution in Laplace space

$$f_{LT}(p) = \int_0^{\infty} e^{-pt} f(t) dt$$

Solution in the Laplace Space

- Micro-scale and macro-scale equations (IC: uniform field)

$$\left\{ \begin{array}{ll} p\tilde{T}_{LT} = \nabla \cdot (k\nabla \tilde{T}_{LT}) + \nabla \cdot (\tilde{k}\nabla \langle T \rangle_{LT}) - \nabla \cdot \langle k\nabla \tilde{T}_{LT} \rangle & \text{micro} \\ p\langle T \rangle_{LT} = \nabla \cdot (\langle k \rangle \nabla \langle T \rangle_{LT} + \langle k\nabla \tilde{T}_{LT} \rangle) & \text{macro} \end{array} \right.$$

- Closure $\tilde{T}_{LT} = p\mathbf{b}_{LT} \cdot \nabla \langle T \rangle_{LT}$
- Macro-scale Equation $p\mathbf{b}_{LT} = \nabla \cdot (k\nabla \mathbf{b}_{LT}) + \frac{1}{p}\nabla \cdot \tilde{k}\mathbf{I} - \nabla \cdot \langle k\nabla \mathbf{b}_{LT} \rangle + \text{period., ...}$

$$p\langle T \rangle_{LT} = \nabla \cdot (\langle k \rangle \nabla \langle T \rangle_{LT} + \langle k\nabla (p\mathbf{b}_{LT} \cdot \nabla \langle T \rangle_{LT}) \rangle)$$

Transient / Steady-State Closure (~asymptotic behavior)

- **Transient Closure**

$$\tilde{T} = \int_0^t \frac{\partial \mathbf{b}}{\partial \tau} \Big|_{\tau} \cdot \nabla \langle T \rangle|_{t-\tau} d\tau = \frac{\partial \mathbf{b}}{\partial t} * \cdot \nabla \langle T \rangle$$

$$\frac{\partial \mathbf{b}}{\partial t} = \nabla \cdot (k \nabla \mathbf{b}) + \nabla \cdot \tilde{k} \mathbf{I} - \nabla \cdot \langle k \nabla \mathbf{b} \rangle$$

- **Steady-State closure**

$$\mathbf{b} = \text{const.} = \lim_{t \rightarrow \infty} \mathbf{b}(t) = \mathbf{b}_{\infty}$$

+period., ...

$$\tilde{T} = \mathbf{b}_{\infty} \cdot \nabla \langle T \rangle$$

$$\frac{\partial \langle T \rangle}{\partial t} = \nabla \cdot (\mathbf{K}_{eff} * \cdot \nabla \langle T \rangle)$$

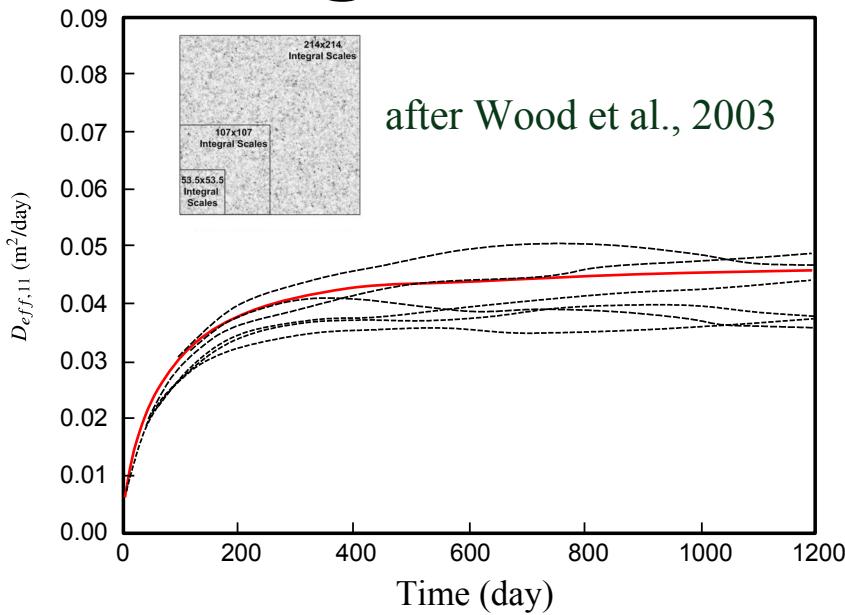

with $\mathbf{K}_{eff} = \langle k \rangle \mathbf{I} + \left\langle k \nabla \frac{\partial \mathbf{b}}{\partial t} \right\rangle$

$$\frac{\partial \langle T \rangle}{\partial t} = \nabla \cdot (\mathbf{K}_{eff}^{\infty} \cdot \nabla \langle T \rangle)$$

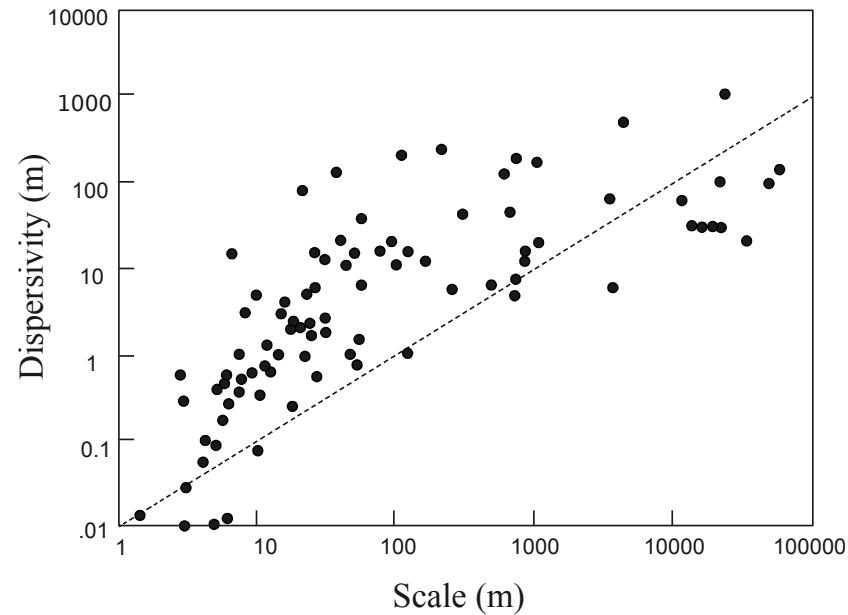

$$\mathbf{K}_{eff}^{\infty} = \langle k \rangle \mathbf{I} + \langle k \nabla \mathbf{b}_{\infty} \rangle$$

Abnormal dispersion in heterogeneous media

after Wood et al., 2003

Long time/length for reaching « Fickian » dispersion !

Dispersivity appears length-scale dependent ! (Gelhar and Axness, 1983)

→ advice: keep as much heterogeneities as possible !

Various models available

Ex.: two-region

$$\frac{\partial \langle c \rangle}{\partial t} + \mathbf{U}_\beta \cdot \nabla \langle c \rangle = \nabla \cdot (\mathbf{K}_{eq}^* \cdot \nabla \langle c \rangle)$$

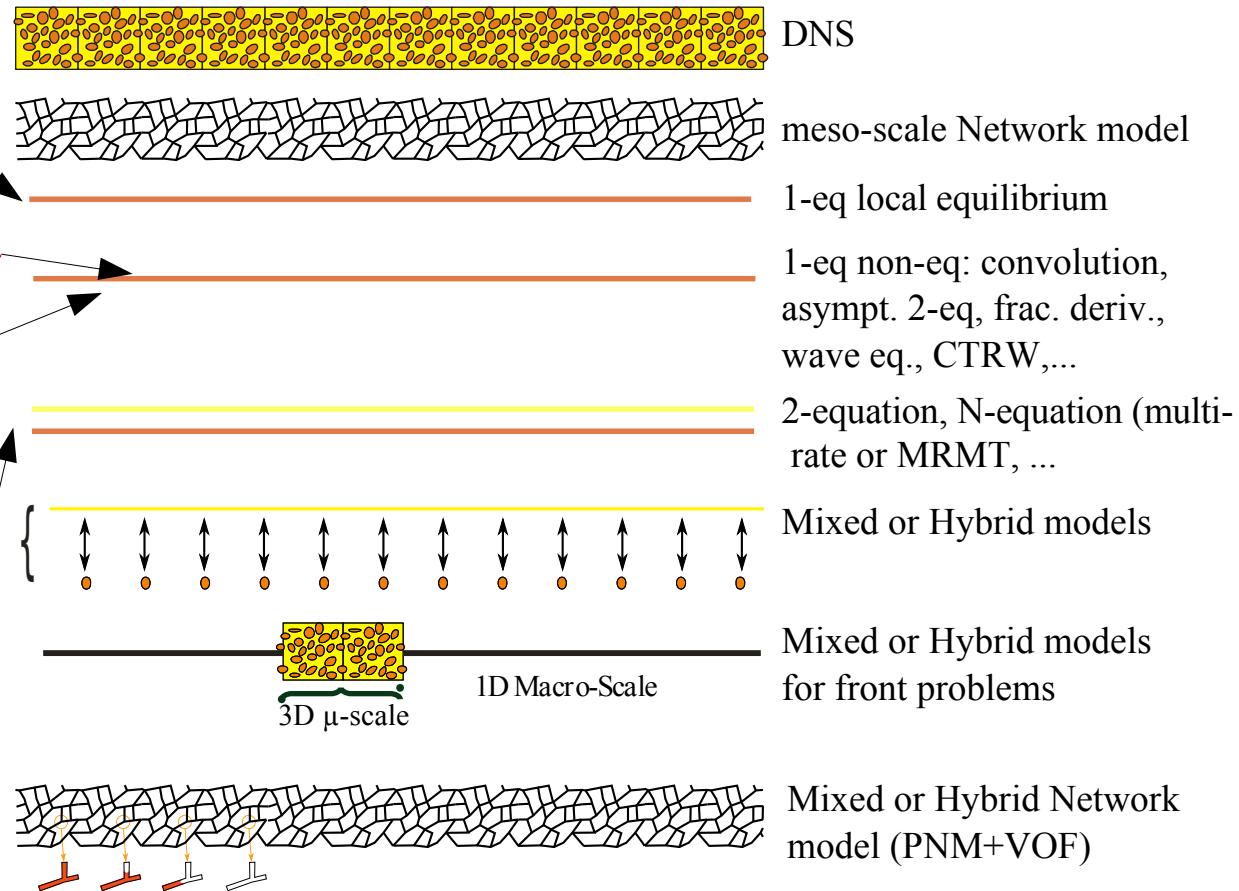

$$\frac{\partial \langle c \rangle^{\beta\sigma}}{\partial t} + \langle \mathbf{v}_\beta \rangle \cdot \nabla \langle c \rangle^{\beta\sigma} = \nabla \cdot \left(\frac{\partial \mathbf{K}^*}{\partial t} * \nabla \langle c \rangle^{\beta\sigma} \right) + \dots$$

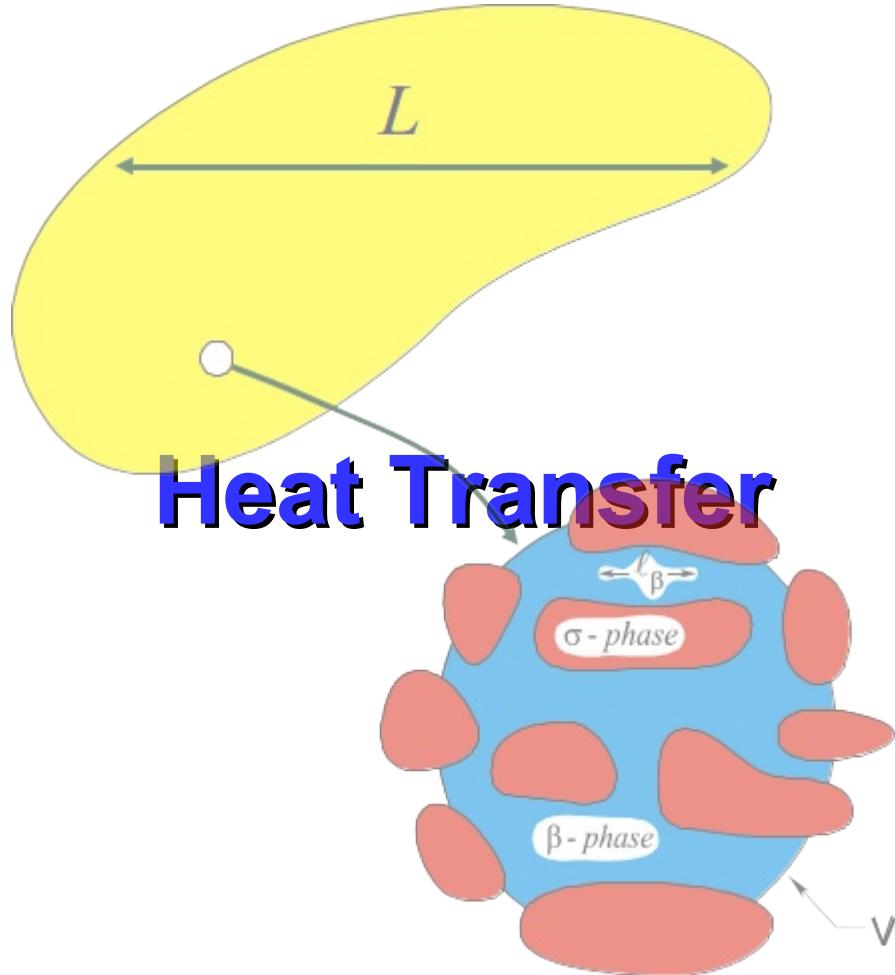

$$\frac{\partial \langle c \rangle^{\beta\sigma}}{\partial t} + \langle \mathbf{v}_\beta \rangle \cdot \nabla \langle c \rangle^{\beta\sigma} = \nabla \cdot (\mathbf{K}_\infty^* \cdot \nabla \langle c \rangle^{\beta\sigma})$$

Equations for $\langle c_\beta \rangle^\beta$, $\langle c_\sigma \rangle^\sigma$

1st order exchange: $-h_{2eq} (\langle c_\sigma \rangle^\sigma - \langle c_\beta \rangle^\beta)$

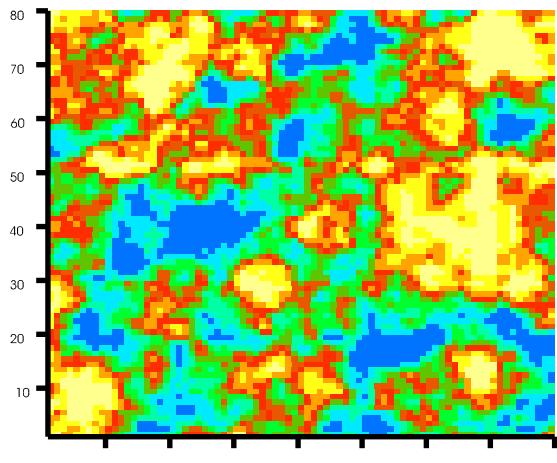

Convolution: $-\frac{\partial h^*}{\partial t} * (\langle c_\sigma \rangle^\sigma - \langle c_\beta \rangle^\beta)$

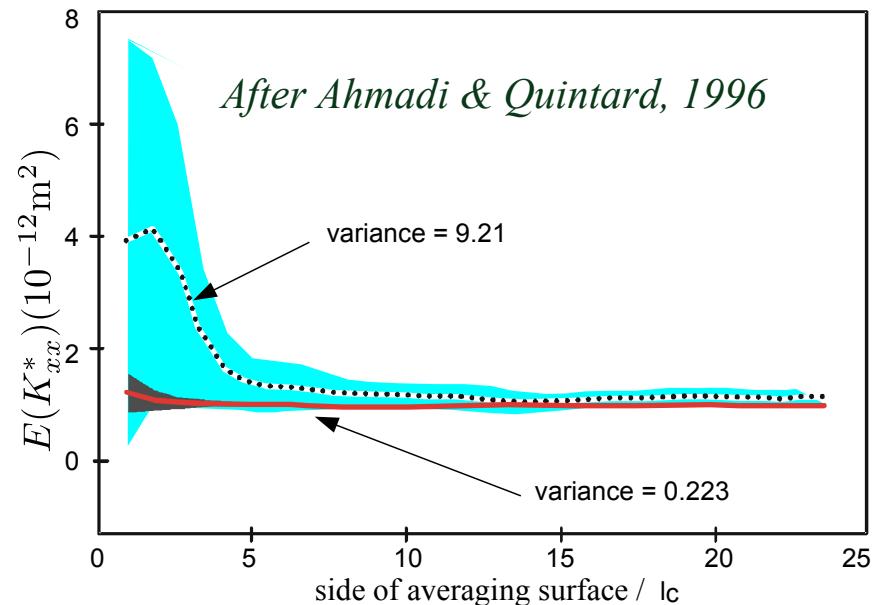

(recall) Diffusion in a heterogenous system : Effective Conductivity

$$\nabla \cdot (\mathbf{k}(x) \cdot \nabla T) = 0 \quad \Rightarrow \quad \left\{ \begin{array}{l} \nabla \cdot (\mathbf{K}_{eff} \cdot \nabla \mathcal{T}) = 0 \\ \mathcal{T} = \langle T \rangle \\ \nabla \cdot (\mathbf{k} \cdot \nabla \mathbf{b}) = -\nabla \cdot \tilde{\mathbf{k}} \\ \mathbf{K}_{eff} = \langle \mathbf{k} \rangle + \langle \mathbf{k} \cdot \nabla \mathbf{b} \rangle \end{array} \right.$$

