**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# Blue and turquoise hydrogen: bridge options or mirage?

Kimon KERAMIDAS, Silvana MIMA, Adrien BIDAUD (Université Grenoble-Alpes)

## MOTIVATION – OBJECTIVE

- Hydrogen (H<sub>2</sub>): promising vector in the race to reach to net-zero
- Many announced national strategies & investments: RePowerEU, Japanese H<sub>2</sub> Strategy...
- Current production based on gas and coal (70 MtH<sub>2</sub>, 750 MtCO<sub>2</sub>)
- How to supply large enough quantities of H<sub>2</sub> while making it a lower-GHG vector than the fuels it replaces?

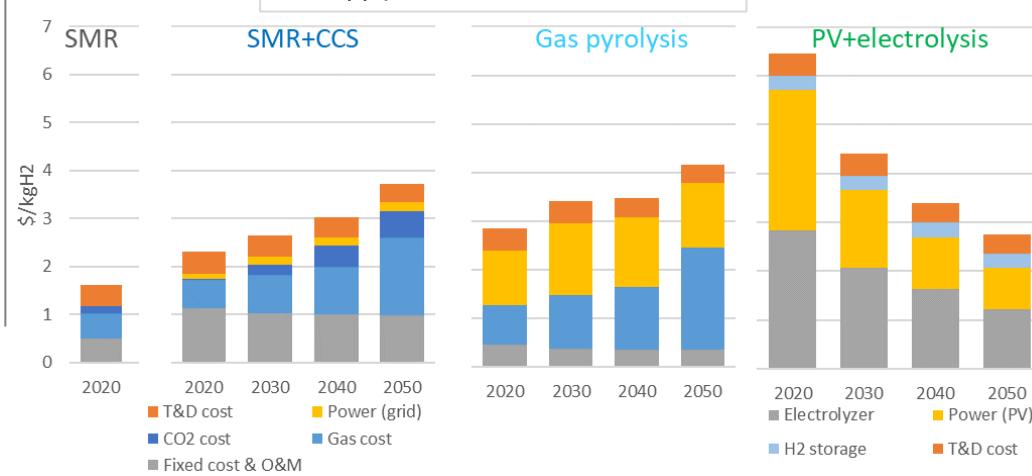

## TECHNOLOGIES for H<sub>2</sub> production:

- **Green H<sub>2</sub>** (wind/solar + electrolysis): decreasing costs in renewable electricity and electrolysis technologies, but needs H<sub>2</sub> buffer storage
- **Pink H<sub>2</sub>** (nuclear + electrolysis): relevant only for countries with large nuclear power deployment plans
- **Blue H<sub>2</sub>** (steam methane reforming with CCS): challenges of CO<sub>2</sub> capture, transport and long-term sequestration
- **Turquoise H<sub>2</sub>** (gas/biomass pyrolysis): no emissions, no impact of carbon price; possibility of using existing supply infrastructure; black carbon reuse

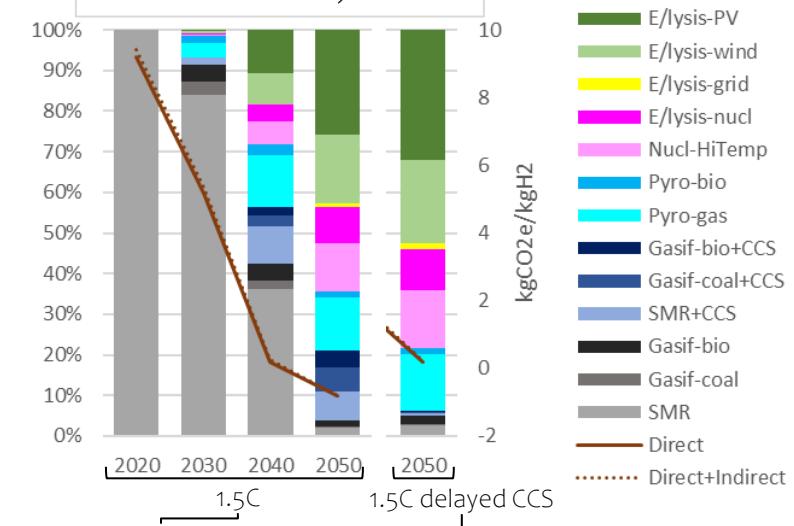

## RESULTS

Supply costs, USA, 1.5C scenario

- Turquoise: nearly as competitive as blue (needs both fossil gas and electricity)
- Green: becomes cost-competitive only long term with climate policy

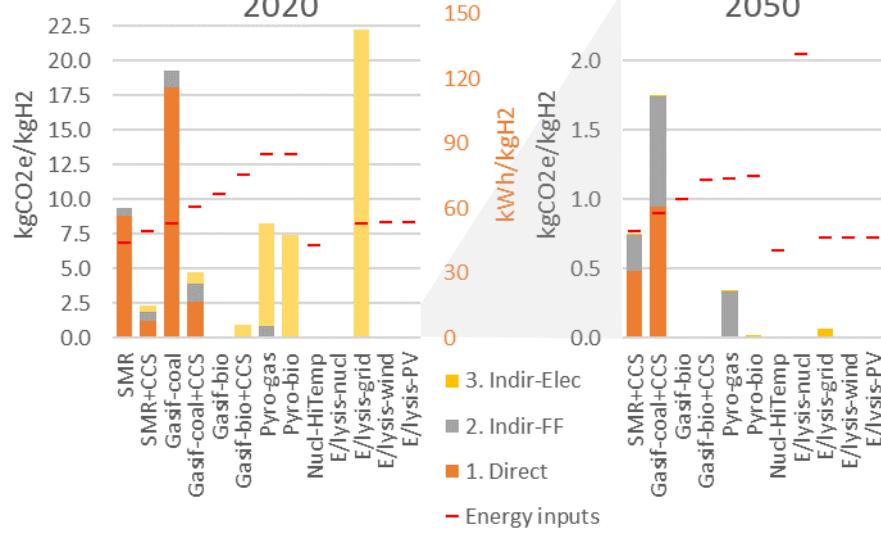

Production mix, USA

2050 market shares:

1. Green+Pink 78%
2. Turquoise 15%
3. Blue / CCS solutions 1%

## Hydrogen direct and indirect emissions, 1.5C USA

## 1. Direct emissions: fuel combustion, CH4 reforming

→ mostly captured in blue (max 95% capture rate)

## 2. Indirect emissions: upstream fossil fuels supply chain

→ partly reduced with climate policy

## 3. Indirect emissions: electricity production

→ reduced to nearly zero by 2050 with climate policy

Total emissions content vs fossil gas, USA:

2020: blue 3x less, turquoise same / 2050: blue 9x less, turquoise 20x less

## > CONCLUSIONS & POLICY RECOMMENDATIONS

- Turquoise H<sub>2</sub> potential bridge, subject to gas market and geopolitical conditions; could get credits from selling carbon black
- Blue H<sub>2</sub> presents additional risk issues related to CCS infrastructure
- Green H<sub>2</sub> only true low-GHG option, long-term
- Investment in blue/turquoise H<sub>2</sub> risks resulting in gas supply infrastructure lock-in
- Early investment in green H<sub>2</sub> will allow learning and cost reductions
