Abstract

We consider the Euler-Poisson equations describing the motion of a heavy rigid body about a fixed point with all six parameters in a complex domain. These equations always admit three functionally independent first integrals $H_1, H_2, H_3$, that is respectively the area, geometrical and conservation of energy first integrals. In four cases (Euler, Lagrange, Kovalevskaya and kinetic symmetry case) a fourth functionally independent first integral appears. In all these four cases this fourth integral can be found among polynomials that do not depend on all variables.

We produce a careful study when, apart from the four cases above, the Euler-Poisson equations, restricted to the level manifolds of $H_1, H_2$ and $H_3$ as well as of all their mutual intersections, admit a new first integral which does not depend on all the variables involved. In this way we cover the well known Goryachev-Chaplygin case of partial integrability and discover in the complex domain a new partially integrable case on level manifold \{$H_1 = 0, \ H_2 = 0$\}.

We provide a general method to find all these cases of partial integrability and corresponding partial first integrals. By meticulous and detailed analysis, we show that these two cases are unique when such an additional partial first integral exists. The use of computer algebra is unavoidable to carry out our investigations.

As a further application of the method we used, we also cover the Sretenskii case of partial integrability of the gyrostat equations and describe their new integrable case in the complex domain.

The method we used is of general interest and is probably the most interesting point of this paper. It can also be applied in many other circumstances.

Key words and phrases: Euler-Poisson equations, partial first integrals, polynomial systems, Gröbner bases, Lie bracket, Frobenius integrability theorem.

\(^{(1)}\) In [59] "the area first integral" is by inadvertance called "kinetic moment first integral".
1. Introduction

This paper is one more contribution to the study of classical problem of Euler-Poisson equations describing the motion of a heavy rigid body about a fixed point. It can be considered as a natural continuation of paper [59] but it can be read completely independently.

1.1. The problem. Let us briefly describe the content of [59] which is devoted to the search of the so called fourth integral of Euler-Poisson equations (see below), but only when this integral does not depend on all the variables. Let us recall some basic facts about the Euler-Poisson equations.

The Euler-Poisson equations are given by the following system

\begin{align}
I_1 \frac{d\omega_1}{dt} &= (I_2 - I_3)\omega_2\omega_3 + Mg(c_3\gamma_2 - c_2\gamma_3), \\
I_2 \frac{d\omega_2}{dt} &= (I_3 - I_1)\omega_1\omega_3 + Mg(c_1\gamma_3 - c_3\gamma_1), \\
I_3 \frac{d\omega_3}{dt} &= (I_1 - I_2)\omega_1\omega_2 + Mg(c_2\gamma_1 - c_1\gamma_2), \\
d\gamma_1/dt &= \omega_3\gamma_2 - \omega_2\gamma_3, \\
d\gamma_2/dt &= \omega_1\gamma_3 - \omega_3\gamma_1, \\
d\gamma_3/dt &= \omega_2\gamma_1 - \omega_1\gamma_2.
\end{align}

In memory of our dear friend Andrzej Nowicki who passed away while we were finishing our work.

Hâtez-vous lentement, et sans perdre courage,
Vingt fois sur le métier remettez votre ouvrage,
Polissez-le sans cesse, et le repolissez,
Ajoutez quelquefois, et souvent effacez.

Nicolas Boileau, Art poétique (1674) \(^2\)

\(^2\) In classical English translation of John Dryden (1683):

Gently make haste, of Labour not afraid;
A hundred times consider what you’ve said:
Polish, repolish, every Colour lay;
And sometimes add; but oft’ner take away.
Studying the Euler-Poisson equations \((1.1)\) from a mechanical point of view, one considers only the real case with \(H = \gamma_1^2 + \gamma_2^2 + \gamma_3^2 = 1\), as well as with the inequalities

\[ I_1 > 0, I_2 > 0, I_3 > 0, I_1 + I_2 \geq I_3, I_2 + I_3 \geq I_1 \text{ and } I_3 + I_1 \geq I_2. \]

Let us note that the Euler-Poisson equations with non-zero real parameters \(I_1, I_2\) and \(I_3\) of different signs appear in the theory of equilibria of elastic rods [33, 39].

Equations \((1.1)\) describe the motion of a heavy rigid body of mass \(M\) about a fixed point \(O\). We consider a body fixed frame \(Oxyz\) with origin in point \(O\) and axes coinciding with the principal axes of inertia through \(O\). Here \(I_1, I_2, I_3\) are the principal moments of inertia about point \(O\), \(c_1, c_2, c_3\) the coordinates of the body mass center, \(g\) is the acceleration of gravity, \(\omega = (\omega_1, \omega_2, \omega_3)\) is the angular velocity of the body and \(\gamma = (\gamma_1, \gamma_2, \gamma_3)\) is the unit vector directed upwards.

It is well known that without any loss of generality one can suppose that \(Mg = 1\) and further on we admit that it is so. Indeed, instead of system \((1.1)\) with principal moments of inertia \(I_1, I_2, I_3\), it suffices to consider such a system but with \(I_1/(Mg), I_2/(Mg), I_3/(Mg)\) as new principal moments of inertia. As we study the totality of the Euler-Poisson equations \((1.1)\), such a rescaling does not change anything. For shortness we introduce the notation \(\mathcal{I}c = (I_1, I_2, I_3, c_1, c_2, c_3)\).

Like in [59], in the present paper we study these equations as a purely mathematical problem considering the general complex case \(\mathcal{I}c \in \mathbb{C}^6\), without any restrictions on the parameters except \(I_1 \neq 0, I_2 \neq 0, I_3 \neq 0\) which will always be assumed.

Equations \((1.1)\) always have three functionally independent first integrals:

\[
\begin{align*}
H_1 &= I_1 \omega_1 \gamma_1 + I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3, \\
H_2 &= \gamma_1^2 + \gamma_2^2 + \gamma_3^2, \\
H_3 &= I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2 + 2(c_1 \gamma_1 + c_2 \gamma_2 + c_3 \gamma_3).
\end{align*}
\]

In the real case these are the area, geometrical and conservation of energy first integrals of system \((1.1)\).

In real case to be integrable [5, Sec. 28], system \((1.1)\) needs a supplementary fourth first integral \(H_4\), functionally independent of \(H_1, H_2, H_3\), called shortly a fourth integral. The only known cases when such fourth integral exists as well in the real case as in complex case are the following four cases: Euler case, defined by the condition

\[ c_1 = c_2 = c_3 = 0, \]

as well as the following two cases, that up to appropriate numeration of principal moments of inertia are: Lagrange case, defined by the conditions

\[ I_1 = I_2, \quad c_1 = c_2 = 0, c_3 \neq 0 \]

and Kovalevskaya case, defined by the conditions

\[ I_1 = I_2 = 2I_3, \quad (c_1, c_2) \neq (0, 0), \quad c_3 = 0. \]

Let us note that in the real case, in the Kovalevskaya case we can always take \(c_2 = 0\) which is reached by an appropriate rotation of the frame of principal axes of inertia around the axis \(z\). In this case we suppose \(c_1 \neq 0\). Let us stress that in the complex case...
the reduction to \( c_2 = 0 \) by a linear change of variables is not always possible. The fourth case is the kinetic symmetry case, defined by

\[
I_1 = I_2 = I_3. \tag{1.6}
\]

We denote sets of parameters satisfying cases (1.3) by \( E \) and (1.4) and (1.5) (up to appropriate numeration of principal moments of inertia) by \( L \) and \( K \), respectively.