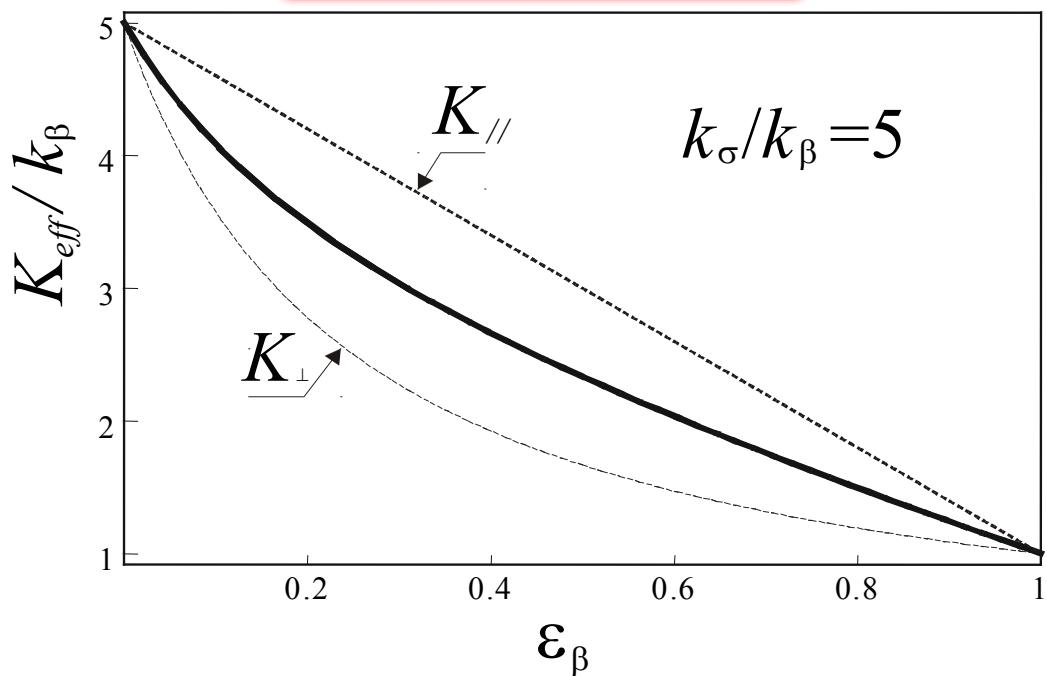

log-normal $k(x)$, spatially correlated

Bounds

Wiener, 1912: $\frac{1}{K_{\perp}} = \frac{\varepsilon_{\sigma}}{k_{\sigma}} + \frac{\varepsilon_{\beta}}{k_{\beta}}$;

$$K_{\perp} \leq K_{eff} \leq K_{\parallel}$$

$$K_{\parallel} = \varepsilon_{\sigma}k_{\sigma} + \varepsilon_{\beta}k_{\beta}$$

Maxwell, 1873

$$K_{eff} = \varepsilon_{\sigma}k_{\sigma} + \varepsilon_{\beta}k_{\beta} - \frac{\varepsilon_{\sigma}\varepsilon_{\beta}(k_{\sigma} - k_{\beta})^2}{\varepsilon_{\beta}k_{\sigma} + \varepsilon_{\sigma}k_{\beta} + 2k_{\beta}}$$

Effect of contact points

(Nozad et al., 1985)

Two-Phase, Unsteady Problem

$$(\rho c_p)_\beta \frac{\partial T_\beta}{\partial t} + (\rho c_p)_\beta \mathbf{v}_\beta \cdot \nabla T_\beta = \nabla \cdot (k_\beta \nabla T_\beta)$$

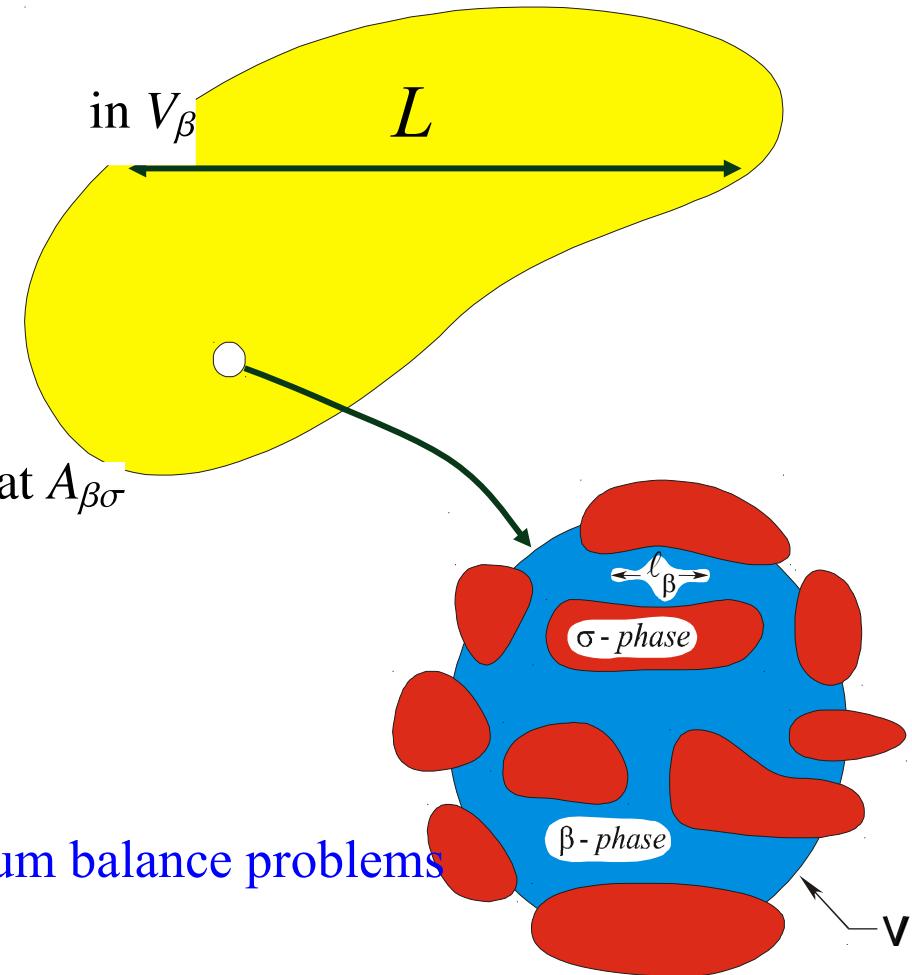

in V_β

L

$$\text{B.C.1} \quad T_\beta = T_\sigma \text{ at } A_{\beta\sigma}$$

$$\text{B.C.2} \quad -\mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla T_\beta = -\mathbf{n}_{\beta\sigma} \cdot k_\sigma \nabla T_\sigma \text{ at } A_{\beta\sigma}$$

$$\rho_\sigma C_\sigma \frac{\partial T_\sigma}{\partial t} = \nabla \cdot (k_\sigma \nabla T_\sigma) \text{ in } V_\sigma$$

Note: decoupled mass and momentum balance problems
→ Darcy, Darcy-Brinkman, etc...

Macro-scale Temperatures

- Temperature not additive: ~OK to use phase average

$$\bar{T}_\beta = \langle T_\beta \rangle^\beta = \frac{1}{V_\beta} \int_{V_\beta} T_\beta dV$$

$$\bar{T}_\sigma = \langle T_\sigma \rangle^\sigma = \frac{1}{V_\sigma} \int_{V_\sigma} T_\sigma dV$$

- Mixture Temperature

$$\langle T \rangle^{\beta\sigma} = \frac{\left(\varepsilon_\beta (\rho c_p)_\beta \langle T_\beta \rangle^\beta + (\rho c_p)_\sigma \langle T_\sigma \rangle^\sigma \right)}{\left(\varepsilon_\beta (\rho c_p)_\beta + \varepsilon_\sigma (\rho c_p)_\sigma \right)}$$

- Phenomenology
 - Contrast of parameters → different regimes
 - Local equilibrium : $\langle T_\beta \rangle^\beta = \langle T_\sigma \rangle^\sigma = \langle T \rangle = \langle T \rangle^{\beta\sigma}$
 - Non-equilibrium models

Upscaling (eqs for β -phase)

$$T_\beta = \left\langle T_\beta \right\rangle^\beta + \tilde{T}_\beta$$

$$T_\sigma = \langle T_\sigma \rangle^\sigma + \tilde{T}_\sigma$$

Micro:

$$(\rho c_p)_\beta \frac{\partial \tilde{T}_\beta}{\partial t} + (\rho c_p)_\beta \tilde{\mathbf{v}}_\beta \cdot \nabla \left\langle T_\beta \right\rangle^\beta + (\rho c_p)_\beta \mathbf{v}_\beta \cdot \nabla \tilde{T}_\beta = \\ \nabla \cdot (k_\beta \nabla \tilde{T}_\beta) - \varepsilon_\beta^{-1} \nabla \cdot \left(k_\beta \frac{1}{\mathcal{V}} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \tilde{T}_\beta \, dA \right) - \varepsilon_\beta^{-1} k_\beta \frac{1}{\mathcal{V}} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot \nabla \tilde{T}_\beta \, dA$$

Macro:

$$\underbrace{\varepsilon_\beta (\rho c_p)_\beta \frac{\partial \langle T_\beta \rangle^\beta}{\partial t}}_{\text{accumulation}} + \underbrace{\varepsilon_\beta (\rho c_p)_\beta \langle \mathbf{v}_\beta \rangle^\beta \cdot \nabla \langle T_\beta \rangle^\beta}_{\text{convection}} = \underbrace{\nabla \cdot \left[k_\beta \left(\varepsilon_\beta \nabla \langle T_\beta \rangle^\beta + \frac{1}{\mathcal{V}} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \tilde{T}_\beta \, dA \right) \right]}_{\text{conduction}} \\ - \underbrace{(\rho c_p)_\beta \nabla \cdot \langle \tilde{\mathbf{v}}_\beta \tilde{T}_\beta \rangle}_{\text{dispersion}} + \underbrace{\frac{1}{\mathcal{V}} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla T_\beta \, dA}_{\text{interfacial flux}}$$

spatial and time non-locality!

Upscaling: BCs, time scales

B.C.:

$$\tilde{T}_\beta = \tilde{T}_\sigma - \underbrace{\left(\langle T_\beta \rangle^\beta - \langle T_\sigma \rangle^\sigma \right)}_{\text{source term}}$$

$$-\mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla \tilde{T}_\beta - \underbrace{\mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla \langle T_\beta \rangle^\beta}_{\text{source term}} = -\mathbf{n}_{\beta\sigma} \cdot k_\sigma \nabla \tilde{T}_\sigma - \underbrace{\mathbf{n}_{\beta\sigma} \cdot k_\sigma \nabla \langle T_\sigma \rangle^\sigma}_{\text{source term}}$$

different time-scales: if (but not sufficient condition...)

$$\left(\frac{(\rho c_p)_\beta l_\beta^2}{k_\beta} \approx \frac{(\rho c_p)_\sigma l_\sigma^2}{k_\sigma} \right) \ll \left(\frac{\varepsilon_\beta (\rho c_p)_\beta L^2}{K_\beta^*} \approx \frac{\varepsilon_\sigma (\rho c_p)_\sigma L^2}{K_\sigma^*} \right)$$

→ local equilibrium

I - Local Equilibrium → 1-Eq model

$$\langle T_\beta \rangle^\beta = \langle T_\sigma \rangle^\sigma = \langle T \rangle = \langle T \rangle^{\beta\sigma} \quad (\text{Carbonell \& Whitaker, 84; Nozad et al, 85; ...})$$

$$\varepsilon_\beta (\rho c_p)_\beta \langle T_\beta \rangle^\beta + \varepsilon_\sigma (\rho c_p)_\sigma \langle T_\sigma \rangle^\sigma = (\rho c_p)^* \langle T \rangle \quad (\rho c_p)^* = \varepsilon_\beta (\rho c_p)_\beta + \varepsilon_\sigma (\rho c_p)_\sigma$$

Closure: $\tilde{T}_\beta = \mathbf{b}_\beta \cdot \nabla \langle T \rangle + O(\ell^2/L^2)$ $\tilde{T}_\sigma = \mathbf{b}_\sigma \cdot \nabla \langle T \rangle + O(\ell^2/L^2)$

$$(\rho c_p)^* \frac{\partial \langle T \rangle}{\partial t} + \varepsilon_\beta (\rho c_p)_\beta \mathbf{U}_\beta \cdot \nabla \langle T \rangle = \nabla \cdot (\mathbf{K}_{eff} \cdot \nabla \langle T \rangle)$$

with:
$$\left\{ \begin{array}{l} \mathbf{U}_\beta = \langle \mathbf{v}_\beta \rangle^\beta \\ \mathbf{K}_{eff} = (\varepsilon_\beta k_\beta + \varepsilon_\sigma k_\sigma) \mathbf{I} + \underbrace{\frac{(k_\beta - k_\sigma)}{V} \int_{A_{\beta\sigma}} (\mathbf{n}_{\beta\sigma} \mathbf{b}_\beta) dA}_{\text{tortuosity}} - \underbrace{(\rho c_p)_\beta \langle \tilde{\mathbf{v}}_\beta \mathbf{b}_\beta \rangle}_{\text{dispersion}} \end{array} \right.$$

LE Closure Problem

dispersion

$$(\rho c_p)_{\beta} \tilde{\mathbf{v}}_{\beta} + (\rho c_p)_{\beta} \mathbf{v}_{\beta} \cdot \nabla \mathbf{b}_{\beta} = k_{\beta} \nabla^2 \mathbf{b}_{\beta} \quad \text{in } V_{\beta}$$

$$\begin{aligned} \text{B.C.1} \quad & -\mathbf{n}_{\beta\sigma} \cdot k_{\beta} \nabla \mathbf{b}_{\beta} - \mathbf{n}_{\beta\sigma} k_{\beta} = \\ & -\mathbf{n}_{\beta\sigma} \cdot k_{\sigma} \nabla \mathbf{b}_{\sigma} - \mathbf{n}_{\beta\sigma} k_{\sigma} \quad \text{at } A_{\beta\sigma} \end{aligned}$$

