### **Reproducibility and Replicability (R&R):**

The challenges of Reproducibility and Replicability have become a focus of attention in order to promote open and accessible research. Therefore, efforts have been made to develop good practices for R&R in the area of computer science. Nevertheless, Deep Learning (DL) based experiments remain difficult to reproduce by others due to the complexity of these techniques. In addition, several challenges concern the use of massive and heterogeneous data that contribute to the complexity of this R&R.

## **Checklist:**

We compiled a checklist (Table 1) with the most relevant items for Reproducibility to improve DL experiments.

This checklist is useful for: an **author reporting on an** experiment, and/or a reviewer seeking to qualify the contributions scientific of the work. This table is based on state-of-the-art guidelines from Pineau's Machine Learning checklist [2], the recommendations from Renard's [3], and the FAIR sub-principles (Hartley & Olsson) [4]. Besides that, we organized these criterias according to a DL workflow.

## How to use?

We report a review of the reproducibility of three publications for Poverty estimation using DL and Remote sensing imagery. For each experiment, we identified the methods and workflows used, if the experiments were not fully reproducible. Although the three use cases were proposed for a specific task (poverty estimation), we believe that the evaluation methods could be applied to more general Deep Learning tasks, where difficulties might include (a) a lack of dataset specificity (and the metadata related with it), (b) inadequate description of the DL methodology, (c) the implementation methodology, and the infrastructure used. We also feel that these recommendations can be extended to other domains such as medical, climatic, biodiversity, industrial, military, etc.
