HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

FAIR-Checker : Checking and Inspecting metadata for FAIR bioinformatics resources

1. Introduction

The continuous increase of life science data production raises the importance of better sharing and reusing biological digital resources (datasets, bioinformatics tools or workflows, training materials, etc.). This led to an increasing importance of Open Science and Reproducibility, **requiring rich and machine-actionable metadata**. To that end, FAIR principles [1] have been proposed and are being adopted by large communities. However, **assessing how much a resource is FAIR is nowadays challenging** since answering human-oriented questionnaires is time-consuming and computational evaluations (FAIRMetrics, RDA Maturity Indicators) often require technical expertise.

In this work, we propose a new release of FAIR-Checker, aimed at empowering scientists and developers in FAIRifing their resources.

2. Motivating use cases

- 1. I am a data producer, I published my dataset through an online registry, does it provide rich metadata?
 - Are these metadata interoperable, reusable?
 - Is the registry exposing metadata through a community agreed controlled vocabulary?
- 2. I am a **software developer**, my source code is on GitHub, but not mature enough to be part of a registry yet.
 - Is my resource exposing agreed and widly used?
 - Am I missing **required** or **recommended** metadata?

- 3. I am in charge of a bioinformatics registry such as Bio.tools
 [2] which provides online access to many tools descriptions.
 - How FAIR are the metadata exposed in each tool page?
 - Inspect if metadata are compliant with the specific profile for their community.
 - What can be done to improve the quality of exposed metadata ?

3. Approach

A. Check. We propose a web interface ^a aimed at empowering scientists to progress in the FAIRification of their resources through a global assessment and technical recommendations. This tool supports an iterative process, leveraging the **web semantic technologies (RDF, SPARQL)** and metrics-specific guidelines, with references to the FAIR Cookbook

4. Results											
A. Check.											
The	evaluation	results	are	presented	d to	the	use	ers as	foll	OWS	:
Principle	Name		Description	Comment	Recommandation		Score	Result	Test	Details	
F1A	Unique IDs		0	ø			2	Success	Check	0	
F1B	Persistent IDs		θ	P	\$		0	Failure	Check	0	
F2A	Structured metadata		0	ø			2	Success	Check	0	
				ŀ	low FAIR are	e Bio.To	ools reg	istered so	ftwares ?

and RDMkit initiative.

B. Inspect. We use semantic technologies to help users in providing finegrained community-agreed metadata. We assemble a Knowledge Graph from embedded RDF, complemented by public SPARQL endpoints. We check that used ontology terms are already known in reference registries (LOV, OLS, BioPortal). Bioschemas specifications are used to generate SHACL shapes. Their evaluation informs users on missing metadata, required or recommended for specific resources (genes, proteins, training, tools, etc.).

After validating more than 25,000 tool from pages Bio.tools we plotted the proportion of tools complying with the FAIR principles. This allows to indicate where the metadata quality can be improved by better annotations. Only 37,9% of the tools have a Licence. More than 60% of the tool descriptions should be improved by providing a License.

B. Inspect.

We show to the user which properties in the metadata can be added to improve the FAIRness of the resource based on the corresponding Bioschemas profile.

5. Future works

A publication of this work is currently under review. As future work, we aim (i) to support HTTP content-negotiation for web sites not embedding metadata in their web pages, (ii) to enhance the matching between a resource type and the corresponding Bioschemas profile, and (iii) to allow the user to annotate and complete its missing metadata. In addition, we plan to develop an API for a better scalability and interoperability of FAIR-Checker.