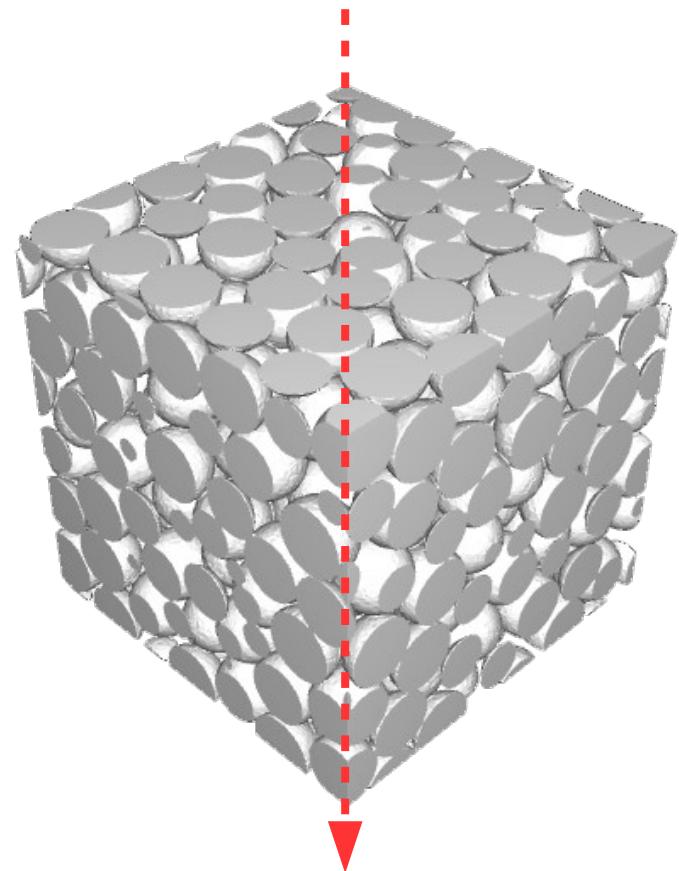

$$\text{B.C.2 } \mathbf{b}_{\beta} = \mathbf{b}_{\sigma} \quad \text{at } A_{\beta\sigma}$$

$$0 = k_{\sigma} \nabla^2 \mathbf{b}_{\sigma} \quad \text{in } V_{\sigma}$$

$$\mathbf{b}_{\beta}(\mathbf{x} + \mathbf{l}_i) = \mathbf{b}_{\beta}(\mathbf{x}) ; \mathbf{b}_{\sigma}(\mathbf{x} + \mathbf{l}_i) = \mathbf{b}_{\sigma}(\mathbf{x})$$

$$\langle \mathbf{b}_{\beta} \rangle = 0 ; \langle \mathbf{b}_{\sigma} \rangle = 0$$

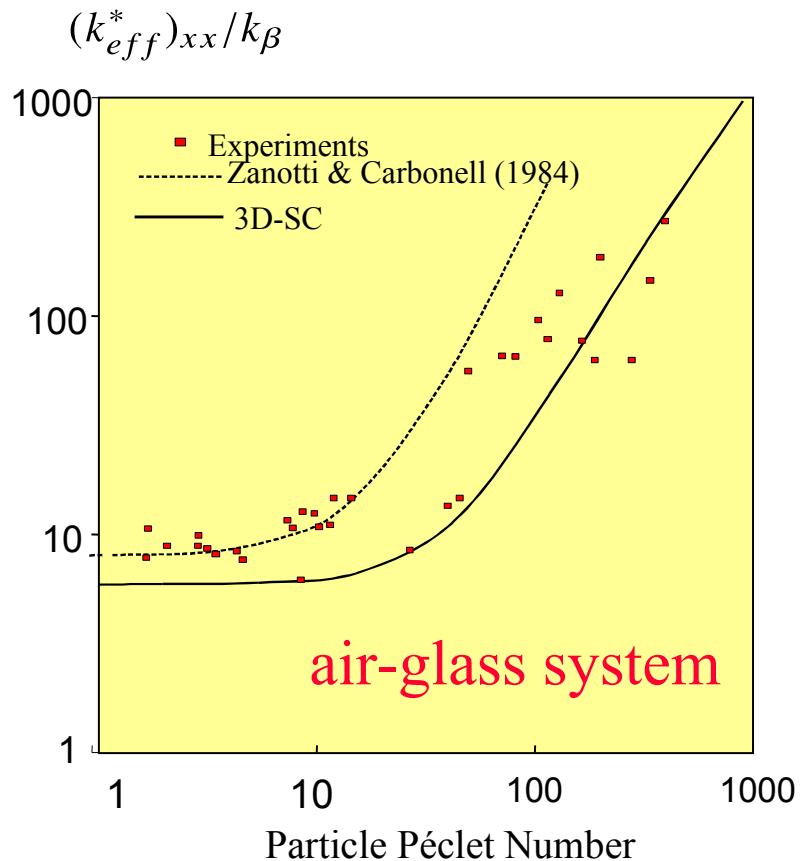

solve for \mathbf{b}

compute K_{eff}

Application: Thermal Dispersion

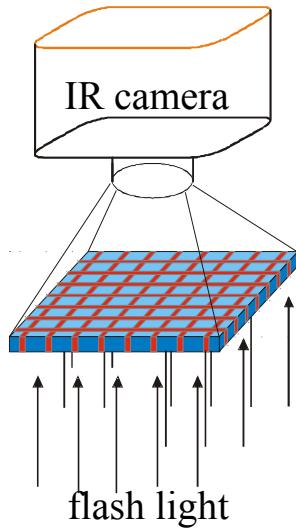

Quintard et al., 1997

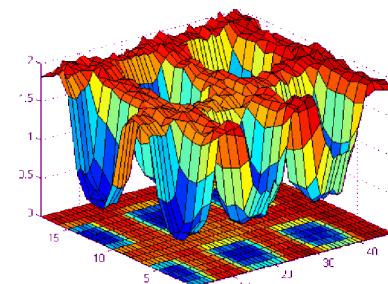

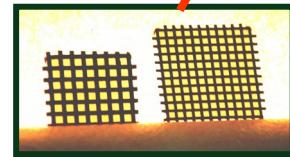

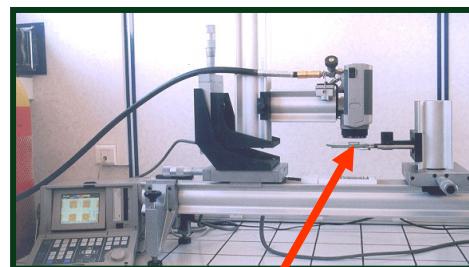

- experiments: Yagi et al., 1960; Gunn and De Souza, 1974

- Quintard & al., 1997: 3D results

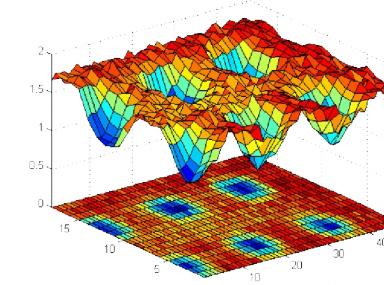

Example of Non-Equilibrium

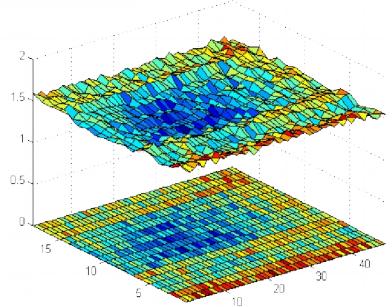

Ramond et al., 98

$t = 0$

$t \rightarrow \infty$

II - Local Non-Equilibrium: Various closures for 2-Eq models

- transient closure (\rightarrow convolution product, at least in time)

$$\tilde{T}_\beta = -\frac{\partial s_\beta}{\partial t} * \left(\langle T_\beta \rangle^\beta - \langle T_\sigma \rangle^\sigma \right) + \frac{\partial \mathbf{b}_{\beta\beta}}{\partial t} * \nabla \langle T_\beta \rangle^\beta + \frac{\partial \mathbf{b}_{\beta\sigma}}{\partial t} * \nabla \langle T_\sigma \rangle^\sigma + \dots$$

$$\tilde{T}_\sigma = +\frac{\partial}{\partial t} s_\sigma * \left(\langle T_\sigma \rangle^\sigma - \langle T_\beta \rangle^\beta \right) + \frac{\partial \mathbf{b}_{\sigma\beta}}{\partial t} * \nabla \langle T_\beta \rangle^\beta + \frac{\partial \mathbf{b}_{\sigma\sigma}}{\partial t} * \nabla \langle T_\sigma \rangle^\sigma + \dots$$

- quasi-steady closure

$$\tilde{T}_\beta = -s_\beta \left(\langle T_\beta \rangle^\beta - \langle T_\sigma \rangle^\sigma \right) + \mathbf{b}_{\beta\beta} \cdot \nabla \langle T_\beta \rangle^\beta + \mathbf{b}_{\beta\sigma} \cdot \nabla \langle T_\sigma \rangle^\sigma + \dots$$

$$\tilde{T}_\sigma = +s_\sigma \left(\langle T_\sigma \rangle^\sigma - \langle T_\beta \rangle^\beta \right) + \mathbf{b}_{\sigma\beta} \cdot \nabla \langle T_\beta \rangle^\beta + \mathbf{b}_{\sigma\sigma} \cdot \nabla \langle T_\sigma \rangle^\sigma + \dots$$

- other ... Hsu (1999), Nakayama, ... DeGroot & Straatman, 2011

$$\tilde{T}_\beta = -s_\beta \left(\langle T_\beta \rangle^\beta - \langle T_\sigma \rangle^\sigma \right) + \mathbf{b}_\beta \cdot \nabla \langle T_\beta \rangle^\beta + \dots$$

- n-th order closure (see Davit and Quintard, 2014, for n=2)

Local Non-Equilibrium Models: 1st order 2-Eq model

- Volume averaging theory, 1st order, quasi-steady closure

(Carbonell & Whitaker, 84; Zanotti & Carbonell, 84; Quintard & Whitaker, 93, 95, 97;
Quintard et al., 96;)

$$\varepsilon_\beta (\rho c_p)_\beta \frac{\partial \langle T_\beta \rangle^\beta}{\partial t} + (\rho c_p)_\beta \langle \mathbf{v}_\beta \rangle \cdot \nabla \langle T_\beta \rangle^\beta - \dots = \nabla \cdot (\mathbf{K}_{\beta\beta}^* \cdot \nabla \langle T_\beta \rangle^\beta + \dots) + q_{\beta\sigma}$$

$$\varepsilon_\sigma (\rho c_p)_\sigma \frac{\partial \langle T_\sigma \rangle^\sigma}{\partial t} - \dots = \nabla \cdot (\mathbf{K}_{\sigma\sigma}^* \cdot \nabla \langle T_\sigma \rangle^\sigma + \dots) - q_{\beta\sigma}$$

$$q_{\beta\sigma} = -h_{2eq} \left(\langle T_\beta \rangle^\beta - \langle T_\sigma \rangle^\sigma \right) + \dots$$

Similar to heuristic models if no non-conventional terms (in red)!

Various estimates for the 1st order exchange coefficient (diffusive case)!

Consequence: various values from inverse methods with ≠ objective functions

Linked to 1st eigenvalue

	Stratified System	2D-Rectangular System	3D-Parallelepiped System
Asymptotic Value	$\pi^2 k_\sigma / l^2$	$\pi^2 k_\sigma \left(\frac{2}{l^2} \right)$	$\pi^2 k_\sigma \left(\frac{3}{l^2} \right)$
Warren & Root (1963)	$12 k_\sigma / l^2$	$16 k_\sigma \left(\frac{2}{l^2} \right)$	$20 k_\sigma \left(\frac{3}{l^2} \right)$
Kazemi et al. (1976, 1992)	$4 k_\sigma / l^2$	$4 k_\sigma \left(\frac{1}{l_x^2} + \frac{1}{l_y^2} \right)$	$4 k_\sigma \left(\frac{1}{l_x^2} + \frac{1}{l_y^2} + \frac{1}{l_z^2} \right)$
Quintard & Whitaker (1992)	$12 k_\sigma / l^2$	$14.22 k_\sigma \left(\frac{1}{l_x^2} + \frac{1}{l_y^2} \right)$	$16.54 k_\sigma \left(\frac{1}{l_x^2} + \frac{1}{l_y^2} + \frac{1}{l_z^2} \right)$

Linked to harmonic mean of eigenvalues!

III - 2-Eq Asymptotic Behavior (mixture temperature)

$$\left(\varepsilon_\beta (\rho c_p)_\beta \langle T_\beta \rangle^\beta + \varepsilon_\sigma (\rho c_p)_\sigma \langle T_\sigma \rangle^\sigma \right) = \left(\varepsilon_\beta (\rho c_p)_\beta + \varepsilon_\sigma (\rho c_p)_\sigma \right) \langle T \rangle^{\beta\sigma}$$

- $t \rightarrow \infty$ for a semi- or infinite medium (see Zanotti & Carbonell, 1984; Davit et al., 2010):

$$\left(\varepsilon_\beta (\rho c_p)_\beta + \varepsilon_\sigma (\rho c_p)_\sigma \right) \frac{\partial \langle T \rangle^{\beta\sigma}}{\partial t} + \varepsilon_\beta (\rho c_p)_\beta U_\beta \frac{\partial \langle T \rangle^{\beta\sigma}}{\partial x} = \boxed{(K_\infty^*)_{xx}} \frac{\partial^2 \langle T \rangle^{\beta\sigma}}{\partial x^2}$$

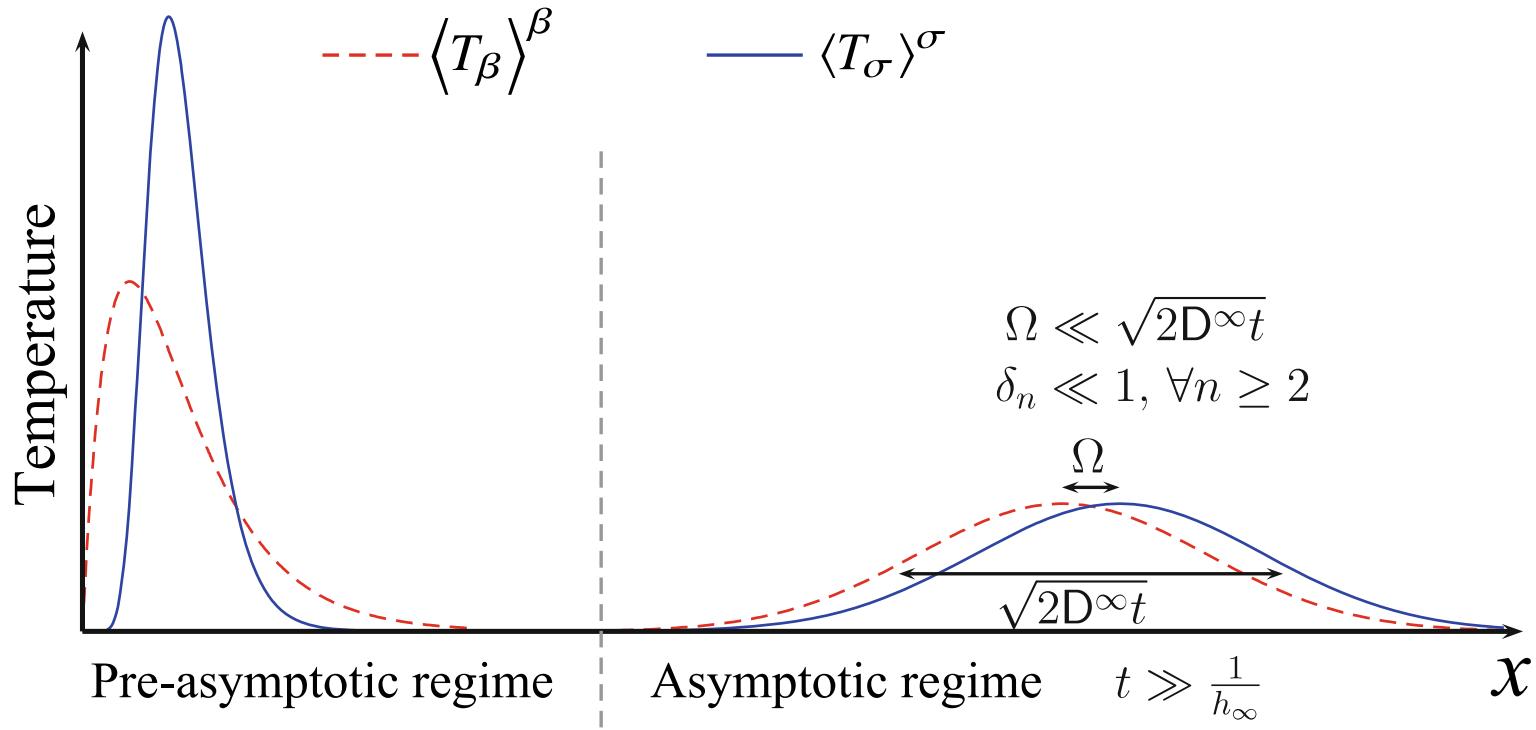

$$(K_\infty^*)_{xx} = (K_{\beta\beta}^*)_{xx} + (K_{\beta\sigma}^*)_{xx} + (K_{\sigma\beta}^*)_{xx} + (K_{\sigma\sigma}^*)_{xx} \\ + \frac{\left(\varepsilon_\beta (\rho c_p)_\beta \varepsilon_\sigma (\rho c_p)_\sigma U_\beta \right)^2}{h_{2eq} \left(\varepsilon_\beta (\rho c_p)_\beta + \varepsilon_\sigma (\rho c_p)_\sigma \right)^2}$$

$$\neq K_{eff} = K_{\beta\beta}^* + K_{\beta\sigma}^* + K_{\sigma\beta}^* + K_{\sigma\sigma}^*$$

- → good test for the choice of ... h_{2eq} !