The fourth integral in cases (1.3)–(1.6) is given as follows:

\[
H_4 = I_2^1 \omega_1^2 + I_2^2 \omega_2^2 + I_3^3 \omega_3^2 \quad \text{when} \quad I_c \in E,
\]

\[
H_4 = \omega_3^3 \quad \text{when} \quad I_c \in L,
\]

\[
H_4 = \left( \omega_1^2 - \omega_2^2 - \frac{c_1 \gamma_1 - c_2 \gamma_2}{I_3} \right)^2 + \left( 2 \omega_1 \omega_2 - \frac{c_2 \gamma_1 + c_1 \gamma_2}{I_3} \right)^2 \quad \text{when} \quad I_c \in K,
\]

\[
H_4 = c_1 \omega_1 + c_2 \omega_2 + c_3 \omega_3 \quad \text{in kinetic symmetry case.}
\]

For \( I_c \in K \), when \( c_2 = 0 \), we recover

\[
H_4 = \left( \omega_1^2 - \omega_2^2 - \frac{c_1 \gamma_1}{I_3} \right)^2 + \left( 2 \omega_1 \omega_2 - \frac{c_1 \gamma_2}{I_3} \right)^2
\]

that is the standard form of fourth integral in the real Kovalevskaya case where \( c_2 = 0 \) \((3, 6, 10, 12, 20, 22, 24, 36, 37, 54)\).

These four cases are called classical cases of integrability of the Euler-Poisson equations.

One sees that for the above four cases the fourth integral does not depend on all variables. So that the question whether there is another case when the fourth integral does not depend on all variables is natural. In \([59]\) for \( I_c \in \mathbb{C}^6 \), \( I_1 \neq 0 \), \( I_2 \neq 0 \), \( I_3 \neq 0 \), we answered this question negatively.

Usually one cites also the so called Goryachev-Chaplygin case that up to appropriate enumeration of principal moments of inertia is the following one. Let \( I_1 = I_2 = 4I_3 \), \((c_1, c_2) \neq (0, 0)\), \( c_3 = 0 \). In this case the restriction of the Euler-Poisson equations to the five-dimensional level manifold \( \{H_1 = 0\} \), admits a supplementary first integral functionally independent of first integrals \( H_2 \) and \( H_3 \). It is given by the formula:

\[
H_4 = I_3 \omega_3 (\omega_1^2 + \omega_2^2) - (c_1 \omega_1 + c_2 \omega_2) \gamma_3. \tag{1.8}
\]

Like in the above four cases, first integral (1.8) depends on number of variables strictly smaller than the dimension of manifold \( \{H_1 = 0\} \).

The first integral like \( H_4 \) in Goryachev-Chaplygin case is an example of the so called partial first integral. More precisely, when a smooth dynamical system defined on manifold \( M \), restricted to an invariant submanifold \( N \subseteq M \), admits a first integral \( \varphi \) that is not the restriction to \( N \) of some first integral defined on \( M \) and \( \varphi \) is functionally independent of restriction to \( N \) of all first integrals defined on \( M \), then \( \varphi \) is called a partial first integral.

Thus the following problems become natural. Let us consider the complex manifolds of complex dimension five:

\[
\{H_1 = U_1\}, \quad \{H_2 = U_2\}, \quad \{H_3 = U_3\},
\]

where \( U_1, U_2, U_3 \) are arbitrary complex numbers. These level manifolds are always invariant manifolds for the Euler-Poisson equations.
Let $1 \leq i, j, k \leq 3$.

a) When on the complex five-dimensional level manifold $\{H_i = U_i\}$ there exists a partial first integral of the Euler-Poisson equations restricted to this manifold, that depends on at most four variables and that is functionally independent of $H_j$ and $H_k, j \neq i, k \neq i, j \neq k$.

b) When on the complex four-dimensional level manifold $\{H_i = U_i, H_j = U_j\}, i \neq j$, there exists a partial first integral of the Euler-Poisson equations restricted to this manifold, that depends on at most three variables and that is functionally independent of $H_k, k \neq i, j$.

c) When on the complex three-dimensional level manifold $\{H_1 = U_1, H_2 = U_2, H_3 = U_3\}$, there exists a partial first integral of the Euler-Poisson equations restricted to this manifold, that depends on at most two variables.

In this paper, we give a complete answer to all these questions, apart from four classical cases of integrability.

Indeed, in (a) we recover the Goryachev-Chaplygin case and in (b) we find a supplementary partial first integral on level manifold $\{H_1 = 0, H_2 = 0\}$. By a meticulous and detailed analysis, we show that these two cases are unique for (a), (b) and (c), when an additional partial first integral which does not depend on all variables exists.

Let us underline that in the paper [25] by D. N. Goryachev from 1900 where the case of Goryachev-Chaplygin appears for the first time, as well as in the paper by S. A. Chaplygin [14] from 1901, there is no explanation how this case was found. To the best of our knowledge no such explanation was published until 1983, when S. L. Ziglin in [79] published it for the first time. See also 2005 paper [43] where A. J. Maciejewski and M. Przybylska present such a deduction in a very clever and clear manner. Nevertheless these deductions are trying and in no way can be considered as simple or elementary.

On the contrary, the deduction of the Goryachev-Chaplygin case from the general principles that we present in Sec. 5.2 is short and simple. It only uses facts that were already well known in 1900. Once tedious computations are now easy through the use of elementary computer algebra.

The Euler-Poisson equations have many modifications which describe the different mathematical models related to the movements of rigid bodies with a fixed point [9, 11, 27, 30, 31, 45, 46]. One of the simplest of these is the system of the equations describing the motion of the so-called gyrostat, the equations of which, in the simplest case, are only slightly modified Euler-Poisson equations (1.1). Indeed, the gyrostat equations differ from Euler-Poisson equations only in first three equations, where linear terms $b_3 \omega_2 - b_2 \omega_3, b_1 \omega_3 - b_3 \omega_1, b_2 \omega_1 - b_1 \omega_2, b_1, b_2, b_3 \in \mathbb{C}$, are respectively added to the first three Euler-Poisson equations (1.1). When $b_1 = b_2 = b_3 = 0$ we recover the Euler-Poisson equations (1.1). The gyrostat equations are explicitly written in [21, 24] and in [62, 63] (see also Sec. 2.7 in [12] and for more details [36, 37, 38, 44, 72]). The four classical integrable cases of Euler-Poisson equations admit their natural extensions to gyrostat equations. As proved by L. N. Sretenskii in [62, 63], the same concerns the Goryachev-Chaplygin case of partial integrability. Its gyrostatic analogue is named the Sretenskii case. By applying the method of Sec. 5.2 which leads to the Goryachev-Chaplygin case, in Sec. 6.2 we recover
the Sretenskii case. We also find a new case of integrability of gyrostat equations in the complex domain.

As it will be proved in Sec. 6.3 in complex domain the gyrostat equations can have a fourth integral outside four classical cases.

Let us note that this kind of deduction of Goryachev-Chaplygin and Sretenskii cases appeared for the first time in [16], but our approach is more general.

In summary, our problem is to know, having a multiparameter family of ordinary differential equations, how to find the values of the parameters for which the supplementary first integral (i.e. non-obvious or not yet known), that does not depend on all the variables, exists.

Below, when we speak about smooth functions, we always mean class $C^1$ functions in the real case and analytic functions in the complex case. Indeed, in complex case any function having a complex derivative at any point of some open subset of $\mathbb{C}^n$ is analytic on it (see [51]).

Let us stress that we only require the $C^1$ differentiability of the first integral we are looking for. Although in complex domain $C^1$ differentiability implies analyticity, we shall never explicitly use this fact. Moreover, all the considerations are local. We never use the fact that such first integral is globally defined. We only require that it be defined on an open subset of phase space and not constant on any open subset of it. But the obtained results in all known examples are global because the explicit formulas that we obtain for them, are globally defined. Let us note that in complex case multivalued analytic functions can appear.

