Crystal structure of the monoglycidyl ether of isoeugenol

Hélène Cattey,* Gilles Boni, Sylvie Pourchet and Laurent Plasseraud*

ICMUB CNRS UMR 6302, Université de Bourgogne Franche-Comté, Faculté des Sciences, 9 avenue Alain Savary, 21000 Dijon, France. *Correspondence e-mail: hcattey@u-bourgogne.fr, Laurent.Plasseraud@u-bourgogne.fr

The title compound, $C_{13}H_{16}O_3$ [**GE-isoEu**; systematic name: 2-({2-methoxy-4-[*(E*-1-propen-1-yl]phenoxy)methyl)oxirane], which crystallizes in the triclinic $P\bar{1}$ space group, was synthesized in one step from *iso*-eugenol, a bio-based phenylpropanoid, with an excess of epichlorohydrin. Colourless prismatic crystals suitable for X-ray diffraction were obtained from a mixture of ethyl acetate and cyclohexane, during purification by column chromatography on silica gel. **GE-isoEu**, which corresponds to the *trans* isomer of the monoglycidyl ether of *iso*-eugenol, is based on a 1,2,4-trisubstituted benzene ring by diglycidyl ether, methoxy and 1-*(E*)-propenyl groups, respectively. In the crystal, molecules are organized through offset π -stacking interactions. Chemically, **GE-isoEu** constitutes an intermediate in the synthesis protocol of 2-[3-methoxy-4-(2-oxiranylmethoxy)phenyl]-3-methyloxirane (**GEEp-isoEu**), a diepoxydized monomer used in the manufacturing of thermosetting resins and intended for the elaboration of bio-composites.

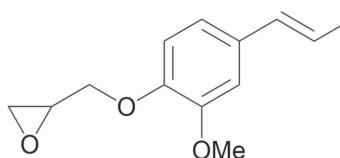

1. Chemical context

The bisphenol A diglycidyl ether molecule, also called BADGE or DGEBA, is the main building block used for the formulation of commercial epoxy resins (Mohan, 2013). Synthetically, this reagent is directly produced from 2,2-bis(4-hydroxyphenyl)propane (bisphenol A), derived from petroleum resources (phenol) and recognized as being an endocrine disruptor (Fenichel *et al.*, 2013). With the aim of designing more sustainable synthetic routes and alternatives to fossil resources, some of the molecules derived from biomass and in particular phenylpropanoids isolated from the fragmentation of lignin, are considered as potential building blocks to replace bisphenol A and its derivatives (Auvergne *et al.*, 2014). This is particularly the case of the *iso*-eugenol molecule generally used in the composition of many perfumes and which can be also transformed into a diepoxydized monomer, 2-[3-methoxy-4-(2-oxiranylmethoxy)phenyl]-3-methyloxirane (**GEEp-isoEu**), well-suited to epoxy thermosetting applications and exhibiting comparable thermomechanical properties to DGEBA (François *et al.*, 2016, 2017). The preparation of **GEEp-isoEu** involves a two-step synthesis *via* firstly the formation of the title compound as a synthesis intermediate. We report herein the X-ray crystal structure of **GE-isoEu** [systematic name: 2-({2-methoxy-4-[*(E*-1-propen-1-yl]phenoxy)methyl)oxirane], which crystallizes upon its purification from a mixture of cyclohexane and ethyl acetate.

2. Structural commentary

The title compound exhibits an asymmetrical structure, which is depicted in Fig. 1. **GE-isoEu** comprises a benzene ring substituted by two oxygenated functional groups, glycidyl ether [$-OCH_2C_2H_3O$] and methoxy [$-OCH_3$], and one 1-(*E*)-propenyl side chain [$-\text{HC}=\text{CHCH}_3$] located in *meta* and *para* positions to the methoxy and glycidyl ether functions, respectively. The aromatic ring is planar with mean bond lengths and angles of 1.392 (3) Å and 120.13 (17)°. While the $-OCH_3$ and $-\text{HC}=\text{CHCH}_3$ groups are in the plane of the benzene ring, $-C_2H_3O$ is out of the plane with an angle of 52.83 (14)°. The oxirane ring ($C1/C2/O1$) of the glycidyl ether group does not undergo any disorder, in contrast to what is frequently observed for diglycidyl ether derivatives (Cho *et al.*, 1999; Flippin-Anderson & Gilardi, 1981). The double-bond distance of the 1-(*E*)-propenyl side chain was determined as 1.315 (3) Å. This length is consistent with those described in the literature for similar compounds (Stomberg *et al.*, 1993; Stomberg & Lundquist, 1995).