2-Eq Asymptotic Behavior (mixture temperature)

from Zanotti & Carbonell, 1984; Davit et al., 2010 (moment analysis)

IV - 1-Eq Non-Equilibrium Model

(Chella et al., 1998; Moyne et al., 2000; Quintard et al., 2001; Davit et al., 2010; ~Brenner's method)

- **Mixture Temperature:**

$$\langle T \rangle^{\beta\sigma} = \frac{\left(\varepsilon_\beta (\rho c_p)_\beta \langle T_\beta \rangle^\beta + (\rho c_p)_\sigma \langle T_\sigma \rangle^\sigma \right)}{\left(\varepsilon_\beta (\rho c_p)_\beta + \varepsilon_\sigma (\rho c_p)_\sigma \right)}$$

- **New decomposition:** $\hat{T}_\beta = T_\beta - \langle T \rangle^{\beta\sigma}$

- **Specific Closure:**

$$\hat{T}_\beta = \mathbf{b}_\beta^\infty \cdot \nabla \langle T \rangle^{\beta\sigma} \quad \hat{T}_\sigma = \mathbf{b}_\sigma^\infty \cdot \nabla \langle T \rangle^{\beta\sigma}$$

- **same equation and effective property as asymptotic eq.**

→ Direct Estimation of K_∞^* (see proof in Davit et al., 2010, if proper closure problem!)

- see Moyne et al. for relation with homogenization theory

V - Better Non-Equilibrium models (N-eq., multi-rate models)

- Multi-rate (Brusseau et al., 1989;...); N-equation (Landereau et al., 1998) → a practical alternative to time convolution

$$\varepsilon_\beta (\rho c_p)_\beta \frac{\partial \langle T_\beta \rangle^\beta}{\partial t} = \nabla \cdot (K_\beta \nabla \langle T_\beta \rangle^\beta) - \sum_n b_n (\langle T_\beta \rangle^\beta - T_{\sigma n})$$

$$\varepsilon_\sigma (\rho c_p)_\sigma \frac{\partial T_{\sigma n}}{\partial t} = -k_\sigma \lambda_n (T_{\sigma n} - \langle T_\beta \rangle^\beta) \quad n = 1, 2, ..$$

Example: 3-eqs

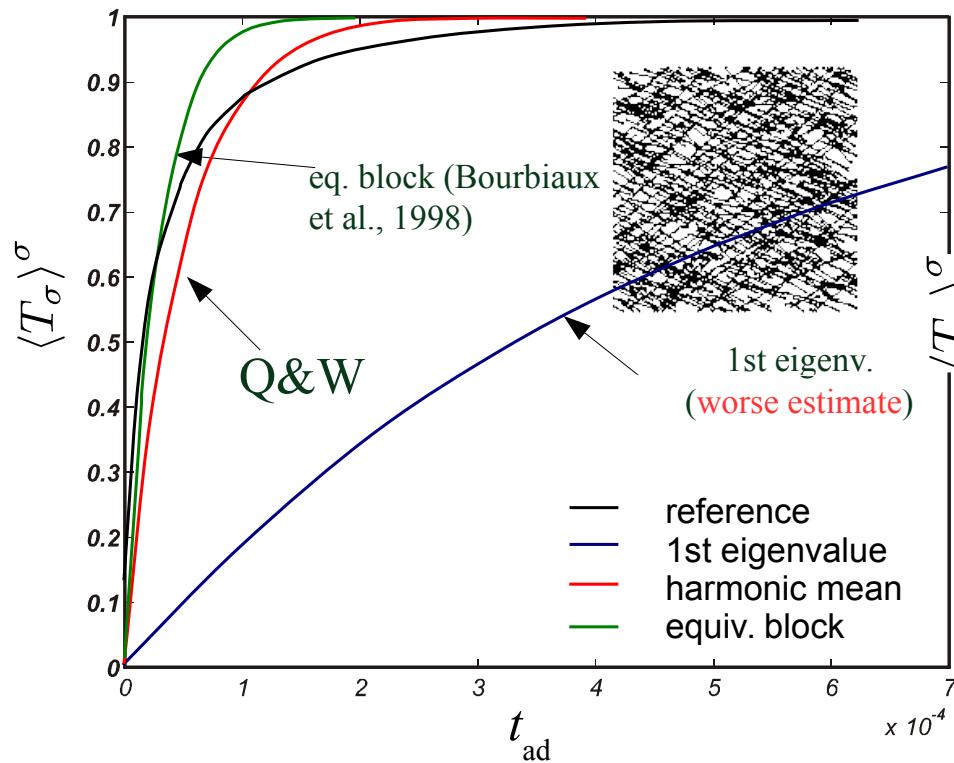

$$T_{\sigma^1}, \quad T_{\sigma^r}$$

with λ_1, λ_r (from the harmo. mean of the remaining eigenv.)

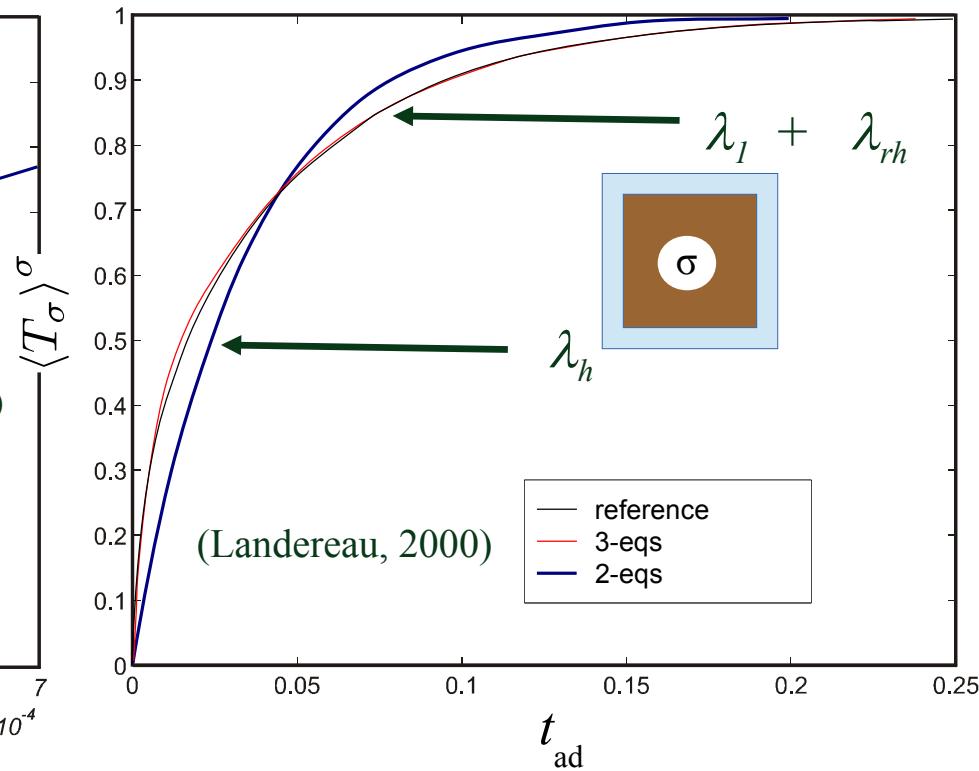

Examples: fractured media

(also for Darcy's law with slightly compressible fluid)

Tests with various h_{2eq}

Test with 3-Eq model

VI - Mixed Model (diffusion, $k_\sigma \ll k_\beta$, dispersed σ -phase; De Swaan, 1976;) (if homogenization theory use $k_\sigma = \varepsilon^{-2} k_\beta$)

$$\underbrace{\langle T_\beta \rangle^\beta}_{O(\frac{l_\beta}{L} \langle T_\beta \rangle^\beta)} + \tilde{T}_\beta = T_\sigma \Rightarrow \underbrace{\langle T_\beta \rangle^\beta}_{\text{macro-scale}} = \underbrace{T_\sigma}_{\text{micro-scale}}$$

Macro-	$\varepsilon_\beta (\rho C_p)_\sigma \frac{\partial \langle T_\beta \rangle^\beta}{\partial t} = \nabla \cdot (\mathbf{K}_\beta^* \cdot \nabla \langle T_\beta \rangle^\beta) - \varphi_{\beta\sigma}$	
Micro-	$(\rho c_p)_\sigma \frac{\partial T_\sigma}{\partial t} = \nabla \cdot (k_\sigma \nabla T_\sigma) \quad \text{in } V_\sigma \quad T_\sigma = \langle T_\beta \rangle^\beta, \text{ at } A_{\beta\sigma}$	

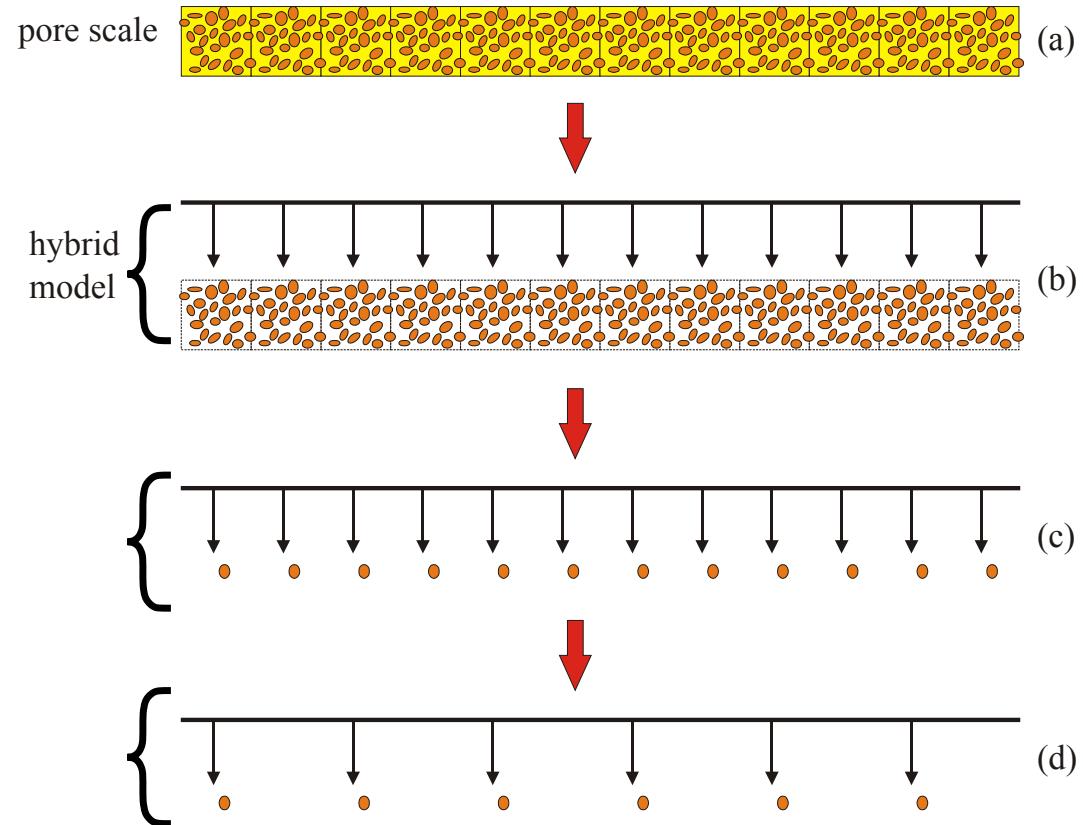

general solution: $T_\sigma(\mathbf{x}, t) = \int_0^t \left. \frac{\partial \langle T_\beta \rangle^\beta}{\partial t} \right|_{t-\tau} \bar{T}_\sigma(\mathbf{x}, \tau) d\tau$

→ involves spectrum of eigenvalues & eigenfunctions → $h(t, BC, IC)$!

Mixed Model: Practical Implementation

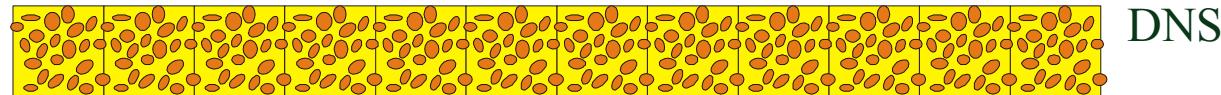

- Direct Numerical Simulation (Heavy computations)
- Mixed Model, Full UC (still Heavy Comp.)
- Mixed Model, Representative Matrix Block,...

...in some cases Analytical Solutions may be available

Summary: a schematic representation of the various models

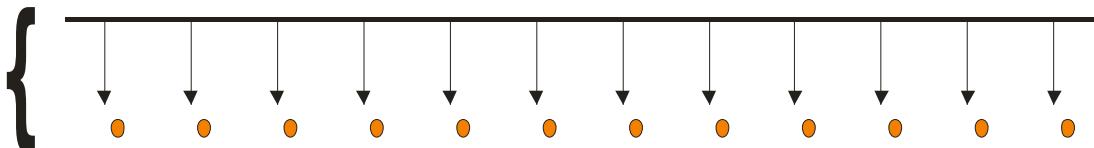

DNS

1-eq local equilibrium

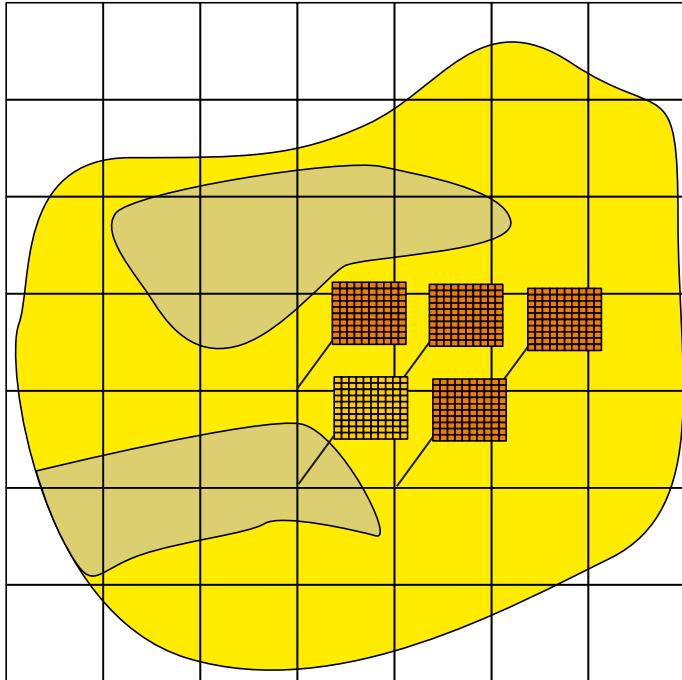

1 equation (convolution, or asymptotic behavior of the 2-eq. model, fractional derivative, Telegraph eq., CTRW ...)

2-equation, N-equation (multi-rate or MRMT, etc...)

