# BROWNIAN MOTION ON INVOLUTIVE BRAIDED SPACES 

UWE FRANZ, MICHAEL SCHÜRMANN, AND MONIKA VARŠO

#### Abstract

Quantum) stochastic processes with independent and stationary increments (i.e. Lévy processes) and in particular Brownian motions in braided monoidal categories are studied. The notion of increments is based on a bialgebra or Hopf algebra structure, as in Sch93, and positivity is taken w.r.t. to an involution. We show that involutive bialgebras and Hopf algebras in the Yetter-Drinfeld categories of a quasi- or coquasi-triangular *-bialgebra admit a symmetrization (or bosonization) and that their Lévy processes are in one-to-one correspondence with a certain class of Lévy processes on their symmetrization. We classify Lévy processes with quadratic generators, i.e., Brownian motions, on several braided Hopf-*-algebras that are generated by their primitive elements (also called braided *-spaces), and on the braided $S U(2)$-quantum groups.

## Introduction

The study of random variables and stochastic processes with values in algebraic structures has a long and rich history, see, e.g., the monograph Gre63. In quantum probability Par92, the commutative algebras of functions on the underlying probability space and the state space of a stochastic process are replaced by possibly noncommutative algebras, typically realized as algebras of operators on a Hilbert space. Quantum (or noncommutative) probability was initially motivated by the wish to have a common framework for classical probability and quantum physics, but it also opened the stage for many new interactions between probability and algebraic structures. In ASW88, Sch93, Lévy processes on involutive bialgebras were introduced and studied as a common generalization of Lévy processes with values in groups and semigroups, and of factorizable representations of groups and Lie algebras.

In this paper we will study quantum stochastic processes and in particular Brownian motions in braided categories. In quantum probability, Brownian motion

[^0]is defined as a Lévy process with quadratic generator, cf. Sch93, Section 5.1]. This generalizes Brownian motions in Euclidean spaces, Lie groups, and Riemannian manifolds, which are fundamental examples of stochastic processes, and which have been the guiding examples in the development of the stochastic calculus and potential theory. The generator of the Markov semigroup of classical Brownian motion is a Laplace or Laplace-Beltrami operator and contains valuable information about the geometry of the underlying space.

In this paper we will develop the theory of Brownian motions and Lévy processes on braided involutive bialgebras, i.e., involutive bialgebras which are objects of a braided monoidal category, cf. Maj95b, HS20. Our main examples will be such algebras, also called braided spaces, which are generated by a finite number of primitive elements satisfying certain quadratic commutative relations coming from an $R$-matrix. This article builds on ideas and results from Maj91, Maj93, ET03, FS98, FSS03.

Our paper introduces several interesting new classes of quantum stochastic processes. In dimension one (i.e., with one self-adjoint primitive generator) there is only one $R$-matrix which leads to a braided involutive space in our setting, the $1 \times 1$ matrix $R=(q)$ with $q \in \mathbb{R} \backslash\{0\}$. In this case the braiding can be defined via a group, and we obtain, e.g., the Azéma process, whose surprising properties have been studied in Em89, Par90, Sch91. But in higher dimension there are many possibilities to choose an $R$-matrix with a compatible involution, and most of them cannot be obtained from groups. As an example, we will classify the Brownian motions (i.e., Lévy processes with quadratic generator) on the braided spaces associated to the $s l_{2}{ }^{-}$and $s l_{3}-R$-matrix in Section 6 .

Let us outline the structure of this paper.
In Section 1, we give the basic definitions and several fundamental results needed to define and study braided Lévy processes.

In Section 2, we show how braided categories can be constructed from a Hopf algebra, a coquasi-triangular or a quasi-triangular bialgebra. Our particular setting has been choosen since it will be convenient when we consider Lévy processes on braided *-bialgebras in these categories. We consider three cases. In the first case we have a Hopf-*-algebra $\mathcal{A}$ and the objects of the category are Yetter-Drinfeld modules carrying an involution, which has to satisfy some compatibility conditions. In the second case $\mathcal{A}$ is a coquasi-triangular bialgebra equipped with an involution. We show that if the $r$-form satisfies a compatibility condition with respect to the involution, then we can build a braided category from the comodules. In the last case, $\mathcal{A}$ is a quasi-triangular bialgebra with an involution. If the $R$-matrix satisfies a certain compatibility condition w.r.t. the involution, then we can again build a braided category, this time from the modules.

In Section 3 we show that for every braided $*$-bialgebra $\mathcal{B}$ in either of the three types of category we can construct a symmetrization (or bosonization), i.e., we can embed it into a bigger $*$-bialgebra $\mathcal{H}$ as an algebra in a way that allows us to "lift" Lévy processes on $\mathcal{B}$ to Lévy processes on $\mathcal{H}$. This generalizes the symmetrization in [Sch93, Chapter 3], where the braiding was defined via actions
and coactions of a group. For more general braidings this kind of construction was introduced by Majid, see Maj95b, Section 9.4], but without the involution, which is crucial for defining and studying quantum stochastic processes. We show that the symmetrization reduces the construction and classification of Lévy processes on braided $*$-bialgebras to usual involutive bialgebras.

In the following section (Section 4), we explicitely construct a familiy of braided *-spaces and their symmetrization. The construction starts from a bi-invertible $R$-matrix of real type I and it yields a braided $*$-space in the category of comodules of the quasi-triangular $*$-bialgebra associated to the $R$-matrix by the Faddeev-Reshetikhin-Takhtajan construction (cf. [FRT89]). Furthermore, these braided *-spaces always come with a canonical quadratic generator that gives rise to a standard Brownian motion on these spaces.

In Section 5 we prove the existence of these invariant, conditionally positive, quadratic functionals on our braided $*$-spaces and study the associated Brownian motions. These processes can be considered as multi-dimensional analogues of the Azéma martingale.

Section 6 contains the explicit quantum stochastic differential equations defining the standard Brownian motion on the braided line and the braided plane as well as the classification of all quadratic generators for the braided $*$-spaces associated to the $1 \times 1-R$-matrix $(q)$, and the standard $s l_{2}{ }^{-}$and $s l_{3}-R$-matrices, and for the braided $S U(2)$-quantum groups.

## 1. Preliminaries

1.1. Lévy processes on braided Hopf-*-algebras. In this section we introduce braided Hopf-*-algebras, braided $*$-bialgebras, and Lévy processes on braided $*$ bialgebras in order to recall some of their elementary theory, in particular the one-to-one correspondence between these processes and their generators. See Maj95b, HS20 and the references therein for information on braided tensor categories and Hopf algebras, and [Sch93, FS16] for the theory of quantum Lévy processes.

A tensor category or monoidal category is a category $\mathcal{C}$ equipped with a bifunctor $\otimes: \mathcal{C} \times \mathcal{C} \rightarrow \mathcal{C}$ satisfying certain conditions, see for example MacL71]. A braiding $\Psi$ in a tensor category is a natural isomorphism between the functors $\otimes:(A, B) \mapsto$ $A \otimes B$ and $\otimes \circ \tau:(A, B) \mapsto B \otimes A$ satisfying the so-called Hexagon Axioms. It is called a symmetry, if it is involutive, i.e. if $\Psi_{B, A} \circ \Psi_{A, B}=\mathrm{id}_{A \otimes B}$ for all objects $A, B$ of $\mathcal{C}$. A braided tensor category or braided monoidal category is a pair $(\mathcal{C}, \Psi)$ consisting of a tensor category $\mathcal{C}$ and a braiding $\Psi$ of $\mathcal{C}$. It is called symmetric tensor category, if the braiding is a symmetry, cf. MacL71.

In this paper we always assume that the objects of our braided tensor categories $(\mathcal{C}, \Psi)$ are complex vector spaces and that the morphisms are linear maps. We call a linear map $L: V \rightarrow W \Psi$-invariant, if $\left(\mathrm{id}_{X} \otimes L\right) \circ \Psi_{V, X}=\Psi_{W, X} \circ\left(L \otimes \mathrm{id}_{X}\right)$ holds for any $X$. Note that due to the naturality of $\Psi$, morphisms of the category $(\mathcal{C}, \Psi)$ always have to satisfy both conditions $\left(\mathrm{id}_{X} \otimes L\right) \circ \Psi_{X, V}=\Psi_{X, W} \circ\left(L \otimes \mathrm{id}_{X}\right)$ and $\left(L \otimes \operatorname{id}_{X}\right) \circ \Psi_{X, V}=\Psi_{X, W} \circ\left(\mathrm{id}_{X} \otimes L\right)$, i.e., they are $\Psi$-invariant and $\Psi^{-1}$ invariant. The notions of bialgebras and Hopf algebras can also be defined in a
braided tensor category, this leads to braided bialgebras and braided Hopf algebras. The product, coproduct, unit, counit and antipode now have to be morphisms of the braided tensor category and satisfy similar axioms as in the usual case, cf. Maj95b. Bialgebras and Hopf algebras are special cases of braided bialgebras and braided Hopf algebras where the flip automorphism $\tau: A \otimes B \rightarrow B \otimes A$, $\tau(u \otimes v)=v \otimes u$ is the braiding.

Since the axioms proposed by Majid in Maj95a, Maj95b do not guarantee that the braided coproduct is a $*$-algebra homomorphism, we follow the ones in FS99.

We want the $*$-structure $*_{\mathcal{B} \otimes \mathcal{B}}$ on $\mathcal{B} \otimes \mathcal{B}$ to be an anti-homomorphism and the canonical inclusions $\mathcal{B} \xrightarrow{\iota_{1}} \mathcal{B} \otimes \mathcal{B} \stackrel{\iota_{2}}{\leftrightarrows} \mathcal{B}$ to be $*$-homomorphisms. Thus we get for $a, b \in \mathcal{B}$

$$
\begin{aligned}
*_{\mathcal{B} \otimes \mathcal{B}}(a \otimes b) & =\left(*_{\mathcal{B} \otimes \mathcal{B}} \circ m_{\mathcal{B} \otimes \mathcal{B}}\right)(a \otimes \mathbb{1} \otimes \mathbb{1} \otimes b) \\
& =\left(m_{\mathcal{B} \otimes \mathcal{B}} \circ\left(*_{\mathcal{B} \otimes \mathcal{B}} \otimes *_{\mathcal{B} \otimes \mathcal{B}}\right) \circ \tau_{\mathcal{B} \otimes \mathcal{B}, \mathcal{B} \otimes \mathcal{B}}\right)(a \otimes \mathbb{1} \otimes \mathbb{1} \otimes b) \\
& =((m \otimes m) \circ(\mathrm{id} \otimes \Psi \otimes \mathrm{id}))\left(\mathbb{1} \otimes b^{*} \otimes a^{*} \otimes \mathbb{1}\right) \\
& =(((m \circ(\mathbb{1} \otimes \mathrm{id})) \otimes(m \circ(\mathrm{id} \otimes \mathbb{1}))) \circ \Psi)\left(b^{*} \otimes a^{*}\right) \\
& =(\Psi \circ(* \otimes *) \circ \tau)(a \otimes b)
\end{aligned}
$$

Hence we get the following
Definition 1.1. A braided $*$-bialgebra is a braided bialgebra $(\mathcal{B}, m, \mathbb{1}, \Delta, \varepsilon, \Psi)$ over $\mathbb{C}$ with an anti-linear map $*: \mathcal{B} \rightarrow \mathcal{B}$, such that $(\mathcal{B}, m, \mathbb{1}, *)$ is a $*$-algebra and ${ }^{\mathcal{B} \otimes \mathcal{B}}:=\Psi \circ(* \otimes *) \circ \tau$ is a self-inverse map turning the coproduct $\Delta$ into a $*-$ algebra-homomorphism for $*_{\mathcal{B} \otimes \mathcal{B}}$.

## Remark 1.2.

- This definition is equivalent to the one given in [FS99, Def. 3.8.2].
- One can show that $*_{\mathcal{B} \otimes \mathcal{B}}$ is indeed an anti-homomorphism and that the canonical inclusions are $*$-algebra-homomorphisms.
- In general the convolution of two positive functionals on a braided *bialgebra is not again positive.

But if we have two positive functionals $\phi$ and $\theta$ on a braided $*$-bialgebra $\mathcal{A}$ such that $\phi$ is $\Psi^{-1}$-invariant or $\theta$ is $\Psi$-invariant, then the convolution $\phi \star \theta=(\phi \otimes \theta) \circ \Delta$ is positive, cf. [FS99, Lemma 4.2.2].
We briefly recall the definition of Lévy processes on braided $*$-bialgebras, see also FS99, Chapter 4]. A quantum probability space is a pair $(\mathcal{A}, \Phi)$ consisting of a $*$-algebra and a state (i.e. a normalized positive linear functional) $\Phi$ on $\mathcal{A}$. A quantum random variable $j$ over a quantum probability space $(\mathcal{A}, \Phi)$ on a ${ }^{*}$ algebra $\mathcal{B}$ is a $*$-algebra homomorphism $j: \mathcal{B} \rightarrow \mathcal{A}$. A quantum stochastic process is a family of quantum random variables over the same quantum probability space, indexed by some set, and defined on the same algebra. Two quantum stochastic processes $\left(j_{t}\right)_{t \in I}$ and $\left(k_{t}\right)_{t \in I}$, indexed by the same set $I$, on the same $*$-algebra $\mathcal{B}$ over the quantum probability spaces $\left(\mathcal{A}_{j}, \Phi_{j}\right)$ and $\left(\mathcal{A}_{k}, \Phi_{k}\right)$ are called equivalent, if all their finite-dimensional distributions agree, i.e. if

$$
\Phi_{j}\left(j_{t_{1}}\left(b_{1}\right) \ldots j_{t_{n}}\left(b_{n}\right)\right)=\Phi_{k}\left(k_{t_{1}}\left(b_{1}\right) \ldots k_{t_{n}}\left(b_{n}\right)\right)
$$

for all $n \in \mathbb{N}, t_{1}, \cdots, t_{n} \in I, b_{1}, \cdots, b_{n} \in \mathcal{B}$.
Definition 1.3. FS99, Def. 4.2.1] Let $(\mathcal{A}, \Phi)$ be a quantum probability space, $\mathcal{B}$ a $*$-algebra, and $\Psi: \mathcal{B} \otimes \mathcal{B} \rightarrow \mathcal{B} \otimes \mathcal{B}$ a linear map. An $n$-tuple $\left(j_{1}, \ldots, j_{n}\right)$ of quantum random variables $j_{i}: \mathcal{B} \rightarrow \mathcal{A}, i=1, \ldots, n$, over $(\mathcal{A}, \Phi)$ on $\mathcal{B}$ is called $\Psi$-independent or braided independent, if
(i) $\Phi\left(j_{\sigma(1)}\left(b_{1}\right) \ldots j_{\sigma(n)}\left(b_{n}\right)\right)=\Phi\left(j_{\sigma(1)}\left(b_{1}\right)\right) \ldots \Phi\left(j_{\sigma(n)}\left(b_{n}\right)\right)$ for all permutations $\sigma \in \mathcal{S}(n)$ and all $b_{1}, \ldots, b_{n} \in \mathcal{B}$, and
(ii) $m_{\mathcal{A}} \circ\left(j_{l} \otimes j_{k}\right)=m_{\mathcal{A}} \circ\left(j_{k} \otimes j_{l}\right) \circ \Psi$ for all $1 \leq k<l \leq n$.

Definition 1.4. [FS99, Def. 4.3.1] Let $\mathcal{B}$ be a braided $*$-bialgebra. A quantum stochastic process $\left(j_{s t}\right)_{0 \leq s \leq t}$ on $\mathcal{B}$ over some quantum probability space $(\mathcal{A}, \Phi)$ is called a Lévy process, if the following conditions are satisfied.
(1) (Increment property)

$$
\begin{aligned}
j_{r s} \star j_{s t} & =j_{r t} \quad \text { for all } 0 \leq r \leq s \leq t, \\
j_{t t} & =\mathbb{1} \circ \varepsilon \quad \text { for all } 0 \leq t .
\end{aligned}
$$

where $j_{r s} \star j_{s t}=m_{\mathcal{A}} \circ\left(j_{r s} \otimes j_{s t}\right) \circ \Delta_{\mathcal{B}}$ denotes the convolution of $j_{r s}$ and $j_{s t}$.
(2) (Independence of increments) The family $\left(j_{s t}\right)_{0 \leq s \leq t}$ is $\Psi$-independent, i.e. $\left(j_{s_{1} t_{1}}, \ldots, j_{s_{n} t_{n}}\right)$ is $\Psi$-independent for all $n \in \mathbb{N}$ and all $0 \leq s_{1} \leq t_{1} \leq s_{2} \leq$ $\ldots \leq t_{n}$.
(3) (Stationarity of increments) The distribution $\varphi_{s t}=\Phi \circ j_{s t}$ of $j_{s t}$ depends only on the difference $t-s$,
(4) (Weak continuity) $j_{s t}$ converges to $j_{s s}(=\mathbb{1} \circ \varepsilon)$ in distribution for $t \searrow s$, i.e., we have $\lim _{t \searrow_{s}} \Phi\left(j_{s t}(b)\right)=\varepsilon(b)$ for all $b \in \mathcal{B}$.

Let $\left(j_{s t}\right)$ be a Lévy process on some $*$-bialgebra. The states on $\mathcal{B}$ defined by $\varphi_{t}=\Phi \circ j_{0 t}$ are called marginal distributions of $\left(j_{s t}\right)$ and uniquely determine a Lévy process (up to equivalence). The marginal distributions form a convolution semigroup. Using the fundamental theorem of coalgebras one can show that there exists a unique, conditionally positive (i.e. positive on the kernel of $\varepsilon$ ) hermitian, linear functional $L: \mathcal{B} \rightarrow \mathbb{C}$ with $L(\mathbb{1})=0$, such that $\varphi_{t}=\exp _{\star} t L$. The functional $L$ is called the generator of the process $\left(j_{s t}\right)$. Using Schoenberg correspondence, we see that the convolution semigroup generated by a conditionally positive, hermitian linear functional $L$ with $L(\mathbb{1})=0$ consists of states, i.e., normalized positive functionals. Due to Remark 1.2 and the braided version of the Schoenberg correspondence for $\Psi$-invariant functionals, see GKL12], these results remain true for Lévy processes on braided $*$-bialgebras. This is summarised in the following proposition.
Proposition 1.5. FS99, Prop. 4.3.2] Let $\mathcal{B}$ be $a *$-bialgebra over $\mathbb{C}$ in a braided category $(\mathcal{C}, \Psi)$. Then there is a one-to-one correspondence between (equivalence classes of) Lévy processes $\left(j_{s t}\right)$, the set of convolution semigroups $\left(\varphi_{t}\right)_{t}$ of $\Psi$ invariant states on $\mathcal{B}$, and the set of $\Psi$-invariant, hermitian, conditionally positive linear functionals $L: \mathcal{B} \rightarrow \mathbb{C}$.
1.2. Quasi-triangular and coquasi-triangular bialgebras. We will now recall some definitions (see e.g. KS97) which allow us later on to "symmetrize" braided *-bialgebras. Let $\mathcal{B}$ be a bialgebra and $R \in \mathcal{B} \otimes \mathcal{B}$. For $R=\sum_{i} x_{i} \otimes y_{i}$ define $R_{12}$, $R_{13}$ und $R_{23} \in \mathcal{B} \otimes \mathcal{B} \otimes \mathcal{B}$ by

$$
R_{12}:=\sum_{i} x_{i} \otimes y_{i} \otimes 1, \quad R_{13}:=\sum_{i} x_{i} \otimes 1 \otimes y_{i}, \quad R_{23}:=\sum_{i} 1 \otimes x_{i} \otimes y_{i} .
$$

Definition 1.6. A quasi-triangular bialgebra $\mathcal{B}$ is a bialgebra $\mathcal{B}$ equipped with an invertible element $R \in \mathcal{B} \otimes \mathcal{B}$, called universal $R$-Matrix, such that the equations

$$
\begin{align*}
\Delta^{o p}(a) & =R \cdot \Delta(a) \cdot R^{-1} \\
(\Delta \otimes \mathrm{id})(R) & =R_{13} R_{23}  \tag{1}\\
(\mathrm{id} \otimes \Delta)(R) & =R_{13} R_{12}
\end{align*}
$$

hold.
Note that the universal $R$-matrix of a quasi-triangular bialgebra satisifes the quantum Yang-Baxter equation (QYBE)

$$
\begin{equation*}
R_{12} R_{13} R_{23}=R_{23} R_{13} R_{12} \tag{2}
\end{equation*}
$$

see, e.g., KS97, Ch. 8.1.1, Prop. 2], Kas95, Theorem VIII.2.4].
A coquasi-triangular bialgebra is a bialgebra $\mathcal{A}$ equipped with a universal $r$ form on $\mathcal{A}$, i.e. a linear functional $\boldsymbol{r}: \mathcal{A} \otimes \mathcal{A} \rightarrow \mathbb{C}$ that is invertible w.r.t. the convolution product (i.e. there exists another functional $\overline{\boldsymbol{r}}: \mathcal{A} \otimes \mathcal{A} \rightarrow \mathbb{C}$ such that $\boldsymbol{r} \star \overline{\boldsymbol{r}}=\overline{\boldsymbol{r}} \star \boldsymbol{r}=\varepsilon \otimes \varepsilon)$ that satisfies

$$
\begin{align*}
m^{o p} & =\boldsymbol{r} \star m \star \overline{\boldsymbol{r}}, \\
\boldsymbol{r}_{13} \star \boldsymbol{r}_{23} & =\boldsymbol{r} \circ(m \otimes \mathrm{id}),  \tag{3}\\
\boldsymbol{r}_{13} \star \boldsymbol{r}_{12} & =\boldsymbol{r} \circ(\mathrm{id} \otimes m),
\end{align*}
$$

where $\boldsymbol{r}_{\mathbf{1 2}}, \boldsymbol{r}_{\mathbf{2 3}}, \boldsymbol{r}_{\mathbf{1 3}}: \mathcal{A} \otimes \mathcal{A} \otimes \mathcal{A} \rightarrow \mathbb{C}$ are defined by $\boldsymbol{r}_{12}:=\boldsymbol{r} \otimes \varepsilon, \boldsymbol{r}_{\mathbf{2 3}}:=\varepsilon \otimes \boldsymbol{r}$ und $\boldsymbol{r}_{13}:=(\boldsymbol{r} \otimes \varepsilon) \circ(\mathrm{id} \otimes \tau)$. Furthermore we have

$$
\begin{equation*}
\boldsymbol{r} \circ(\mathbb{1} \otimes \mathrm{id})=\boldsymbol{\varepsilon}=\boldsymbol{r} \circ(\mathrm{id} \otimes \mathbb{1}) \tag{4}
\end{equation*}
$$

and, if $\mathcal{A}$ has an antipode $S$, then the antipode is invertible and satisfies

$$
\boldsymbol{r} \circ(S \otimes \mathrm{id})=\overline{\boldsymbol{r}}=\boldsymbol{r} \circ\left(\mathrm{id} \otimes S^{-1}\right) .
$$