3. Supramolecular features

The most significant supramolecular interaction observed in the crystal consists of offset π -stacking involving aromatic rings of **GE-isoEu** (Fig. 2 – red dotted lines). The interplanar and the centroid-to-centroid distances between parallel molecules are 3.456 (2) and 4.5931 (5) Å, respectively. The important difference between these two distances indicates that the benzene rings are strongly slipped. The slip angle (angle between the normal to the planes and the centroid–centroid vector) is 41.20° corresponding to a slippage distance of 3.025 (3) Å (these high values can nevertheless be consid-

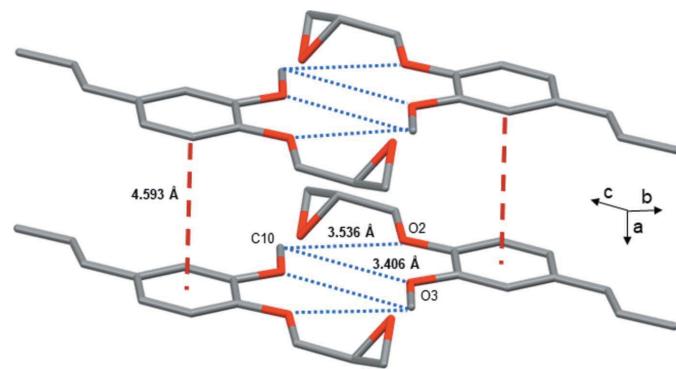

Figure 2

Mercury representation (Macrae *et al.*, 2020; colour code: C dark grey, O red; hydrogen atoms are omitted for clarity) showing intermolecular interactions in the crystal structure of the title compound with hydrogen bonding (blue dotted line, C–H \cdots O distance) and π – π stacking (red dotted line, centroid–centroid distance).

ered as limit values). Typically, for such interactions, the interplanar distance between the arene planes is found around 3.3 to 3.8 Å (Janiak, 2000). In addition, molecules of **GE-isoEu** also interact in pairs, forming dimers, *via* non-classical intermolecular hydrogen bonds involving the methyl groups of the methoxy substituents, with the oxygen atoms of the ether [$C10–H10A\cdots O2 = 3.537$ (2) Å, 167°] and methoxy functions [$C10–H10A\cdots O3 = 3.405$ (2) Å, 132°] (Fig. 2 – blue dotted lines). These supramolecular interactions result in a propagation of stacks of molecules oriented along the *a*-axis (Fig. 3).

4. Database survey

A search in the Cambridge Structural Database (WebCSD v1.1.2, update 2022-03-05; Groom *et al.*, 2016), highlighted that, up to now, seventeen crystal structures comprising glycidyl ether-substituted phenyl ring moieties have been