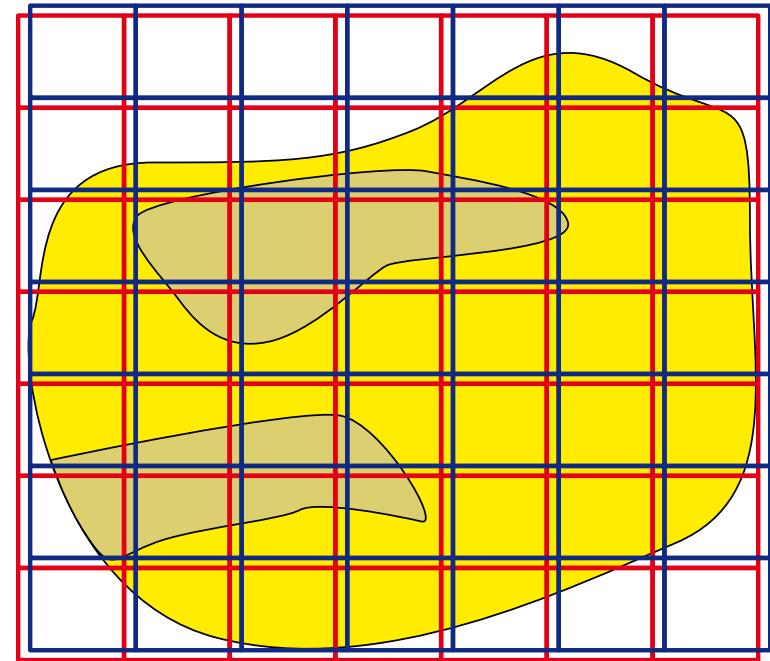

Mixed models

Numerical implementation

Mixed or hybrid models

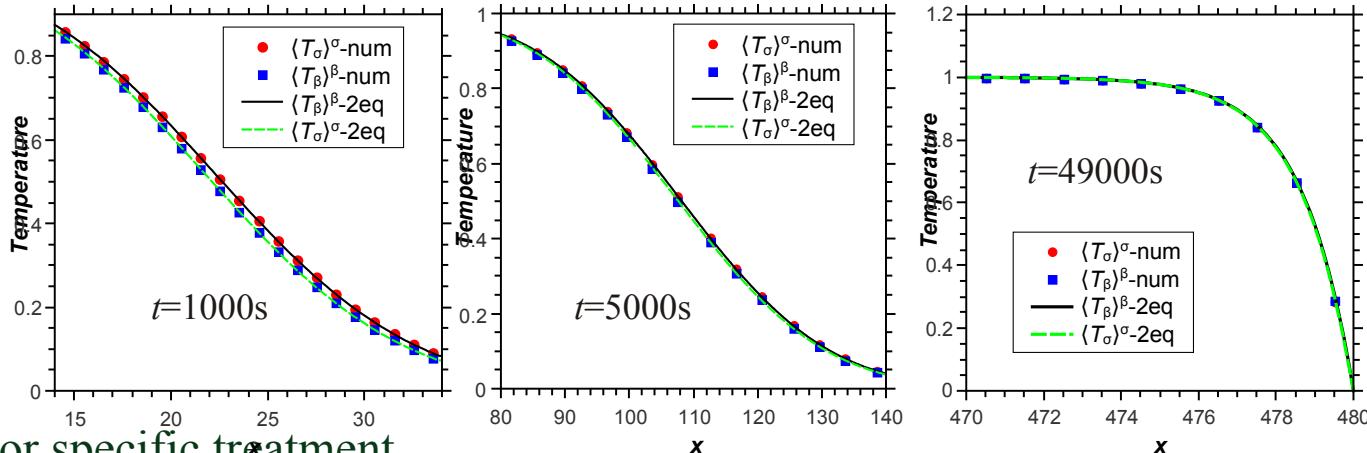

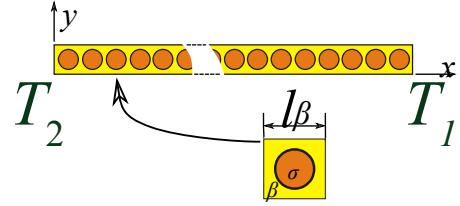

2-eq models

 Keep heterogeneities as much as possible to
avoid abnormal dispersion in the local model !

Important: transitions between the various models!

(Davarzani et al., 2010; Davit & Quintard, 2014)

- $t \sim 0$ non-homogenizable or specific treatment
- $t > 0$ LNE models
- $t \gg 0$ (if enough length): 1-Eq asymptotic model
- $t \rightarrow \infty$ (revert to 1eq-LE if finite domain, because of Dirichlet condition)

Conclusions:

- 1-Eq asympt. not valid in all circumstances
- 2-Eq robust for dealing with transitions

More on homogenization and Local Non-equilibrium model

- Pernin, 1984: $-\mathbf{n}_{\beta\sigma} \cdot k_{\beta} \nabla T_{\beta} = h(T_{\beta} - T_{\sigma})$ at $A_{\beta\sigma}$
 - recover a 2-eq. model
 - drawback: h must be a solution not an assumption!
- if $k_{\sigma} = (l/L)^2 k_{\beta}$ (Hornung, Arbogast, ...):
 - mixed model
 - may recover 2-eq model through approx. solution (but 1st eigenvalue a very bad solution!)
- $k_{\sigma} = (l/L) k_{\beta}$: at 1st order obtain 2-Eq model
see double expansion in Bertin et al., 2000

Simple coupled problems (non-linear properties, one-side coupling, ...)

Non-Linear Properties

- **Approximation**

$$\left. \begin{aligned} k_\beta &= F(T_\beta) = F\left(\langle T_\beta \rangle^\beta\right) + \frac{\partial F}{\partial T_\beta}\left(\langle T_\beta \rangle^\beta\right)\tilde{T}_\beta + \dots \\ \tilde{T}_\beta &= O\left(\frac{l_\beta}{L}\langle T_\beta \rangle^\beta\right)^* \end{aligned} \right\} k_\beta = F(T_\beta) \approx F\left(\langle T_\beta \rangle^\beta\right)$$

- **Consequence: closure and effective properties depend on parameter $\langle T_\beta \rangle^\beta$**

* not always the case : example $\tilde{\mathbf{v}}_\beta \approx \langle \mathbf{v}_\beta \rangle^\beta$

Coupled problems, a simple example: transport with Soret effect

- one-side coupling (T_β , known problem):

$$\tilde{T}_\beta = \mathbf{b}_{T\beta} \cdot \nabla \langle T \rangle \quad ; \quad \tilde{T}_\sigma = \mathbf{b}_{T\sigma} \cdot \nabla \langle T \rangle$$
$$\frac{\partial c_\beta}{\partial t} + \nabla \cdot (c_\beta \mathbf{v}_\beta) = \nabla \cdot (D_\beta \nabla c_\beta + D_{T\beta} \nabla T_\beta)$$

- Closure (Lacabanne et al., 2002; Davarzani et al., 2010, 2011, ext. for $\text{Pe} \neq 0$):

$$\tilde{c}_\beta = \mathbf{b}_{C\beta} \cdot \nabla \langle c_\beta \rangle^\beta + \mathbf{b}_{S\beta} \cdot \nabla \langle T \rangle$$

problem involves $\mathbf{b}_{T\beta}$!

$$\mathbf{v}_\beta \cdot \nabla \mathbf{b}_{S\beta} = D_\beta \nabla^2 \mathbf{b}_{S\beta} + D_{T\beta} \nabla^2 \mathbf{b}_{T\beta}$$
$$\text{BC: } -\mathbf{n}_{\beta\sigma} \cdot (D_\beta \nabla \mathbf{b}_{S\beta} + D_{T\beta} \nabla \mathbf{b}_{T\beta}) = \mathbf{n}_{\beta\sigma} \cdot D_{T\beta}, \text{ at } A_{\beta\sigma}$$

etc... ☺!

Coupled problems, a simple example: transport with Soret effect

- macro-equation:

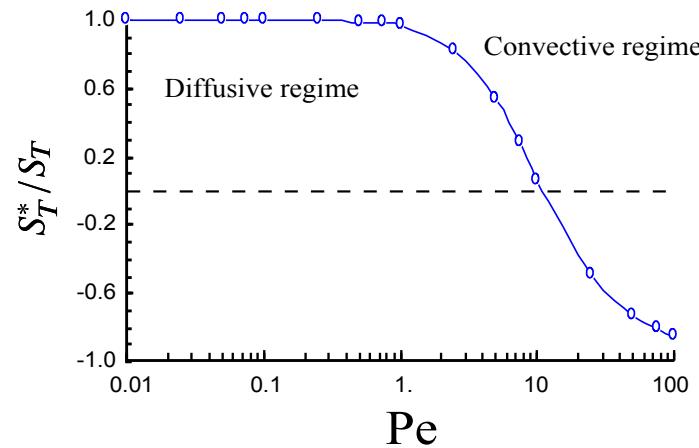

$$\frac{\partial \varepsilon_\beta \langle c_\beta \rangle^\beta}{\partial t} + \nabla \cdot \left(\varepsilon_\beta \langle \mathbf{v}_\beta \rangle^\beta \langle c_\beta \rangle^\beta \right) = \nabla \cdot \left(\varepsilon_\beta \mathbf{D}_\beta^* \cdot \nabla \langle c_\beta \rangle^\beta + \varepsilon_\beta \mathbf{D}_{T\beta}^* \cdot \nabla \langle T \rangle \right)$$

- Results for Soret Coefficient:

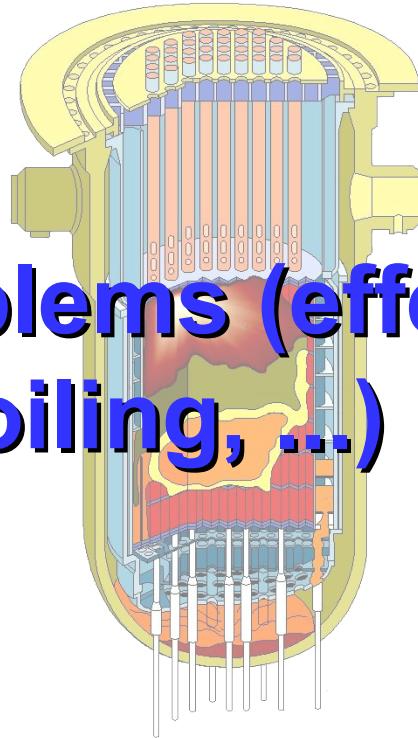

$$S_T = D_{T\beta}/D_\beta$$
$$S_T^* = D_{T\beta}^*/D_\beta^*$$

$$\frac{\mathbf{D}_\beta^*}{D_\beta} = \frac{\mathbf{D}_{T\beta}^*}{D_{T\beta}} \sim \frac{1}{\tau} \text{ if } \text{Pe} = 0$$

results validated against
experiments ($\text{Pe}=0$) and DNS!

Complex coupled problems (effect of source terms, boiling, ...)

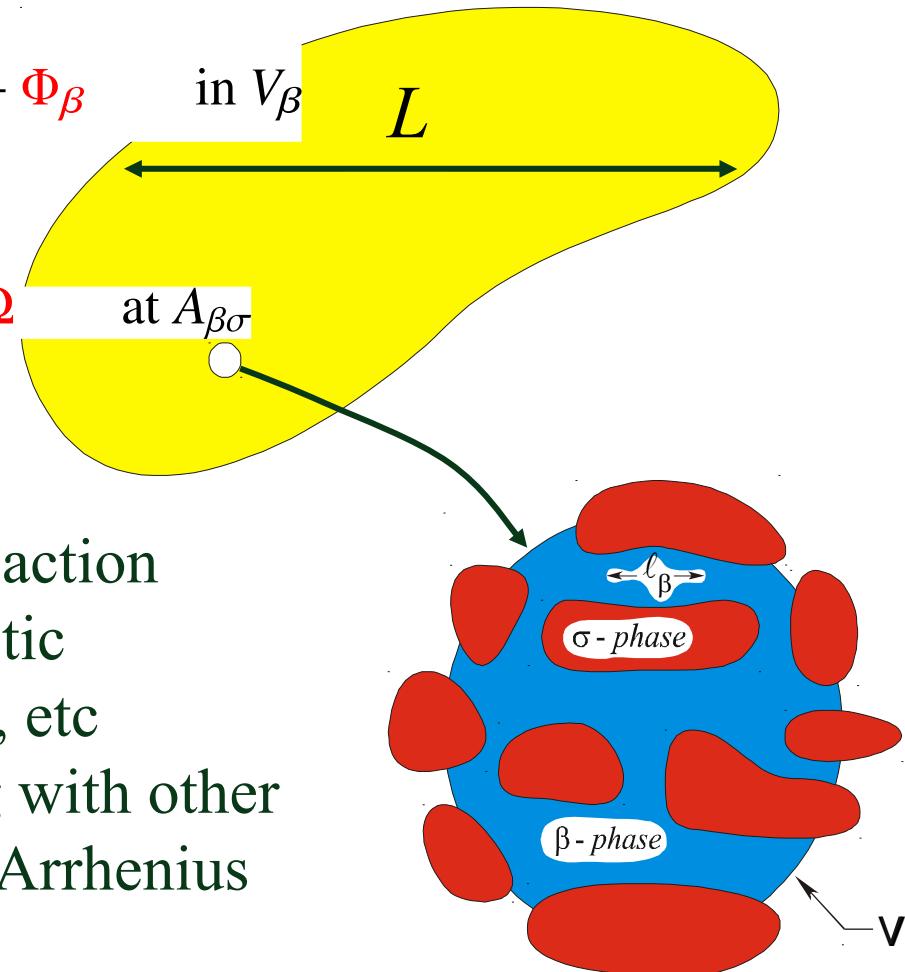

Potential strong coupling: Effect of source terms

$$(\rho c_p)_\beta \frac{\partial T_\beta}{\partial t} + (\rho c_p)_\beta \mathbf{v}_\beta \cdot \nabla T_\beta = \nabla \cdot (k_\beta \nabla T_\beta) + \Phi_\beta \quad \text{in } V_\beta$$

$$\text{B.C.1} \quad T_\beta = T_\sigma \text{ at } A_{\beta\sigma}$$

$$\text{B.C.2} \quad -\mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla T_\beta = -\mathbf{n}_{\beta\sigma} \cdot k_\sigma \nabla T_\sigma - \Omega \quad \text{at } A_{\beta\sigma}$$

$$(\rho c_p)_\sigma \frac{\partial T_\sigma}{\partial t} = \nabla \cdot (k_\sigma \nabla T_\sigma) + \Phi_\sigma \quad \text{in } V_\sigma$$

- applications: chemical reaction (combustion, ...), magnetic induction, nuclear safety, etc
- strong potential coupling with other transport problems (like Arrhenius reaction rates, radiation)

Coupled micro- and macro-scale problems

$$\begin{aligned}
 & \underbrace{\varepsilon_\beta (\rho c_p)_\beta \frac{\partial \langle T_\beta \rangle^\beta}{\partial t}}_{\text{accumulation}} + \underbrace{\varepsilon_\beta (\rho c_p)_\beta \langle \mathbf{v}_\beta \rangle^\beta \cdot \nabla \langle T_\beta \rangle^\beta}_{\text{convection}} = \nabla \cdot \underbrace{\left[k_\beta \left(\varepsilon_\beta \nabla \langle T_\beta \rangle^\beta + \frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \tilde{T}_\beta dA \right) \right]}_{\text{conduction}} \\
 & - \underbrace{(\rho c_p)_\beta \nabla \cdot \langle \tilde{\mathbf{v}}_\beta \tilde{T}_\beta \rangle}_{\text{dispersion}} + \underbrace{\frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla T_\beta dA}_{\text{interfacial flux}} + \underbrace{\varepsilon_\beta \langle \Phi_\beta \rangle^\beta}_{\text{homogeneous thermal source}} \\
 & \varepsilon_\sigma (\rho c_p)_\sigma \frac{\partial \langle T_\sigma \rangle^\sigma}{\partial t} = \nabla \cdot \left[k_\sigma \left(\varepsilon_\sigma \nabla \langle T_\sigma \rangle^\sigma + \frac{1}{V} \int_{A_{\sigma\beta}} \mathbf{n}_{\sigma\beta} \tilde{T}_\sigma dA \right) \right] + \frac{1}{V} \int_{A_{\sigma\beta}} \mathbf{n}_{\sigma\beta} \cdot k_\sigma \nabla T_\sigma dA + \varepsilon_\sigma \langle \Phi_\sigma \rangle^\sigma
 \end{aligned}$$

Note: B.C.2 gives

$$\frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla T_\beta dA = \frac{1}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot k_\sigma \nabla T_\sigma dA + a_v \langle \Omega \rangle_{\beta\sigma}$$

$$a_v = \frac{1}{V} \int_{A_{\beta\sigma}} dA \quad (\text{specific area}) \quad \frac{1}{V} \int_{A_{\beta\sigma}} \Omega dA = a_v \langle \Omega \rangle_{\beta\sigma} \quad \varepsilon_\beta = \frac{V_\beta}{V}$$

Pore-Scale Deviation Problem

$$(\rho c_p)_\beta \frac{\partial \tilde{T}_\beta}{\partial t} + (\rho c_p)_\beta \mathbf{v}_\beta \cdot \nabla \tilde{T}_\beta + \underbrace{(\rho c_p)_\beta \tilde{\mathbf{v}}_\beta \cdot \nabla \langle T_\beta \rangle^\beta}_{\text{source}} = \nabla \cdot (k_\beta \nabla \tilde{T}_\beta) - \frac{\varepsilon_\beta^{-1}}{V} \int_{A_{\beta\sigma}} \mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla \tilde{T}_\beta dA + \tilde{\Phi}_\beta$$

$$\text{B.C.1} \quad \tilde{T}_\beta = \tilde{T}_\sigma - \underbrace{(\langle T_\beta \rangle^\beta - \langle T_\sigma \rangle^\sigma)}_{\text{source}}, \quad \text{at } A_{\beta\sigma}$$

$$\text{B.C.2} \quad \mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla \tilde{T}_\beta = \mathbf{n}_{\beta\sigma} \cdot k_\sigma \nabla \tilde{T}_\sigma - \underbrace{\mathbf{n}_{\beta\sigma} \cdot k_\beta \nabla \langle T_\beta \rangle^\beta}_{\text{source}} + \underbrace{\mathbf{n}_{\beta\sigma} \cdot k_\sigma \nabla \langle T_\sigma \rangle^\sigma}_{\text{source}} + \underbrace{\langle \Omega \rangle_{\beta\sigma}}_{\text{source}} + \tilde{\Omega}, \quad \text{at } A_{\beta\sigma}$$

$$(\rho c_p)_\sigma \frac{\partial \tilde{T}_\sigma}{\partial t} = \nabla \cdot (k_\sigma \nabla \tilde{T}_\sigma) - \frac{\varepsilon_\sigma^{-1}}{V} \int_{A_{\sigma\beta}} \mathbf{n}_{\sigma\beta} \cdot k_\sigma \nabla \tilde{T}_\sigma dA + \tilde{\Phi}_\sigma$$

with

$$\Omega = \langle \Omega \rangle_{\beta\sigma} + \tilde{\Omega}, \quad \Phi_\sigma = \langle \Phi_\sigma \rangle^\sigma + \tilde{\Phi}_\sigma$$

Note: no source terms for homogeneous heat sources if Φ constant
 → no impact on effective properties!