The important open question is whether, in the studied examples, there are cases with supplementary partial first integral depending on all the variables while there is no supplementary local partial first integral that does not depend on all variables.

It should be emphasized that there is a substantial difference between [42, 59] and the present paper. In both of the cited papers, the use of the computer algebra could in principle be avoided by tedious hand calculations. This is not the case here, where the huge systems of polynomial equations in several variables that appear, cannot even be written and solved without the use of computer algebra.

1.2. The method. Following [59], let us explain the approach used which is general and can be applied to many frequently encountered systems of ordinary differential equations. We describe it in the real case but it also works in the complex case.

Let

$$\frac{dx}{dt} = G(x)$$

be an autonomous system of ordinary differential equations defined on $\mathbb{R}^n$ (or on its open connected subset), $x = (x_1, \ldots, x_n)$, $G = (G_1, \ldots, G_n)$, $G$ is of class $C^\infty$. Let us note that $G = \sum_{i=1}^n G_i \frac{\partial}{\partial x_i}$ is the vector field that defines the system (1.9) and for a smooth function $f = f(x)$, $G(f) = \sum_{i=1}^n G_i \frac{\partial f}{\partial x_i}$.

Function $F \in C^1(U)$, where $U \subset \mathbb{R}^n$ is an open subset, is a first integral of system (1.9) if $F$ is constant along the orbits of system (1.9), that is $G(F) = 0$, and $F$ is not
constant on any open subset of \( U \).

We are interested here by the first integrals that do not depend on all variables.

1.2.1. Part one. Let us search a first integral \( F \) of system (1.9) that does not depend on \( x_1 \), that means \( F = F(\vec{x}) \), where \( \vec{x} = (x_2, \ldots, x_n) \), or equivalently \( \frac{\partial F}{\partial x_1} = 0 \) identically. Here we have privileged \( x_1 \), but similar conditions can be written for every index \( r \), \( 1 \leq r \leq n \). Then for every \( x \):

\[
G(F(x)) = \sum_{i=2}^{n} G_i(x) \frac{\partial F}{\partial x_1}(\vec{x}) = 0.
\]

As \( F \) does not depend on \( x_1 \), then for every \( k \geq 1 \) one has

\[
\sum_{i=2}^{n} \frac{\partial^k G_i}{\partial x_1^k}(x) \frac{\partial F}{\partial x_i}(\vec{x}) = 0.
\]

In other words, if one notes by \( Y_k \) the vector fields

\[
Y_k = \sum_{i=2}^{n} \frac{\partial^k G_i}{\partial x_1^k}(x) \frac{\partial}{\partial x_i},
\]

then for every \( k \geq 0 \) one has \( Y_k(F) = 0 \), where \( Y_0 = G \), that is \( F \) is a first integral of all these vector fields. All these vector fields are defined on \( n \)-dimensional space \( \mathbb{R}^n(x) \).

If among the vector fields \( \{Y_k\}_{k \geq 0} \) one can find \((n-1)\) of them that are linearly independent at some point \( a \in \mathbb{R}^n(x) \), then by continuity they are also linearly independent on some open neighborhood of \( a \). As \( Y_k(F) = 0 \) for all \( k \geq 0 \), one deduces that grad \( F \) vanishes identically on \( U \) and consequently \( F|_U = const \). Then \( F \) is not a first integral of system (1.9) because by definition a first integral is non constant on any open subset of its domain of definition. The same argument works also when arbitrary \( n - 1 \) vector fields \( \{Z_i\}_{1 \leq i \leq n-1} \) such that \( Z_i(F) = 0 \), \( 1 \leq i \leq n-1 \), are given. Such a criterion of non existence of the first integral will be frequently used in future.

Let us suppose now that the vector field \( G \) is of the form

\[
G(x) = \sum_{i=0}^{p} x_1^i \tilde{Y}_{p-i}(\vec{x}) = x_1^p \tilde{Y}_0(\vec{x}) + \ldots + x_1 \tilde{Y}_{p-1}(\vec{x}) + \tilde{Y}_p(\vec{x})
\]

for some smooth vector fields \( \{\tilde{Y}_i\}_{0 \leq i \leq p} \) defined on \( \mathbb{R}^{n-1}(\vec{x}) \) (or on some open subset of \( \mathbb{R}^{n-1}(\vec{x}) \)). Then as \( F \) does not depend on \( x_1 \), one has

\[
0 = G(F(x)) = x_1^p \tilde{Y}_0(F)(\vec{x}) + \ldots + x_1 \tilde{Y}_{p-1}(F)(\vec{x}) + \tilde{Y}_p(F)(\vec{x}).
\]

As \( \tilde{Y}_p(\vec{x}) \) does not depend on \( x_1 \), one deduces that \( \tilde{Y}_p(F) = 0 \). Thus \( G(x) = x_1 G_1(x) \) where the smooth vector field \( G_1 \) is

\[
G_1(x) = x_1^{p-1} \tilde{Y}_0(\vec{x}) + \ldots + x_1 \tilde{Y}_{p-2}(\vec{x}) + \tilde{Y}_{p-1}(\vec{x}).
\]

As above, one deduces that \( \tilde{Y}_{p-1}(F) = 0 \), etc. Finally one deduces that \( \tilde{Y}_i(F) = 0 \) for all \( 0 \leq i \leq p \). Thus all vector fields \( \tilde{Y}_i \) defined on \( \mathbb{R}^{n-1}(\vec{x}) \) have a common first integral \( F \) that does not depend on \( x_1 \).

What follows is completely independent of condition (1.11). Like in [59] the main tools used to decide if two smooth vector fields could have a common first integral are
the simplest facts from linear algebra and the following well known fact. If \( F \) is a first integral common for two vector fields \( X \) and \( Y \) defined on some open subset \( U \) of \( \mathbb{R}^p \), \( p \geq 2 \), then \( F \) is also a first integral of their Lie bracket (also known as Jacobi-Lie bracket) or the commutator of vector fields \([X, Y] \), defined by \([X, Y](f) = X(Y(f)) - Y(X(f))\) for all twice differentiable functions \( f \). Indeed, if \( X(F) = Y(F) = 0 \), then evidently \([X, Y](F) = X(Y(F)) - Y(X(F)) = 0\).

For vector fields \( X = \sum_{i=1}^{p} X_i \frac{\partial}{\partial x_i} \) and \( Y = \sum_{i=1}^{p} Y_i \frac{\partial}{\partial x_i} \), simple computations give
\[
[X, Y] = \sum_{i=1}^{p} \sum_{j=1}^{p} \left( X_j \frac{\partial Y_i}{\partial x_j} - Y_j \frac{\partial X_i}{\partial x_j} \right) \frac{\partial}{\partial x_i}.
\]
Consequently if \( X \) and \( Y \) are \( C^\infty \), then \([X, Y]\) is also \( C^\infty \).

For \( x \in U \), let us denote by \( D(x) \) the two-dimensional vector subspace of \( \mathbb{R}^p \) spanned by vectors \( X(x) \) and \( Y(x) \). Let us note \( D_0 = \{ D(x), x \in U \} \). Let us note \( D_1 = D_0 + [D_0, D_0] = D_0 + \{ [A, B] ; A, B \in D_0 \} \), where \([A, B] = AB - BA\) is the Lie bracket of vector fields \( A \) and \( B \). Let us note \( D_2 = D_1 + [D_1, D_1] = D_1 + \{ [A, B] ; A, B \in D_1 \} \), etc, where \( A + B = \{ a + b ; a \in A ; b \in B \} \). Thus \( D_0 \subset D_1 \subset D_2 \subset \ldots \). For some \( k \), necessarily \([D_k, D_k] = D_k \). \( D_k \) is nothing but the smallest Lie algebra generated by vector fields \( X \) and \( Y \).