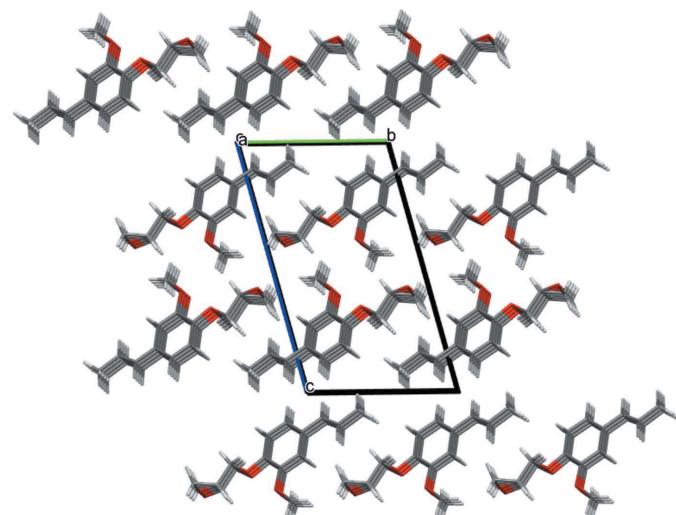

Figure 3

reported. They include (*S*)-1-(2-chloro-5-methylphenoxy)-2,3-epoxypropane (CIKQIZ: Bredikhin *et al.*, 2018), 2,2-bis(3,5-dibromo-4-hydroxybenzene)propane diglycidyl ether (COMNEX: Saf'yanov *et al.*, 1984), 2,2-bis(4-(oxiran-2-ylmethoxy)-3,5-dibromophenyl)propane (COMNEY: Cheban *et al.*, 1985), *rac*-1,2-epoxy-3-(2-methoxyphenoxy)propane (DAXKAP: Bredikhin *et al.*, 2005), diglycidyl ether of bisphenol A (DGEBPA: Flippen-Anderson & Gilardi, 1980; (DGEBPA01: Heinemann *et al.*, 1993; DGEBPA10: Flippen-Anderson & Gilardi, 1981), *p*-di(2,3-epoxypropoxy)benzene (EOXHQE: Saf'yanov *et al.*, 1977), 2,2'-[1,3-phenylene-bis(oxymethylene)]bis(oxirane) (FITWOU: Bocelli & Grenier-Loustalot, 1987), 1,2-epoxy-3-(2-cyanophenoxy)propane (JESHOF: Bredikhin, *et al.*, 2006), 2-[{4-[3-[4-(oxiran-2-ylmethoxy)phenyl]tricyclo[3.3.1.13,7]decan-1-yl]phenoxy}-methyl]oxirane (LANRUQ: Wang *et al.*, 2017), 2-{4-[4-(oxiran-2-ylmethoxy)phenoxy]phenyl}phenoxy(methyl)oxirane (LAQTII: Song *et al.*, 2012), 10-[2,5-bis(2,3-epoxy-1-propoxy)phenyl]-9-oxa-10-phosphaphhenanthren-10-one (LIPSOS: Cho *et al.*, 1999), 3,7-dimethoxy-2-[4-methoxy-3-(oxiran-2-ylmethoxy)phenyl]-5-(oxiran-2-ylmethoxy)-4H-chromen-4-one (ORASAD: Kristufek *et al.*, 2016), 2,2'-{methylenebis[(2,1-phenylene)oxymethylene]}bis(oxirane) [PALQUS: Liu *et al.*, 2021], 2-(*N*-methoxyethanimidoyl)-5-(oxiran-2-ylmethoxy)benzonitrile (SIJZIW: Gong *et al.*, 2013); 2-({3-methoxy-4-[{(oxiran-2-yl)methoxy]phenyl}methyl]oxirane (WASCIF: Vigier *et al.*, 2017), 4-(oxiran-2-ylmethoxy)-benzoic acid (ZEPYUQ: Obreza & Perdih, 2012). To the best of our knowledge, the structure of **GE-isoEu** based on a benzene ring tri-substituted by glycidyl ether, methoxy and 1-propenyl functions is new. In terms of application, several of these compounds are targeted as synthesis intermediates or precursors devoted to the formulation of thermosetting resins. The polymerization process involves the epoxy rings of molecules and occurs in the presence of hardeners (such as amines or acid anhydrides), leading to the cross-linking of infusible polymer networks.

5. Synthesis and crystallization

The title compound was prepared in one step from a commercial source of natural isoeugenol (mixture of *cis/trans*, 99% purity, Sigma-Aldrich) according to a previously reported protocol (François *et al.*, 2016). The details of the synthesis of the title compound are summarized in Fig. 4. *iso*-Eugenol (10.0 g, 60.9 mmol) was added to an ethanolic sodium hydroxide solution (2.7 g, 66.6 mmol of NaOH in 30 mL of

EtOH), then followed by the addition of an excess of epichlorohydrin (19.1 mL, 22.5 g, 243.6 mmol). The reaction mixture was heated at 353 K over 3 h under constant stirring. 70 mL of toluene were then added at room temperature. After cannula filtration, the filtrate was washed with distilled water (3 × 20 mL) and brine (1 × 20 mL), and finally dried over anhydrous MgSO₄. After complete evaporation of the solvent under vacuum, the residue was then further purified by column chromatography using a mixture of cyclohexane/ethyl acetate (3:1, v/v) as eluent to give a white solid characterized as the monoglycidyl ether of *iso*-eugenol (6.2 g, yield 46%). Crystals of the *trans* isomer of **GE-isoEu** suitable for X-ray analysis were obtained during the purification by column chromatography by evaporation of the eluting solvents at room temperature. ¹H NMR (300.1 MHz, CDCl₃): 6.90–6.82 (m, 3H, aryl), 6.08 (dq, J = 6.6 and 15.7 Hz, 1H, CH-propenyl), 6.33 (dd, J = 1.6 and 15.7 Hz, 1H, CH-propenyl), 4.21 (dd, J = 11.4 and 3.6 Hz, 1H, CH₂O), 4.03 (dd, J = 11.4 and 5.5 Hz, 1H, CH₂O), 3.88 (s, 3H, OCH₃); 3.38 (m, 1H, CH-oxirane), 2.89 (dd, J = 5.1 and 4.2 Hz, 1H, CH₂-oxirane), 2.73 (dd, J = 5.0 and 2.7 Hz, 1H, CH₂-oxirane), δ 1.86 (dd, J = 1.6 and 6.6 Hz, 3H, CH₃); ¹³C{¹H} NMR (75.4 MHz, CDCl₃) δ 149.6, 147.1, 132.2, 130.5, 124.2, 118.6, 114.2, 109.1, 70.3, 55.8, 50.2, 45.0, 18.4; IR (ATR): 3023, 3000, 2957, 2937, 2913, 2878, 2842, 1601, 1582, 1509, 1464, 1450, 1419, 1259, 1226, 1195, 1158, 1135, 1024, 961, 908, 857, 805, 778, 759, 734, 621, 612, 569, 464 cm⁻¹. 6. Refinement details

Crystal data, data collection and structure refinement details are summarized in Table 1. All H atoms on carbon and oxygen atoms were placed at calculated positions using a riding model with C—H = 0.95 Å (aromatic) or 0.99 Å (methylene group) with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$ and C—H = 0.98 Å (methyl group) with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{H})$.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