Macro-scale models

- Local equilibrium

$$\begin{aligned} (\rho c_p)^* \frac{\partial \langle T \rangle}{\partial t} + \varepsilon_\beta (\rho c_p)_\beta \langle \mathbf{v}_\beta \rangle^\beta \cdot \nabla \langle T \rangle &= \nabla \cdot (\mathbf{K}_{eff} \cdot \nabla \langle T \rangle) \\ &+ a_V \langle \Omega \rangle_{\beta\sigma} + \varepsilon_\sigma \langle \Phi_\sigma \rangle^\sigma + \varepsilon_\beta \langle \Phi_\beta \rangle^\beta \end{aligned}$$

- 2eq model (Quintard & Whitaker, Hdbk Porous Media, 2000; Davit and Quintard, Hdbk Porous Media, 2015)

$$\begin{aligned} \varepsilon_\beta (\rho c_p)_\beta \frac{\partial \langle T_\beta \rangle^\beta}{\partial t} + \varepsilon_\beta (\rho c_p)_\beta \langle \mathbf{v}_\beta \rangle^\beta \cdot \nabla \langle T_\beta \rangle^\beta - \mathbf{u}_{\beta\beta} \cdot \nabla \langle T_\beta \rangle^\beta - \mathbf{u}_{\beta\sigma} \cdot \nabla \langle T_\sigma \rangle^\sigma \\ = \nabla \cdot (\mathbf{K}_{\beta\beta}^* \cdot \nabla \langle T_\beta \rangle^\beta + \mathbf{K}_{\beta\sigma}^* \cdot \nabla \langle T_\sigma \rangle^\sigma) - a_V h (\langle T_\beta \rangle^\beta - \langle T_\sigma \rangle^\sigma) + a_V \xi \Omega + \varepsilon_\beta \langle \Phi_\beta \rangle^\beta + \dots \end{aligned}$$

distribution coefficient

see extension to radiative heat transfer (Leroy et al., 2013), application to combustion (Chen et al., 2014), ...

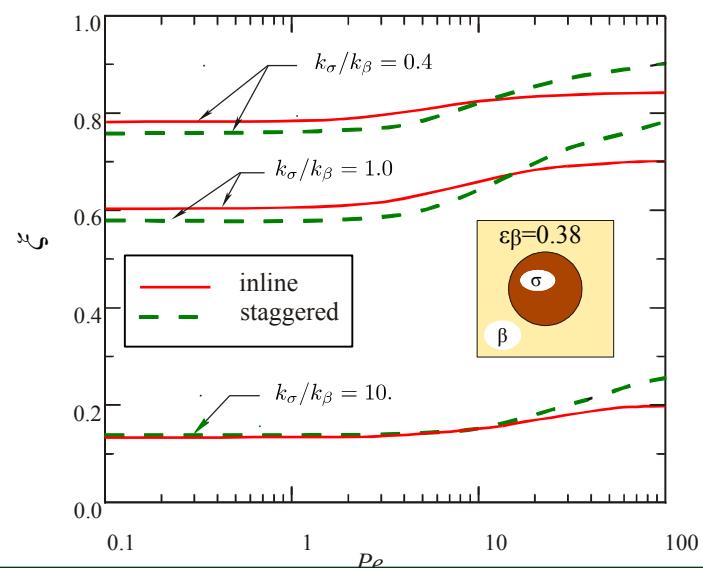

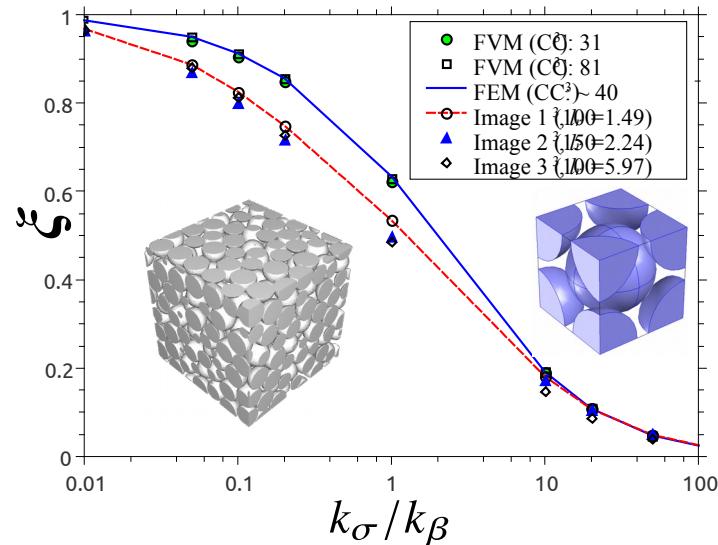

Calculation of ξ

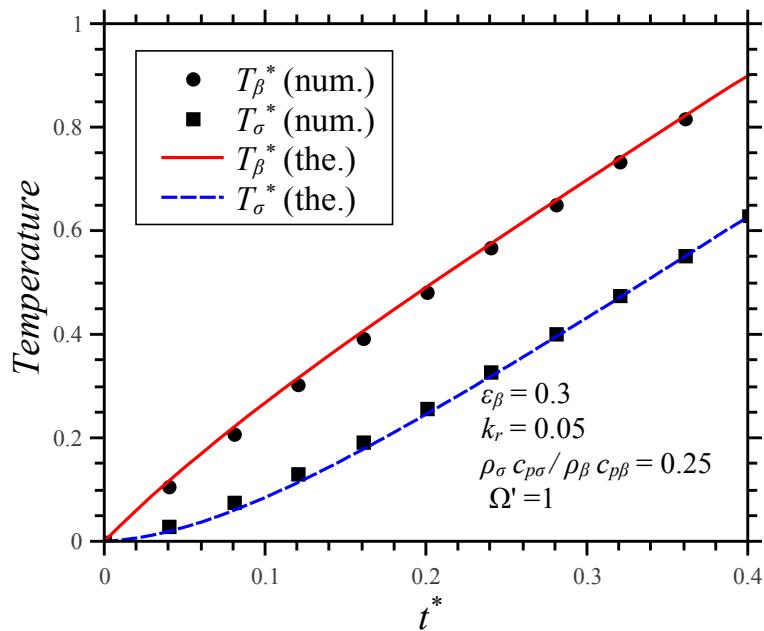

- if $k_\sigma/k_\beta \rightarrow \infty, \xi \rightarrow 0$
- if $k_\sigma/k_\beta \rightarrow 0, \xi \rightarrow 1$

- Moderate influence of Péclet number
- REV $> d_p$?
- Role of a_v ?

 **Warning!**
Engng practice: $\xi \rightarrow 0$

0D “experiment”: example of stratified UC

DNS

$$\varphi_\sigma = \left(\frac{\varepsilon_\sigma (\rho c_p)_\sigma}{\varepsilon_\beta (\rho c_p)_\beta + \varepsilon_\sigma (\rho c_p)_\sigma} \right)$$

$$\lim_{t \rightarrow \infty} \left(\langle T_\beta \rangle^\beta - \langle T_\sigma \rangle^\sigma \right) = \frac{\xi \varepsilon_\sigma (\rho c_p)_\sigma - (1 - \xi) \varepsilon_\beta (\rho c_p)_\beta}{h_{2eq} \left(\varepsilon_\sigma (\rho c_p)_\sigma + \varepsilon_\beta (\rho c_p)_\beta \right)} a_v \Omega$$

- The more conductive material has not necessarily the highest average T
- Note: Good test for the theory for both h_{2eq} and ξ

Example: Combustion

Yang et al., TiPM, 2015

$$\Omega = A_0 e^{-E/RT_{int}} \times H_{rxn}$$

$$\varepsilon (\rho c_p)_\beta \frac{\partial \langle T_\beta \rangle^\beta}{\partial t} + (\rho c_p)_\beta \langle \mathbf{v}_\beta \rangle \cdot \nabla \langle T_\beta \rangle^\beta - \mathbf{u}_{\beta\beta} \cdot \nabla \langle T_\beta \rangle^\beta - \mathbf{u}_{\beta\sigma} \cdot \nabla \langle T_\sigma \rangle^\sigma =$$

$$\nabla \cdot \left(\mathbf{K}_{\beta\beta} \cdot \nabla \langle T_\beta \rangle^\beta + \mathbf{K}_{\beta\sigma} \cdot \nabla \langle T_\sigma \rangle^\sigma \right) - h_{2eq} \left(\langle T_\beta \rangle^\beta - \langle T_\sigma \rangle^\sigma \right)$$

$$+ \varepsilon_\beta \langle \Phi_\beta \rangle^\beta + a_V \xi \left(1 + w \frac{E}{R (\langle T_\sigma \rangle^\sigma)^2} \right) A_0 e^{-E/R\langle T_\sigma \rangle^\sigma} H_{rxn}$$

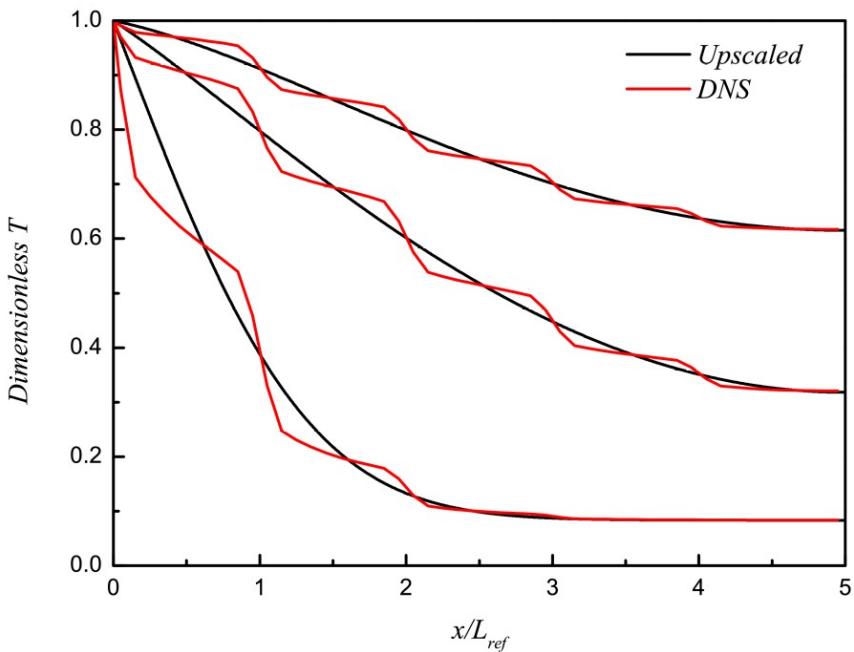

$$w \approx \frac{\frac{E}{R(\langle T_\beta \rangle^\beta)^2} e^{-E/R\langle T_\beta \rangle^\beta} \left(\langle T_\sigma \rangle^\sigma - \langle T_\beta \rangle^\beta \right) - \left(e^{-E/R\langle T_\sigma \rangle^\sigma} - e^{-E/R\langle T_\beta \rangle^\beta} \right)}{\frac{E}{R(\langle T_\sigma \rangle^\sigma)^2} e^{-E/R\langle T_\sigma \rangle^\sigma} - \frac{E}{R(\langle T_\beta \rangle^\beta)^2} e^{-E/R\langle T_\beta \rangle^\beta}}$$

with

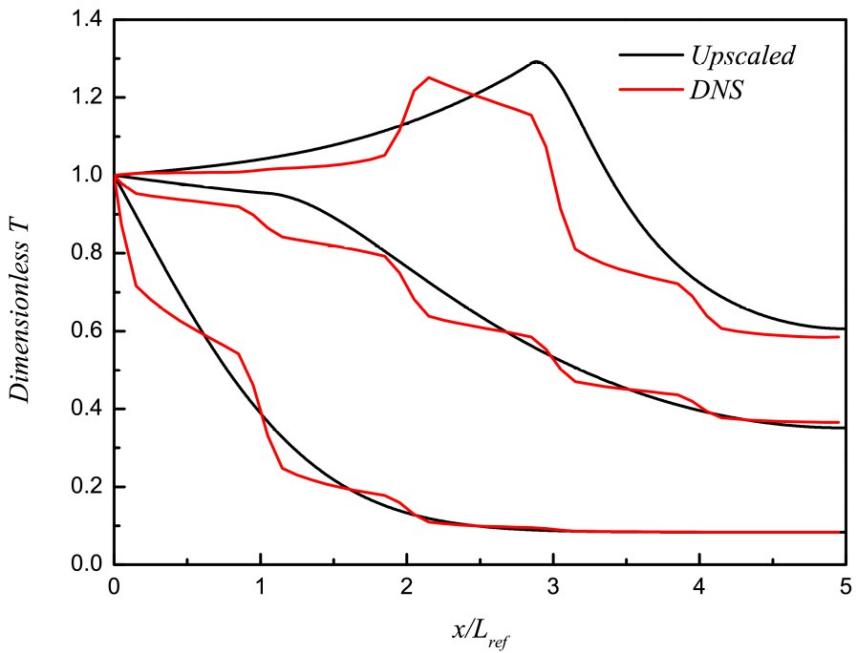

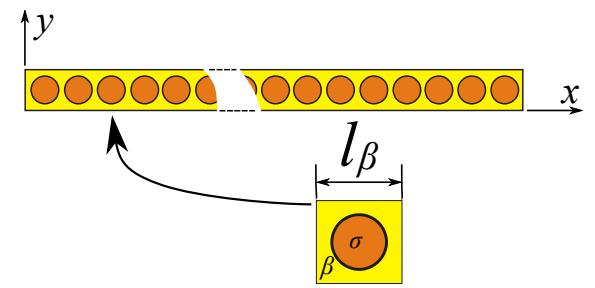

Example: Combustion

Yang et al., TiPM, 2015

$$Da = \frac{A_0 e^{-E/R\langle T_\sigma \rangle^\sigma} l_\sigma}{k_\sigma / (\rho c_p)_\sigma}$$

Two-Phase Flow with Phase Change

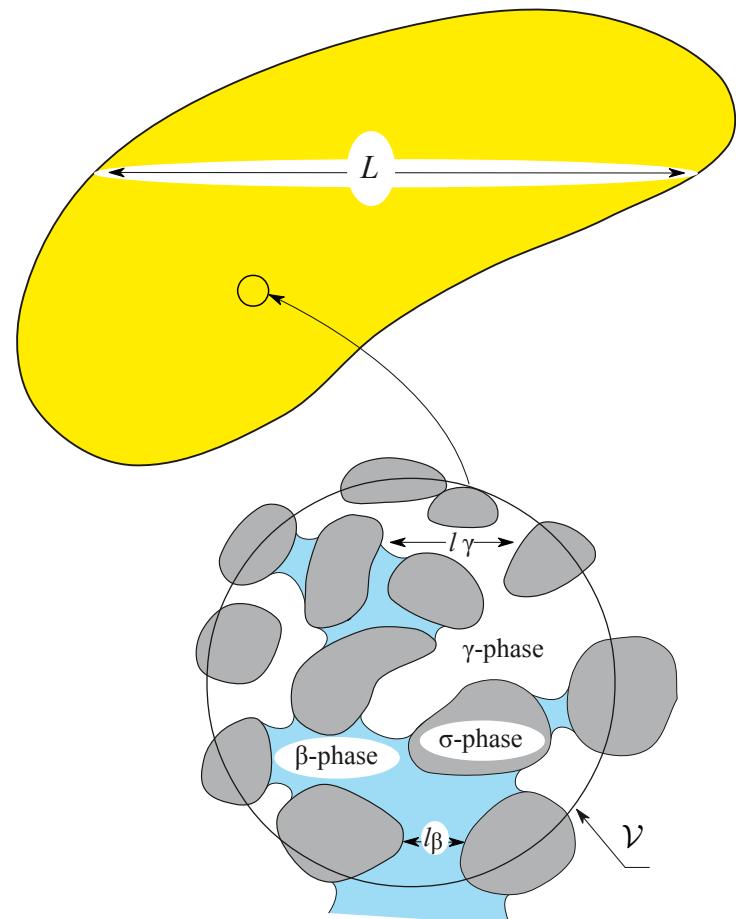

Case with no inert gas!