The inverse $\overline{\boldsymbol{r}}$ satisfies similar conditions, i.e.

$$
\begin{align*}
\bar{r}_{12} \star \bar{r}_{13} \star \bar{r}_{23} & =\bar{r}_{23} \star \bar{r}_{13} \star \bar{r}_{12}, \\
\bar{r}_{23} \star \bar{r}_{13} & =\bar{r} \circ(m \otimes \mathrm{id}), \\
\bar{r}_{12} \star \bar{r}_{13} & =\bar{r} \circ(\mathrm{id} \otimes m),  \tag{5}\\
\bar{r} \circ(\mathbb{1} \otimes \mathrm{id}) & =\bar{r} \circ(\mathrm{id} \otimes \mathbb{1})=\varepsilon .
\end{align*}
$$

## 2. Construction of braided categories

We will now study the special case of tensor categories whose objects are YetterDrinfeld modules of some given bialgebra $\mathcal{A}$. Our main goal is to construct such categories with objects that are equipped with an involution which is compatible with the braiding in the sense of Definition 1.1. Let $\mathcal{A}$ be a bialgebra. A $\mathbb{C}$-vector space $V$ is called (left) Yetter-Drinfeld module (over $\mathcal{A}$ ), if it is both, a left $\mathcal{A}$ module with action $\alpha: \mathcal{A} \otimes V \rightarrow V$ and a left $\mathcal{A}$-comodule with left coaction $\gamma: V \rightarrow \mathcal{A} \otimes V$, such that the (left) Yetter-Drinfeld equation

$$
\sum a_{(1)} v^{(1)} \otimes a_{(2)} \cdot v^{(2)}=\sum\left(a_{(1)} \cdot v\right)^{(1)} a_{(2)} \otimes\left(a_{(1)} \cdot v\right)^{(2)}
$$

or equivalently

$$
\begin{align*}
& (m \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \gamma) \\
& \quad=(m \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\gamma \otimes \mathrm{id}) \circ(\alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\Delta \otimes \mathrm{id}) \tag{6}
\end{align*}
$$

is satisfied for all $a \in \mathcal{A}, v \in V$, where $a . b:=\alpha(a \otimes b)$ and $\gamma(v)=v^{(1)} \otimes v^{(2)}$. The category ${ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}$ of (left) Yetter-Drinfeld-modules is well studied, see for example Y90 or Mon93, Ch. 10]. It is a braided tensor category with braiding $\Psi=$ $(\alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\gamma \otimes \mathrm{id})$. For actions $\alpha_{V}, \alpha_{W}$ on a bialgebra $\mathcal{A}$ a linear map $\Phi: V \rightarrow W$ is called (left) module map, if $\Phi \circ \alpha_{V}=\alpha_{W} \circ(\mathrm{id} \otimes \Phi)$ and (left) comodule map for coactions $\gamma_{V}, \gamma_{W}$, if $\gamma_{W} \circ \Phi=(\mathrm{id} \otimes \Phi) \circ \gamma_{V}$.
2.1. The category $\left({ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}_{*}, \Psi\right)$ of Yetter-Drinfeld modules with an involu-
tion. Now we want to equip the objects in the category ${ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}$ with an involution and construct a new category ${ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}_{*}$.
Lemma 2.1. Let $\mathcal{A}$ be a Hopf-*-algebra with antipode $S$ and $V \in \operatorname{Obj}\left({ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}\right)$ with action $\alpha$ and coaction $\gamma$. Suppose that there exists $a *$-structure on $V$, such that $\alpha$ and $\gamma$ satisfy

$$
\begin{align*}
& * \circ \alpha=\alpha \circ(* \otimes *) \circ(S \otimes \mathrm{id}),  \tag{7}\\
& \gamma \circ *=(* \otimes *) \circ \gamma . \tag{8}
\end{align*}
$$

Then $*_{V \otimes V}=(\alpha \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma) \circ(* \otimes *)$ is an involution on $V \otimes V$. Proof: Recall that the inverse of $\Psi=(\alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\gamma \otimes \mathrm{id})$ is given by

$$
\Psi^{-1}=(\mathrm{id} \otimes \alpha) \circ(\tau \otimes \mathrm{id}) \circ\left(S^{-1} \otimes \mathrm{id} \otimes \mathrm{id}\right) \circ(\gamma \otimes \mathrm{id}) \circ \tau,
$$

see [Y90, Theorem 7.2]. We have

$$
\begin{aligned}
(* \otimes *) \circ \Psi \circ(* \otimes *) & \stackrel{\boxed{7}) \text { and }}{=}(\alpha \otimes \mathrm{id}) \circ(* \otimes * \otimes *) \circ(S \otimes \tau) \circ(* \otimes * \otimes *) \circ(\gamma \otimes \mathrm{id}) \\
& =\tau \circ \Psi^{-1} \circ \tau,
\end{aligned}
$$

since $* \circ S \circ *=S^{-1}$. This proves that $*_{V \otimes V}=\Psi \circ(* \otimes *) \circ \tau$ is its own inverse.
Theorem 2.2. Let $\mathcal{A}$ be a Hopf-*-algebra. Then we can define a braided category ${ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y D}_{*}$ as follows. The objects $(V, \alpha, \gamma, *)$ are Yetter-Drinfeld modules equipped with an involution $*$, such that equations (7) and (8) are satisfied. The morphisms are
the linear maps that are module and comodule maps. The tensor product of objects is given by

$$
\left(V, \alpha_{V}, \gamma_{V}, *_{V}\right) \otimes\left(W, \alpha_{W}, \gamma_{W}, *_{W}\right):=\left(V \otimes W, \alpha_{V \otimes W}, \gamma_{V \otimes W}, *_{V \otimes W}\right)
$$

where

$$
\begin{aligned}
\alpha_{V \otimes W} & :=\left(\alpha_{V} \otimes \alpha_{W}\right) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \mathrm{id} \otimes \mathrm{id}), \\
\gamma_{V \otimes W} & :=(m \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ\left(\gamma_{V} \otimes \gamma_{W}\right), \\
*_{V \otimes W} & :=\Psi_{W, V} \circ\left(*_{W} \otimes *_{V}\right) \circ \tau_{V, W} .
\end{aligned}
$$

The braiding is again given by $\Psi=(\alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\gamma \otimes \mathrm{id})$.
Proof: To show that this is again a braided category it only remains to show that $\left(V \otimes W, \alpha_{V \otimes W}, \gamma_{V \otimes W}, *_{V \otimes W}\right)$ is again an object in the category $\mathcal{A}_{\mathcal{A}} \mathcal{Y D}_{*}$. First we show that $*_{V \otimes W}$ satisfies equation (7). We have

$$
*_{V \otimes W} \circ \alpha_{V \otimes W}=\Psi \circ(* \otimes *) \circ \tau \circ(\alpha \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \mathrm{id} \otimes \mathrm{id})
$$

$$
\begin{aligned}
& \stackrel{77}{=} \Psi \circ(\alpha \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(* \otimes * \otimes *) \\
& \quad \circ(S \otimes \mathrm{id} \otimes \mathrm{id}) \\
& =(\alpha \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Psi) \circ(* \otimes * \otimes *) \circ(S \otimes \tau) \\
& =\alpha_{V \otimes W} \circ\left(*_{\mathcal{A}} \otimes *_{V \otimes W}\right) \circ(S \otimes \mathrm{id}),
\end{aligned}
$$

because $\Psi$ is a module map, since it has to be a morphism in the category. Now we show that it also satisfies equation (8).

$$
\begin{aligned}
& \left(*_{\mathcal{A}} \otimes *_{V \otimes W)} \circ \gamma_{V \otimes W}\right. \\
& \quad=(\mathrm{id} \otimes \Psi) \circ(m \otimes \mathrm{id}) \circ(\tau \otimes \tau) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(* \otimes * \otimes * \otimes *) \circ(\gamma \otimes \gamma) \\
& \quad=\gamma_{V \otimes W} \circ *_{V \otimes W}
\end{aligned}
$$

2.2. The category $\left({ }^{\mathcal{A}} \mathbf{C}_{*}, \Psi\right)$ of comodules over a coquasi-triangular $*$ bialgebra. We start by considering the category ${ }^{\mathcal{A}} \mathrm{C}$ of $\mathcal{A}$-comodules over a coquasitriangular bialgebra $\mathcal{A}$.
Lemma 2.3. Let $\mathcal{A}$ be a coquasi-triangular bialgebra. If $\gamma$ is a coaction of $\mathcal{A}$ on $V$, then

$$
\begin{equation*}
\alpha_{\gamma}=(\overline{\boldsymbol{r}} \otimes \mathrm{id}) \circ\left(\mathrm{id} \otimes \gamma_{V}\right) \tag{9}
\end{equation*}
$$

defines an action of $\mathcal{A}$ on $V$ and $\left(V, \alpha_{\gamma}, \gamma\right)$ is a Yetter-Drinfeld module. Furthermore, if a linear map $f: V \rightarrow W$ between two comodules $V, W$ is $\gamma$-invariant (i.e. a comodule map), then it is also $\alpha_{\gamma}$-invariant.
Proof: First we show that $\alpha_{\gamma}$ is an action. It is

$$
\begin{aligned}
& \alpha_{\gamma} \circ(m \otimes \mathrm{id})=(\overline{\boldsymbol{r}} \otimes \mathrm{id}) \circ(m \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \gamma) \\
& \quad \stackrel{\text { 55 }}{=}\left(\left(\overline{\boldsymbol{r}}_{\mathbf{2 3}} \star \overline{\boldsymbol{r}}_{\mathbf{1 3}}\right) \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \gamma) \\
& \quad=\left(\left(((\varepsilon \otimes \overline{\boldsymbol{r}}) \otimes((\overline{\boldsymbol{r}} \otimes \varepsilon) \circ(\mathrm{id} \otimes \tau))) \circ \Delta_{\mathcal{A}} \otimes \mathcal{A} \otimes \mathcal{A}\right) \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \gamma) \\
& \quad=(\overline{\boldsymbol{r}} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma) \circ(\mathrm{id} \otimes((\overline{\boldsymbol{r}} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma)))=\alpha_{\gamma} \circ\left(\mathrm{id} \otimes \alpha_{\gamma}\right)
\end{aligned}
$$

as well as

$$
\alpha_{\gamma} \circ(\mathbb{1} \otimes \mathrm{id})=((\overline{\boldsymbol{r}} \circ(\mathbb{1} \otimes \mathrm{id})) \otimes \mathrm{id}) \circ \gamma \stackrel{\sqrt[4]{4}}{=}(\varepsilon \otimes \mathrm{id}) \circ \gamma=\mathrm{id} .
$$

Now we want to show that $\gamma$ and $\alpha_{\gamma}$ fulfill the Yetter-Drinfeld equation (6).

$$
\begin{aligned}
&(m\left.\otimes \alpha_{\gamma}\right) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \gamma) \\
&=(m \otimes \overline{\boldsymbol{r}} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\Delta \otimes \Delta \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma) \\
&=((m \star \overline{\boldsymbol{r}}) \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma) \\
& \stackrel{\sqrt{3}}{=}\left(\left(\overline{\boldsymbol{r}} \star m^{o p}\right) \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \gamma) \\
&=(\overline{\boldsymbol{r}} \otimes m \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id} \otimes \tau) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \gamma \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma \otimes \mathrm{id}) \\
& \quad \circ(\mathrm{id} \otimes \tau) \circ(\Delta \otimes \mathrm{id}) \\
&=(m \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\gamma \otimes \mathrm{id}) \circ\left(\alpha_{\gamma} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \tau) \circ(\Delta \otimes \mathrm{id})
\end{aligned}
$$

It remains to show that $\alpha_{\gamma}$ is a module-map. We have

$$
\alpha_{W} \circ(\mathrm{id} \otimes f)=(\overline{\boldsymbol{r}} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes f) \circ\left(\mathrm{id} \otimes \gamma_{W}\right)
$$

Note that for the braiding $\Psi=\left(\alpha_{\gamma} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \tau) \circ(\gamma \otimes \mathrm{id})$ defined in this way between two $\mathcal{A}$-comodules $V$ and $W$, we have

$$
\Psi(v \otimes w)=\overline{\boldsymbol{r}}\left(v^{(1)} \otimes w^{(1)}\right) w^{(2)} \otimes v^{(2)}
$$

for $v \in V, w \in W$, and where $\gamma_{V}(v)=v^{(1)} \otimes v^{(2)}, \gamma(w)=w^{(1)} \otimes w^{(2)}$. Up to a conjugation by the flip and the use of $\overline{\boldsymbol{r}}$ instead of $\boldsymbol{r}$, this is the same as the definition of the braiding associated to a universal $r$-form in Kas95, Equation (VIII.5.9)].

One can show as in Kas95 that the category of $\mathcal{A}$-comodules becomes a braided category $\left({ }^{\mathcal{A}} \mathrm{C}, \Psi\right)$ in this way. Unlike for the construction for Yetter-Drinfeld modules in Theorem 2.2, this does not require $\mathcal{A}$ to be a Hopf algebra, because the invertibility of $\Psi$ follows from that of the universal $r$-form.

Now we want to extend the objects in the category ${ }^{\mathcal{A}} \mathrm{C}$ by an involution $*$ and define the category ${ }^{\mathcal{A}} \mathrm{C}_{*}$.

A coquasi-triangular $*$-bialgebra (resp. Hopf-*-algebra) is a coquasi-triangular bialgebra (resp. Hopf-algebra) which is also a *-bialgebra (resp. Hopf-*-algebra) such that the universal r-form $\boldsymbol{r}$ fulfills the equation

$$
\begin{equation*}
{ }^{-} \circ \boldsymbol{r}=\overline{\boldsymbol{r}} \circ(* \otimes *), \tag{10}
\end{equation*}
$$

where - denotes the complex conjugation on $\mathbb{C}$. A universal r-form that satsifies equation 10) is called involutive $r$-form.

Theorem 2.4. Let $\mathcal{A}$ be a coquasi-triangular *-bialgebra. Then we can construct a braided category $\left({ }^{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$ as follows. The objects are triples $\left(V, \gamma_{V}, *_{V}\right)$ consisting of an $\mathcal{A}$-comodule $V$ with coaction $\gamma$ and an involution * such that equation (8) is satsified. The morphisms between two objects are the comodule maps. The tensor product of objects is given by

$$
\left(V, \gamma_{V}, *_{V}\right) \otimes\left(W, \gamma_{W}, *_{W}\right):=\left(V \otimes W, \gamma_{V \otimes W}, *_{V \otimes W}\right),
$$

where

$$
\begin{aligned}
& \gamma_{V \otimes W}:=(m \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ\left(\gamma_{V} \otimes \gamma_{W}\right) \\
& *_{V \otimes W}:=\Psi_{W, V} \circ\left(*_{W} \otimes *_{V}\right) \circ \tau_{V, W} .
\end{aligned}
$$

The braiding $\Psi$ is given by
$\Psi_{V, W}=\left(\alpha_{\gamma} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \tau) \circ(\gamma \otimes \mathrm{id})=\tau \circ(\overline{\boldsymbol{r}} \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ\left(\gamma_{V} \otimes \gamma_{W}\right)$.
Proof: Let $\left(V, \gamma_{V}, *_{V}\right),\left(W, \gamma_{W}, *_{W}\right)$ be two objects of $\left({ }^{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$, i.e., $\mathcal{A}$-comodules with a coaction and an involution that satisfy (8). We have to check that $*_{V \otimes W}$ is an involution and that $V \otimes W$ is again an object of $\left({ }^{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$. For $v \in V, w \in W$ with $\gamma_{V}(v)=v^{(1)} \otimes v^{(2)}, \gamma(w)=w^{(1)} \otimes w^{(2)}$ we have

$$
\begin{aligned}
(v \otimes w)^{*} & =\Psi\left(w^{*} \otimes v^{*}\right)=\overline{\boldsymbol{r}}\left(\left(w^{(1)}\right)^{*} \otimes\left(v^{(1)}\right)^{*}\right)\left(v^{(2)}\right)^{*} \otimes\left(w^{(2)}\right)^{*} \\
& =\overline{\boldsymbol{r}\left(w^{(1)} \otimes v^{(1)}\right)}\left(v^{(2)}\right)^{*} \otimes\left(w^{(2)}\right)^{*}
\end{aligned}
$$

and

$$
\begin{aligned}
\left((v \otimes w)^{*}\right)^{*} & =\boldsymbol{r}\left(v^{(1)} \otimes w^{(1)}\right)\left(\left(v^{(2)}\right)^{*} \otimes\left(w^{(2)}\right)^{*}\right)^{*} \\
& =\boldsymbol{r}\left(w^{(1)} \otimes v^{(1)}\right) \Psi\left(w^{(2)} \otimes v^{(2)}\right) \\
& =\boldsymbol{r}\left(w^{(1)} \otimes v^{(1)}\right) \overline{\boldsymbol{r}}\left(w^{(2)} \otimes v^{(2)}\right) v^{(3)} \otimes w^{(3)} \\
& =v \otimes w
\end{aligned}
$$

since $r \star \bar{r}=\varepsilon \otimes \varepsilon$. Furthermore,

$$
\begin{aligned}
\gamma_{V \otimes W} \circ *_{V \otimes W}(v \otimes w) & =\gamma_{V \otimes W}\left(\overline{\boldsymbol{r}\left(w^{(1)} \otimes v^{(1)}\right)}\left(v^{(2)}\right)^{*} \otimes\left(w^{(2)}\right)^{*}\right) \\
& =\left(\boldsymbol{r}\left(w^{(1)} \otimes v^{(1)}\right) w^{(2)} v^{(2)}\right)^{*}\left(v^{(3)}\right)^{*} \otimes\left(w^{(3)}\right)^{*} \\
& =\left(v^{(1)} w^{(1)} \boldsymbol{r}\left(w^{(2)} \otimes v^{(2)}\right)\right)^{*}\left(v^{(3)}\right)^{*} \otimes\left(w^{(3)}\right)^{*} \\
& =\left(v^{(1)} w^{(1)}\right)^{*} \otimes\left(\overline{\boldsymbol{r}\left(w^{(2)} \otimes v^{(2)}\right)}\left(v^{(3)}\right)^{*} \otimes\left(w^{(3)}\right)^{*}\right) \\
& =\left(\gamma_{V \otimes W}(v \otimes w)\right)^{* \otimes * V \otimes W},
\end{aligned}
$$

since $\boldsymbol{r} \star m=m^{\mathrm{op}} \star \boldsymbol{r}$. I.e., $\gamma_{V \otimes W}$ satisfies (8), and therefore $\left(V \otimes W, \gamma_{V \otimes W}, *_{V \otimes W}\right)$ is an object of $\left({ }^{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$.

Remark 2.5. In general, $\mathcal{A}$ does not have an antipode. Thus equation (7) is not satisfied and $\left(V, \alpha_{\gamma}, \gamma, *\right)$ is not an object in $\left({ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}_{*}, \Psi\right)$ and therefore $\left({ }^{\wedge} \mathrm{C}_{*}, \Psi\right)$ can not be interpreted asa subcategory of $\left({ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}_{*}, \Psi\right)$. But if $\mathcal{A}$ is a coquasitriangular Hopf- $*$-algebra, then the antipode $S$ is automatically invertible and we have $\overline{\boldsymbol{r}}=\boldsymbol{r} \circ(S \otimes \mathrm{id})$, which, combined with equation (10), implies that $\alpha_{\gamma}$ satisfies equation (7). So if $\mathcal{A}$ is a coquasi-triangular Hopf-*-algebra, then because of Lemma 2.3. the category ${ }^{\mathcal{A}} \mathrm{C}_{*}$ can be viewed as a subcategory of ${ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}_{*}$.
2.3. The category $\left({ }_{\mathcal{A}} \mathbf{C}_{*}, \Psi\right)$ of modules over a quasi-triangular *-bialgebra. We start with the category ${ }_{\mathcal{A}} \mathrm{C}$ of $\mathcal{A}$-modules over a quasi-triangular bialgebra $\mathcal{A}$, and then introduce the category ${ }_{\mathcal{A}} \mathrm{C}_{*}$, if $\mathcal{A}$ has an involution that is compatible with the $R$-matrix, see below. Let $\mathcal{A}$ be a quasi-triangular bialgebra and define $\widetilde{R}: \mathbb{C} \rightarrow \mathcal{A} \otimes \mathcal{A}$ by $\widetilde{R}(c)=c R$ for all $c \in \mathbb{C}$.
Lemma 2.6. If $\alpha$ is an action of $\mathcal{A}$ on $V$, then

$$
\gamma_{\alpha}=(\mathrm{id} \otimes \alpha) \circ(\tau \otimes \mathrm{id}) \circ(\widetilde{R} \otimes \mathrm{id})
$$

defines a coaction of $\mathcal{A}$ on $V$ and $\left(V, \alpha, \gamma_{\alpha}\right)$ is a Yetter-Drinfeld module. Furthermore, if a linear map $f: V \rightarrow W$ between two modules $V, W$ is $\alpha$-invariant (i.e. a module map), then it is also $\gamma_{\alpha}$-invariant.

