HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Blue and turquoise hydrogen: bridge options or mirage?

Kimon KERAMIDAS, Silvana MIMA, Adrien BIDAUD (Université Grenoble-Alpes)

kimon.keramidas@univ-grenoble-alpes.fr

MOTIVATION – OBJECTIVE

- Hydrogen (H₂): promising vector in the race to reach to net-zero
- Many announced national strategies & investments: RePowerEU, Japanese H₂ Strategy...
- Current production based on gas and coal (70 MtH₂, 750 MtCO₂)
- How to supply large enough quantities of H₂ while making it a lower-GHG vector than the fuels it replaces?

METHODS

- POLES: global energy system model (multi-regional partial equilibrium) – results here for USA
- Endogenous modelling of H₂ demand for energy uses and industry feedstock + 13 H₂ production technologies
- Scenarios: 1.5C (global carbon price) + 1.5C with 20-year delay in CCS deployment

TECHNOLOGIES for H₂ production:

- **Green H₂** (wind/solar + electrolysis): decreasing costs in renewable electricity and electrolysis technologies, but needs H₂ buffer storage
- **Pink H₂** (nuclear + electrolysis): relevant only for countries with large nuclear power deployment plans
- **Blue H₂** (steam methane reforming with CCS): challenges of CO₂ capture, transport and long-term sequestration
- **Turquoise H₂** (gas/biomass pyrolysis): no emissions, no impact of carbon price; possibility of using existing supply infrastructure; black carbon reuse

RESULTS

Supply costs, USA, 1.5C scenario

- Turquoise: nearly as competitive as blue (needs both fossil gas and electricity)
- Green: becomes cost-competitive only long term with climate policy

Production mix, USA

2050 market shares:

- | | |
|-----------------------------|----------------------------|
| 1. Green+Pink 64% | 1. Green+Pink 78% |
| 2. Turquoise 15% | 2. Turquoise 15% |
| 3. Blue / CCS solutions 17% | 3. Blue / CCS solutions 1% |

Hydrogen direct and indirect emissions, 1.5C, USA

1. Direct emissions: fuel combustion, CH₄ reforming → mostly captured in blue (max 95% capture rate)
2. Indirect emissions: upstream fossil fuels supply chain → partly reduced with climate policy
3. Indirect emissions: electricity production → reduced to nearly zero by 2050 with climate policy

Total emissions content vs fossil gas, USA:

2020: blue 3x less, turquoise same / 2050: blue 9x less, turquoise 20x less

> CONCLUSIONS & POLICY RECOMMENDATIONS

- Turquoise H₂ potential bridge, subject to gas market and geopolitical conditions; could get credits from selling carbon black
- Blue H₂ presents additional risk issues related to CCS infrastructure
- Green H₂ only true low-GHG option, long-term
- Investment in blue/turquoise H₂ risks resulting in gas supply infrastructure lock-in
- Early investment in green H₂ will allow learning and cost reductions