{ Mass balances+Momentum balances
+Energy balances

Specific Bcs at $A_{\beta\gamma}$:

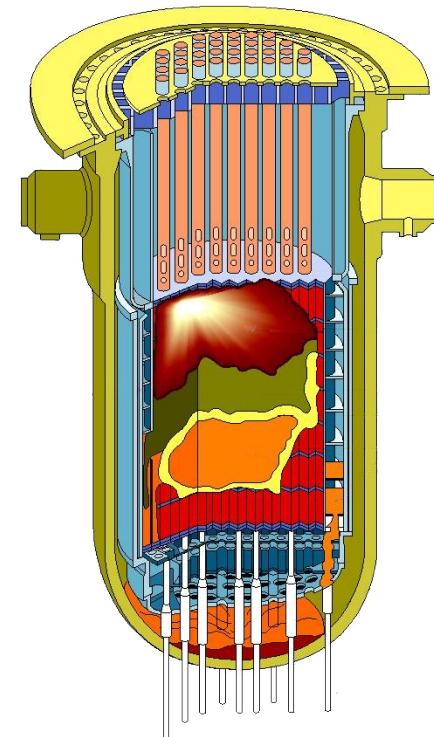

$$\left\{ \begin{array}{l} T_\gamma = T_\beta = T_{sat}(p) \\ \mathbf{n}_{\beta\gamma} \cdot (\rho_\gamma (\mathbf{v}_{\gamma v} - \mathbf{w}_{\beta\gamma}) \delta h_{\beta\gamma}) \\ \quad - \mathbf{n}_{\beta\gamma} \cdot (k_\gamma \nabla T_\gamma) = -\mathbf{n}_{\beta\gamma} \cdot (k_\beta \nabla T_\beta) \end{array} \right.$$

If Local Eq.: $\mathcal{T}_\beta = \mathcal{T}_\gamma = \mathcal{T}_\sigma = T_{sat}(P)$ (not always observed!)

Nuclear LOCA accident

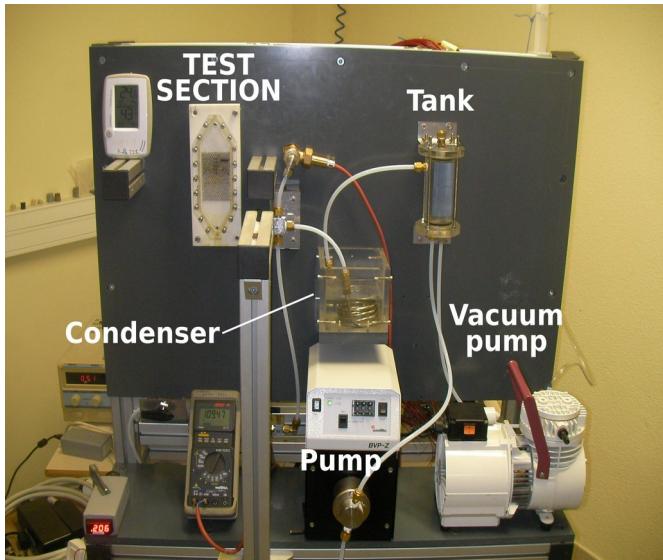

- Important source term in the solid phase → local non-equilibrium !
- Decoupled 2-phase flow, quasi-steady → Generalized Darcy-Forchheimer? (time-space ergodicity?)
- 3-T model, extension of 2-T model: Berthoud & Valette (1994); Petit et al. (1999); Duval et al. (2004);...based on quasi-steady approx.
- Heuristic: time averaging of averaged equations → porous media Nukiyama curves (see Sapin et al., 2014)

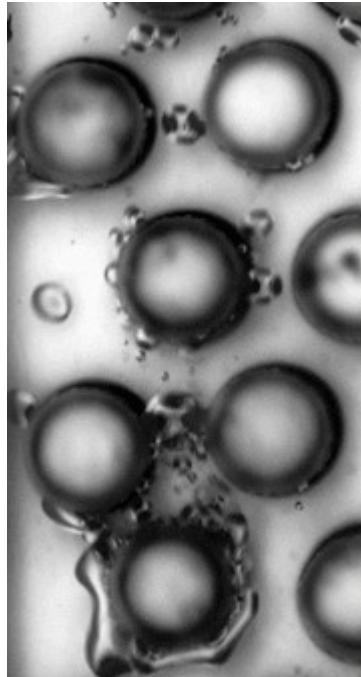

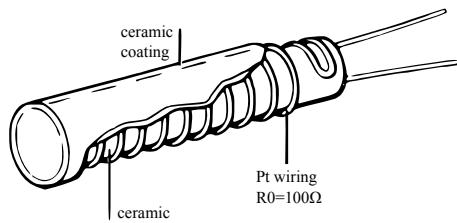

Highly open problem!

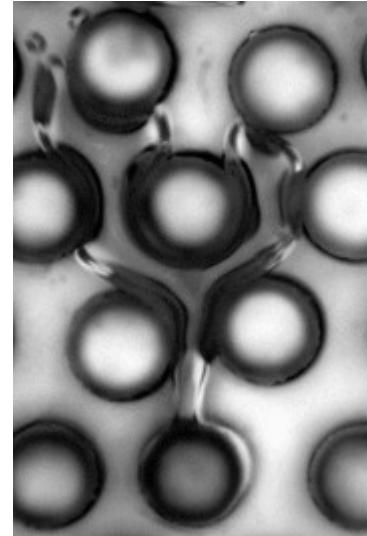

Pore-Scale Experimentations

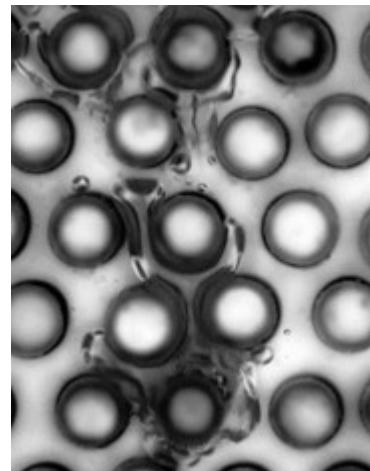

Sapin et al., 2014

Nucleate Boiling

Film Boiling

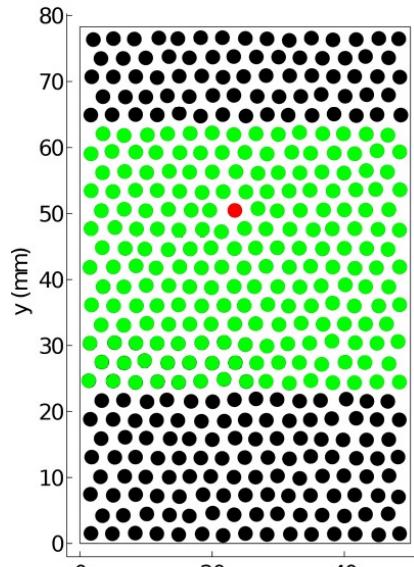

Intense Boiling

Need time-averaging!

Porous Media Nukiyama Curves

- cylinders heated at Q_{mp}
- heated cylinder

$$Q_{mp} = 20 \text{ mW}$$

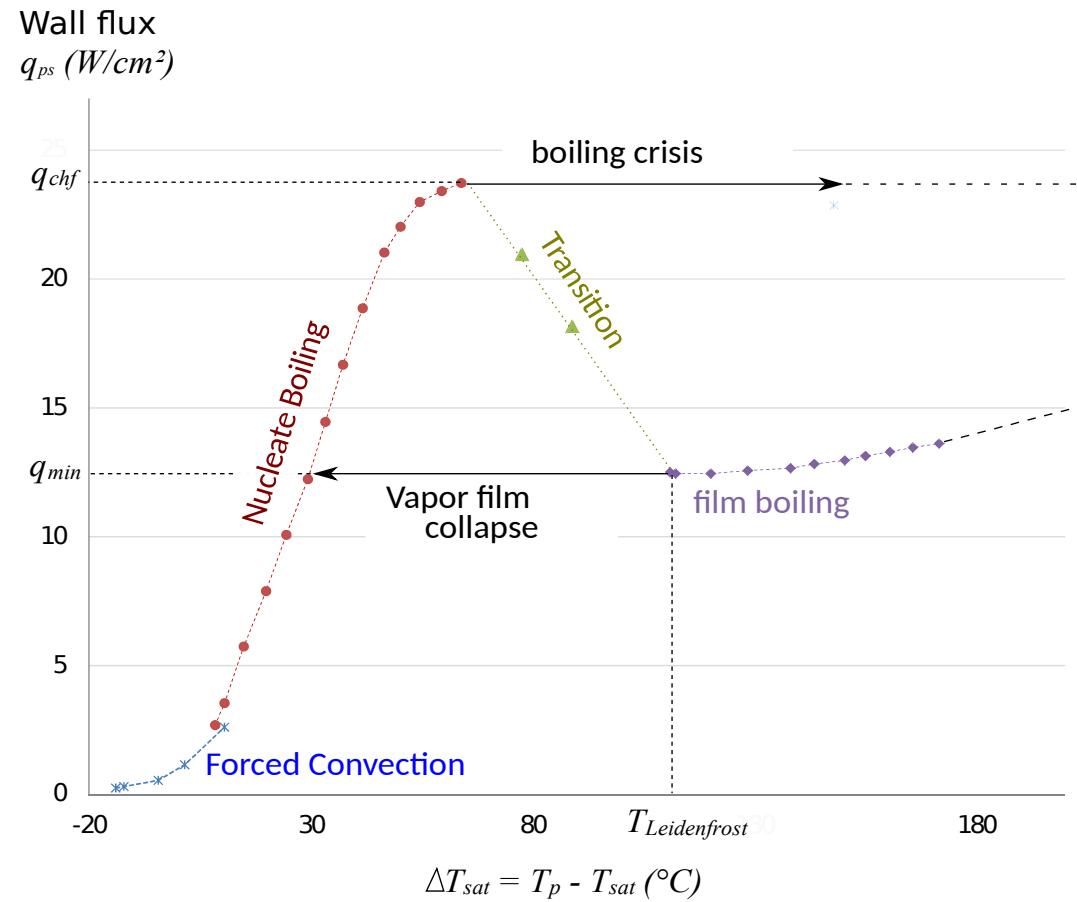

$$T_l = 24.4^\circ\text{C}$$

$$P = 1.181 \text{ bar}$$

$$T_{sat} = f(P) = 39.9^\circ\text{C}$$

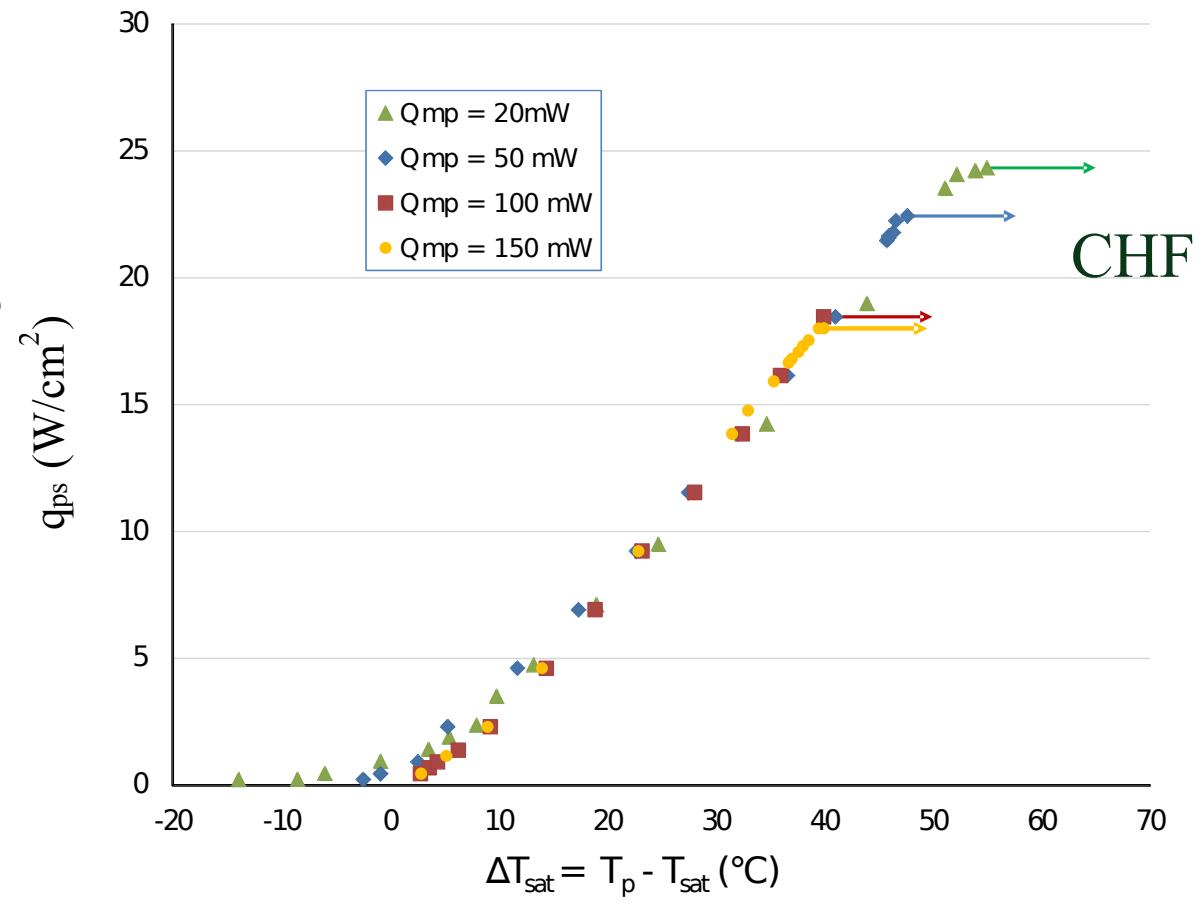

$$v_l = 3.4 \text{ mm/s}$$

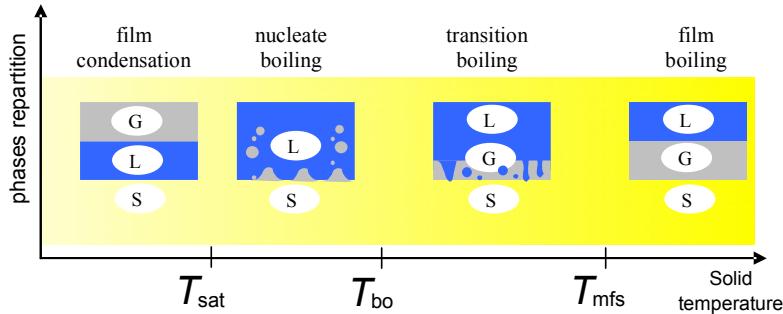

Critical Flux

Surrounding heating changes critical flux!
...but the behavior up to CHF seems to be unaffected (contrary to modeling guess)?!