Proof: First we show that $\gamma_{\alpha}$ is a coaction. It is
$(\Delta \otimes \mathrm{id}) \circ \gamma_{\alpha}=(\mathrm{id} \otimes \mathrm{id} \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id}) \circ(\widetilde{R} \otimes \mathrm{id})$
표 $(\mathrm{id} \otimes \mathrm{id} \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(m \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id})$

$$
\begin{aligned}
& \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\widetilde{R} \otimes \widetilde{R} \otimes \mathrm{id}) \\
= & \left(\mathrm{id} \otimes \gamma_{\alpha}\right) \circ \gamma_{\alpha},
\end{aligned}
$$

as well as

$$
(\varepsilon \otimes \mathrm{id}) \circ \gamma_{\alpha}=\alpha \circ(\mathrm{id} \otimes \varepsilon \otimes \mathrm{id}) \circ(\widetilde{R} \otimes \mathrm{id})=\alpha \circ(\mathbb{1} \otimes \mathrm{id})=\mathrm{id}
$$

Now we show that $\alpha$ and $\gamma_{\alpha}$ satisify the Yetter-Drinfeld equation (6).

$$
\begin{aligned}
(m & \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ\left(\Delta \otimes \gamma_{\alpha}\right) \\
& =(m \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \alpha) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \widetilde{R} \otimes \mathrm{id}) \\
& =(\mathrm{id} \otimes \alpha) \circ(m \otimes \mathrm{id} \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\tau \otimes \tau \otimes \mathrm{id}) \circ(\widetilde{R} \otimes \Delta \otimes \mathrm{id}) \\
& =(m \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ\left(\gamma_{\alpha} \otimes \mathrm{id}\right) \circ(\alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\Delta \otimes \mathrm{id}) .
\end{aligned}
$$

That $\gamma_{\alpha}$ is a comodule-map follows directly.
Define a quasi-triangular $*$-bialgebra as a quasi-triangular bialgebra which is also a $*$-bialgebra such that $(* \otimes *)(R)=R^{-1}$.

Theorem 2.7. Let $\mathcal{A}$ be a quasi-triangular Hopf-*-algebra with antipode $S$. Then we can construct a braided category $\left({ }_{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$ as follows. The objects are triples $(V, \alpha, *)$ consisting of an $\mathcal{A}$-module $V$ with action $\alpha$ and an involution $*$ such that equation (7) is satsified. The morphisms between two objects are the module maps. The tensor product of objects is given by

$$
\left(V, \alpha_{V}, *_{V}\right) \otimes\left(W, \alpha_{W}, *_{W}\right):=\left(V \otimes W, \alpha_{V \otimes W}, *_{V \otimes W}\right)
$$

where

$$
\begin{aligned}
& \alpha_{V \otimes W}:=\left(\alpha_{V} \otimes \alpha_{W}\right) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \mathrm{id} \otimes \mathrm{id}), \\
& *_{V \otimes W}:=\Psi_{W, V} \circ\left(*_{W} \otimes *_{V}\right) \circ \tau_{V, W} .
\end{aligned}
$$

The braiding $\Psi$ is given by

$$
\begin{aligned}
\Psi_{V, W} & =(\alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ\left(\gamma_{\alpha} \otimes \mathrm{id}\right) \\
& =(\alpha \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\tau \otimes \tau) \circ(\widetilde{R} \otimes \mathrm{id} \otimes \mathrm{id})
\end{aligned}
$$

Proof: This follows directly from Lemma 2.6 and Theorem 2.2
Lemma 2.8. Let $\mathcal{A}$ be a quasi-triangular Hopf-*-algebra and let $(V, \alpha, *)$ be an object in $\left({ }_{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$. Then $\gamma_{\alpha}$ satisfies equation (8).
Proof: Since $(S \otimes \mathrm{id}) \circ \widetilde{R}=\widetilde{R^{-1}}$, we have

$$
\begin{aligned}
& (* \otimes *) \circ \gamma_{\alpha}=(* \otimes *) \circ(\mathrm{id} \otimes \alpha) \otimes(\tau \otimes \mathrm{id}) \circ(\widetilde{R} \otimes \mathrm{id}) \\
& \quad \text { (7) }(\mathrm{id} \otimes \alpha) \circ(* \otimes * \otimes *) \circ(\mathrm{id} \otimes S \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id}) \circ(\widetilde{R} \otimes \mathrm{id}) \\
& \quad=(\mathrm{id} \otimes \alpha) \circ(\tau \otimes \mathrm{id}) \circ(* \otimes * \otimes *) \circ\left(\widetilde{R^{-1}} \otimes \mathrm{id}\right) \\
& \quad=(\mathrm{id} \otimes \alpha) \circ(\widetilde{R} \otimes *)=\gamma_{\alpha} \circ *
\end{aligned}
$$

Remark 2.9. It follows from Lemma 2.8 and Lemma 2.6 that $\left(V, \alpha, \gamma_{\alpha}, *\right) \in$ $\operatorname{Obj}\left({ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}\right)$ and hence $\left({ }_{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$ is a subcategory of $\left({ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}_{*}, \Psi\right)$.

### 2.3.1. Cocommutative bialgebras.

If the bialgebra $\mathcal{A}$ is cocommutative (i.e. $\tau \circ \Delta=\Delta$ ), then $1 \otimes 1$ defines an $R$-matrix. The corresponding braiding is simply the flip $\tau$.

We show now that the construction in Theorem 2.2 includes as a special case the construction given in Sch93]. Schürmann's construction has as input the group algebra $\mathcal{A}=\mathbb{C} \Gamma$ of some group $\Gamma$, and actions and coactions of $\mathcal{A}$ on the objects $V$ that satisfy the compatibility condition

$$
\begin{equation*}
\gamma \circ \alpha=(\operatorname{ad} \otimes \alpha) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \gamma) \tag{11}
\end{equation*}
$$

see Sch93, page 14], where ad $=m \circ(\mathrm{id} \otimes m) \circ(\mathrm{id} \otimes \mathrm{id} \otimes S) \circ(\mathrm{id} \otimes \tau) \circ(\Delta \otimes \mathrm{id})$ is the adjoint action of $\mathcal{A}$ on itself. The following lemma shows that our construction is a generalisation of the one presented there.

Lemma 2.10. Let $\mathcal{A}$ be a cocommutative bialgebra. Let $\alpha$ and $\gamma$ be an action and a coaction of $\mathcal{A}$ on some vector space $V$. If $\alpha$ and $\gamma$ satisfy (11), then $(V, \alpha, \gamma)$ is a Yetter-Drinfeld module.

Proof: Substituting (11) into the right side of (6), we get after some simplifications

$$
\left(m^{(4)} \otimes \alpha\right) \circ(\mathrm{id} \otimes \tau \otimes \tau \otimes \mathrm{id}) \circ\left(\mathrm{id} \otimes \tau_{\mathcal{A} \otimes \mathcal{A}, \mathcal{A}} \circ \mathrm{id}\right) \circ\left(\mathrm{id}_{\mathcal{A}} \otimes S \otimes \mathrm{id}\right) \circ\left(\Delta^{(4)} \otimes \gamma\right)
$$

where $m^{(4)}=m \circ(m \otimes \mathrm{id}) \circ(m \otimes \mathrm{id} \otimes \mathrm{id}), \Delta^{(4)}=(\Delta \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\Delta \otimes \mathrm{id}) \circ \Delta$. Using the cocommutativity, we can produce a term of the form $m \circ(S \otimes \mathrm{id}) \circ \Delta$, to which we can apply the antipode axiom. Using the unit and the counit axiom to clean up the resulting expression, we get the desired result.

## 3. SYMmetrization of Braided *-Bialgebras and their Lévy processes

3.1. Symmetrizing braided $*$-bialgebras. Now we will present a construction that will allow us in Subsection 3.2 to associate with every Lévy process on a braided $*$-bialgebra $\mathcal{B}$ a Lévy process on a usual (i.e., symmetric or $\tau$-braided) $*$ bialgebra. The idea is to construct a bigger (symmetric) bialgebra $\mathcal{H}$ that contains the braided bialgebra $\mathcal{B}$ as a subalgebra and whose coproduct is related to that of $\mathcal{B}$ in a "nice way". For the case where the braiding is defined through the action and coaction of a group, this construction can be found in Sch93, Chapter 3]. For the general case a similar construction, called bosonization, was introduced by Majid, see [Maj95b, Section 9.4] and the references indicated there. But the role of the involution is not studied there. In this section we study the left symmetrization of braided $*$-bialgebras. Note that the whole theory works analogously for categories consisting of right modules and comodules.

Theorem 3.1. Let $\mathcal{A}$ be a Hopf-*-algebra and let $\mathcal{B}$ be a braided $*$-bialgebra in $\left({ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y D}_{*}, \Psi\right)$. Then $\mathcal{H}=\mathcal{B} \otimes \mathcal{A}$ (as a vector space) becomes a $*$-bialgebra with

$$
\begin{aligned}
m_{\mathcal{H}} & =\left(m_{\mathcal{B}} \otimes m_{\mathcal{A}}\right) \circ(\mathrm{id} \otimes \alpha \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id}), \\
\mathbb{1}_{\mathcal{H}} & =\mathbb{1}_{\mathcal{B}} \otimes \mathbb{1}_{\mathcal{A}}, \\
\Delta_{\mathcal{H}} & =(\mathrm{id} \otimes m \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma \otimes \mathrm{id} \otimes \mathrm{id}) \circ\left(\Delta_{\mathcal{B}} \otimes \Delta_{\mathcal{A}}\right), \\
\varepsilon_{\mathcal{H}} & =\varepsilon_{\mathcal{B}} \otimes \varepsilon_{\mathcal{A}}, \\
*_{\mathcal{H}} & =(\alpha \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta) \circ\left(*_{\mathcal{B}} \otimes *_{\mathcal{A}}\right) .
\end{aligned}
$$

The map $\operatorname{id}_{\mathcal{B}} \otimes \mathbb{1}_{\mathcal{A}}: \mathcal{B} \rightarrow \mathcal{B} \otimes \mathcal{A} \cong \mathcal{H}$ defines an embedding, i.e., an injective $*-$ algebra homomorphism. Furthermore we have the following commutative diagrams

Proof: For the proof that $\mathcal{H}$ is a bialgebra, see Maj95b, Section 9.4]. To show that it is even a $*$-bialgebra we first have to verify that $*_{\mathcal{H}}$ is its own inverse. Using the facts that $\Delta$ is a $*$-algebra homomorphism and $*$ is self-inverse, as well as equation (7) and the relation $* \circ S \circ *=S^{-1}$, we get

$$
\begin{aligned}
*_{\mathcal{H}} \circ *_{\mathcal{H}}=(\alpha \otimes \mathrm{id}) & \circ(\mathrm{id} \otimes \alpha \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \\
& \circ(\mathrm{id} \otimes \mathrm{id} \otimes \Delta) \circ\left(S^{-1} \otimes \mathrm{id} \otimes \mathrm{id}\right) \circ(\tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta) .
\end{aligned}
$$

Applying the module equation and the coassociativity, this expression transforms to

$$
(\alpha \otimes \mathrm{id}) \circ\left(\left(m \circ\left(\mathrm{id} \otimes S^{-1}\right) \circ \tau \circ \Delta\right) \otimes \mathrm{id} \otimes \mathrm{id}\right) \circ(\tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta)
$$

and using the antipode axiom to

$$
(\alpha \otimes \mathrm{id}) \circ((\mathbb{1} \circ \varepsilon) \otimes \tau) \circ(\Delta \otimes \mathrm{id}) \circ \tau=\tau \circ \tau=\mathrm{id} \otimes \mathrm{id},
$$

which shows that $*_{\mathcal{H}}$ is its own inverse. Next we want to show that $*_{\mathcal{H}}$ is an algebra-antihomomorphism. After applying some basic transformations, as well as equation (7) and the bialgebra equation

$$
\Delta \circ m=(m \otimes m) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \Delta)
$$

twice, we get the expression

$$
\begin{aligned}
*_{\mathcal{H}} & \circ m_{\mathcal{H}}=(m \otimes \mathrm{id}) \circ(\alpha \otimes \alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \tau) \circ(m \otimes m \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes m \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\Delta \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id}) \circ \tau_{\mathcal{H} \otimes \mathcal{H}} \circ(\tau \otimes \tau) \\
& \circ(\mathrm{id} \otimes \alpha \otimes \mathrm{id} \otimes \mathrm{id}) \circ\left(\mathrm{id} \otimes S^{-1} \otimes \tau \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id}) \circ(* \otimes * \otimes * \otimes *) .
\end{aligned}
$$

Again after using some basic transformations and reordering, we get the expression

$$
\begin{aligned}
& (m \otimes m) \circ(\mathrm{id} \otimes \alpha \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \quad \circ(\alpha \otimes \mathrm{id} \otimes \alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \tau) \circ(\Delta \otimes \mathrm{id} \otimes \Delta \otimes \mathrm{id}) \circ(\tau \otimes \tau) \\
& \quad \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\tau \otimes \tau) \circ(\mathrm{id} \otimes \alpha \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes m \otimes \tau \otimes \mathrm{id}) \\
& \quad \circ(\mathrm{id} \otimes S \otimes \mathrm{id} \otimes S \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \quad \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \quad \circ\left(\mathrm{id} \otimes S^{-1} \otimes \mathrm{id} \otimes \mathrm{id}\right) \circ(* \otimes * \otimes * \otimes *) .
\end{aligned}
$$

After applying the antipode axiom and some simplifications, this becomes

$$
\begin{aligned}
& (m \otimes m) \circ(\mathrm{id} \otimes \alpha \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \quad \circ(\alpha \otimes \mathrm{id} \otimes \alpha \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id} \otimes \Delta) \circ(* \otimes * \otimes * \otimes *) \\
& \quad \circ(\tau \otimes \tau) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id})=m_{\mathcal{H}} \circ\left(*_{\mathcal{H}} \otimes *_{\mathcal{H}}\right) \circ \tau_{\mathcal{H} \otimes \mathcal{H}} .
\end{aligned}
$$

Thus we have shown that $*_{\mathcal{H}}$ is an algebra homomorphism.
Now we want to show that $\Delta$ is a $*$-algebra homomorphism. After using the coassociativity twice and some reordering, we get the expression

$$
\begin{aligned}
& \Delta_{\mathcal{H}} \circ *_{\mathcal{H}}=(\mathrm{id}\otimes((m \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\gamma \otimes \mathrm{id}) \circ(\alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\Delta \otimes \mathrm{id})) \otimes \mathrm{id}) \\
& \circ(((\alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\Delta \otimes \mathrm{id})) \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \circ(\tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \Delta) \circ(* \otimes *) .
\end{aligned}
$$

Using the Yetter-Drinfeld equation as well as the equations (7) and (8), this transforms to

$$
\begin{aligned}
& (* \otimes * \otimes * \otimes *) \circ(\mathrm{id} \otimes((m \otimes \alpha) \circ(\tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \mathrm{id} \otimes \mathrm{id})) \otimes \mathrm{id}) \\
& \quad \circ\left(\left((\alpha \otimes \mathrm{id}) \circ\left(S^{-1} \otimes \tau\right) \circ(\Delta \otimes \mathrm{id}) \circ \tau\right) \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id}\right) \circ(\alpha \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \quad \circ\left(S^{-1} \otimes \mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}\right) \circ(\tau \otimes \gamma \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\Delta \otimes \Delta) .
\end{aligned}
$$

After a few more basic transformations, this becomes

$$
\begin{aligned}
& (* \otimes * \otimes * \otimes *) \circ\left(\left(\left(\alpha \circ\left(S^{-1} \otimes \mathrm{id}\right) \circ \tau\right) \otimes \mathrm{id} \otimes\left(\alpha \circ\left(S^{-1} \otimes \mathrm{id}\right) \circ \tau\right) \otimes \mathrm{id}\right)\right. \\
& \quad \circ(\mathrm{id} \otimes((m \otimes m) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\Delta \otimes \Delta)) \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \quad \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma \otimes \mathrm{id} \otimes \Delta) \circ(\Delta \otimes \Delta) .
\end{aligned}
$$

Using the bialgebra equation, we get

$$
\begin{aligned}
& (((\alpha \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta) \circ(* \otimes *)) \otimes((\alpha \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta) \circ(* \otimes *))) \\
& \circ(\mathrm{id} \otimes((m \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\gamma \otimes \mathrm{id})) \otimes \mathrm{id}) \circ(\Delta \otimes \Delta)
\end{aligned}
$$

and thus we have shown that $\Delta$ is a $*$-algebra homomorphism. It remains to show that the inclusions are $*$-algebra homomorphisms and that both diagrams commute. This can easily be verified by straightforward calculations.

Due to the connection between the categories we get the following corollaries for the categories $\left({ }^{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$ and $\left({ }_{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$.

Corollary 3.2. Let $\mathcal{A}$ be a coquasi-triangular $*$-bialgebra and $\mathcal{B}$ a braided $*-$ bialgebra in $\left({ }^{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$. Then $\mathcal{H}=\mathcal{B} \otimes \mathcal{A}$ (as a vector space) becomes a $*$-bialgebra with $\mathbb{1}_{\mathcal{H}}, \Delta_{\mathcal{H}}$ and $\varepsilon_{\mathcal{H}}$ as in Theorem 3.1 and

$$
\begin{aligned}
m_{\mathcal{H}} & =\left(m_{\mathcal{B}} \otimes m_{\mathcal{A}}\right) \circ\left(\mathrm{id} \otimes \alpha_{\gamma} \otimes \mathrm{id} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id}) \\
& =\left(m_{\mathcal{B}} \otimes m_{\mathcal{A}}\right) \circ(\mathrm{id} \otimes \overline{\boldsymbol{r}} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \gamma \otimes \mathrm{id}), \\
*_{\mathcal{H}} & =\left(\alpha_{\gamma} \otimes \mathrm{id}\right) \circ(\tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta) \circ\left(*_{\mathcal{B}} \otimes *_{\mathcal{A}}\right) \\
& =(\overline{\boldsymbol{r}} \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\gamma \otimes \Delta) \circ\left(*_{\mathcal{B}} \otimes *_{\mathcal{A}}\right) .
\end{aligned}
$$

Corollary 3.3. Let $\mathcal{A}$ be a quasi-triangular $*$-bialgebra and $\mathcal{B}$ a braided $*$-bialgebra in $\left({ }_{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$. Then $\mathcal{H}=\mathcal{B} \otimes \mathcal{A}$ (as a vector space) becomes $a *$-bialgebra with $m_{\mathcal{H}}$, $\mathbb{1}_{\mathcal{H}}, \varepsilon_{\mathcal{H}}$ and $*_{\mathcal{H}}$ as in Theorem 3.1 and

$$
\begin{aligned}
\Delta_{\mathcal{H}}= & (\mathrm{id} \otimes m \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ\left(\mathrm{id} \otimes \gamma_{\alpha} \otimes \mathrm{id} \otimes \mathrm{id}\right) \circ\left(\Delta_{\mathcal{B}} \otimes \Delta_{\mathcal{A}}\right) \\
= & (\mathrm{id} \otimes m \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \alpha \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \widetilde{R} \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\Delta \otimes \Delta) .
\end{aligned}
$$

3.2. Symmetrizing braided Lévy processes. The following proposition is important for symmetrizing Lévy processes, i.e. for constructing a Lévy processes on $\mathcal{H}$, for a given Lévy processes on $\mathcal{B}$. In Theorem 3.5 below we shall show that the process we construct on $\mathcal{H}$ allows to recover a process on $\mathcal{B}$ which is equivalent to the original process.

Proposition 3.4. The map $F: \mathcal{B}^{\prime} \rightarrow \mathcal{H}^{\prime}, \varphi \mapsto \varphi \otimes \varepsilon_{\mathcal{A}}$ is a unital injective algebra homomorphism w.r.t. the convolution product. Furthermore, it maps positive (or hermitian, conditionally positive) $\Psi$-invariant functionals $\varphi \in \mathcal{B}^{\prime}$ to positive (or hermitian, conditionally positive, resp.) functionals $F(\varphi) \in \mathcal{H}^{\prime}$.

Proof: The injectivity of $F$ is clear, because $\widetilde{F}: \mathcal{H}^{\prime} \rightarrow \mathcal{B}^{\prime} \cong(\mathcal{B} \otimes \mathbb{1})^{\prime}$ defined by $\widetilde{F}(\psi)=\psi \circ(\operatorname{id} \otimes \mathbb{1})$ is a left inverse of $F$. It is unital, since $F\left(\varepsilon_{\mathcal{B}}\right)=\varepsilon_{\mathcal{B}} \otimes \varepsilon_{\mathcal{A}}=\varepsilon_{\mathcal{H}}$.

