HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Secure data storage into DNA molecules compliant with biological constraints Ensuring the confidentiality of data stored into DNA molecules

Big data : le volume de données créées va exploser Volume de données numériques créées dans le monde depuis 2010 (en zettaoctets) *

Motivation - Considering the security of a promising storage medium

- Context Actual storage technologies (flash memory, hard drives, magnetic tapes,..) are outpaced by the exponential rise of digital data production [1]
- Advantages of DNA storage [2] Density of 10²¹ bytes in one gram (10⁶ times more compact than hard disks), durability for centuries, energy cost close to zero (molecules kept at room temperature with no maintenance)

Motivation – Introducing security to ensure the confidentiality of the data stored into DNA molecules

DNA data storage - A new storage medium

- Principle [WRITING] Encode binary data into 4-base sequences following the DNA structure, transfer this data into synthetic DNA molecules. [**READING**] Amplify encoded sequences of interest and get several reads of them with a sequencing device. Reads are then processed and decoded back to binary data
- Constraints i) Biological DNA synthesis and sequencing are imperfect and introduce errors. ii) devices have structural DNA requirements when generating 4-base sequences
- Vulnerabilities This chain is notably vulnerable to: theft or cloning of molecules; spying attacks on the sequencing or synthesis devices; DDoS attack by adding fake DNA sequence to confuse sequencing

DNA-based data storage chain, including the constraints on the structure of DNA sequences to store, and types of errors caused by biological processes

Non-binary Dynamic Concatenation Binary Binary message Encryption in bases of message message encoding of error-Enc(M)^B Μ Enc(M) and code with correcting bits into Enc(M)^B || CC **AES-256** LDPC code bases 2N or 2N-1 bits are Cipher key encoded into N K_{AFS} of 256 bits bases Enc(M) = $Enc(M)^{B} || CC =$ M = $Enc(M)^{B} =$ 000110..01101 CAGT..ATC || CGGA..TTAC 01101...01011 CAGT..ATC

Encoding solution to ensure data confidentiality in the entire DNA data storage channel

Dynamic encoding - a solution for confidentiality

- Challenge Ensure confidentiality under biological constraints while approaching the ideal rate of 2 bits of information per base
- Solution A three step coding process that includes encryption, dynamic data encoding and error-correction code
 - Step 1: Encryption with AES-256 to ensure confidentiality and to regulate the G-C base rate and homopolymers
 - > Step 2: Dynamic encoding to manage unwanted base patterns; encoding based on the addition or not of one bit of data every N bases to avoid homopolymers longer than N
 - Step 3: Non-binary LDPC error-correction code to correct any base substitutions, deletions or insertions

References

Dynamic information encoding into bases. In a block of N bases, each base X_i encodes two bits: b_{2i-1} and b_{2i} , except X_N , which encodes either b_{2N-1} only, or b_{2N-1} and b_{2N}

Experimental results

Simulation of the biological processes using the simulator from [3]

[3] Hamoum, B., Dupraz, E., Conde-Canencia, L., Lavenier, D. (2021, & August). Channel Model with Memory for DNA Storage with Data Nanopore Sequencing. In 2021 11th International Symposium on Topics in Coding (ISTC) (pp. 1-5). IEEE.

Results: no homopolymers longer than N, G-C content of 43-57%, data recovery without errors. For *N*=4, information rate of 1,875 bits per base.

Conclusion and future work

- Confidentiality in the entire storage chain that takes into account biological constraints
- Encoding solution independent from encryption algorithm and error-correction code, adaptable to the size of unwanted patterns
- Extend the approach to other synthesis and sequencing technologies