Macro-Scale Model?

Bachrata et al., 2013 (implemented in CATHARE Safety code)

Need effective properties as a function of saturations, temperatures, velocities !

$$H_i = \langle h_i \rangle^i ; \alpha = S_g$$

$$\frac{\partial \varepsilon_g \rho_g}{\partial t} + \nabla \cdot (\rho_g \mathbf{V}_g) = \dot{m}$$

$$\frac{\partial \varepsilon_l \rho_l}{\partial t} + \nabla \cdot (\rho_l \mathbf{V}_l) = -\dot{m}$$

$$\dot{m} = -\frac{1}{V} \int_{A_{gl}} \mathbf{n}_{gl} \cdot \rho_g (\mathbf{v}_g - \mathbf{w}) dA$$

$$\frac{\partial ((1-\alpha) \varepsilon \rho_l H_l)}{\partial t} + \nabla \cdot ((1-\alpha) \varepsilon \rho_l \mathbf{V}_l H_l) = \nabla \cdot (\mathbf{K}_l^* \cdot \nabla \mathcal{T}_l) - \dot{m}_{lg} h_l^{sat} + Q_{sl} - Q_{li}$$

$$\frac{\partial ((1-\varepsilon) \rho_s H_s)}{\partial t} = \nabla \cdot (\mathbf{K}_s^* \cdot \nabla \mathcal{T}_s) - Q_{sl} - Q_{sg} - Q_{si} + \omega_s$$

$$Q_{\beta i} = h_{\beta i}(\mathcal{T}_\beta - T_{sat}) ; Q_{s\beta} = h_{s\beta}(\mathcal{T}_s - \mathcal{T}_\beta)$$

$$\dot{m}_{lg} h_{lg} = Q_{si} + Q_{gi} + Q_{li}$$

$$\begin{aligned} \frac{\partial (\alpha \varepsilon \rho_g H_g)}{\partial t} + \nabla \cdot (\alpha \varepsilon \rho_g \mathbf{V}_g H_g) &= \nabla \cdot (\mathbf{K}_g^* \cdot \nabla \mathcal{T}_g) \\ &+ \dot{m}_{lg} h_g^{sat} + Q_{sg} - Q_{gi} \end{aligned}$$

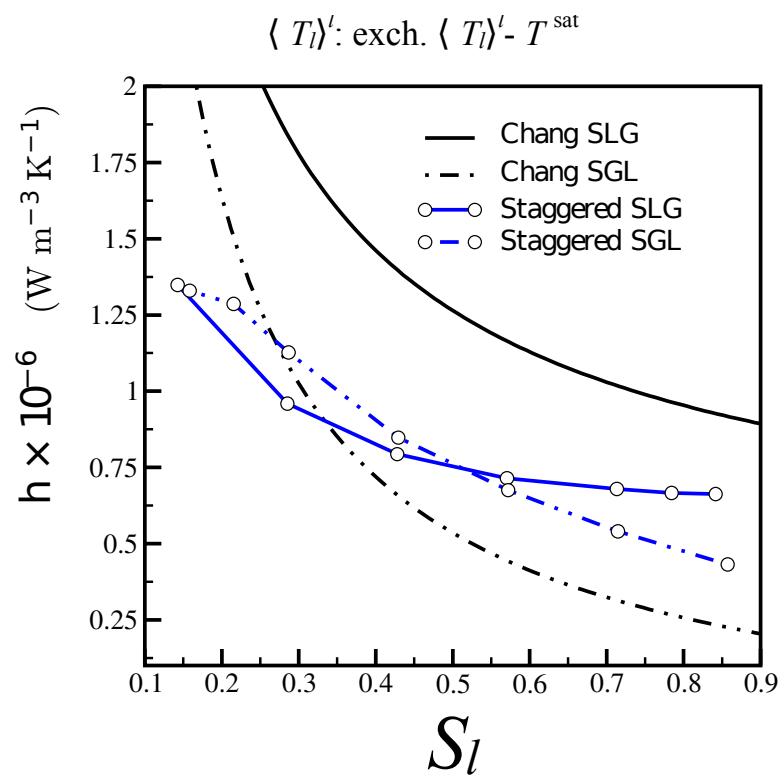

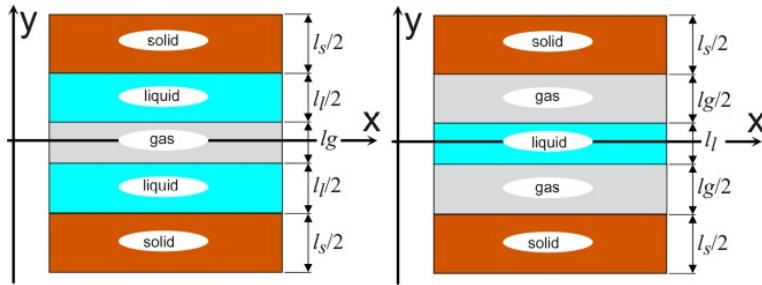

+ generalized Forchheimer

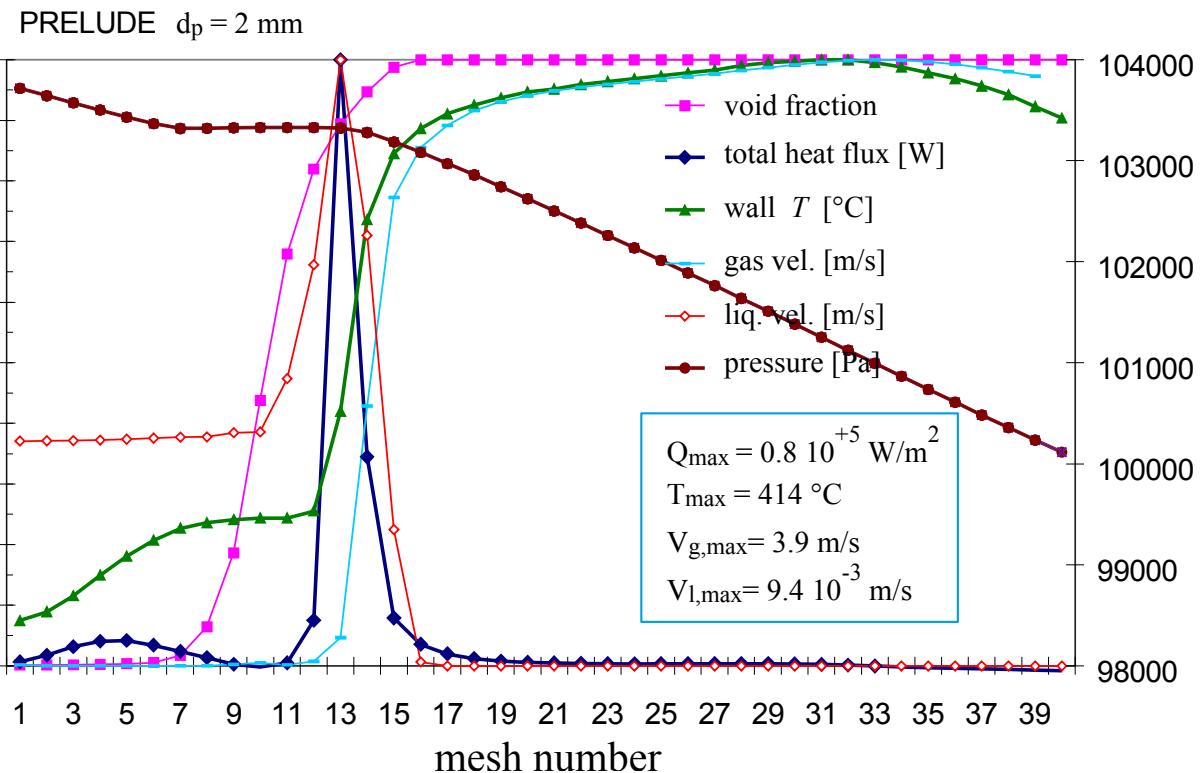

Heat Exchange Terms

- Quasi-static two-phase flow theory + inertia terms

Example: impact of phase configuration!

Example : comparison with experiments

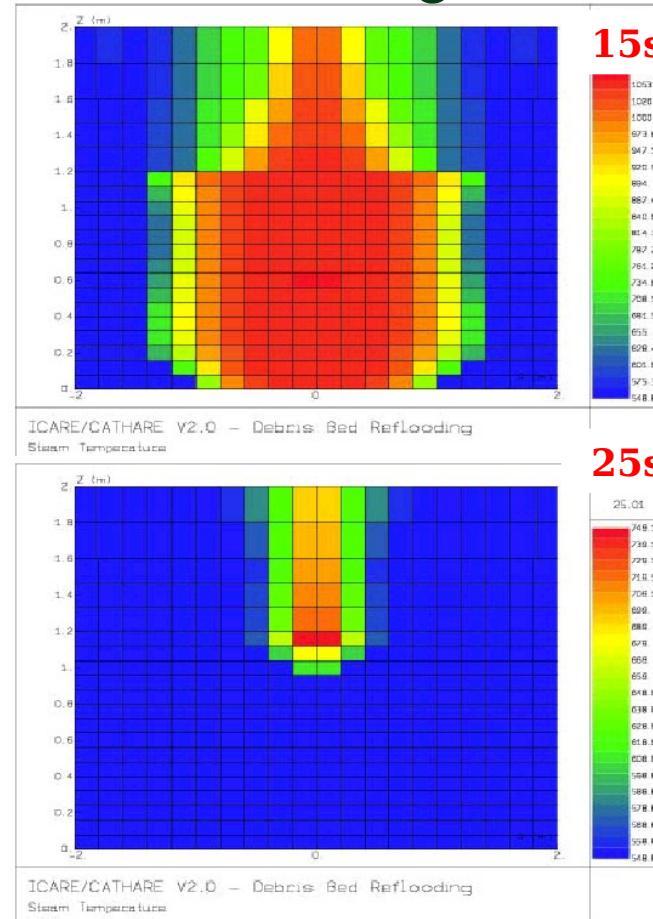

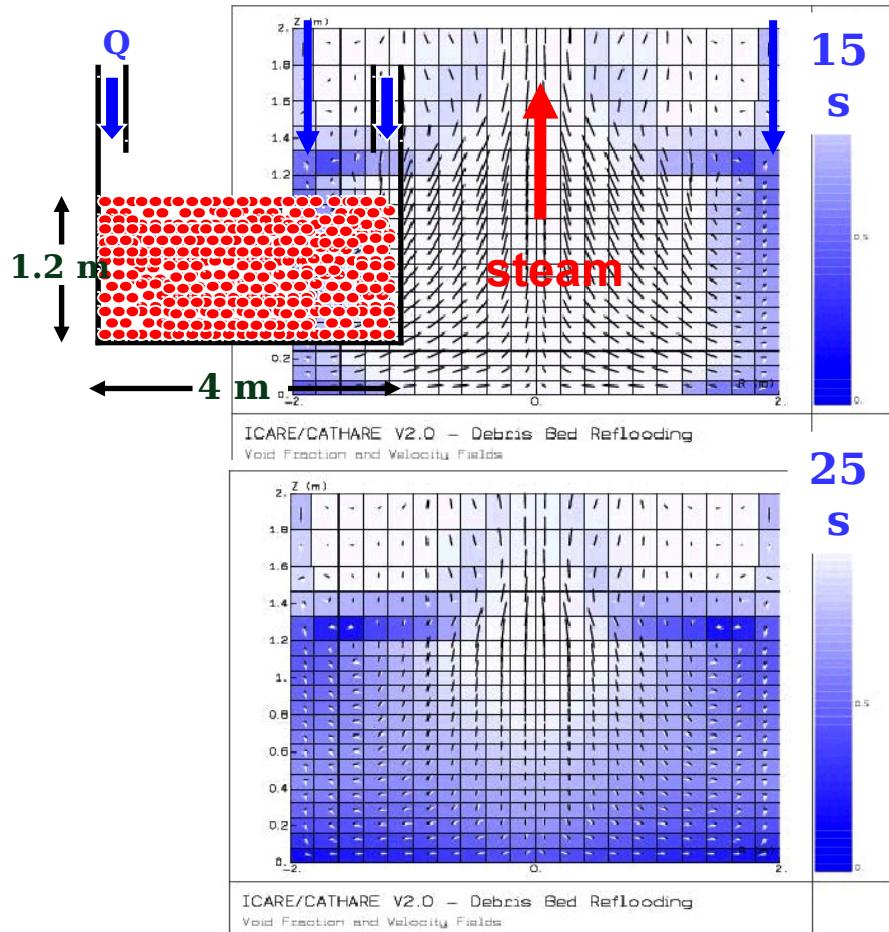

IRSN Experiments:
PRELUDE, SYLPHIDE, ...

Work confirm main required features (inertia, NLE,...)
→ Macro-scale behavior (heuristic time averaging)
→ Need for adapted correlations

Example of Macro-Scale Simulations (Quenching)

Tregoures et al. (2003)

Water and steam velocities

Temperature field

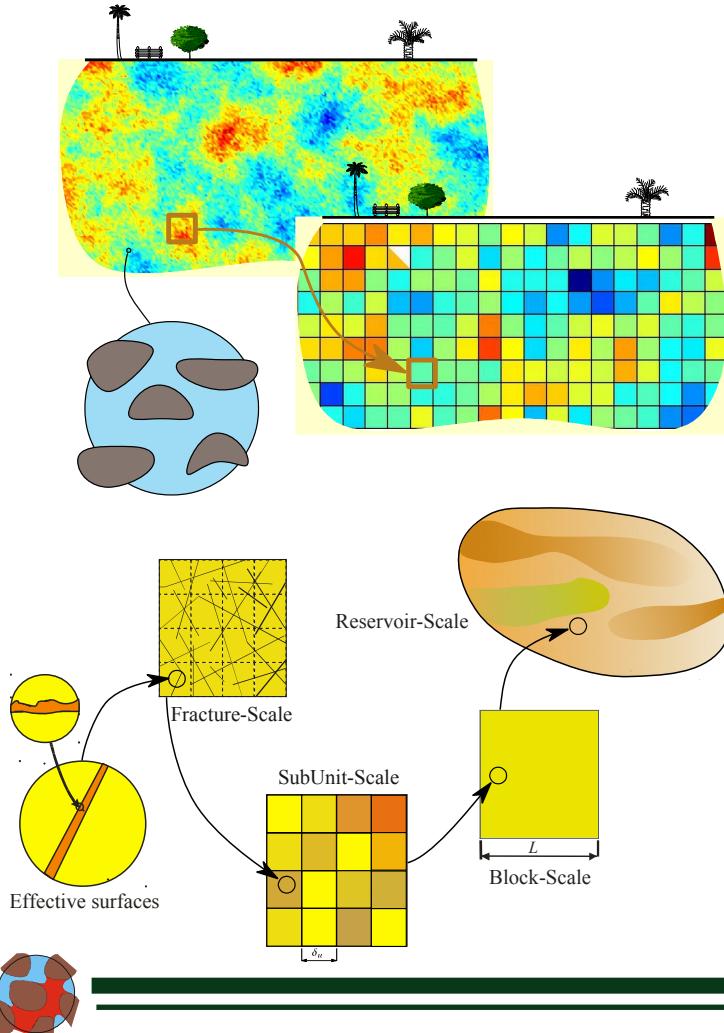

Conclusions on Porous Medium Modelling Approaches

- Various types of models (1-Eq, N-Eq, asymptotic, non-equilibrium, mixed or hybrid models, convolution, etc...)
- Validity conditions may be broken *during the same process!*
 - See Vafai, Nield, Vadasz, Jiang, ... MANY others! → depend on 3D, various Bcs and ICs, heterogeneity, ...
 - Better robustness of non-Equilibrium models
- Effective properties: estimates, bounds, computation from 3D images, measurement, ...
- Couplings and non-linearities: a lot of open problems!
 - Coupled closure problems
 - Role of non-conventional and cross-terms
 - non-linearities, especially reaction rates, radiation, ...
 - time and space averaging (turbulence, boiling, multiphase flow, ...)
- Good modeling practice: keep heterogeneities as much as possible!

A Final Word : Real Life Modeling !

- Use macro-scale equations even if :
 - No clear separation of scale
 - Finite length scale ratios
- Sequential upscaling approximately keeps percolation properties
- Keep heterogeneities in the final scale representation to incorporate the maximum of « abnormal » behavior

Percolation problem