Furthermore it preserves the convolution product, because

$$
\begin{aligned}
& F\left(\varphi_{1}\right) \star F\left(\varphi_{2}\right)=\left(F\left(\varphi_{1}\right) \otimes F\left(\varphi_{2}\right)\right) \circ \Delta \\
& \quad=\left(\varphi_{1} \otimes \varepsilon \otimes \varphi_{2} \otimes \varepsilon\right) \circ(\mathrm{id} \otimes m \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \quad \circ(\Delta \otimes \Delta) \\
& \quad=\left(\varphi_{1} \otimes \varepsilon \otimes \varphi_{2} \otimes \varepsilon \otimes \varepsilon\right) \circ(\mathrm{id} \otimes \gamma \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\Delta \otimes \Delta) \\
& \quad=\left(\left(\varphi_{1} \otimes \varphi_{2}\right) \circ \Delta\right) \otimes \varepsilon=F\left(\left(\varphi_{1} \otimes \varphi_{2}\right) \circ \Delta\right)=F\left(\varphi_{1} \star \varphi_{2}\right) .
\end{aligned}
$$

Assume now that $\varphi$ is positive and $\Psi$-invariant. Let $c=\sum_{k} b_{k} \otimes a_{k} \in \mathcal{B} \otimes \mathcal{A} \cong \mathcal{H}$. We want to show that $F(\varphi)$ is again positive. Because $\left(b_{k} \otimes a_{k}\right)^{*}=\Psi\left(a_{k}^{*} \otimes b_{k}^{*}\right)$, we have

$$
\begin{aligned}
c^{*} c & =\left(\sum_{k} b_{k} \otimes a_{k}\right)^{*}\left(\sum_{k} b_{k} \otimes a_{k}\right)=m_{\mathcal{H}}\left(\sum_{k, l}\left(b_{k} \otimes a_{k}\right)^{*} \otimes\left(b_{l} \otimes a_{l}\right)\right) \\
& =m_{\mathcal{H}}\left(\sum_{k, l} \Psi\left(a_{k}^{*} \otimes b_{k}^{*}\right) \otimes b_{l} \otimes a_{l}\right) .
\end{aligned}
$$

Since $m$ is a morphism and thus $\Psi$-invariant, it is
$(m \otimes m) \circ(\mathrm{id} \otimes \Psi \otimes \mathrm{id}) \circ(\Psi \otimes \mathrm{id} \otimes \mathrm{id})=(\mathrm{id} \otimes m) \circ(\Psi \otimes \mathrm{id}) \circ(\mathrm{id} \otimes m \otimes \mathrm{id})$ and therefore we get

$$
\begin{aligned}
& (F(\varphi))\left(c^{*} c\right)=(\varphi \otimes \varepsilon) \circ m_{\mathcal{H}}\left(\sum_{k, l} \Psi\left(a_{k}^{*} \otimes b_{k}^{*}\right) \otimes b_{l} \otimes a_{l}\right) \\
& \quad=\left(\varphi \otimes \varepsilon \circ(m \otimes m) \circ(\mathrm{id} \otimes \Psi \otimes \mathrm{id}) \circ(\Psi \otimes \mathrm{id} \otimes \mathrm{id})\left(\sum_{k, l} a_{k}^{*} \otimes b_{k}^{*} \otimes b_{l} \otimes a_{l}\right)\right. \\
& \quad=(\varphi \otimes \varepsilon) \circ(\mathrm{id} \otimes m) \circ(\Psi \otimes \mathrm{id}) \circ(\mathrm{id} \otimes m \otimes \mathrm{id})\left(\sum_{k, l} a_{k}^{*} \otimes b_{k}^{*} \otimes b_{l} \otimes a_{l}\right) \\
& \quad=\varepsilon \circ m \circ\left(\Psi_{\mathcal{A}, \mathbb{C}} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \varphi \otimes \mathrm{id}) \circ(\mathrm{id} \otimes m \otimes \mathrm{id})\left(\sum_{k, l} a_{k}^{*} \otimes b_{k}^{*} \otimes b_{l} \otimes a_{l}\right) \\
& \quad=(\varepsilon \circ m)\left(\sum_{k, l} \varphi\left(b_{k}^{*} b_{l}\right) a_{k}^{*} \otimes a_{l}\right) \\
& \quad=\sum_{k, l} \varphi\left(b_{k}^{*} b_{l}\right) \varepsilon\left(a_{k}^{*} a_{l}\right) .
\end{aligned}
$$

This is positive, since it is the Schur product of two positive definite matrices. Conditional positivity can be shown similarly and hermitianity is a straightforward calculation.

Theorem 3.5. Let $\mathcal{B}$ be a braided $*$-bialgebra in one of the categories $\left({ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y D}_{*}\right)$, $\left({ }^{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$ or $\left({ }_{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$. Let $\left(j_{s t}\right)_{0 \leq s \leq t}$ be a Lévy process on $\mathcal{B}$ with convolution semigroup $\left(\varphi_{t}\right)_{t \geq 0}$ and let $\left(j_{s t}^{\mathcal{H}}\right)_{0 \leq s \leq t}$ be a Lévy process on $\mathcal{H} \cong \mathcal{B} \otimes \mathcal{A}$ with convolution semigroup $\left(F\left(\varphi_{t}\right)\right)_{t \geq 0}$. Then $\left(\hat{\jmath}_{s t}\right)_{0 \leq s \leq t}$ with

$$
\hat{\jmath}_{s t}:=m \circ\left(j_{0 s}^{\mathcal{H}} \otimes j_{s t}^{\mathcal{H}}\right) \circ\left(\mathbb{1}_{\mathcal{B}} \otimes \gamma \otimes \mathbb{1}_{\mathcal{A}}\right)
$$

defines a Lévy process on $\mathcal{B}$. Furthermore $\left(\hat{\jmath}_{s t}\right)_{0 \leq s \leq t}$ is equivalent to $\left(j_{s t}\right)_{0 \leq s \leq t}$.

Remark 3.6. This theorem generalizes Sch93, Theorem 3.3.1].
Proof: We will use Sweedler's notation $\Delta_{\mathcal{B}}(b)=\sum b_{(1)} \otimes b_{(2)} \in \mathcal{B} \otimes \mathcal{B}$ and $\gamma(b)=$ $\sum b^{(1)} \otimes b^{(2)} \in \mathcal{B} \otimes \mathcal{A}$ for the coproduct and coaction on an element $b \in \mathcal{B}$. We have

$$
\begin{equation*}
\hat{\jmath}_{s t}(b)=m \circ\left(j_{0 s}^{\mathcal{H}} \otimes j_{s t}^{\mathcal{H}}\right) \circ\left(\mathbb{1}_{\mathcal{B}} \otimes \gamma \otimes \mathbb{1}_{\mathcal{A}}\right)(b)=j_{0 s}^{\mathcal{H}}\left(\mathbb{1} \otimes b^{(1)}\right) \cdot j_{s t}^{\mathcal{H}}\left(b^{(2)} \otimes \mathbb{1}\right) \tag{12}
\end{equation*}
$$

as well as

$$
\begin{align*}
j_{0 s}^{\mathcal{H}}(1 \otimes a) & =\left(j_{0 r}^{\mathcal{H}} \star j_{r s}^{\mathcal{H}}\right)(\mathbb{1} \otimes a)=m \circ\left(j_{0 r}^{\mathcal{H}} \otimes j_{r s}^{\mathcal{H}}\right) \circ \Delta_{\mathcal{H}}(\mathbb{1} \otimes a) \\
& =j_{0 r}^{\mathcal{H}}\left(\mathbb{1} \otimes a_{(1)}\right) \cdot j_{r s}^{\mathcal{H}}\left(\mathbb{1} \otimes a_{(2)}\right) . \tag{13}
\end{align*}
$$

and

$$
\begin{equation*}
\Delta_{\mathcal{H}}\left(b^{(2)} \otimes \mathbb{1}\right)=b_{(1)}^{(2)} \otimes b_{(2)}^{(2)}{ }^{(1)} \otimes b_{(2)}^{(2)}{ }^{(2)} \otimes \mathbb{1} \tag{14}
\end{equation*}
$$

Let $0 \leq r \leq s \leq t$. Then we have

$$
\begin{aligned}
& \left(\hat{\jmath}_{r s} \star \hat{\jmath}_{s t}\right)(b)=m \circ\left(\hat{\jmath}_{r s} \otimes \hat{\jmath}_{s t}\right) \circ \Delta(b)=\hat{\jmath}_{r s}\left(b_{(1)}\right) \cdot \hat{\jmath}_{s t}\left(b_{(2)}\right) \\
& \stackrel{12}{=} j_{0 r}^{\mathcal{H}}\left(\mathbb{1} \otimes b_{(1)}{ }^{(1)}\right) \cdot j_{r s}^{\mathcal{H}}\left(b_{(1)}{ }^{(2)} \otimes \mathbb{1}\right) \cdot j_{0 s}^{\mathcal{H}}\left(\mathbb{1} \otimes b_{(2)}{ }^{(1)}\right) \cdot j_{s t}^{\mathcal{H}}\left(b_{(2)}{ }^{(2)} \otimes \mathbb{1}\right) \\
& \stackrel{13}{=} j_{0 r}^{\mathcal{H}}\left(\mathbb{1} \otimes b_{(1)}{ }^{(1)}\right) \cdot j_{0 r}^{\mathcal{H}}\left(\mathbb{1} \otimes b_{(2)}{ }^{(1)}{ }_{(1)}\right) \cdot j_{r s}^{\mathcal{H}}\left(b_{(1)}{ }^{(2)} \otimes \mathbb{1}\right) \\
& \\
& \quad \cdot j_{r s}^{\mathcal{H}}\left(\mathbb{1} \otimes b_{(2)}{ }^{(1)}{ }_{(2)}\right) \cdot j_{s t}^{\mathcal{H}}\left(b_{(2)}{ }^{(2)} \otimes \mathbb{1}\right) \\
& = \\
& =j_{0 r}^{\mathcal{H}}\left(\mathbb{1} \otimes b_{(1)}{ }^{(1)} \cdot b_{(2)}{ }^{(1)}{ }_{(1)}\right) \cdot j_{r s}^{\mathcal{H}}\left(b_{(1)}{ }^{(2)} \otimes b_{(2)}{ }^{(1)}{ }_{(2)}\right) \cdot j_{s t}^{\mathcal{H}}\left(b_{(2)}{ }^{(2)} \otimes \mathbb{1}\right) \\
& = \\
& m \circ(m \otimes \mathrm{id}) \circ\left(j_{0 r}^{\mathcal{H}} \otimes j_{r s}^{\mathcal{H}} \otimes j_{s t}^{\mathcal{H})} \circ(\mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id} \otimes \gamma \otimes \mathrm{id}) \circ(\mathrm{id} \otimes m \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id})\right. \\
& \quad \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \gamma \otimes \gamma \otimes \mathrm{id}) \circ\left(\mathbb{1}_{\mathcal{B}} \otimes \Delta \otimes \mathbb{1}_{\mathcal{A}}\right)(b) \\
& = \\
& =j_{0 r}^{\mathcal{H}}\left(1 \otimes b^{(1)}\right) \cdot j_{r s}^{\mathcal{H}}\left(b^{(2)}{ }_{(1)}^{(1)} \otimes b^{(2)}{ }_{(2)}{ }^{(1)}\right) \cdot j_{s t}^{\mathcal{H}}\left(b^{(2)}{ }_{(2)}{ }^{(2)} \otimes \mathbb{1}\right)
\end{aligned}
$$

$$
\stackrel{14}{=} j_{0 r}^{\mathcal{H}}\left(\mathbb{1} \otimes b^{(1)}\right) \cdot\left(m \circ\left(j_{r s}^{\mathcal{H}} \otimes j_{s t}^{\mathcal{H}}\right) \circ \Delta_{\mathcal{H}}\left(b^{(2)} \otimes \mathbb{1}\right)\right)
$$

$$
=j_{0 r}^{\mathcal{H}}\left(\mathbb{1} \otimes b^{(1)}\right) \cdot\left(j_{r s}^{\mathcal{H}} \star j_{s t}^{\mathcal{H}}\right)\left(b^{(2)} \otimes \mathbb{1}\right)=j_{0 r}^{\mathcal{H}}\left(\mathbb{1} \otimes b^{(1)}\right) \cdot j_{r t}^{\mathcal{H}}\left(b^{(2)} \otimes 1\right)
$$

$$
=m \circ\left(j_{0 r}^{\mathcal{H}} \otimes j_{r t}^{\mathcal{H}}\right) \circ\left(\mathbb{1}_{\mathcal{B}} \otimes \gamma \otimes \mathbb{1}_{\mathcal{A}}\right)(b)=\hat{\jmath}_{r t}(b)
$$

Thus we have shown that $\left(\hat{\jmath}_{s t}\right)_{0 \leq s \leq t}$ satisfies the increment property. Furthermore, because of the independence of increments, it follows

$$
\begin{aligned}
\Phi \circ \hat{\jmath}_{s t} & =\left(\left(\Phi \circ j_{0 s}^{\mathcal{H}}\right) \otimes\left(\Phi \circ j_{s t}^{\mathcal{H}}\right)\right) \circ\left(\mathbb{1}_{\mathcal{B}} \otimes \gamma \otimes \mathbb{1}_{\mathcal{A}}\right)=\left(F\left(\varphi_{s}\right) \otimes F\left(\varphi_{t-s}\right)\right) \circ\left(\mathbb{1}_{\mathcal{B}} \otimes \gamma \otimes \mathbb{1}_{\mathcal{A}}\right) \\
& =\left(\varphi_{s} \otimes \varepsilon_{\mathcal{A}} \otimes \varphi_{t-s} \otimes \varepsilon_{\mathcal{A}}\right) \circ\left(\mathbb{1}_{\mathcal{B}} \otimes \gamma \otimes \mathbb{1}_{\mathcal{A}}\right)=\varphi_{t-s},
\end{aligned}
$$

i.e., the processes $\left(j_{s t}\right)_{0 \leq s \leq t}$ and $\left(\hat{\jmath}_{s t}\right)_{0 \leq s \leq t}$ have the same marginal distributions. This implies the stationarity and the weak continuity of the increments of $\left(\hat{\jmath}_{s t}\right)_{0 \leq s \leq t}$ and completes the proof that $\left(\hat{\jmath}_{s t}\right)_{0 \leq s \leq t}$ is a Lévy process. Furthermore it establishes the equivalence of the two processes and completes the proof of the theorem.

Lévy processes on symmetric $*$-bialgebras can be realized on Bose Fock spaces using quantum stochastic differential calculus HP84, Par92, Mey93. The necessary
input is a triple $(\rho, \eta, L)$, where $\rho$ is a $*$-representation of $\mathcal{A}$, on some pre-Hilbert space $P, \eta: \mathcal{A} \rightarrow P$ is a $\rho$-cocycle, i.e.

$$
\eta(a b)=\rho(a) \eta(b)-\eta(a) \varepsilon(b)
$$

for $a, b \in \mathcal{A}$, and $L: \mathcal{A} \rightarrow \mathbb{C}$ is a hermitian linear functional s.t.

$$
\left\langle\eta\left(a^{*}\right), \eta(b)\right\rangle=\varepsilon(a) L(b)+L(a b)-L(a) \varepsilon(b)
$$

for $a, b, \in \mathcal{A}$. Such triples are called Schürmann triples in Mey93, Chapter VII] and FS16.

Let us recall the GNS-type construction of the triple ( $\rho, \eta, L$ ) from the functional $L$, see [Sch93, Section 2.3]. Let $\mathcal{B}$ be a $*$-algebra with a unital, hermitian character $\varepsilon: \mathcal{B} \rightarrow \mathbb{C}\left(\right.$ i.e. $\varepsilon(\mathbb{1})=1, \varepsilon\left(b^{*}\right)=\overline{\varepsilon(b)}$, and $\varepsilon(a b)=\varepsilon(a) \varepsilon(b)$ for all $a, b$ in $\left.\mathcal{B}\right)$ and let $L: \mathcal{B} \rightarrow \mathbb{C}$ be a generator. We define an inner product $\langle\cdot, \cdot\rangle_{\mathcal{B}_{0}}: \mathcal{B}_{0} \times \mathcal{B}_{0} \rightarrow \mathbb{C}$ on $\mathcal{B}_{0}:=\operatorname{ker} \varepsilon$ by $(a, b) \mapsto L\left(a^{*} b\right)$. This inner product is positive semi-definite, since $L$ is conditionally positive. We define the null space by $\mathcal{N}_{0}:=\left\{b \in \mathcal{B}_{0} \mid\langle b, b\rangle=0\right\}$. The quotient space $P:=\mathcal{B}_{0} / \mathcal{N}_{0}$ with inner product

$$
\left\langle a+\mathcal{N}_{0}, b+\mathcal{N}_{0}\right\rangle_{P}:=\langle a, b\rangle_{\mathcal{B}_{0}}
$$

becomes a pre-Hilbert space. The (left) action $\alpha: \mathcal{B} \times \mathcal{B}_{0} \rightarrow \mathcal{B}_{0}$ with $(a, b) \mapsto a \cdot b$ induces an action $\tilde{\alpha}$ on $P$, since $\alpha\left(\mathcal{N}_{0}\right) \subseteq \mathcal{N}_{0}$. Now we define $\rho(a) \in \mathcal{L}(P, P)$ by

$$
\rho(a)\left(b+\mathcal{N}_{0}\right):=\tilde{\alpha}\left(a, b+\mathcal{N}_{0}\right)
$$

for $a \in \mathcal{B}$ and $b+\mathcal{N}_{0} \in P$ as well as

$$
\begin{aligned}
\eta: \mathcal{B} & \rightarrow P \\
b & \mapsto\left(b-\varepsilon(b) \cdot 1_{\mathcal{B}}\right)+\mathcal{N}_{0},
\end{aligned}
$$

where

$$
\eta(b)=\left\{\begin{array}{l}
b+\mathcal{N}_{0}, \text { for all } b \in \mathcal{B}_{0} \\
0+\mathcal{N}_{0}, \text { for all } b \in\left\langle 1_{\mathcal{B}}\right\rangle
\end{array}\right.
$$

The equations

$$
\eta(a \cdot b)=\rho(a) \eta(b)+\eta(a) \varepsilon(b)
$$

and

$$
\langle\eta(a), \eta(b)\rangle=L\left(a^{*} b\right)-\varepsilon\left(a^{*}\right) L(b)-L\left(a^{*}\right) \varepsilon(b)
$$

hold. Thus $(\rho, \eta, L)$ is a surjective triple, i.e., a triple whose cocycle $\eta$ is surjective.
If we know the triple for a generator $L$ on a braided $*$-bialgebra $\mathcal{B}$, then the following proposition tells us how to extend it to a triple for $L^{\mathcal{H}}=F(L)$.

Theorem 3.7. Let $\left(j_{s t}\right)_{0 \leq s \leq t}$ be a Lévy process on a braided $*$-bialgebra $\mathcal{B}$ in $\left({ }_{\mathcal{A}}^{\mathcal{A}} \mathcal{Y} \mathcal{D}_{*}\right),\left({ }_{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$ or $\left({ }^{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$ with $\alpha$-invariant generator $L$ and triple $(\rho, \eta, L)$. Furthermore let $\left(j_{s t}^{\mathcal{H}}\right)_{0 \leq s \leq t}$ be the Lévy process on the symmetrization $\mathcal{H} \cong \mathcal{B} \otimes \mathcal{A}$ from Theorem 3.5 with triple $\left(\rho^{\mathcal{H}}, \eta^{\mathcal{H}}, L^{\mathcal{H}}\right)$. Then we have

- The pre-Hilbert spaces $P$ and $P^{\mathcal{H}}$ belonging to the triples are isometrically isomorphic, i.e. there exists a linear, bijective map $\check{T}: P^{\mathcal{H}} \rightarrow P$ such that

$$
\langle a, b\rangle_{P^{\mathcal{H}}}=\langle\check{T}(a), \check{T}(b)\rangle_{P}
$$

- $\check{T} \circ \eta^{\mathcal{H}}(b \otimes a)=\varepsilon_{\mathcal{A}}(a) \eta(b)$ and $\check{T} \circ \eta^{\mathcal{H}}$ vanishes on $\mathbb{1}_{\mathcal{B}} \otimes \mathcal{A}$.
- $\rho^{\mathcal{H}}$ is determinded by

$$
\begin{aligned}
\check{T}\left(\rho^{\mathcal{H}}\left(\mathbb{1}_{\mathcal{B}} \otimes a\right) \eta^{\mathcal{H}}\left(b_{0}^{\prime} \otimes \mathbb{1}_{\mathcal{A}}\right)\right) & =\eta\left(\alpha\left(a \otimes b_{0}^{\prime}\right)\right) \\
\check{T}\left(\rho^{\mathcal{H}}\left(b \otimes \mathbb{1}_{\mathcal{A}}\right) \eta^{\mathcal{H}}\left(b_{0}^{\prime} \otimes \mathbb{1}_{\mathcal{A}}\right)\right) & =\eta\left(b b_{0}^{\prime}\right)
\end{aligned}
$$

for $a \in \mathcal{A}, b \in \mathcal{B}, b_{0}^{\prime} \in \mathcal{B}_{0}$.
Proof: Using the construction above we know that the triple ( $\rho, \eta, L$ ) belonging to $\left(j_{s t}\right)_{0 \leq s \leq t}$ is defined on the pre-Hilbert-space $P:=\mathcal{B}_{0} / \mathcal{N}_{0}$ with inner product

$$
\left\langle a+\mathcal{N}_{0}, b+\mathcal{N}_{0}\right\rangle_{P}:=\langle a, b\rangle_{\mathcal{B}_{0}}=L\left(a^{*} b\right)
$$

where $\mathcal{N}_{0}=\left\{G \in \mathcal{B}_{0} \mid\langle G, G\rangle_{\mathcal{B}_{0}}=0\right\}$. The representation $\rho$ is given by $\rho(a)(b+$ $\left.\mathcal{N}_{0}\right):=\left(a \cdot b+\mathcal{N}_{0}\right)$ and the $\rho$-cocycle by

$$
\eta(a)=\left(a-\varepsilon(a) \cdot \mathbb{1}_{\mathcal{B}}\right)+\mathcal{N}_{0} .
$$