Let now \( a \in U \), \( X(a) \neq 0 \) and \( Y(a) \neq 0 \). The Frobenius Integrability Theorem \cite{34, 51} implies that in some neighborhood of point \( a \in U \) there exists a function \( \Phi \) such that \( X(\Phi) = Y(\Phi) = 0 \), if an only if \( \dim D_k(a) < p \), where \( D(x) \) is the vector space of the vector bundle \( D_k \) over \( x \). The number of functionally independent solutions of equations \( X(F) = Y(F) = 0 \) defined in some neighborhood of \( a \) is equal to \( p - \dim D_k(a) \).

The equation \( X(F)(x) = 0 \), \( x \in U \), can be considered as a linear homogeneous equations with unknowns \( \left\{ \frac{\partial F}{\partial x_i}(x) \right\}_{1 \leq i \leq p} \). The same is true for equations \( Y(F)(x) = 0 \) and \([X, Y](F)(x) = 0 \). More generally this is true for all vector fields from \( D_k \). Then if \( \dim D_k(a) = p \), by continuity \( \dim D_k(x) = p \) for \( x \) belonging to some neighborhood \( V \subset U \) of \( a \). Choosing an arbitrary basis \( v_1, \ldots, v_p \) of vector bundle \( D(V) = \bigcup_{x \in V} D_k(x) \) and writing the corresponding linear homogeneous equations with in general variable coefficients and unknowns \( \left\{ \frac{\partial F}{\partial x_i}(x) \right\}_{1 \leq i \leq p} \), as \( \dim D_k(x) = p \) for \( x \in V \), one deduces that \( \frac{\partial F}{\partial x_i}(x) = 0 \) for \( x \in V \), and finally that \( F|_V = \text{const} \). This contradicts the assumption that \( F \) is a first integral.

Thus the condition \( \dim D_k(a) < p \) is necessary for the existence of first integral. In this case the corresponding system of linear equations has infinitely many non-zero solutions. From Frobenius Integrability Theorem we know that now first integrals exist in some neighborhood of point \( a \). But we do not know if these first integrals are the restrictions of first integrals defined on whole phase space: \( \mathbb{R}^n \) for system (1.9).

Let us return to system (1.9) and let us suppose that \( \dim D_k(a) = n - 2 \) for some \( a \in \mathbb{R}^n \) and thus \( \dim D_k(x) = n - 2 \) for \( x \) from some neighborhood \( W \) of \( a \).

In this case, for \( x \in W \), \( \left\{ \frac{\partial F}{\partial x_i}(x) \right\}_{2 \leq i \leq n} \) satisfy some system of \( n - 2 \) linearly independent linear homogeneous equations. Let \( \left\{ \varphi_i(x) \right\}_{2 \leq i \leq n} \) be a fixed solution of this system.
Any other solution is of the form \( \{ \mu(x) \phi_i(x) \}_{2 \leq i \leq n} \) for some smooth function \( \mu \).

If \( F \) is a first integral, then for some smooth function \( \mu, \frac{\partial F}{\partial x_i}(x) = \mu(x) \phi_i(x) \), which means that \( \mu \) is an integrating factor of differential form \( \sum_{i=1}^{n} \phi_i(x) dx_i \). From Frobenius Integrability Theorem we know that such an integrating factor exists because a first integral exists. Surprisingly, in this work in all cases when this situation arises, that is when \( \dim D_k = n - 2 \) and \( n \leq 6 \), MAPLE is able to compute explicitly the first integral \( F \), globally defined. This is precisely in this way we compute all the unknown first integrals.

**1.2.2. Part two.** Let us consider now the systems of ordinary differential equations like \((1.9)\) but depending on parameters \( \lambda = (\lambda_1, \ldots, \lambda_k) \)

\[
\frac{dx}{dt} = G(x, \lambda),
\]

where \( G \in C^\infty(\mathbb{R}^{n+k}, \mathbb{R}^k) \) and for smooth function \( f = f(x) \),

\[
G(f, \lambda)(x) = \sum_{i=1}^{n} G_i(x, \lambda) \frac{\partial f}{\partial x_i}(x).
\]

All the content of Sec. 1.2.1 without parameters remains valid also with parameters. So, like \((1.10)\) we have the vector fields \( Y_k(x, \lambda) \), \( k \geq 0 \), etc.

As an example, let us consider the simple case when all functions \( G_i = G_i(x, \lambda), 1 \leq i \leq n \), are of the form \( G_i(x, \lambda) = x_1 g_i(\hat{x}, \lambda) + h_i(\hat{x}, \lambda) \), \( 1 \leq i \leq n \).

Let us search a first integral \( F(x, \lambda) \) of system \((1.12)\) that does not depend on \( x_1 \). We repeat the whole Sec. 1.2.1 but for now the new data depending on \( \lambda \) appear.

This leads us to the identity

\[
0 = G(F(\hat{x}, \lambda), \lambda) = x_1 \tilde{Y}_1(F(\hat{x}, \lambda), \lambda) + \tilde{Y}_2(F(\hat{x}, \lambda), \lambda),
\]

where

\[
\tilde{Y}_1(\hat{x}, \lambda) = \sum_{i=2}^{n} g_i(\hat{x}, \lambda) \frac{\partial}{\partial x_i}, \quad \tilde{Y}_2(\hat{x}, \lambda) = \sum_{i=2}^{n} h_i(\hat{x}, \lambda) \frac{\partial}{\partial x_i},
\]

etc.

In particular for every \( \lambda = (\lambda_1, \ldots, \lambda_k) \) and \( x \in \mathbb{R}^n \), starting from vector fields \( \tilde{Y}_1(\hat{x}, \lambda) \) and \( \tilde{Y}_2(\hat{x}, \lambda) \), computing their commutator and commutators of higher orders we define Lie algebra \( D_{k(\lambda)}(\hat{x}, \lambda) \) like Lie algebra \( D_k(\hat{x}) \) in Sec. 1.2.1.

We search the smooth function \( F(x, \lambda) \) such that for any fixed \( \lambda, F \) is a first integral of system \((1.12)\). This leads to the necessary condition

\[
\dim D_{k(\lambda)}(\hat{x}, \lambda) \leq n - 2 \quad (1.13)
\]

for the existence of such first integral.

As in all examples treated below, \( n \leq 6 \), without difficulty we compute explicitly a base of vector space \( D_{k(\lambda)}(\hat{x}, \lambda) \). Let \( M(\hat{x}, \lambda) \) be a matrix whose rows are coordinates of vectors of above base. The condition \((1.13)\) is nothing other but

\[
\text{rank } M(\hat{x}, \lambda) \leq n - 2 \quad (1.14)
\]
for all $\hat{x} \in \mathbb{R}^{n-1}$. Using MAPLE and the method described in Sec. 3 in all our examples we manage to determine all parameters $\lambda$ such that (1.14) holds, and thus also that (1.13), is satisfied for all $\hat{x} \in \mathbb{R}^{n-1}$.

Having a concrete example to examine, we compute the associated vector fields and their commutators. After, using computer algebra, we determine the parameters $\lambda$ that answer the problem posed; existence or nonexistence of supplementary first integral. For details, see Sec. 5 and 8-9.

All that, with evident changes, remains valid in complex case with $G = (G_1, \ldots, G_n)$ analytic in some open, connected subset of $\mathbb{C}^n$, because Frobenius integrability theorem can be also formulated in complex framework ([34, 51]).

