HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Introduction

Tillandsia genus belongs to the Bromeliaceae family and is distributed from the South of the United States to the South of Argentina. More than 700 species are listed worldwide^{1,2}. Among the 350 different species cultivated at *Tillandsia* PROD plant nursery, the studied *Tillandsia* species for this PhD (*T. aeranthos* and *T. bergeri*) are acclimated to the Occitanie region.

Tillandsia aeranthos

Tillandsia bergeri

Bio monitoring is the study of the pollution of a region helped with a plant able to accumulate pollutants³. In our case, we focus on air pollution and *Tillandsia*, commonly known as “air plants” could be, referring to the bibliography, interesting bio indicators for the monitoring of air pollution⁴. *Tillandsia aeranthos* and *Tillandsia bergeri* have never been studied for their ability to accumulate pollutants from the air. Thus, this study is of interest because *Tillandsia* are epiphytic plants, independent from the soil, growing by up taking nutrients from the air or the rainwater.

Study of the bio monitoring potential for metal air pollution

Tillandsia acclimated in Occitanie

Determination of control values from unpolluted area

Sampling area

Exposition of *Tillandsia* to city and industrial pollution

Monitoring of bio accumulation in *Tillandsia* on 6 exposure sites. Evaluation of the accumulation as a function of the time.

Laboratory experimentation in a controlled atmosphere⁵

Determination of maximum metal accumulation capacity of *Tillandsia*.
Soaking method

Primary results for 1 exposure site (in ppm and ppb)

As	Ba	Pb	Pd	Pt	Co	Cr	Cu	Fe	Mn	Ni	Sn	Ti	Zn
0,247	0,043	0,013	0,057	0,018	0,055	0,028	0,012	0,600	0,039	0,013	0,187	0,055	0,123

Results were obtained by ICP-OES and ICP-MS analysis with calibration curves of the 14 studied metals

Conclusion and perspectives

Exposure of *Tillandsia* acclimated in Occitanie and study in a controlled atmosphere allow the evaluation of the accumulation and bio indication ability of metals air pollution by *Tillandsia* over time.

This work is financially supported by La Région Occitanie, Université de Nîmes and *Tillandsia* PROD.