Analogously, the triple $\left(\rho^{\mathcal{H}}, \eta^{\mathcal{H}}, L^{\mathcal{H}}\right)$ of the process $\left(j_{s t}^{\mathcal{H}}\right)_{0 \leq s \leq t}$ on the (left) symmetrization $\mathcal{H}$ of $\mathcal{B}$, with $L^{\mathcal{H}}=F(L)$, is defined on the pre-Hilbert space $P^{\mathcal{H}}:=$ $\mathcal{H}_{0} / \mathcal{N}_{0}^{\mathcal{H}}$ with inner product

$$
\begin{equation*}
\left\langle a+\mathcal{N}_{0}^{\mathcal{H}}, b+\mathcal{N}_{0}^{\mathcal{H}}\right\rangle_{P^{\mathcal{H}}}:=\langle a, b\rangle_{\mathcal{H}_{0}}=L^{\mathcal{H}}\left(a^{*} b\right), \tag{15}
\end{equation*}
$$

where $\mathcal{H}_{0}:=\operatorname{ker} \varepsilon_{\mathcal{H}}$. The representation $\rho^{\mathcal{H}}$ is defined by $\rho^{\mathcal{H}}(a)\left(b+\mathcal{N}_{0}^{\mathcal{H}}\right):=$ $(a \cdot b)+\mathcal{N}_{0}^{\mathcal{H}}$ and the $\rho$-cocycle $\eta^{\mathcal{H}}$ is given by

$$
\begin{equation*}
\eta^{\mathcal{H}}(b \otimes a)=\left(b \otimes a-\varepsilon_{\mathcal{H}}(b \otimes a) \cdot \mathbb{1}_{\mathcal{H}}\right)+\mathcal{N}_{0}^{\mathcal{H}} . \tag{16}
\end{equation*}
$$

First we want to show that the pre-Hilbert spaces $P$ und $P^{\mathcal{H}}$ are isometrically isomorphic, i.e. there exists a linear bijective map $\widetilde{T}: P^{\mathcal{H}} \rightarrow P$ with

$$
\langle a, b\rangle_{P^{\mathcal{H}}}=\langle\widetilde{T}(a), \widetilde{T}(b)\rangle_{P}
$$

for all $a, b \in P^{\mathcal{H}}$. Let $b \otimes a, d \otimes c \in \mathcal{H}_{0}=\operatorname{ker}\left(\varepsilon_{\mathcal{B}} \otimes \varepsilon_{\mathcal{A}}\right), b, d \in \mathcal{B}$ and $a, c \in \mathcal{A}$. We have

$$
\left(L \otimes \varepsilon_{\mathcal{A}}\right)\left((b \otimes a)^{*}(d \otimes c)\right)=\varepsilon_{\mathcal{A}}\left(a^{*} c\right) L\left(b^{*} d\right)
$$

since

$$
\begin{aligned}
L^{\mathcal{H}} \circ & m_{\mathcal{H}} \circ\left(* \mathcal{H} \otimes \mathrm{id}_{\mathcal{H}}\right) \\
= & (L \otimes \varepsilon) \circ(m \otimes m) \circ(\mathrm{id} \otimes \alpha \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \circ(((\alpha \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Delta) \circ(* \otimes *)) \otimes \mathrm{id} \otimes \mathrm{id}) \\
= & (L \otimes \varepsilon \otimes \varepsilon) \circ(m \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\alpha \otimes \alpha \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id} \otimes \tau \otimes \mathrm{id}) \\
& \circ(\mathrm{id} \otimes((\Delta \otimes \mathrm{id}) \circ \Delta) \otimes \mathrm{id} \otimes \mathrm{id}) \circ(* \otimes * \otimes \mathrm{id} \otimes \mathrm{id}) \\
= & (L \otimes \varepsilon) \circ(m \otimes \mathrm{id}) \circ(\alpha \otimes \alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(\Delta \otimes \mathrm{id} \otimes \mathrm{id} \otimes \mathrm{id}) \\
& \circ(\tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(* \otimes * \otimes \mathrm{id} \otimes \mathrm{id}) \\
= & (L \otimes \varepsilon) \circ(\alpha \otimes \mathrm{id}) \circ(\mathrm{id} \otimes m \otimes \mathrm{id}) \circ(\tau \otimes \mathrm{id} \otimes \mathrm{id}) \circ(* \otimes * \otimes \mathrm{id} \otimes \mathrm{id}) \\
= & (\varepsilon \otimes \varepsilon) \circ(\mathrm{id} \otimes \mathrm{id} \otimes m) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\tau \otimes \tau) \circ(* \otimes * \otimes \mathrm{id} \otimes \mathrm{id}) \\
= & (\varepsilon \otimes L) \circ(m \otimes m) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\tau \otimes \tau) \circ(* \otimes * \otimes \mathrm{id} \otimes \mathrm{id})
\end{aligned}
$$

and thus

$$
\begin{aligned}
& L^{\mathcal{H}}\left((b \otimes a)^{*}(d \otimes c)\right)=L^{\mathcal{H}} \circ m_{\mathcal{H}} \circ\left(*_{\mathcal{H}} \otimes \operatorname{id}_{\mathcal{H}}\right)(b \otimes a \otimes d \otimes c) \\
& \quad=\left(\varepsilon_{\mathcal{A}} \otimes L\right) \circ(m \otimes m) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\tau \otimes \tau) \circ(* \otimes * \otimes \mathrm{id} \otimes \mathrm{id})(b \otimes a \otimes d \otimes c) \\
& \quad=\varepsilon_{\mathcal{A}}\left(a^{*} c\right) L\left(b^{*} d\right)
\end{aligned}
$$

From this it follows that

$$
\begin{align*}
\langle b \otimes a, d \otimes c\rangle_{\mathcal{H}_{0}} & =L^{\mathcal{H}}\left((b \otimes a)^{*}(d \otimes c)\right)=\left(L \otimes \varepsilon_{\mathcal{A}}\right)\left((b \otimes a)^{*}(d \otimes c)\right) \\
& =\varepsilon_{\mathcal{A}}\left(a^{*} c\right) L\left(b^{*} d\right)=\varepsilon_{\mathcal{A}}\left(a^{*} c\right)\langle b, d\rangle_{\mathcal{B}_{0}} . \tag{17}
\end{align*}
$$

That $(\rho, \eta, L)$ is the triple of the generator $L$ means that

$$
L\left(b^{*} d\right)=\langle\eta(b), \eta(d)\rangle_{P}+\varepsilon\left(b^{*}\right) L(d)+L\left(b^{*}\right) \varepsilon(d) .
$$

Thus from equation (17) it follows that

$$
\begin{aligned}
\varepsilon_{\mathcal{A}}\left(a^{*} c\right) L\left(b^{*} d\right)= & \varepsilon_{\mathcal{A}}\left(a^{*} c\right)\langle\eta(b), \eta(d)\rangle_{P} \\
& \quad+\varepsilon_{\mathcal{A}}\left(a^{*}\right) \varepsilon_{\mathcal{A}}(a) \varepsilon_{\mathcal{B}}\left(b^{*}\right) L(d)+\varepsilon_{\mathcal{A}}\left(a^{*}\right) \varepsilon_{\mathcal{A}}(a) L\left(b^{*}\right) \varepsilon_{\mathcal{B}}(d) .
\end{aligned}
$$

It is

$$
\begin{aligned}
\operatorname{ker} \varepsilon_{\mathcal{H}} & =\left(\operatorname{ker} \varepsilon_{\mathcal{B}} \otimes\left(\operatorname{ker} \varepsilon_{\mathcal{A}} \oplus\left\langle\mathbb{1}_{\mathcal{A}}\right\rangle\right)\right) \oplus\left(\left(\operatorname{ker} \varepsilon_{\mathcal{B}} \otimes\left\langle\mathbb{1}_{\mathcal{B}}\right)\right\rangle\right) \otimes \operatorname{ker} \varepsilon_{\mathcal{A}} \\
& =\left(\operatorname{ker} \varepsilon_{\mathcal{B}} \otimes \operatorname{ker} \varepsilon_{\mathcal{B}}\right) \oplus\left(\operatorname{ker} \varepsilon_{\mathcal{B}} \otimes\left\langle\mathbb{1}_{\mathcal{A}}\right\rangle\right) \oplus\left(\left\langle\mathbb{1}_{\mathcal{B}}\right\rangle \otimes \operatorname{ker} \varepsilon_{\mathcal{A}}\right) .
\end{aligned}
$$

and the second and the third addend vanish. Hence we have

$$
\begin{equation*}
\langle\eta(b), \eta(d)\rangle_{P}=L\left(b^{*} d\right)=\langle b, d\rangle_{P} \tag{18}
\end{equation*}
$$

and with equations (17) and 18) it follows that

$$
\begin{aligned}
\langle b \otimes a, d \otimes c\rangle_{\mathcal{H}_{0}} & =\varepsilon_{\mathcal{A}}\left(a^{*} c\right) L\left(b^{*} c\right) \\
& =\varepsilon_{\mathcal{A}}\left(a^{*} c\right)\langle\eta(b), \eta(d)\rangle_{P} \\
& =\left\langle\varepsilon_{\mathcal{A}}(a) \eta(b), \varepsilon_{\mathcal{A}}(c) \eta(d)\right\rangle_{P}
\end{aligned}
$$

Now we define the map

$$
\begin{aligned}
T: \mathcal{H}_{0} & \rightarrow P \\
b \otimes a & \mapsto \varepsilon_{\mathcal{A}}(a) \eta(b)
\end{aligned}
$$

Since $T(b \otimes a)=0$ for $b \otimes a \in \mathcal{N}_{0}^{\mathcal{H}}$ we can lift the map to $P^{\mathcal{H}}$ and we get the isometric isomorphism

$$
\begin{aligned}
\widetilde{T}: P^{\mathcal{H}} & \rightarrow P \\
\eta^{\mathcal{H}} & \mapsto \varepsilon_{\mathcal{A}}(a) \eta(b),
\end{aligned}
$$

where the injectivity follows from $\operatorname{ker} \widetilde{T}=\{0\}$ and the surjectivity of $\widetilde{T}$ from the surjectivity of $\eta$. Since we have

$$
\begin{equation*}
\eta\left(\mathbb{1}_{\mathcal{B}}\right)=\left(\mathbb{1}_{\mathcal{B}}-\varepsilon_{\mathcal{B}}\left(\mathbb{1}_{\mathcal{B}}\right) \cdot \mathbb{1}_{\mathcal{B}}\right)+\mathcal{N}_{0}^{\mathcal{H}}=0+\mathcal{N}_{0}^{\mathcal{H}} \tag{19}
\end{equation*}
$$

it follows that

$$
\begin{aligned}
\widetilde{T} \circ \eta^{\mathcal{H}}(b \otimes a) & \stackrel{16}{=} \widetilde{T}\left(\left(b \otimes a-\varepsilon_{\mathcal{H}}(b \otimes a) \cdot \mathbb{1}_{\mathcal{H}}\right)+\mathcal{N}_{0}^{\mathcal{H}}\right) \\
& =\widetilde{T}\left(b \otimes a+\mathcal{N}_{0}^{\mathcal{H}}\right)-\widetilde{T}\left(\varepsilon_{\mathcal{B}}(b) \varepsilon_{\mathcal{A}}(a) \cdot\left(\mathbb{1}_{\mathcal{B}} \otimes \mathbb{1}_{\mathcal{A}}\right)+\mathcal{N}_{0}^{\mathcal{H}}\right) \\
& =\varepsilon_{\mathcal{A}}(a) \eta(b)-\varepsilon_{\mathcal{B}}(b) \varepsilon_{\mathcal{A}}(a) \varepsilon_{\mathcal{A}}\left(\mathbb{1}_{\mathcal{A}}\right) \eta\left(\mathbb{1}_{\mathcal{B}}\right) \\
& \stackrel{19}{=} \varepsilon_{\mathcal{A}}(a) \eta(b) .
\end{aligned}
$$

From equation (19) also follows that

$$
\widetilde{T} \circ \eta^{\mathcal{H}}\left(\mathbb{1}_{\mathcal{B}} \otimes a\right)=\varepsilon_{\mathcal{A}}(a) \eta\left(\mathbb{1}_{\mathcal{B}}\right)-\varepsilon_{\mathcal{B}}\left(\mathbb{1}_{\mathcal{B}}\right) \varepsilon_{\mathcal{A}}(a) \varepsilon_{\mathcal{A}}\left(\mathbb{1}_{\mathcal{A}}\right) \eta\left(\mathbb{1}_{\mathcal{B}}\right)=0
$$

for all $a \in \mathcal{A}$ and thus $\widetilde{T} \circ \eta^{\mathcal{H}}$ vanishes on $\mathbb{1}_{\mathcal{B}} \otimes \mathcal{A}$. For the proof of the last part let $b=b_{0}+c_{b} \cdot \mathbb{1}_{\mathcal{B}} \in \operatorname{ker} \varepsilon_{\mathcal{B}} \oplus \mathbb{C} \cdot \mathbb{1}_{\mathcal{B}}=\mathcal{B}$ und $a=a_{0}+c_{a} \cdot \mathbb{1}_{\mathcal{A}} \in \operatorname{ker} \varepsilon_{\mathcal{A}} \oplus \mathbb{C} \cdot \mathbb{1}_{\mathcal{A}}=\mathcal{A}$. It is

$$
\begin{aligned}
\left\langle b_{0} \otimes a_{0}, b_{0} \otimes a_{0}\right\rangle_{\mathcal{H}_{0}} \stackrel{\sqrt{15}}{=} L^{\mathcal{H}}\left(\left(b_{0} \otimes a_{0}\right)^{*}\left(b_{0} \otimes a_{0}\right)\right) & \\
& =\varepsilon_{\mathcal{A}}\left(\left(a_{0}\right)^{*}\right) \varepsilon_{\mathcal{A}}\left(a_{0}\right) L\left(\left(b_{0}\right)^{*} b_{0}\right)=0
\end{aligned}
$$

and hence we get

$$
\begin{aligned}
\eta^{\mathcal{H}}(b \otimes a)= & \eta^{\mathcal{H}}\left(b_{0} \otimes a_{0}\right)+\eta^{\mathcal{H}}\left(b_{0} \otimes c_{a} \cdot \mathbb{1}_{\mathcal{A}}\right)+\eta^{\mathcal{H}}\left(c_{b} \cdot \mathbb{1}_{\mathcal{B}} \otimes a_{0}\right) \\
& +\eta^{\mathcal{H}}\left(c_{b} \cdot \mathbb{1}_{\mathcal{B}}+c_{a} \cdot \mathbb{1}_{\mathcal{A}}\right) \\
= & \eta^{\mathcal{H}}\left(b_{0} \otimes c_{a} \cdot \mathbb{1}_{\mathcal{A}}\right) .
\end{aligned}
$$

Therefore it remains to show the assertion for $b_{0} \otimes c_{a} \cdot \mathbb{1}_{\mathcal{A}} \in \operatorname{ker} \varepsilon_{\mathcal{B}} \oplus \mathbb{C} \cdot \mathbb{1}_{\mathcal{B}}$. Let $b \in \mathcal{B}, a \in \mathcal{A}$ und $b_{0}^{\prime} \in \operatorname{ker} \varepsilon_{\mathcal{B}}$. It is $m_{\mathcal{H}}(b \otimes a \otimes d \otimes c)=b \cdot \alpha\left(a_{(1)} \otimes d\right) \otimes a_{(2)} \cdot c$.

Because of that we get

$$
\begin{aligned}
\widetilde{T}\left(\rho^{\mathcal{H}}(b \otimes a) \eta^{\mathcal{H}}\left(b_{0}^{\prime} \otimes \mathbb{1}_{\mathcal{A}}\right)\right) & \stackrel{\boxed{16]}}{=} \widetilde{T}\left(\rho^{\mathcal{H}}(b \otimes a)\left(\left(b_{0}^{\prime} \otimes \mathbb{1}_{\mathcal{A}}-\varepsilon_{\mathcal{H}}\left(b_{0}^{\prime} \otimes \mathbb{1}_{\mathcal{A}}\right) \cdot \mathbb{1}_{\mathcal{H}}+\mathcal{N}_{0}^{\mathcal{H}}\right)\right)\right. \\
& =\widetilde{T}\left((b \otimes a) \cdot \mathcal{H}^{( }\left(b_{0}^{\prime} \otimes \mathbb{1}_{\mathcal{A}}\right)\right)-\widetilde{T}\left(\varepsilon_{\mathcal{H}}\left(b_{0}^{\prime} \otimes \mathbb{1}_{\mathcal{A}}\right)(b \otimes a)\right) \\
& =\widetilde{T}\left(b \cdot \alpha\left(a_{(1)} \otimes b_{0}^{\prime}\right) \otimes a_{(2)}\right)=\eta\left(b \cdot \alpha\left(a \otimes b_{0}^{\prime}\right)\right) .
\end{aligned}
$$

Since $\rho^{\mathcal{H}}$ is an algebra homomorphism we have

$$
\begin{aligned}
\widetilde{T}\left(\rho^{\mathcal{H}}\left(\mathbb{1}_{\mathcal{B}} \otimes a\right) \eta^{\mathcal{H}}\left(b_{0}^{\prime} \otimes \mathbb{1}_{\mathcal{A}}\right)\right) & =\eta\left(\alpha\left(a \otimes b_{0}^{\prime}\right)\right) \text { for } b \otimes a=\mathbb{1}_{\mathcal{B}} \otimes a \\
\text { and } \widetilde{T}\left(\rho^{\mathcal{H}}\left(b \otimes \mathbb{1}_{\mathcal{A}}\right) \eta^{\mathcal{H}}\left(b_{0}^{\prime} \otimes \mathbb{1}_{\mathcal{A}}\right)\right) & =\eta\left(b \cdot \alpha\left(\mathbb{1}_{\mathcal{B}} \otimes b_{0}^{\prime}\right)=\eta\left(b b_{0}^{\prime}\right) \text { for } b \otimes a=b \otimes \mathbb{1}_{\mathcal{A}} .\right.
\end{aligned}
$$

This completes the proof of the theorem for triples constructed in the way described above. But since the pre-Hilbert spaces belonging to two surjective triples which come from the same generator $L$ are isometrically isomorphic, this gives rise to an isometric isomorphism $\check{T}: P^{\mathcal{H}} \rightarrow P$ with $\check{T} \circ \eta^{\mathcal{H}}(b \otimes a)=\varepsilon_{\mathcal{A}}(a) \eta(b)$, such that the assertions hold for arbitrary triples belonging to the same generator.

## 4. A construction of braided *-Spaces

In this section we will construct a large class of braided $*$-spaces and their symmetrizations.