1.3. History. Today, the standard approach for the detection of integrable versus non-integrable cases of ordinary differential equations of quite general nature follows mainly the ideas that begun with S. V. Kovalevskaya (1889) and A. M. Lyapunov (1894) from one side and those of J. Liouville (around 1840), E. Picard (1883-1896) and E. Vessiot (1892) from the other and culminate in the so-called Morales-Ramis theory. The history of this subject, as well as some of its applications, can be found in [47, 48, 49, 23, 2]. See also [66, 67, 70, 71, 69, 40, 7].

The method of compatible vector fields that is used in this paper was initiated independently by three persons: Anatolij Dokshevich [16], Vladimir Bogaevskii [8] and Stefan Rauch-Wojciechowski (in the past Wojciechowski) [75].

Let us make a digression on the problem of priority between A. Dokshevich and V. Bogaevskii. The book where A. Dokshevich paper is published was sent to the print June 30, 1964. The paper of V. Bogaevskii was received by the editor October 20, 1964. In footnote of page 93 of [8] he says that the paper was submitted to the editor before the publication of [16]. Let us stress also that [8] was published in largely known mathematical journal published in Moscow and that [16] was published in proceedings of some conference in Tashkent, at the time the capital of Soviet Uzbekistan. There is no doubt that the two authors independently each other have discovered and applied the method of compatible vector fields.

Let us give a very short review of these papers. Both papers are devoted to the study of real Euler-Poisson equations having supplementary first integral that does not depend on all variables. In both papers the condition $\gamma_1^2 + \gamma_2^2 + \gamma_3^2 = 1$ is assumed.

In Dokshevich paper [16], using method of compatible vector fields one proves that if the supplementary first integral is of the form $F = F(\omega_1, \omega_2, \gamma_1, \gamma_2)$ then this occurs only in Kovalevskaya case and when $c_2 = 0$, the explicit formula for Kovalevskaya first integral is deduced. The other cases studied in [16] concern the supplementary first integrals of the form $F = F(\omega_3)$, $F = F(\omega_1, \omega_2)$, $F = F(\omega_1, \omega_2, \gamma_1, \gamma_2)$, $F = F(\omega_1, \omega_2, \omega_3, \gamma_3)$ which lead to the cases of integrability of Lagrange and Euler, to the invariant relation of Hess (if $I_1(I_2-I_3)c_1^2 = I_2(I_1-I_3)c_2^2$, $c_3 = 0$ then $I_1c_1\omega_1 + I_2c_2\omega_2 = 0$ is an invariant manifold for the Euler-Poisson equations) and the Goryachev-Chaplygin partial integrability case respectively. The author notes also that Sretenskii case of partial integrability of gyrostat equations can be found among the same lines as Goryachev-Chaplygin case.
Let us quote the last paragraph of [16], where the principle of the method of compatible vector fields is clearly stated.

“From a more general point of view, the idea of the presented technique is as follows. It is required to solve some first order partial differential equation

\[ \sum_{i=1}^{n} \frac{\partial F}{\partial x_i} X^i(x_1, \ldots, x_n) = 0. \]

We add to it also partial differential equations of the simplest form, for example

\[ \frac{\partial F}{\partial x_k} = 0, \quad 1 \leq k \leq s, \quad s < n. \]

Then it will be required that the built system is compatible. If the compatibility conditions are satisfied, then the solution of the system will be at the same time some solution of the original equation.”

In Bogaevskii paper [8] one considers the supplementary first integral of the form \( F = F(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3) \) for the Euler-Poisson equations of motion of a rigid body with a fixed point in the potential force field \( U = U(\gamma_1, \gamma_2, \gamma_3) \). When \( U = c_1\gamma_1 + c_2\gamma_2 + c_3\gamma_3 \), we recover the standard Euler-Poisson equations (1.1). Applying the method of compatible vector fields one identifies the classical cases of integrability: Euler, Lagrange and Kovalevskaya.

Afterwards, one considers the problem of finding the general form of the potential \( U = U(\gamma_1, \gamma_2, \gamma_3) \) when there exists a supplementary first integral \( F = F(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3) \). A new generalization of the Kovalevskaya case appears.

Unlike [59] and the present paper, where we sweep up all possible cases of first integrals that do not depend on all variables, in [16] and [8] they only focus on a few concrete cases that enable them to catch integrable cases.

This line of research was pursued by Yu. A. Arkhangelskii [3, 4] directly inspired by [16] and [8] and also by S. I. Popov [55, 56, 57]. For further development see [58, 42, 59] and the present paper.

Around twenty years later, around 1986, Stefan Rauch-Wojciechowski motivated by [73, 74], where implicitly the Euler equations on the dual of Lie algebras appear [52], Ch. 6] and also [10, 12, 19, 36, 65, 53], discovered independently the method of compatible vector fields (the name coined by him) advocating their application to three-dimensional systems [61, 75, 76, 26, 77]. For further development see [50, 28, 35].

The method of compatible vector fields uses exclusively notions and facts already well known by Jacobi even if their formal settings were not perfect. Jacobi and some of his contemporaries already knew and understood vector fields, Jacobi-Lie bracket and the link between compatible vector fields and existence of the common first integrals for them, i.e. Frobenius theorem ([13], Ch. Groupes de Lie et algèbres de Lie, p. 310], [29], Sec. 2.5], [70, 71]). We cannot therefore exclude that the method of compatible vector fields appeared in certain works now forgotten, in the period going from the second half of the nineteen century, or even before, until the publication of [16, 8].

The paper is organized as follows. In Sec. 2 an important technical tool, the so called permutational symmetries are shortly described. Sec. 3 is devoted to the use of Gröbner
basis to obtain by MAPLE the solutions of the enormous systems of polynomial equations which appear in this article. The direct approach used in [59] is totally inappropriate here. This is one of the pivots of the paper.

Sec. 5 is devoted to the study of five-dimensional invariant manifolds \( \{ H_i = U_i \} \), \( 1 \leq i \leq 3 \), that is the problem (a) formulated before. This leads us to recover in a natural way the Goryachev-Chaplygin case. This is the content of Sec. 5.2. In Sec. 6 we sketch the study of gyrostat equations and of derivation of Sretenskii case. In Secs. 5.4 and 5.3 without giving the tedious and long proofs, we shortly report what happens on manifolds \( \{ H_3 = U_3 \} \) and \( \{ H_2 = 0 \} \), respectively. The case of manifolds \( \{ H_2 = U_2 \neq 0 \} \) was completely elucidated in Sec. 5 of [59]. In Sec. 7 we determine the so called domain of the Goryachev-Chaplygin partial first integral. In Secs. 8 and 9 we study what happens on four and three-dimensional invariant manifolds \( \{ H_i = U_i, H_j = U_j \} \), \( 1 \leq i, j \leq 3, i \neq j \), and \( \{ H_1 = U_1, H_2 = U_2, H_3 = U_3 \} \), respectively. We refer to [59] for some supplementary details.

The method we used is of general interest and is probably the most interesting point of this paper. It can also be applied in many other circumstances (see for example [10] - [12]).

2. Permutational symmetries

The Euler-Poisson equations (1.1) possess invariant property which we called permutational symmetry. The permutational symmetries can be described in a general framework as follows. Let \( x = (x_1, \ldots, x_n) \in \mathbb{C}^n \), \( \lambda = (\lambda_1, \ldots, \lambda_n) \in \mathbb{C}^n \), and let \( V(x, \lambda) = (V_1(x, \lambda), \ldots, V_n(x, \lambda)) \) depend smoothly on \( x \). Let us consider the following system of differential equations

\[
\frac{dx}{dt} = V(x, \lambda). \tag{2.1}
\]

Let \( \sigma \) be an element of the symmetric group \( S_n \), i.e., the group of all permutations of \( \{1, \ldots, n\} \). For \( a = (a_1, \ldots, a_n) \in \mathbb{C}^n \) we will note \( \sigma(a) = (a_{\sigma(1)}, \ldots, a_{\sigma(n)}) \).