Let $R \in \mathbb{C}^{n \times n} \otimes \mathbb{C}^{n \times n}$ be a universal $R$-matrix and thus $R$ satisfies the quantum Yang-Baxter equation (2). We suppose that $R$ is of real type I, i.e.

$$
\overline{R_{k l}^{i j}}=R_{j i}^{l k},
$$

and that $R$ is bi-invertible, i.e. that there exist matrices $R^{-1}$ and $\widetilde{R} \in \mathbb{C}^{n \times n} \otimes \mathbb{C}^{n \times n}$, such that

$$
\begin{aligned}
\sum_{k, l}\left(R^{-1}\right)_{k l}^{i j} R_{p q}^{k l} & =\sum_{k, l} R_{k l}^{i j}\left(R^{-1}\right)_{p q}^{k l}=\delta_{p}^{i} \delta_{q}^{j}, \\
\sum_{k, j} \widetilde{R}_{k l}^{i j} R_{p j}^{k q} & =\sum_{k, j} R_{k l}^{i j} \widetilde{R}_{p j}^{k q}=\delta_{p}^{i} \delta_{l}^{q} .
\end{aligned}
$$

Note that if $R$ is of real type I and bi-invertible, than $R^{-1}$ and $\widetilde{R}$ are also of real type I.
4.1. The FRT-*-bialgebra. We denote by $\mathcal{A}_{*}(R)$ the $*$-bialgebra generated by the elements $\left\{a_{j}^{i}\right\}_{i, j=1,2, \ldots, n}$ and their adjoints $\left\{b_{l}^{k}\right\}_{k, l=1,2, \ldots, n}$, where $b_{l}^{k}:=\left(a_{k}^{l}\right)^{*}$,
with the relations

$$
\begin{aligned}
\sum_{p, q} R_{p q}^{i k} a_{j}^{p} a_{l}^{q} & =\sum_{p, q} a_{q}^{k} a_{p}^{i} R_{j l}^{p q} \\
\sum_{k, j} R_{k l}^{i j} b_{q}^{k} a_{j}^{p} & =\sum_{k, j} a_{l}^{k} b_{j}^{i} R_{q k}^{j p} \\
\sum_{k} \Delta\left(a_{j}^{i}\right) & =a_{k}^{i} \otimes a_{j}^{k} \\
\varepsilon\left(a_{j}^{i}\right) & =\delta_{j}^{i}
\end{aligned}
$$

The proof that these relations define indeed a $*$-bialgebra is similar to the construction of the FRT-bialgebra in FRT89. See also Mal17.
Lemma 4.1. Let $V$ be a finite dimensional vector space and $R \in \operatorname{End}(V \otimes V) a$ bi-invertible solution of the quantum Yang-Baxter equation (2). Then $\mathcal{A}_{*}(R)$ is a coquasi-triangular $*$-bialgebra, with the unique involutive $r$-form

$$
\boldsymbol{r}: \mathcal{A}_{*}(R) \otimes \mathcal{A}_{*}(R) \rightarrow \mathbb{C}
$$

such that

$$
\begin{aligned}
& \boldsymbol{r}\left(a_{j}^{i} \otimes a_{l}^{k}\right)=R_{j l}^{i k}, \quad \boldsymbol{r}\left(a_{j}^{i} \otimes b_{l}^{k}\right)=R_{l j}^{k i} \\
& \boldsymbol{r}\left(a_{j}^{i} \otimes \mathbb{1}\right)=\boldsymbol{r}\left(\mathbb{1} \otimes a_{j}^{i}\right)=\delta_{j}^{i} .
\end{aligned}
$$

The inverse (w.r.t. the convolution) $\overline{\boldsymbol{r}}: \mathcal{A}_{*}(R) \otimes \mathcal{A}_{*}(R) \rightarrow \mathbb{C}$ is defined by

$$
\begin{aligned}
& \overline{\boldsymbol{r}}\left(a_{j}^{i} \otimes a_{l}^{k}\right)=\left(R^{-1}\right)_{j l}^{i k}, \quad \overline{\boldsymbol{r}}\left(a_{j}^{i} \otimes b_{l}^{k}\right)=\widetilde{R}_{l j}^{k i} \\
& \overline{\boldsymbol{r}}\left(a_{j}^{i} \otimes \mathbb{1}\right)=\overline{\boldsymbol{r}}\left(\mathbb{1} \otimes a_{j}^{i}\right)=\delta_{j}^{i} .
\end{aligned}
$$

Proof: The proof is similar to [KS97, Ch. 10.1.2, Theo. 7]. See Mal17] for a more detailed treatment.
4.2. The left symmetrization $\mathcal{H}=\mathcal{V}(\boldsymbol{R}) \otimes \mathcal{A}_{*}\left(\boldsymbol{R}^{\prime}\right)$. Consider the FRT-*-bialgebra $\mathcal{A}_{*}\left(R^{\prime}\right)$ for $R^{\prime}:=\tau(R)$. From Lemma 4.1 it follows that $\mathcal{A}_{*}\left(R^{\prime}\right)$ is coquasitriangular with the $r$-form $\boldsymbol{r}^{\prime}: \mathcal{A}_{*}\left(R^{\prime}\right) \otimes \mathcal{A}_{*}\left(\overline{R^{\prime}}\right) \rightarrow \mathbb{C}$ where

$$
\begin{array}{ll}
\boldsymbol{r}^{\prime}\left(a_{j}^{i} \otimes a_{l}^{k}\right)=R_{l j}^{k i}, & \boldsymbol{r}^{\prime}\left(a_{j}^{i} \otimes b_{l}^{k}\right)=R_{j l}^{i k}, \\
\boldsymbol{r}^{\prime}\left(b_{j}^{i} \otimes a_{l}^{k}\right)=\widetilde{R}_{l j}^{k i}, & \boldsymbol{r}^{\prime}\left(b_{j}^{i} \otimes b_{l}^{k}\right)=\left(R^{-1}\right)_{j l}^{i k}
\end{array}
$$

and the inverse $\overline{\boldsymbol{r}^{\prime}}: \mathcal{A}_{*}\left(R^{\prime}\right) \otimes \mathcal{A}_{*}\left(R^{\prime}\right) \rightarrow \mathbb{C}$ with

$$
\begin{aligned}
\overline{\boldsymbol{r}^{\prime}}\left(a_{j}^{i} \otimes a_{l}^{k}\right)=\left(R^{-1}\right)_{l j}^{k i}, & \overline{\boldsymbol{r}^{\prime}}\left(a_{j}^{i} \otimes b_{l}^{k}\right)=\widetilde{R}_{j l}^{i k}, \\
\overline{\boldsymbol{r}^{\prime}}\left(b_{j}^{i} \otimes a_{l}^{k}\right)=R_{l j}^{k i}, & \overline{\boldsymbol{r}^{\prime}}\left(b_{j}^{i} \otimes b_{l}^{k}\right)=R_{j l}^{i k}
\end{aligned}
$$

We extend $\boldsymbol{r}^{\prime}$ to general elements such that equations (3) are satisifed. Let $\mathcal{V}(R)$ be the free algebra generated by the elements $x_{1}, \cdots, x_{n}$ and their adjoints $v^{1}=$ $\left(x_{1}\right)^{*}, \cdots, v^{n}=\left(x_{n}\right)^{*}$. The map $\gamma: \mathcal{V}(R) \rightarrow \mathcal{A}_{*}\left(R^{\prime}\right) \otimes \mathcal{V}(R)$ with

$$
\gamma(\mathbb{1})=\mathbb{1} \otimes \mathbb{1}, \quad \gamma\left(x_{i}\right)=\sum_{j} b_{i}^{j} \otimes x_{j}, \quad \gamma\left(v^{i}\right)=\sum_{j} a_{j}^{i} \otimes v^{j}
$$

defines a left coaction on $\mathcal{V}(R)$. Thus the left action $\alpha=\left(\overline{\boldsymbol{r}^{\prime}} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \gamma)$ introduced in Lemma 2.3 is given by

$$
\begin{array}{ll}
\alpha\left(a_{j}^{i} \otimes x_{k}\right)=\sum_{l} \widetilde{R}_{j k}^{i l} x_{l}, & \alpha\left(a_{j}^{i} \otimes v^{k}\right)=\sum_{l}\left(R^{-1}\right)_{l j}^{k i} v^{l}, \\
\alpha\left(b_{j}^{i} \otimes x_{k}\right)=\sum_{l} R_{j k}^{i l} x_{l}, & \alpha\left(b_{j}^{i} \otimes v^{k}\right)=\sum_{l} R_{l j}^{k i} v^{l}
\end{array}
$$

and the braiding $\Psi$ is given by

$$
\begin{aligned}
& \Psi\left(x_{i} \otimes x_{j}\right)=\sum_{k, l} R_{i j}^{k l} x_{l} \otimes x_{k}, \\
& \Psi\left(x_{i} \otimes v^{j}\right)=\sum_{k, l} R_{l i}^{j k} v^{l} \otimes x_{k}, \\
& \Psi\left(v^{i} \otimes x_{j}\right)=\sum_{k, l} \widetilde{R}_{k j}^{i l} x_{l} \otimes v^{k}, \\
& \Psi\left(v^{i} \otimes v^{j}\right)=\sum_{k, l}\left(R^{-1}\right)_{l k}^{j i} v^{l} \otimes v^{k}
\end{aligned}
$$

on the generators and extended to arbitrary elements by

$$
\begin{aligned}
\Psi(\mathbb{1} \otimes u) & =u \otimes \mathbb{1}, \\
\Psi(u \otimes \mathbb{1}) & =\mathbb{1} \otimes u, \\
\Psi \circ(\mathrm{id} \otimes m) & =(m \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Psi) \circ(\Psi \otimes \mathrm{id}), \\
\Psi \circ(m \otimes \mathrm{id}) & =(\mathrm{id} \otimes m) \circ(\Psi \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \Psi),
\end{aligned}
$$

such that the multiplication is $\Psi$-invariant. $\mathcal{V}(R)$ becomes a bialgebra with comultiplication $\Delta$ and counit $\varepsilon$ given by

$$
\begin{aligned}
\Delta\left(x_{i}\right) & =x_{i} \otimes \mathbb{1}+\mathbb{1} \otimes x_{i}, & \Delta\left(v^{i}\right)=v^{i} \otimes \mathbb{1}+\mathbb{1} \otimes v^{i} \\
\varepsilon(\mathbb{1}) & =1, & \varepsilon\left(x_{i}\right)=\varepsilon\left(v^{i}\right)=0
\end{aligned}
$$

on the generators and extended such that it is a homomorphism from $\mathcal{V}(R)$ to $\mathcal{V}(R) \otimes \mathcal{V}(R)$, where the latter is equipped with the multiplication $(m \otimes m) \circ(\mathrm{id} \otimes$ $\Psi \otimes \mathrm{id})$. Hence $\mathcal{V}(R)$ is a braided $*$-bialgebra in the braided category $\left({ }^{\mathcal{A}}\left(R^{\prime}\right) \mathrm{C}_{*}, \Psi\right)$ and we can give the relations of the (left) symmetrization $\mathcal{H}=\mathcal{V}(R) \otimes \mathcal{A}\left(R^{\prime}\right)$ of $\mathcal{V}(R)$, cf. Corollary $3.2 \mathcal{H}$ is the $*$-bialgebra generated by the elements $x_{i} \otimes$ $\mathbb{1}_{\mathcal{A}_{*}\left(R^{\prime}\right)}, v^{i} \otimes \mathbb{1}_{\mathcal{A}_{*}\left(R^{\prime}\right)}=\left(x_{i}\right)^{*} \otimes \mathbb{1}_{\mathcal{A}_{*}\left(R^{\prime}\right)}, \mathbb{1}_{\mathcal{V}(R)} \otimes a_{j}^{i}, \mathbb{1}_{\mathcal{V}_{*}(R)} \otimes b_{i}^{j}=\mathbb{1}_{\mathcal{V}_{*}(R)} \otimes\left(a_{j}^{i}\right)^{*}$ with the relations

$$
\begin{aligned}
\sum_{p, q} R_{p q}^{i k} a_{j}^{p} a_{l}^{q} & =\sum_{p, q} a_{q}^{k} a_{p}^{i} R_{j l}^{p q} \\
\sum_{k, j} R_{k l}^{i j} b_{q}^{k} a_{j}^{p} & =\sum_{k, j} a_{l}^{k} b_{j}^{i} R_{q k}^{j p}
\end{aligned}
$$

$$
\begin{aligned}
a_{k}^{j} x_{i} & =\sum_{p, l} \widetilde{R}_{p i}^{j l} x_{l} a_{k}^{p}, \\
b_{k}^{j} x_{i} & =\sum_{p, l} R_{k i}^{p l} x_{l} b_{p}^{j}, \\
a_{k}^{j} v_{i} & =\sum_{p, l}\left(R^{-1}\right)_{l p}^{i j} v^{l} a_{k}^{p}, \\
b_{k}^{j} v^{i} & =\sum_{p, l} R_{l k}^{i p} v^{l} b_{p}^{j}, \\
\Delta\left(a_{j}^{i}\right) & =\sum_{k} a_{k}^{i} \otimes a_{j}^{k}, \\
\Delta\left(b_{j}^{i}\right) & =\sum_{k} b_{j}^{k} \otimes b_{k}^{i}, \\
\Delta\left(x_{i}\right) & =x_{i} \otimes \mathbb{1}+\sum_{j} b_{i}^{j} \otimes x_{j}, \\
\Delta\left(v^{i}\right) & =v^{i} \otimes \mathbb{1}+\sum_{j} a_{j}^{i} \otimes v^{j}, \\
\varepsilon\left(a_{j}^{i}\right) & =\varepsilon\left(b_{j}^{i}\right)=\delta_{j}^{i}, \\
\varepsilon\left(x_{i}\right) & =\varepsilon\left(v^{i}\right)=0 .
\end{aligned}
$$

4.3. The right symmetrization $\mathcal{H}_{R}=\mathcal{A}_{*}(\boldsymbol{R}) \otimes \mathcal{V}(\boldsymbol{R})$. For the second construction we choose the coquasi-triangular $*$-bialgebra $\mathcal{A}_{*}(R)$ with universal $r$-form $\boldsymbol{r}: \mathcal{A}_{*}(R) \otimes \mathcal{A}_{*}(R) \rightarrow \mathbb{C}$ from Lemma 4.1 given by

$$
\begin{aligned}
\boldsymbol{r}\left(a_{j}^{i} \otimes a_{l}^{k}\right) & =R_{j l}^{i k}, & \boldsymbol{r}\left(a_{j}^{i} \otimes b_{l}^{k}\right) & =R_{l j}^{k i}, \\
\boldsymbol{r}\left(b_{j}^{i} \otimes a_{l}^{k}\right) & =\widetilde{R}_{j l}^{i k}, & \boldsymbol{r}\left(b_{j}^{i} \otimes b_{l}^{k}\right) & =\left(R^{-1}\right)_{l j}^{k i}
\end{aligned}
$$

and inverse $\overline{\boldsymbol{r}}: \mathcal{A}_{*}(R) \otimes \mathcal{A}_{*}(R) \rightarrow \mathbb{C}$

$$
\begin{aligned}
\overline{\boldsymbol{r}}\left(a_{j}^{i} \otimes a_{l}^{k}\right) & =\left(R^{-1}\right)_{j l}^{i k}, & & \overline{\boldsymbol{r}}\left(a_{j}^{i} \otimes b_{l}^{k}\right)
\end{aligned}=\widetilde{R}_{l j}^{k i}, ~ 子, ~ \overline{\boldsymbol{r}}\left(b_{j}^{i} \otimes b_{l}^{k}\right)=R_{l j}^{k i} .
$$

The map $\bar{\gamma}: \mathcal{V}(R) \rightarrow \mathcal{V}(R) \otimes \mathcal{A}_{*}(R)$ with

$$
\bar{\gamma}(\mathbb{1})=\mathbb{1} \otimes \mathbb{1}, \quad \bar{\gamma}\left(x_{i}\right)=\sum_{j} x_{j} \otimes a_{i}^{j}, \quad \bar{\gamma}\left(v^{i}\right)=\sum_{j} v^{j} \otimes b_{j}^{i}
$$

defines a right coaction on $\mathcal{V}(R)$. Thus $\bar{\alpha}=(\mathrm{id} \otimes \boldsymbol{r}) \circ(\bar{\gamma} \otimes \mathrm{id})$ gives us a right action $\bar{\alpha}: \mathcal{V}(R) \otimes \mathcal{A}_{*}(R) \rightarrow \mathcal{V}(R)$ as an analog of Lemma 2.3 which is given on the generators by

$$
\begin{array}{rlrl}
\bar{\alpha}\left(x_{i} \otimes a_{j}^{k}\right) & =R_{i j}^{l k} x_{l}, & \bar{\alpha}\left(x_{i} \otimes b_{j}^{k}\right)=R_{j i}^{k l} x_{l}, \\
\bar{\alpha}\left(v^{i} \otimes a_{j}^{k}\right)=\widetilde{R}_{l j}^{i k} v^{l}, & \bar{\alpha}\left(v^{i} \otimes b_{j}^{k}\right)=\left(R^{-1}\right)_{j l}^{k i} v^{l} .
\end{array}
$$

Furthermore the braiding is defined by

$$
\begin{aligned}
& \bar{\Psi}\left(x_{i} \otimes x_{j}\right)=\sum_{l} R_{i j}^{l k} x_{k} \otimes x_{l}, \\
& \bar{\Psi}\left(x_{i} \otimes v^{j}\right)=\sum_{l} R_{k i}^{j l} v^{k} \otimes x_{l}, \\
& \bar{\Psi}\left(v^{i} \otimes x_{j}\right)=\sum_{l} \widetilde{R}_{l j}^{i k} x_{k} \otimes v^{l}, \\
& \bar{\Psi}\left(v^{i} \otimes v^{j}\right)=\sum_{k}\left(R^{-1}\right)_{k l}^{j i} v^{k} \otimes v^{l} .
\end{aligned}
$$

Therefore we can define a braided category $\left(\left(\mathrm{C}^{\mathcal{A}_{*}}(R)\right)_{*}, \bar{\Psi}\right)$ whose objects are right $\mathcal{A}_{*}(R)$-comodules in the same way as we constructed $\left({ }^{\mathcal{A}} \mathrm{C}_{*}, \Psi\right)$ in Subsection 2.2 . and $\mathcal{V}(R)$ is a braided $*$-bialgebra in the category $\left(\left(\mathrm{C}^{\mathcal{A}_{*}(R)}\right)_{*}, \bar{\Psi}\right)$. Using a version of Corollary 3.2 for this category, we get the right symmetrization $\mathcal{H}_{R}=\mathcal{A}_{*}(R) \otimes$ $\mathcal{V}(R)$. It is the $*$-bialgebra generated by the elements $\mathbb{1}_{\mathcal{A}_{*}(R)} \otimes x_{i}, \mathbb{1}_{\mathcal{A}_{*}(R)} \otimes v^{i}, a_{j}^{i} \otimes$ $\mathbb{1}_{\mathcal{V}(R)}, b_{j}^{i} \otimes \mathbb{1}_{\mathcal{V}(R)}$ with the relations

$$
\begin{aligned}
\sum_{p, q} R_{p q}^{i k} a_{j}^{p} a_{l}^{q} & =\sum_{p, q} a_{q}^{k} a_{p}^{i} R_{j l}^{p q}, \\
\sum_{k, j} R_{k l}^{i j} b_{q}^{k} a_{j}^{p} & =\sum_{k, j} a_{l}^{j} b_{k}^{i} R_{q j}^{k p}, \\
x_{i} a_{k}^{j} & =\sum_{p, l} R_{i k}^{l p} a_{p}^{j} x_{l}, \\
x_{i} b_{k}^{j} & =\sum_{p, l} R_{p i}^{j l} x_{l} b_{p}^{j}, \\
v^{i} a_{k}^{j} & =\sum_{p, l} \widetilde{R}_{l k}^{i p} v^{l} a_{k}^{p}, \\
v^{i} b_{k}^{j} & =\sum_{p, l}\left(R^{-1}\right)_{l k}^{i p} v^{l} b_{p}^{j}, \\
\Delta\left(a_{j}^{i}\right) & =\sum_{k} a_{k}^{i} \otimes a_{j}^{k}, \\
\Delta\left(b_{j}^{i}\right) & =\sum_{k} b_{j}^{k} \otimes b_{k}^{i}, \\
\Delta\left(x_{i}\right) & =\sum_{j} x_{j} \otimes a_{j}^{i}+\mathbb{1} \otimes x_{i}, \\
\Delta\left(v^{i}\right) & =\sum_{j} v^{j} \otimes b_{i}^{j}+\mathbb{1} \otimes v^{j}, \\
\varepsilon\left(a_{j}^{i}\right) & =\varepsilon\left(b_{j}^{i}\right)=\delta_{j}^{i}, \\
\varepsilon\left(x_{i}\right) & =\varepsilon\left(v^{i}\right)=0 .
\end{aligned}
$$

## 5. Realization of Quantum Lévy processes on braided *-Bialgebras

In this section we will show that there always exists a Lévy process on the braided $*$-spaces constructed in the previous section that can be considered as a standard Brownian motion on these spaces.

Definition 5.1. Sch93, Section 5.1] Let $\mathcal{B}$ be a braided bialgebra. A linear functional $\phi: \mathcal{B} \rightarrow \mathbb{C}$ is called quadratic (or Gaussian), if it satisfies

$$
\phi(a b c)=0
$$

for all $a, b, c \in \operatorname{ker} \varepsilon_{\mathcal{B}}$. A Lévy process whose generator is quadratic is called Brownian motion.

For the rest of this section $R$ will denote a fixed bi-invertible R-matrix of real type I , and $\mathcal{V}(R)$ the associated free braided $*$-space from the previous section. For explicit calculations we will use the basis $B$ consisting of the words in the generators $x_{1}, \ldots, x_{n}, v^{1}, \ldots, v^{n}$. Let $L: \mathcal{V}(R) \rightarrow \mathbb{C}$ be the functional defined by $L\left(x_{i} v^{j}\right)=\delta_{i}^{j}$ on basis elements of the form $x_{i} v^{j}$, and zero on all other basis elements.

Proposition 5.2. The functional $L$ is quadratic, $\Psi$-invariant, hermitian, and conditionally positive (i.e. positive on ker $\varepsilon_{\mathcal{B}}$ ).
Proof: For the $\Psi$-invariance we have to show that $(\mathrm{id} \otimes L) \circ \Psi=\Psi \circ(L \otimes \mathrm{id})$. It is

$$
\begin{aligned}
(\mathrm{id} \otimes L) \circ \Psi\left(x_{i} v^{j} \otimes x_{k}\right) & =\sum_{r, s, p, q} \widetilde{R}_{p k}^{j q} R_{i q}^{r s} x_{s} \otimes L\left(x_{r} v^{p}\right)=\sum_{s} \delta_{i}^{j} \delta_{k}^{s} x_{s} \\
& =\Psi \circ(L \otimes \mathrm{id})\left(x_{i} v^{j} \otimes x_{k}\right) .
\end{aligned}
$$

Similary we get

$$
\begin{aligned}
(\mathrm{id} \otimes L) \circ \Psi\left(x_{i} v^{j} \otimes v^{k}\right) & =\sum_{r, s, p, q}\left(R^{-1}\right)_{p q}^{k j} R_{r i}^{p s} v^{r} \otimes L\left(x_{s} v^{q}\right)=\sum_{r} \delta_{r}^{k} \delta_{i}^{j} v^{r} \\
& =\Psi \circ(L \otimes \mathrm{id})\left(x_{i} v^{j} \otimes v^{k}\right) .
\end{aligned}
$$

A generator $L$ is quadratic, if and only if the associated representation is of the form $\rho=\varepsilon(\cdot)$ id. This is the case, since we have $\rho\left(x_{i}\right)=\rho\left(v^{i}\right)=0$ (see below). That $L$ is hermitian and conditionally positive are straightforward calculations.