The permutation \( \sigma \in S_n \) will be called a permutational symmetry of system (2.1) if for all \( x \in \mathbb{C}^n \), \( \lambda \in \mathbb{C}^n \), one has

\[
V_k(\sigma(x), \sigma(\lambda)) = \varepsilon V_{\sigma(k)}(x, \lambda), \quad 1 \leq k \leq n, \tag{2.2}
\]

where \( \varepsilon = \pm 1 \) is a constant depending on \( k \) but independent of \( x \) and \( \lambda \). It is obvious that all permutational symmetries of given equation form a group.

Let us recall that the subset \( M \subset \mathbb{C}^n \) is an invariant subset of system (2.1) if \( M \) is formed by the entire orbits of it. That means that if for some \( t_0 \in \mathbb{C} \), \( x(t_0) \in M \), then \( x(t) \in M \) for all \( t \in \mathbb{C} \) such that \( x(t) \) is well defined.

Let us formulate the following theorem, already proved in [12] and [59] respectively. We formulated it in the complex setting, but it remains valid also in the real framework as well. For the sake of completeness, we also report its proof.
Theorem 2.1. The permutational symmetries of the Euler-Poisson equations (1.1) are the following:

\[
\begin{align*}
\sigma_1 &= \{(1, 2, 3), (1, 2, 3)\},
\sigma_2 &= \{(1, 3, 2), (1, 3, 2)\},
\sigma_3 &= \{(2, 3, 1), (2, 3, 1)\},
\sigma_4 &= \{(2, 1, 3), (2, 1, 3)\},
\sigma_5 &= \{(3, 1, 2), (3, 1, 2)\},
\sigma_6 &= \{(3, 2, 1), (3, 2, 1)\},
\end{align*}
\]

(2.3)

where \(\sigma\{(i_1, i_2, i_3), (j_1, j_2, j_3)\}, 1 \leq i_r, j_r \leq 3, 1 \leq r \leq 3, \) is the permutation

\[
\sigma(s_1, s_2, s_3, t_1, t_2, t_3) = (s_{i_1}, s_{i_2}, s_{i_3}, t_{j_1}, t_{j_2}, t_{j_3}).
\]

Proof. The permutation \(\sigma_1\) with \(\varepsilon = 1\) is evidently a permutational symmetry for the Euler-Poisson equations. One can see from these equations that \(\sigma_2\) with \(\varepsilon = -1\) is a permutational symmetry too. The same is true for \(\sigma_3\) with \(\varepsilon = 1\).

Taking into account the equalities

\[
\sigma_4 = \sigma_2 \circ \sigma_3, \quad \sigma_5 = \sigma_3^2, \quad \sigma_6 = \sigma_3 \circ \sigma_2
\]

we deduce that \(\sigma_4\) with \(\varepsilon = -1\), \(\sigma_5\) with \(\varepsilon = 1\) and \(\sigma_6\) with \(\varepsilon = -1\) are permutational symmetries for the Euler-Poisson equations.

To complete the proof of the theorem it remains only to note that if the permutation

\[
\sigma(1, 2, 3, 4, 5, 6) = (l_1, l_2, l_3, l_4, l_5, l_6)
\]

is a permutational symmetry for the Euler-Poisson equations then \(l_1, l_2, l_3 \in \{1, 2, 3\}\) and \(l_4, l_5, l_6 \in \{4, 5, 6\}\). Thus \(\sigma = \{(l_{i_1}, l_{i_2}, l_{i_3}), (l_{j_1}, l_{j_2}, l_{j_3})\}\). Now, from the Euler-Poisson equations one deduces easily that \(i_k = j_k, 1 \leq k \leq 3\).

It is interesting to observe that the three sets \(E, L\) and \(K\) are invariant with respect to the permutational symmetries. The same concerns the kinetic symmetry case.

In other words, all permutational symmetries of Euler-Poisson equations (1.1) coincide with symmetric group \(S_3\), where the same permutation is simultaneously applied to variables \(\{\omega_1, \omega_2, \omega_3\}\) and \(\{\gamma_1, \gamma_2, \gamma_3\}\) and to parameters \(\{I_1, I_2, I_3\}\) and \(\{c_1, c_2, c_3\}\).

It is also important to note that the first integrals \(H_1, H_2\) and \(H_3\) are invariant with respect to all permutational symmetries of Euler-Poisson equations. This means that for any such permutational symmetry \(\sigma\) one has:

\[
H_i(I, c, \omega, \gamma) = H_i(\sigma(I), \sigma(c), \sigma(\omega), \sigma(\gamma)), \quad 1 \leq i \leq 3,
\]

where for permutation \(\sigma \in S_3, \sigma(a_1, a_2, a_3) = (a_{\sigma(1)}, a_{\sigma(2)}, a_{\sigma(3)})\).

This leads to the following general statement that will be frequently used in the future.

Let us define the function \(\Phi_0, \Phi_0(x, \lambda) = 1\) for all \(x \in \mathbb{C}^n\) and \(\lambda \in \mathbb{C}^n\). Let \(U_0 = 1\) and let us note \(M(U_0, \lambda) = \{x \in \mathbb{C}^n; \Phi_0(x, \lambda) = 1\} = \mathbb{C}^n\).

Let \(\lambda \in \mathbb{C}^n\) be fixed. Let \(\Phi_i = \Phi_i(x, \lambda), 1 \leq i \leq k < n,\) be a finite number of first integrals of system (2.1), that are all invariant with respect to all permutational
symmetries $\sigma$ of the system (2.1), that is
\[ \Phi_i(x, \lambda) = \Phi_i(\sigma(x), \sigma(\lambda)), \quad 1 \leq i \leq k. \] (2.4)

For $U_1, \ldots, U_k \in \mathbb{C}^n$ and $k \geq 0$ let us note:
\[ M(U_0, \ldots, U_k, \lambda) = \{ x \in \mathbb{C}^n; \Phi_i(x, \lambda) = U_i, \quad 0 \leq i \leq k \}. \] (2.5)

In the future, without repeating it each time, we will only consider the cases where $M(U_0, \ldots, U_k, \lambda)$ is either $\mathbb{C}^n$ (when $k = 0$) or a non-empty submanifold (perhaps with singularities) of $\mathbb{C}^n$ (when $k \geq 1$).

All these submanifolds of $\mathbb{C}^n$ are invariant manifolds of the system (2.1) and from (2.4) it follows that they are all invariant with respect to all permutational symmetries of system (2.1).

**Theorem 2.2.** Let $k \geq 0$. Let $\sigma$ be some permutational symmetry of system (2.1). Let us consider the system (2.1) restricted to the invariant manifold $M(U_0, \ldots, U_k, \lambda)$ and its local first integral $F = F(x)$ defined on some open subset $W_F \subset M(U_0, \ldots, U_k, \lambda)$. Then the function $G = F \circ \sigma^{-1}$, i.e. $G(x) = F(\sigma^{-1}(x))$, defined on the open subset $\sigma(W_F) = \{ x \in M(U_0, \ldots, U_k, \lambda); \sigma^{-1}(x) \in W_F \}$ of $M(U_0, \ldots, U_k, \lambda)$ is a local first integral of the system
\[ \frac{dx}{dt} = V(x, \sigma(\lambda)). \] (2.6)

restricted to $M(U_0, \ldots, U_k, \lambda)$.