We can now carry out the construction described in Sch93, Chapter 2] to obtain quantum stochastic differential equations for the symmetrization of the process $\left(j_{s t}\right)_{0 \leq s \leq t}$ associated to the generator $L$. Let

$$
\mathcal{N}:=\left\{b \in \mathcal{V}(R) \mid L\left((u-\varepsilon(u) \mathbb{1})^{*}(u-\varepsilon(u) \mathbb{1})\right)=0\right\}
$$

and $P:=\mathcal{V}(R) / \mathcal{N} . P$ is a Hilbert space with the inner product induced by $\langle u, v\rangle=$ $\left.L(u-\varepsilon(u) \mathbb{1})^{*}(v-\varepsilon(v) \mathbb{1})\right)$. Furthermore $\left(\eta\left(v^{i}\right)\right)_{i \in\{1, \ldots, n\}}$ with

$$
\begin{aligned}
\eta: \mathcal{V}(R) & \rightarrow P \\
b & \mapsto b+\mathcal{N}
\end{aligned}
$$

forms an orthonormal basis in $P$ and we have

$$
\eta(y)= \begin{cases}v^{i}+\mathcal{N}, & \text { if } y=v^{i} \\ 0, & \text { else }\end{cases}
$$

Therefore it is $P \cong \mathbb{C}^{n}$. Since $\eta$ is a $\rho$-cocycle it is

$$
\begin{aligned}
& \rho\left(x_{i}\right) \eta\left(v^{j}\right)=\eta\left(x_{i} v^{j}\right)-\eta\left(x_{i}\right) \varepsilon\left(v^{j}\right)=0 \\
& \rho\left(v^{i}\right) \eta\left(v^{j}\right)=\eta\left(v^{i} v^{j}\right)-\eta\left(v^{i}\right) \varepsilon\left(v^{j}\right)=0
\end{aligned}
$$

and thus $\rho\left(x_{i}\right)=\rho\left(v^{i}\right)=0$. One verifies that $L$ is $\alpha$-invariant for the right action $\bar{\alpha}=(\mathrm{id} \otimes \boldsymbol{r}) \circ(\bar{\gamma} \otimes \mathrm{id})$ from Lemma 2.3, i.e. $L(\alpha(u \otimes a))=\varepsilon_{\mathcal{A}}(a) L(u)$ for all $a \in \mathcal{A}(R), u \in \mathcal{V}(R)$. Therefore we can use Theorem 3.7 to get the triple ( $\left.\rho^{\mathcal{H}_{R}}, \eta^{\mathcal{H}_{R}}, L^{\mathcal{H}_{R}}\right)$ on the right symmetrization $\mathcal{H}_{R}$. The pre-Hilbert space is given by $P^{\mathcal{H}_{R}}=(\mathcal{A}(R) \otimes \mathcal{V}(R)) / \mathcal{N}^{\mathcal{H}_{R}}$ with

$$
\mathcal{N}^{\mathcal{H}_{R}}:=\left\{a \otimes b \mid L^{\mathcal{H}_{R}}\left(a \otimes b-\delta_{\mathcal{H}_{R}}(a \otimes b) \mathbb{1}_{\mathcal{H}_{R}}\right)^{*}\left(a \otimes b-\delta_{\mathcal{H}_{R}}(a \otimes b) \mathbb{1}_{\mathcal{H}_{R}}\right)=0\right\} .
$$

The $\rho$-cocycle $\eta^{\mathcal{H}_{R}}: \mathcal{H}_{R} \rightarrow P^{\mathcal{H}_{R}}$ is given by

$$
\eta^{\mathcal{H}_{R}}(1 \otimes y)= \begin{cases}\eta(1 \otimes y)=v^{i}+\mathcal{N}, & \text { for } y=v^{i}  \tag{20}\\ 0, & \text { else. }\end{cases}
$$

and it follows for the $*$-representation $\rho^{\mathcal{H}_{R}}$ that we have

$$
\rho^{\mathcal{H}_{R}}\left(\mathbb{1}_{\mathcal{A}} \otimes b\right) \eta^{\mathcal{H}_{R}}\left(\mathbb{1}_{\mathcal{A}} \otimes v^{i}\right)= \begin{cases}v^{i}+\mathcal{N}, & \text { for } b=\mathbb{1}_{\mathcal{B}} \text { (the empty word) }  \tag{21}\\ 0, & \text { else }\end{cases}
$$

and

$$
\rho^{\mathcal{H}_{R}}\left(a \otimes \mathbb{1}_{\mathcal{B}}\right) \eta^{\mathcal{H}_{R}}\left(\mathbb{1}_{\mathcal{A}} \otimes v^{i}\right)= \begin{cases}\widetilde{R}_{p j}^{k i} \eta^{\mathcal{H}_{R}}\left(\mathbb{1}_{\mathcal{A}} \otimes v^{p}\right), & \text { for } a=a_{j}^{i}  \tag{22}\\ \left(R^{-1}\right)_{j p}^{i k} \eta^{\mathcal{H}_{R}}\left(\mathbb{1}_{\mathcal{A}} \otimes v^{p}\right), & \text { for } a=b_{j}^{i} .\end{cases}
$$

The generator $L$ is given by

$$
L^{\mathcal{H}_{R}}(a \otimes b)= \begin{cases}\delta_{i j} \delta_{k l}, & \text { for } a=a_{j}^{i} \text { or } b_{j}^{i} \text { and } b=x_{k} v^{l}  \tag{23}\\ 0, & \text { else }\end{cases}
$$

Using the theory of Schürmann [Sch93, Chapter 2] we get the following theorem.
Theorem 5.3. Let $j_{s t}^{H}$ be the Lévy process in $\mathcal{H}_{R}$ with triple $\left(\eta^{\mathcal{H}_{R}}, \rho^{\mathcal{H}_{R}}, L^{\mathcal{H}_{R}}\right)$ given in equations (20) - Then a realisation of the right symmetrization $j_{s t}^{H}$ on the Fock space $\Gamma\left(L^{2}\left(\mathbb{R}_{+}, \mathbb{C}^{n}\right)\right)$ is given by the unique solution of the quantum
stochastic differential equations

$$
\begin{aligned}
\mathrm{d} X_{i} & =\sum_{j} \mathrm{~d} X_{j} \cdot \mathrm{~d} \Lambda\left(\left(\widetilde{R}_{l i}^{k j}-\delta_{i}^{j} \delta_{l}^{k}\right)_{1 \leq k, l \leq n}\right)+\mathrm{d} A_{i} \\
\mathrm{~d} X_{i}^{*} & =\sum_{j} \mathrm{~d} X_{j}^{*} \cdot \mathrm{~d} \Lambda\left(\left(\left(R^{-1}\right)_{i p}^{j k}-\delta_{i}^{j} \delta_{p}^{k}\right)_{1 \leq k, p \leq n}\right)+\mathrm{d} A_{i}^{*} \\
\mathrm{~d} A_{j}^{i} & =\sum_{k} A_{k}^{i} \cdot \mathrm{~d} \Lambda\left(\left(\widetilde{R}_{p j}^{l k}-\delta_{j}^{k} \delta_{p}^{l}\right)_{1 \leq l, p \leq n}\right) \\
\mathrm{d} B_{j}^{i} & =\sum_{k} A_{k}^{i} \cdot \mathrm{~d} \Lambda\left(\left(\left(R^{-1}\right)_{k p}^{i l}-\delta_{k}^{i} \delta_{p}^{l}\right)_{1 \leq l, p \leq n}\right)
\end{aligned}
$$

where

$$
\begin{aligned}
\mathrm{d} X_{i} & :=\mathrm{d} j_{s t}^{\mathcal{H}_{R}}\left(\mathbb{1} \otimes x_{i}\right) \\
\mathrm{d} X_{i}^{*} & :=\mathrm{d} j_{s t}^{\mathcal{H}_{R}}\left(\mathbb{1} \otimes v_{i}\right) \\
\mathrm{d} A_{j}^{i} & :=\mathrm{d} j_{s t}^{\mathcal{H}_{R}}\left(a_{j}^{i} \otimes \mathbb{1}\right) \\
\mathrm{d} B_{j}^{i} & :=\mathrm{d} j_{s t}^{\mathcal{H}_{R}}\left(b_{j}^{i} \otimes \mathbb{1}\right) .
\end{aligned}
$$

## 6. Examples

6.1. The one-dimensional $\boldsymbol{R}$-matrix $\boldsymbol{R}=(\boldsymbol{q})$. Let us first consider the onedimensional $R$-matrix $R_{1}=(q)$. For $q \in \mathbb{R}, q \neq 0$, this is a bi-invertible $R$-matrix of real-type I and defines therefore a braided $*$-space $\mathcal{V}(q)$. As an algebra $\mathcal{V}(q)$ is the free algebra generated by $x$ and $x^{*}=v$. We will use the words in $x$ and $v$ as a basis for $\mathcal{V}(q)$. The braiding is given by

$$
\begin{aligned}
\Psi(x \otimes x)=q x \otimes x, & \Psi(x \otimes v)=q v \otimes x, \\
\Psi(v \otimes x)=q^{-1} x \otimes v, & \Psi(v \otimes v)=q^{-1} v \otimes v .
\end{aligned}
$$

To be a generator of a Brownian Motion a linear functional $L: \mathcal{V}(q) \rightarrow \mathbb{C}$ has to be $\Psi$-invariant, i.e. it has to satisfy

$$
\begin{aligned}
L(x) x & =\Psi \circ(L \otimes \mathrm{id})(x \otimes x)=(\mathrm{id} \otimes L) \circ \Psi(x \otimes x)=q L(x) x \\
L(v) x & =\Psi \circ(L \otimes \mathrm{id})(v \otimes x)=(\mathrm{id} \otimes L) \circ \Psi(v \otimes x)=q L(v) x \\
L(x x) x & =\Psi \circ(L \otimes \mathrm{id})(x x \otimes x)=(\mathrm{id} \otimes L) \circ \Psi(x x \otimes x)=q^{2} L(x x) x \\
L(x v) x & =\Psi \circ(L \otimes \mathrm{id})(x v \otimes x)=(\mathrm{id} \otimes L) \circ \Psi(x v \otimes x)=L(x v) x \\
L(v x) x & =\Psi \circ(L \otimes \mathrm{id})(v x \otimes x)=(\mathrm{id} \otimes L) \circ \Psi(v x \otimes x)=q L(v x) x \\
L(v v) x & =\Psi \circ(L \otimes \mathrm{id})(v v \otimes x)=(\mathrm{id} \otimes L) \circ \Psi(v v \otimes x)=q^{-2} L(v v) x
\end{aligned}
$$

and a similar set of equations for $v$. Thus for $q^{2} \neq 1$ a $\Psi$-invariant quadratic functional can have non-zero values only on $x v$ and $v x$. A quadratic functional on
$\mathcal{V}(q)$ is conditionally positive if and only if the matrix

$$
\hat{L}:=\left(\begin{array}{ll}
L(x v) & L(x x) \\
L(v v) & L(v x)
\end{array}\right)
$$

is positive semi-definite. It is also hermitian if we have $L(v)=\overline{L(x)}$. Thus we get the following classification for the quadratic generators on $\mathcal{V}(q)$.

Theorem 6.1. A quadratic functional $L: \mathcal{V}(q) \rightarrow \mathbb{C}$ is a generator of a Lévy process on $\mathcal{V}(q)$ if and only if

1. for $q=1: \hat{L}$ is positive semi-definite and $L(v)=\overline{L(x)}$,
2. for $q=-1$ : $\hat{L}$ is positive semi-definite and $L(x)=L(v)=0$,
3. for $q^{2} \neq 1$ : $L(x v), L(v x) \geq 0$ and $L$ vanishes on all other basis elements.

The symmetrization of this braided $*$-space gives for $\mathcal{A}(q)$ the free commutative algebra with group-like generator $a$ and its adjoint $b$. $\mathcal{H}$ is generated by $a, x$ and their adjoints $b=a^{*}$ and $v=x^{*}$. The algebraic relations are

$$
a b=b a, \quad x a=q a x, \quad b x=q x b
$$

and the coalgebraic relations are

$$
\Delta(a)=a \otimes a, \quad \Delta(x)=x \otimes a+\mathbb{1} \otimes x .
$$

Let $L$ now be the generator with $L(x v)=1$ and $L(u)=0$ on all other basis elements. The construction of the triple gives the pre-Hilbert space $D^{\mathcal{H}_{R}}=\mathbb{C}$, the $\rho$-cocycle

$$
\eta^{\mathcal{H}_{R}}(m)= \begin{cases}0, & \text { for } m \in\{x, a, b\} \\ 1, & \text { for } m=v\end{cases}
$$

and the representation

$$
\rho^{\mathcal{H}_{R}}(m)= \begin{cases}q^{-1}, & \text { for } m \in\{a, b\} \\ 0, & \text { for } m \in\{x, v\} .\end{cases}
$$

Thus we get the stochastic differential equations

$$
\begin{aligned}
\mathrm{d} X & =X \mathrm{~d} \Lambda\left(q^{-1}-1\right)+\mathrm{d} A(1) \\
\mathrm{d} V & =V \mathrm{~d} \Lambda\left(q^{-1}-1\right)+\mathrm{d} A^{*}(1) \\
\mathrm{d} A & =A \mathrm{~d} \Lambda\left(q^{-1}-1\right) \\
\mathrm{d} B & =B \mathrm{~d} \Lambda\left(q^{-1}-1\right)
\end{aligned}
$$

for the processes $X(t)=j_{t}(x), V(t)=j_{t}(v), A(t)=j_{t}(a), B(t)=j_{t}(b)$. The solution of this system of quantum stochastic differential equations is the quantum Azéma martingale, see Par90 Sch91.
6.2. The $\boldsymbol{s l _ { 2 }} \boldsymbol{-} \boldsymbol{R}$-matrix. Let $R_{2}$ be the $R$-Matrix of the standard two-dimensional quantum plane, i.e.

$$
R_{2}=\left(\begin{array}{cccc}
q^{2} & 0 & 0 & 0 \\
0 & q & q^{2}-1 & 0 \\
0 & 0 & q & 0 \\
0 & 0 & 0 & q^{2}
\end{array}\right)
$$

cf. Maj95b, Example 10.2.2].
Then $t R_{2}$ with $q, t \in \mathbb{R}, q, t \neq 0$ is bi-invertible and of real type I and we can therefore define a braided $*$-space $\mathcal{V}\left(t R_{2}\right)$ for it. As an algebra this is the free algebra generated by $x_{1}, x_{2}$ and their adjoints $x_{1}^{*}=v^{1}, x_{2}^{*}=v^{2}$. We will use the words in these four elements as a basis of $\mathcal{V}\left(t R_{2}\right)$. It turns out that the $\Psi$-invariance restricts very much the possible generators.

Proposition 6.2. Let $L$ be a quadratic functional on $\mathcal{V}\left(t R_{2}\right), q, t \neq 0$. Then $L$ is characterized by

$$
\begin{array}{ll}
A=\left(A_{i j}\right)=\left(L\left(x_{i} x_{j}\right)\right) & B=\left(B_{i}{ }^{j}\right)=\left(L\left(x_{i} v^{j}\right)\right) \\
C=\left(C^{i}{ }_{j}\right)=\left(L\left(v^{i} x_{j}\right)\right) & D=\left(D^{i j}\right)=\left(L\left(v^{i} v^{j}\right)\right) \\
a=\left(a_{i}\right)=\left(L\left(x_{i}\right)\right) & b=\left(b^{i}\right)=\left(L\left(v^{i}\right)\right)
\end{array}
$$

The functional $L$ is $\Psi$-invariant if and only if

1. for $q=1$ and
a) $t=1$ : all functionals are $\Psi$-invariant
b) $t=-1: a=b=0$ and $A, B, C$ and $D$ are arbitrary
c) $t^{2} \neq 1: A=D=0$ and $a=b=0$ and $B$ and $C$ are arbitrary
2. for $q=-1$ and
a) $t^{2}=1: A, B, C$ and $D$ are diagonal and $a, b$ vanish
b) $t^{2} \neq 1: B, C$ are diagonal and $A, D, a, b$ vanish
3. for $q^{2} \neq 1$ and
a) $t^{2} q^{3}=1: q A_{12}+A_{21}=0, B_{1}{ }^{1}=B_{2}{ }^{2}, C^{1}{ }_{1}=q^{2} C^{2}{ }_{2}, D^{12}+q D^{21}=0$ and all other coefficients vanish
b) $t^{2} q^{3} \neq 1: B_{1}{ }^{1}=B_{2}{ }^{2}, C^{1}{ }_{1}=q^{2} C^{2}{ }_{2}$ and all other coefficients vanish

Proof: Let $L$ be an arbitrary quadratic functional. $L$ ist $\Psi$-invariant if and only if the following equations are satisifed

$$
\begin{aligned}
& A_{i j} \delta_{k}^{l}=\sum_{n_{1}, n_{2}, n_{3}} t^{2} A_{n_{3} n_{1}} R^{n_{3}}{ }_{i{ }^{l} n_{2}} R_{j_{1}}^{n_{1}}{ }^{n_{2}}{ }_{k}, \\
& A_{i j} \delta_{l}^{k}=\sum_{n_{1}, n_{2}, n_{3}} t^{2} A_{n_{3} n_{1}} R_{l}^{n_{2}{ }_{l}{ }_{l}{ }_{i}{ }_{i} R_{n_{2}}^{k}{ }^{n_{1}}{ }_{j},} \\
& B_{i}^{j} \delta_{k}^{l}=\sum_{n_{1}, n_{2}, n_{3}} B_{n_{3}}{ }^{n_{1}} R_{i{ }_{i}}^{n_{3} l} \widetilde{R}_{n_{1}}^{j}{ }_{k}^{n_{2}}, \\
& B_{i}{ }^{j} \delta_{l}^{k}=\sum_{n_{1}, n_{2}, n_{3}} B_{n_{3}}{ }^{n_{1}} R^{n_{2}}{ }_{l}{ }^{n_{3}}{ }_{i}\left(R^{-1}\right)^{k}{ }_{n_{2}}{ }^{j}{ }_{n_{1}}, \\
& C^{i}{ }_{j} \delta_{k}^{l}=\sum_{n_{1}, n_{2}, n_{3}} C^{n_{3}}{ }_{n_{1}} \widetilde{R}_{n_{3}{ }^{i}{ }_{2}{ }_{2} R_{j}^{n_{1}{ }_{j}{ }_{2}}{ }_{k}, ~}^{\text {, }} \\
& C^{i} \delta_{l}^{k}=\sum_{n_{1}, n_{2}, n_{3}} C_{n_{1}}^{n_{3}}\left(R^{-1}\right)^{n_{2}}{ }_{l}{ }_{l{ }_{n}}{ }_{3} R_{n_{2}}^{k}{ }_{n_{1}}{ }_{j}, \\
& D^{i j} \delta_{k}^{l}=\sum_{n_{1}, n_{2}, n_{3}} t^{-2} D^{n_{3} n_{1}} \widetilde{R}_{n_{3}}^{i}{ }_{n_{2}} \widetilde{R}_{n_{1}}^{j}{ }_{k}{ }_{k}, \\
& D^{i j} \delta_{l}^{k}=\sum_{n_{1}, n_{2}, n_{3}} t^{-2} D^{n_{3} n_{1}}\left(R^{-1}\right)^{n_{2}}{ }_{l}{ }_{l n_{3}}\left(R^{-1}\right)^{k}{ }_{n_{2}}{ }^{j}{ }_{n_{1}}, \\
& a_{i} \delta_{j}^{k}=\sum_{n_{1}} t R^{n_{1}}{ }_{i}{ }_{j}{ }_{j} a_{n_{1}}, \quad a_{i} \delta_{k}^{j}=\sum_{n_{1}} t R^{j}{ }_{k}{ }^{n_{1}}{ }_{i} a_{n_{1}}, \\
& b^{i} \delta_{j}^{k}=\sum_{n_{1}} t^{-1} \widetilde{R}_{n_{1}}^{i}{ }_{j}{ }_{j} b^{n_{1}} \quad b^{i} \delta_{k}^{j}=\sum_{n_{1}} t^{-1}\left(R^{-1}\right)^{j}{ }_{k}{ }_{k}{ }_{n_{1}} b^{n_{1}}
\end{aligned}
$$

for all $i, j, k, l=1, \ldots, n$. These equations follow directly from the invariance condition. For the first equation, e.g., we apply $\Psi \circ(L \otimes \mathrm{id})=(\mathrm{id} \otimes L) \circ \Psi$ to $x_{i} x_{j} \otimes x_{k}$. Solving this system of linear equations (using e.g. a computer program for symbolic computation like Maple) one arrives at the results listed in the proposition.