**Proof.** As $F$ is a first integral of system (2.1), restricted to $W_F$ then for every $x \in W_F$
\[ \sum_{k=1}^{n} V_k(x, \lambda) \left( \frac{\partial F}{\partial x_k} \right)(x) = 0. \]
As $\sigma$ is a permutation of $\{1, \ldots, n\}$, the last equality is equivalent to
\[ \sum_{k=1}^{n} V_{\sigma(k)}(x, \lambda) \left( \frac{\partial F}{\partial x_{\sigma(k)}} \right)(x) = 0. \]
Taking into account (2.2), we can write this as:
\[ \sum_{k=1}^{n} V_k(\sigma(x), \sigma(\lambda)) \left( \frac{\partial F}{\partial x_{\sigma(k)}} \right)(x) = 0. \]
The last equality is satisfied for every $x \in W_F$. Then putting instead of $x$, $\sigma^{-1}(x)$ we obtain that for every $x \in \sigma(W_F)$
\[ \sum_{k=1}^{n} V_k(x, \sigma(\lambda)) \left( \frac{\partial F}{\partial x_{\sigma(k)}} \right)(\sigma^{-1}(x)) = 0. \]
On the other hand a function $G = G(x)$ is a first integral of system (2.6) if
\[ \sum_{k=1}^{n} V_k(x, \sigma(\lambda)) \left( \frac{\partial G}{\partial x_k} \right)(x) = 0. \]
Thus to finish the proof it remains to prove that for \( G = F \circ \sigma^{-1} \) and \( 1 \leq k \leq n \) one has
\[
\left( \frac{\partial F}{\partial x_{\sigma(k)}} \right)(\sigma^{-1}(x)) = \left( \frac{\partial G}{\partial x_k} \right)(x),
\]
but this is obvious. ■

For \( k = 0 \), Theorem 2.2 coincides with Theorem 2.1 from \([42]\) and also from \([59]\).

Theorem 2.2 shows that from the point of view of integrability/non-integrability the systems (2.1) and (2.6), both restricted to \( M(U_0, \ldots, U_k, \lambda) \), are exactly of the same nature.

In the future, when considering the local first integrals, the word “local” will frequently be omitted.

Thereafter, we will always have \( \Phi_i = H_i, 1 \leq i \leq 3 \).

3. Solving some systems of polynomial equations

The method applied to solve all systems of polynomial equations encountered in this paper uses the theory of Gröbner bases of polynomial rings (\([15, 18, 60]\)).

Let us recall some basic facts concerning them and their Maple implementations.

For all computations we use exclusively the monomial order
\[
tdeg(U_1, U_2, U_3, I_1, I_2, I_3, c_1, c_2, c_3)
\]
with ordering \( U_1 > U_2 > U_3 > I_1 > I_2 > I_3 > c_1 > c_2 > c_3 \).

A Maple reduced Gröbner basis is such a Gröbner basis that if we remove a polynomial from it, the remaining polynomials no longer form a Gröbner basis and it has the additional property that no monomial of any polynomial in the basis is divisible by any of the leading monomials (other than itself). If all polynomials in a Maple reduced Gröbner basis have leading coefficient 1, then this basis is unique up to permutation of its elements and is called reduced Gröbner basis. Let us stress that the reduced Gröbner basis always exists.

As proved by the following simple example, in general, Maple reduced Gröbner basis is not the reduced Gröbner basis.

Let us consider the polynomial ring \( \mathbb{C}[x, y, z] \) where \( x > y > z \) and its ideal \( L \) generated by polynomials
\[
\{3y^2 - 8z^3, xy^2 + yz^3, x^2 - 2xz + 5\}.
\]
With monomial order \( \text{tdeg}(x, y, z) \), the command \textbf{Groebner[Basis]} gives the following Maple reduced Gröbner basis of \( L \):

\[
x^2 - 2xz + 5, 8z^3 - 3y^2, 8xy^2 + 3y^3, 9y^4 + 48y^3z + 320y^2
\]

with leading coefficients \([1, 8, 8, 9]\). With monomial order \( \text{plex}(x, y, z) \) we obtain the Maple reduced basis

\[
1600z^3 - 96z^8 + 240z^6 + 9z^9, -40z^5 + 32z^7 - 3z^8 + 80yz^3, 3y^2 - 8z^3, 120z^5 - 96z^7 + 9z^8 + 640xz^3, x^2 - 2xz + 5
\]

with leading coefficients \([9, 80, 3, 640, 1]\).

We observe that the obtained Maple reduced Gröbner bases consist of polynomials, each with integer coprime coefficients and positive leading coefficient.

The reason that \textsc{Maple} in its definition of the reduced Gröbner bases does not require that the leading coefficients are 1 is due to avoidance of use of rational non-integer numbers.

All factorizations are over \( \mathbb{Q} \), that is in the polynomial ring

\[
\mathbb{Q}[U, I, c] = \mathbb{Q}[U_1, U_2, U_3, I_1, I_2, I_3, c_1, c_2, c_3].
\]

Let us consider polynomials \( P_i = P_i(U, I, c) = P_i(U_1, U_2, U_3, I_1, I_2, I_3, c_1, c_2, c_3) \in \mathbb{Q}[U, I, c], 1 \leq i \leq n \). We want to find all complex solutions of the system \( P_i(U, I, c) = 0, 1 \leq i \leq n \), such that \( I_j \neq 0, 1 \leq j \leq 3 \). Such solutions will be called \textit{good solutions}. To find them we proceed as follows (steps A.1–A.3) and in all cases encountered we achieve a success.

Let us note \( \mathbb{C}_g^9 = \{(U, I, c) \in \mathbb{C}^9; I_i \neq 0, 1 \leq i \leq 3 \} \). The good solutions are in \( \mathbb{C}_g^9 \).

\section*{A.1.} With \textsc{Maple} command \textbf{factor}, we factorize over \( \mathbb{Q} \) all polynomials \( P_i(U, I, c), 1 \leq i \leq n \),

\[
P_i = I_1^{\alpha_{i1}} I_2^{\alpha_{i2}} I_3^{\alpha_{i3}} \prod_{k=1}^{r_i} D_{ik}^{\beta_{ik}},
\]

where \( \beta_{ik} \in \mathbb{N} = \{1, 2, \ldots\}, \alpha_{i1}, \alpha_{i2}, \alpha_{i3} \in \mathbb{N} \cup \{0\}, D_{ik} \in \mathbb{Q}[U, I, c] \). Moreover, for \( k \neq l \), polynomials \( D_{ik} \) and \( D_{il} \) are relatively prime and irreducible in \( \mathbb{Q}[U, I, c], 1 \leq k, l \leq r_i, 1 \leq i \leq n \).

Then

\[
\{(U, I, c) \in \mathbb{C}_g^9; P_i(U, I, c) = 0, 1 \leq i \leq n \} = \{(U, I, c) \in \mathbb{C}_g^9; \tilde{P}_i(U, I, c) = 0, 1 \leq i \leq n \},
\]

where \( \tilde{P}_i = \prod_{k=1}^{r_i} D_{ik} \) is a square-free factorization of \( \prod_{k=1}^{r_i} D_{ik}^{\beta_{ik}} \). Let us stress that in

\[
(3.1)
\]

we have identity of zeros but perhaps not of their multiplicities.

It is clear that the following inclusion of ideals in the ring \( \mathbb{Q}[U, I, c] \) takes place:

\[
\{P_1, \ldots, P_n\} \subset \{\tilde{P}_1, \ldots, \tilde{P}_n\},
\]

where \( \{R_1, \ldots, R_q\} \) denotes the ideal in \( \mathbb{Q}[U, I, c] \) generated by the polynomials

\[
R_1, \ldots, R_q \in \mathbb{Q}[U, I, c].
\]
A.2. Using MAPLE command Groebner[Basis] we compute in the ring \( \mathbb{Q}[U, I, c] \) a Maple reduced Gröbner basis \( \{Q_1, \ldots, Q_m\} \) of ideal \( \{\hat{P}_1, \ldots, \hat{P}_n\} \subset \mathbb{Q}[U, I, c] \). The polynomials \( Q_1, \ldots, Q_m \) can have multiple factors in \( \mathbb{Q}[U, I, c] \).