The functional $L$ is conditionally positive semi-definite, if and only if the matrix

$$
\hat{L}:=\left(L\left(\begin{array}{cc}
x_{i} v^{j} & x_{i} x_{j} \\
v^{i} v^{j} & v^{i} x_{j}
\end{array}\right)\right)=\left(\begin{array}{cc}
B & A \\
D & C
\end{array}\right)
$$

is positive semi-definite. For $L$ to be hermitian, we need to impose furthermore $a_{i}=L\left(x_{i}\right)=\overline{L\left(v^{i}\right)}=\overline{b^{i}}$, for $i=1, \ldots, n$. This leads to the following classification.
Theorem 6.3. Suppose $q^{2} \neq 1$.
a) If $t^{2} q^{3}=1$, then all $\Psi$-invariant generators on $\mathcal{V}\left(t R_{2}\right)$ are of the form

$$
\hat{L}=\left(\begin{array}{cccc}
b & 0 & 0 & -q a \\
0 & b & a & 0 \\
0 & \bar{a} & q^{2} c & 0 \\
-q \bar{a} & 0 & 0 & c
\end{array}\right)
$$

and $L\left(x_{i}\right)=L\left(v^{i}\right)=0$ for $i=1, \ldots, n$, where $b, c \geq 0$, $b c \geq q^{2}|a|^{2}$, and $b c \geq q^{-2}|a|^{2}$.
b) If $t^{2} q^{3} \neq 1$, then all $\Psi$-invariant generators on $\mathcal{V}\left(t R_{2}\right)$ are of the form

$$
\hat{L}=\left(\begin{array}{cccc}
b & 0 & 0 & 0 \\
0 & b & 0 & 0 \\
0 & 0 & q^{2} c & 0 \\
0 & 0 & 0 & c
\end{array}\right)
$$

and $L\left(x_{i}\right)=L\left(v^{i}\right)=0$ for $i=1, \ldots, n$, where $b, c \geq 0$.
Proof: a) Proposition 6.2 a) implies that a $\Psi$-invariant functional

$$
L: \mathcal{V}\left(t R_{2}\right) \rightarrow \mathbb{C}
$$

is of the form

$$
\hat{L}=\left(\begin{array}{cccc}
b & 0 & 0 & -q a \\
0 & b & a & 0 \\
0 & d & q^{2} c & 0 \\
-q d & 0 & 0 & c
\end{array}\right)
$$

and $L\left(x_{i}\right)=L\left(v^{i}\right)=0$, where $a=L\left(x_{2} x_{1}\right), b=L\left(x_{1} v^{1}\right), c=L\left(v^{2} x_{2}\right)$ and $d=L\left(v^{1} x_{2}\right)$. Such an invariant functional $L$ is a generator, if and only if this matrix is positive semi-definite. This is the case if and only if the matrices $\left(\begin{array}{cc}b & -q a \\ -q d & c\end{array}\right)$ and $\left(\begin{array}{cc}b & a \\ d & q^{2} c\end{array}\right)$ are positive semi-definite, which leads immediatly to to the conditions given in the theorem.
b) Proposition 6.2 b ) shows us that if $t^{2} q^{3} \neq 1$, then $L$ is $\Psi$-invariant if and only if we also have $a=d=0$.
6.3. The $s l_{3}$ - $\boldsymbol{R}$-matrix. Let now

$$
R_{3}=\left(\begin{array}{ccccccccc}
q^{2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & q & 0 & q^{2}-1 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & q & 0 & 0 & 0 & q^{2}-1 & 0 & 0 \\
0 & 0 & 0 & q & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & q^{2} & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & q & 0 & q^{2}-1 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & q & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & q & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & q^{2}
\end{array}\right)
$$

be the $s l_{3}$ - $R$-matrix. We get a similar classification for the generators on $\mathcal{V}\left(t R_{3}\right)$ as in the previous subsection, but there are no additional generators for the special case $t^{2} q^{3}=1$ (as in Proposition 6.2 c) ).

Theorem 6.4. Suppose $q^{2} \neq 1$. Then all $\Psi$-invariant generators on $\mathcal{V}\left(t R_{3}\right)$ are of the form

$$
\hat{L}=\left(\begin{array}{cccccc}
b & 0 & 0 & 0 & 0 & 0 \\
0 & b & 0 & 0 & 0 & 0 \\
0 & 0 & b & 0 & 0 & 0 \\
0 & 0 & 0 & q^{4} c & 0 & 0 \\
0 & 0 & 0 & 0 & q^{2} c & 0 \\
0 & 0 & 0 & 0 & 0 & c
\end{array}\right)
$$

and $L\left(x_{i}\right)=L\left(v^{i}\right)=0$ for $i=1, \ldots, n$, where $b, c \geq 0$.
Proof: We first determine all invariant quadratic functionals and then we check positivity, as in Proposition 6.2 and Theorem 6.3.
6.4. The braided quantum $S U(2)$ groups $S U_{q}(2), q \in \mathbb{C} \backslash\{0\}$. Finally, let us treat the braided Hopf-*-algebra underlying the braided compact quantum groups introduced and studied by Kasprzak, Meyer, Roy, and Woronowicz in KMRW16. The braiding is not actually defined in KMRW16, instead the authors define a monoidal category of $\mathrm{C}^{*}$-algebras. Here we show how this example fits into the framework of braided ${ }^{*}$-bialgebras that we used in this paper.

Let $\mathbb{C Z} \cong \operatorname{Pol}(\mathbb{T})$ be the group algebra of $\mathbb{Z}$. We will write $[z]$ for the canonical basis element of $\mathbb{C} \mathbb{Z}$ associated to an integer $z \in \mathbb{Z}$. Recall that $\mathbb{C} \mathbb{Z}$ is a Hopf-*algebra with the following operations: for $z, z_{1}, z_{2} \in \mathbb{Z}, c \in \mathbb{C}$, we set

$$
\begin{aligned}
m_{\mathbb{C Z}}\left(\left[z_{1}\right] \otimes\left[z_{2}\right]\right) & =\left[z_{1}+z_{2}\right] \\
\mathbb{1}(c) & =c[0] \\
\Delta([z]) & =[z] \otimes[z] \\
\varepsilon([z]) & =1 \\
S([z]) & =[-z]=[z]^{*},
\end{aligned}
$$

and extend $m_{\mathbb{C Z}}, \mathbb{1}, \Delta, \delta$ as algebra homomorphisms, $S$ as an algebra anti-homomorphism, and $*$ as a anti-linear algebra anti-homomorphism.

Let $\mathcal{B}$ be a $\mathbb{C Z}$-graded $*$-bialgebra. In particular, we have $\operatorname{deg}(v w)=\operatorname{deg}(v)+$ $\operatorname{deg}(w)$ and $\operatorname{deg}\left(v^{*}\right)=-\operatorname{deg}(v)$. Let $\zeta=\frac{q}{\bar{q}}$ for $0<|q|<1$.

We can use the grading to define an action of $\mathbb{C Z}$.

## Lemma 6.5.

$$
\begin{aligned}
\tilde{\vartheta}: \mathbb{C Z} & \otimes \mathcal{B}
\end{aligned} \rightarrow \mathcal{B}, ~[z] \otimes v \mapsto \zeta^{-z \operatorname{deg}(v)} \cdot v
$$

defines a left action and

$$
\begin{aligned}
\tilde{\rho}: \mathcal{B} & \rightarrow \mathbb{C Z} \otimes \mathcal{B} \\
v & \rightarrow[\operatorname{deg}(v)] \otimes v
\end{aligned}
$$

defines a left coaction.

Lemma 6.6. $\tilde{\vartheta}$ and $\tilde{\rho}$ satisfy the Yetter-Drinfeld-condition, i.e.

$$
\begin{aligned}
& \left(m_{\mathbb{C Z}} \otimes \tilde{\vartheta}\right) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\tilde{\Delta} \otimes \tilde{\rho}) \\
& \quad=\left(m_{\mathbb{C Z}} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \tau) \circ(\tilde{\rho} \otimes \mathrm{id}) \circ(\tilde{\vartheta} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\tilde{\Delta} \otimes \mathrm{id})
\end{aligned}
$$

Proof: For the left hand side we get

$$
\begin{aligned}
\left(m_{\mathbb{C} \mathbb{Z}}\right. & \otimes \tilde{\vartheta}) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id}) \circ(\tilde{\Delta} \otimes \tilde{\rho})([z] \otimes v) \\
& =\left(m_{\mathbb{C} \mathbb{Z}} \otimes \tilde{\vartheta}\right) \circ(\mathrm{id} \otimes \tau \otimes \mathrm{id})([z] \otimes[z] \otimes \operatorname{deg}(v) \otimes v) \\
& =\left(m_{\mathbb{C} \mathbb{Z}} \otimes \tilde{\vartheta}\right)([z] \otimes[\operatorname{deg}(v)] \otimes[z] \otimes v) \\
& =\zeta^{-z \cdot \operatorname{deg}(v)}([z+\operatorname{deg}(v)]) \otimes v
\end{aligned}
$$

and the right hand side can be reduced to the same expression,

$$
\begin{aligned}
\left(m_{\mathbb{C} \mathbb{Z}}\right. & \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\tilde{\rho} \otimes \mathrm{id}) \circ(\tilde{\vartheta} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\tilde{\Delta} \otimes \mathrm{id})([z] \otimes v) \\
& =\left(m_{\mathbb{C} \mathbb{Z}} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \tau) \circ(\tilde{\rho} \otimes \mathrm{id}) \circ(\tilde{\vartheta} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau)([z] \otimes[z] \otimes v) \\
& =\left(m_{\mathbb{C} \mathbb{Z}} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \tau) \circ(\tilde{\rho} \otimes \mathrm{id}) \circ(\tilde{\vartheta} \otimes \mathrm{id})([z] \otimes v \otimes[z]) \\
& =\left(m_{\mathbb{C} \mathbb{Z}} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \tau) \circ(\tilde{\rho} \otimes \mathrm{id})\left(\zeta^{-z \cdot \operatorname{deg} v} \cdot v \otimes[z]\right) \\
& =\left(m_{\mathbb{C} \mathbb{Z}} \otimes \mathrm{id}\right) \circ(\mathrm{id} \otimes \tau)\left(\zeta^{z \cdot \operatorname{deg} v}[\operatorname{deg}(v)] \otimes v \otimes[z]\right) \\
& =\left(m_{\mathbb{C} \mathbb{Z}} \otimes \mathrm{id}\right)\left(\zeta^{-z \cdot \operatorname{deg} v} \cdot[\operatorname{deg}(v)] \otimes[z] \otimes v\right) \\
& =\zeta^{-z \cdot \operatorname{deg} v} \cdot(\operatorname{deg}(v)+z) \otimes v
\end{aligned}
$$

Lemma 6.7. The equations

$$
\begin{aligned}
& * \circ \tilde{\vartheta}=\tilde{\vartheta} \circ(* \otimes *) \circ(S \otimes \mathrm{id}) \\
& \tilde{\rho} \circ *=(* \otimes *) \circ \tilde{\rho}
\end{aligned}
$$

hold.
Proof: Equation 1:

$$
\begin{aligned}
& * \circ \tilde{\vartheta}([z] \otimes v)=\left(\zeta^{-z \operatorname{deg}(v)} \cdot v\right)^{*}=\overline{\zeta^{-z \operatorname{deg}(v) \cdot v}}=\bar{\zeta}^{-z \operatorname{deg}(v)} \cdot v^{*} \\
& \quad=\zeta^{z \cdot \operatorname{deg}(v)} \cdot v^{*}=\zeta^{-z \cdot \operatorname{deg}\left(v^{*}\right)} \cdot v^{*}=\tilde{\vartheta}\left([z] \otimes v^{*}\right) \\
& \quad=\tilde{\vartheta} \circ(* \otimes *)([-z] \otimes v)=\tilde{\vartheta} \circ(* \otimes *)(S \otimes \mathrm{id})([z] \otimes v) .
\end{aligned}
$$

Equation 2:

$$
\begin{aligned}
\tilde{\rho} \circ *(v) & =\tilde{\rho}\left(v^{*}\right)=\left[\operatorname{deg}\left(v^{*}\right)\right] \otimes v^{*}=[-\operatorname{deg}(v)] \otimes v^{*} \\
& =[\operatorname{deg}(v)]^{*} \otimes v^{*}=(* \otimes *)([\operatorname{deg}(v)] \otimes v)=(* \otimes *) \circ \tilde{\rho}(v) .
\end{aligned}
$$

Corollary 6.8. $(\mathcal{B}, \tilde{\vartheta}, \tilde{\rho})$ is an involutive Yetter-Drinfeld-module and thus an object in the category $\mathbb{C} \mathbb{Z} \mathcal{Z} \mathcal{D}_{*}$.

The category $\underset{\mathbb{C Z}}{\mathbb{Z}} \mathcal{Y} \mathcal{D}_{*}$ is braided with the braiding $\Psi$ given by

$$
\begin{aligned}
\Psi(v \otimes w) & =(\tilde{\vartheta} \otimes \mathrm{id}) \circ(\mathrm{id} \otimes \tau) \circ(\tilde{\rho} \otimes \mathrm{id})(v \otimes w) \\
& =\zeta^{-\operatorname{deg}(v) \operatorname{deg}(w)} \cdot w \otimes v
\end{aligned}
$$

Thus the multiplication on the tensor product is given by

$$
\begin{aligned}
m_{\mathcal{B} \otimes \mathcal{B}}\left(v_{1} \otimes v_{2} \otimes w_{1} \otimes w_{2}\right) & =(m \otimes m) \circ(\mathrm{id} \otimes \Psi \otimes \mathrm{id})\left(v_{1} \otimes v_{2} \otimes w_{1} \otimes w_{2}\right) \\
& =\zeta^{-\operatorname{deg}\left(v_{2}\right) \operatorname{deg}\left(w_{1}\right)} v_{1} w_{1} \otimes v_{2} w_{2}
\end{aligned}
$$

and the involution is given by

$$
\begin{aligned}
*_{\mathcal{B} \otimes \mathcal{B}}(v \otimes w) & =\Psi \circ(* \otimes *) \circ \tau(v \otimes w)=\zeta^{-\operatorname{deg}\left(w^{*}\right) \operatorname{deg}\left(v^{*}\right)} v^{*} \otimes w^{*} \\
& =\zeta^{-\operatorname{deg}(w) \operatorname{deg}(v)} v^{*} \otimes w^{*}
\end{aligned}
$$

Let $\tilde{\mathcal{A}}:=\mathbb{C}\left\langle\alpha, \alpha^{*}, \gamma, \gamma^{*}\right\rangle$ be equipped with a $\mathbb{C Z}$-graduation determined by $\operatorname{deg}(\alpha)=\operatorname{deg}\left(\alpha^{*}\right)=0, \operatorname{deg}(\gamma)=1, \operatorname{deg}\left(\gamma^{*}\right)=-1$.
Lemma 6.9. $\tilde{\Delta}: \tilde{\mathcal{A}} \rightarrow \tilde{\mathcal{A}} \otimes \tilde{\mathcal{A}}$ given by

$$
\begin{aligned}
& \tilde{\Delta}(\alpha)=\alpha \otimes \alpha-q \gamma^{*} \otimes \gamma \\
& \tilde{\Delta}(\gamma)=\gamma \otimes \alpha+\alpha^{*} \otimes \gamma
\end{aligned}
$$

is coassociative and $\tilde{\varepsilon}: \tilde{\mathcal{A}} \rightarrow \mathbb{C}$ with $\tilde{\varepsilon}(\alpha)=1$ and $\tilde{\varepsilon}(\gamma)=0$ satisfies the counit axiom.
Proof: First we show $(\operatorname{id} \otimes \tilde{\Delta}) \circ \tilde{\Delta}(\alpha)=(\tilde{\Delta} \otimes \mathrm{id}) \circ \tilde{\Delta}(\alpha)$.
We have

$$
\begin{aligned}
(\mathrm{id} \otimes \tilde{\Delta}) \circ \tilde{\Delta}(\alpha) & =(\mathrm{id} \otimes \tilde{\Delta})\left(\alpha \otimes \alpha-q \gamma^{*} \otimes \gamma\right) \\
& =\alpha \otimes \tilde{\Delta}(\alpha)-q \gamma^{*} \otimes \tilde{\Delta}(\gamma) \\
& =\alpha \otimes\left(\alpha \otimes \alpha-q \gamma^{*} \otimes \gamma\right)-q \gamma^{*} \otimes\left(\gamma \otimes \alpha+\alpha^{*} \otimes \gamma\right) \\
& =\alpha \otimes \alpha \otimes \alpha-q \alpha \otimes \gamma^{*} \otimes \gamma-q \gamma^{*} \otimes \gamma \otimes \alpha+q \gamma^{*} \otimes \alpha^{*} \otimes \gamma \\
& =\alpha \otimes \alpha \otimes \alpha-q \gamma^{*} \otimes \gamma \otimes \alpha-q\left(\gamma^{*} \otimes \alpha^{*}+\alpha \otimes \gamma^{*}\right) \otimes \gamma \\
& =\left(\alpha \otimes \alpha-q \gamma^{*} \otimes \gamma\right) \otimes \alpha-q\left(\gamma \otimes \alpha+\alpha^{*} \otimes \gamma\right)^{*} \otimes \gamma \\
& =\tilde{\Delta}(\alpha) \otimes \alpha-q \tilde{\Delta}(\gamma)^{*} \otimes \gamma \\
& =(\tilde{\Delta} \otimes \mathrm{id})\left(\alpha \otimes \alpha-q \gamma^{*} \otimes \gamma\right)=(\tilde{\Delta} \otimes \mathrm{id}) \circ \tilde{\Delta}(\alpha)
\end{aligned}
$$

Similarly, we can check that $(\mathrm{id} \otimes \tilde{\Delta}) \circ \tilde{\Delta}(\gamma)=(\tilde{\Delta} \otimes \mathrm{id}) \circ \tilde{\Delta}(\gamma)$.
The counit property for $\alpha$ :

$$
\begin{aligned}
(\operatorname{id} \otimes \tilde{\varepsilon}) \circ \tilde{\Delta}(\alpha) & =(\operatorname{id} \otimes \tilde{\varepsilon})\left(\alpha \otimes \alpha-q \gamma^{*} \otimes \gamma\right) \\
& =\alpha \otimes \tilde{\delta}(\alpha)-q \gamma^{*} \otimes \tilde{\varepsilon}(\gamma) \\
& =\alpha \\
& =\tilde{\varepsilon}(\alpha) \otimes \alpha-q \tilde{\varepsilon}\left(\gamma^{*}\right) \otimes \gamma \\
& =(\tilde{\varepsilon} \otimes \mathrm{id})\left(\alpha \otimes \alpha-q \gamma^{*} \otimes \gamma\right)=(\tilde{\varepsilon} \otimes \mathrm{id}) \circ \tilde{\Delta}(\alpha)
\end{aligned}
$$

The counit property for $\gamma$ can be verified in the same way.
It is also straightforward to check that $\tilde{\Delta}$ preserves the grading.
Let $I$ be the two-sided ${ }^{*}$-ideal in $\tilde{\mathcal{A}}$ generated by the relations

$$
\begin{aligned}
& I_{1}:=\alpha^{*} \alpha+\gamma^{*} \gamma-\mathbb{1} \\
& I_{2}:=\alpha \alpha^{*}+|q|^{2} \gamma^{*} \gamma-\mathbb{1} \\
& I_{3}:=\gamma \gamma^{*}-\gamma^{*} \gamma \\
& I_{4}:=\alpha \gamma-\bar{q} \gamma \alpha \\
& I_{5}:=\alpha \gamma^{*}-q \gamma^{*} \alpha
\end{aligned}
$$

and $\mathcal{A}:=\tilde{\mathcal{A}} / I$ the quotient algebra.
Lemma 6.10. $I$ is a coideal in $\tilde{\mathcal{A}}$.
Proof: One checks that

$$
\begin{aligned}
\tilde{\Delta}(I) & \subseteq \tilde{\mathcal{A}} \otimes I+I \otimes \tilde{\mathcal{A}} \\
\tilde{\varepsilon}(I) & =\{0\}
\end{aligned}
$$

Since $I$ is a coideal in $\tilde{\mathcal{A}}$ and $\tilde{\Delta}$ is coassociative, there exists an unique bialgebrastructure $\Delta$, $\delta$ on quotient algebra $\mathcal{A}=\tilde{\mathcal{A}} / \tilde{\mathcal{I}}$. We have $\operatorname{deg} I=0$, so $\mathcal{A}$ inherits a grading, and we can lift the action and the coaction on $\mathcal{A}$ to an action $\vartheta: \mathbb{C Z} \otimes \mathcal{A} \rightarrow$ $\mathcal{A}$ and a coaction $\rho: \mathcal{A} \rightarrow \mathbb{C Z} \otimes \mathcal{A}$ on $\mathcal{A}$. It follows that $(\mathcal{A}, \vartheta, \rho)$ is again an object in $\mathbb{C} \mathbb{Z} \mathcal{Y} \mathcal{D}_{*}$. With these structures, $\mathcal{A}=\operatorname{Pol}\left(S U_{q}(2)\right)$ is the braided Hopf-*-algebra of the braided compact quantum groups $S U_{q}(2), 0<|q|<1$, defined and studied in KMRW16.

Schürmann and Skeide described all generators on $\operatorname{Pol}\left(S U_{q}(2)\right)$ for $q \in \mathbb{R} \backslash\{0\}$, i.e., in the unbraided case, see [S98]. We extend the classification of the quadratic generators in [S98, Corollary 3.3] to the braided $S U(2)$ quantum groups.
Proposition 6.11. Let $H$ be a Hilbert space. For any vector $v \in H$ and real number $\lambda$ there exists a unique triple $(\varepsilon, \eta, L)$ such that

$$
\begin{aligned}
\eta(\gamma) & =\eta\left(\gamma^{*}\right)=0 \\
\eta(\alpha) & =-\eta\left(\alpha^{*}\right)=v \\
L(\gamma) & =L\left(\gamma^{*}\right)=0 \\
L(\alpha) & =i \lambda-\frac{\|v\|^{2}}{2} \\
L\left(\alpha^{*}\right) & =-i \lambda-\frac{\|v\|^{2}}{2} .
\end{aligned}
$$

Two such triples determined by pairs $(v, \lambda)$ and $\left(v^{\prime}, \lambda^{\prime}\right)$ have the same generator $L$ if and only if $\|v\|=\left\|v^{\prime}\right\|$ and $\lambda=\lambda^{\prime}$. Furthermore, all quadratic generators on $\operatorname{Pol}\left(S U_{q}(2)\right)$ arise in this way.
Proof: Similar to [S98].

It turns out that all quadratic generators on $\operatorname{Pol}\left(S U_{q}(2)\right)$ are invariant and therefore define Brownian motions. In fact, like in [SS98, $\varepsilon, \eta$, and $L$ vanish on $\gamma$ and $\gamma^{*}$, which implies that the triple factorizes through the quotient map

$$
\mathcal{A} \rightarrow \mathcal{A} / \mathcal{J}_{\gamma} \cong \mathbb{C} \mathbb{Z} \cong \operatorname{Pol}(\mathbb{T})
$$

where $\mathcal{J}_{\gamma}$ denotes the ${ }^{*}$-ideal generated by $\gamma$. This means that the Brownian motions on $S U_{q}(2)$ are induced from Brownian motions of the undeformed subgroup $\mathbb{T} \subseteq S U_{q}(2)$.

## Acknowledgements

We thank René Schott for his suggestions and his participation in an earlier stage of this paper.