Formulas (3.1) and (3.2) imply respectively that

\[
\{(U, I, c) \in \mathbb{C}_g^9, P_i(U, I, c) = 0, 1 \leq i \leq n\} = \\
\{(U, I, c) \in \mathbb{C}_g^9, Q_j(U, I, c) = 0, 1 \leq j \leq m\}
\]

and

\[
\{P_1, \ldots, P_n\} \subset \{Q_1, \ldots, Q_m\}.
\]

As \( \{R_1, \ldots, R_u\} \subset \{\hat{R}_1, \ldots, \hat{R}_u\} \) we have

\[
\{P_1, \ldots, P_n\} \subset \{\hat{Q}_1, \ldots, \hat{Q}_m\}. \tag{3.3}
\]

and

\[
\{(U, I, c) \in \mathbb{C}_g^9, P_i(U, I, c) = 0, 1 \leq i \leq n\} = \\
\{(U, I, c) \in \mathbb{C}_g^9, \hat{Q}_j(U, I, c) = 0, 1 \leq j \leq m\} \tag{3.4}
\]

The passage from the system \( P_1 = 0, \ldots, P_n = 0 \) to the system \( \hat{Q}_1 = 0, \ldots, \hat{Q}_m = 0 \) will be called a simplification.

According to (3.4) the system obtained by simplification has the same good solutions as the source system and in all encountered cases the obtained system of equations is simpler than the source one.

As the ring \( \mathbb{Q}[U, I, c] \) is Noetherian, then after a finite number of consecutive simplifications, we will arrive (see (3.3)) to the system \( S_1 = 0, \ldots, S_t = 0 \), that will not be modified by another simplification, that is, every polynomial \( S_i, 1 \leq i \leq t \), is square-free, without factors of the form \( I_1^{a_1} I_2^{a_2} I_3^{a_3} \) and the polynomials \( \{S_i\}_{1 \leq i \leq t} \) form a Maple reduced Gröbner basis of the ideal \( \{S_1, \ldots, S_t\} \).

We call the system of equations \( S_1 = 0, \ldots, S_t = 0 \) reduced system or reduction of the source system \( P_1 = 0, \ldots, P_n = 0 \). The reduced system \( \{S_j = 0\} \) has the same set of good solutions as the source system \( \{P_i = 0\} \). The simplest MAPLE computational criterion that the system \( S_1 = 0, \ldots, S_t = 0 \) is a reduction of the source system is that its simplification coincides with it. This criterion will be constantly used by us.

A.3. The final step is then to describe the set of all complex solutions of the reduced system \( \{S_j = 0\}, 1 \leq j \leq t \).

It is clear that when \( t = 1 \) and \( S_1 = 1 \), then the source system does not admit any good solution.

Fortunately, in an unexplained and unexpected way, in all other cases encountered below, the reduced systems are simple, of low degrees and all \( \{S_j\}_{1 \leq j \leq t} \) are factorized in product of factors that depend on only one kind of unknowns \( \{U_1, U_2, U_3\}, \{c_1, c_2, c_3\} \) or \( \{I_1, I_2, I_3\} \). Moreover every factor belong to the following short list of possibilities:

\[
U_1, \ U_2, \ U_3, \ a_1I_1 + a_2I_2 + a_3I_3, \ \ c_1, \ c_2, \ c_3 \ \ and \ \ b_1c_1^2 + b_2c_2^2 + b_3c_3^2, \tag{3.5}
\]

where \( a_i \) and \( b_i \), \( 1 \leq i \leq 3 \), are some integers. There is only one exception in Sec. 8.2.1 where in one of the equations of the reduced system a factor appears that depends simultaneously on \( I_i \) and \( c_i \), \( 1 \leq i \leq 3 \), and it is \( (I_2 - I_3)c_1^2 + (I_1 - I_3)c_2^2 + (I_2 - I_1)c_3^2 \).
In many cases the situation is even simpler because some of polynomials $S_j$, $1 \leq j \leq t$, merely coincide with some of the possibilities from list (3.5). For example, in Sec. 7 (see formula (7.8)) polynomial $S_1 = c_3$.

Thus, without any difficulty, all the good solutions can be found either by hand or by applications of elementary computer algebra, MAPLE for example.

4. Some algebra

The following two simple Propositions will be used repeatedly until the end of the article. The first one is well known and follows from the well known elementary properties of resultant ([15, Chap. 3, §6] and [18]).

Let $\mathbb{K}$ be a field of characteristic 0 and $\mathbb{K}[x]$ be as usual the ring of polynomials of one variable $x$ with coefficients in $\mathbb{K}$.

**Proposition 4.1.** Let $g \in \mathbb{K}[x]$ be a polynomial and $h(x) = \frac{dg}{dx}$. Let $\rho$ be the resultant of $g$ and $h$ and $\rho \neq 0$. Let $\overline{x}$ be some root of $g$, $g(\overline{x}) = 0$. Then

(i) $h(\overline{x}) \neq 0$,

(ii) $g$ has no multiple roots.

**Proof.** (i) It follows immediately from the well known fact. If $f, g \in \mathbb{K}[x]$ then $f$ and $g$ have a common factor in $\mathbb{K}[x]$ if and only if their resultant is 0 or equivalently if $f$ and $g$ have a common root (perhaps in algebraic closure of the field $\mathbb{K}$ if this field is not algebraically closed).

(ii) It follows from the evident fact that if $g$ has a multiple root, then $h(x) = \frac{dg}{dx}$ has the same root and thus $g$ and $h$ has a common factor. ■

The second Proposition is completely evident but for convenience it is called Proposition.

Let $\mathbb{K}$ be a field of characteristic 0. Let $f, g \in \mathbb{K}[x]$ are polynomials of one variable $x$ and $g \neq 0$. By Euclidean division we know that for some polynomials $q, r \in \mathbb{K}[x]$ one has

$$f(x) = q(x)g(x) + r(x), \quad \deg r < \deg g \quad \text{or} \quad r = 0.$$

**Proposition 4.2.** Let

(i) all roots of $g$ are simple and are in $\mathbb{K}$,

(ii) all roots of $g$ are also roots of $f$.

Then $g$ divides $f$ in $\mathbb{K}[x]$, that means that the remainder $r$ (which is in $\mathbb{K}[x]$) vanishes identically.

In the following, for fixed $n \geq 1$, let $\mathbb{K}_n = \text{Alg}(s_1, \ldots, s_n)$ be the field of algebraic functions of complex variables $(s_1, \ldots, s_n) \in \mathbb{C}^n$ ([11], [61], [68]). The field $\mathbb{K}_n$ is of characteristic 0.

Let us explain this more in details. Following [11], let $P_0, \ldots, P_k \in \mathbb{C}[x_1, \ldots, x_n]$ be complex polynomials of variables $x_1, \ldots, x_n$, and with $P_k(x_1, \ldots, x_n) \neq 0$. A function
\( y = y(x_1, \ldots, x_n) \) of the variables \( x_1, \ldots, x_n \) is called complex algebraic function if

\[
P_k(x_1, \ldots, x_n)y^k + P_{k-1}(x_1, \ldots, x_n)y^{k-1} + \cdots + P_0(x_1, \ldots, x_n) = 0 \tag{4.1}
\]

for all \( (x_1, \ldots, x_n) \in \mathbb{C}^n \) and if the above polynomial of \( y \) is irreducible in \( \mathbb{C}[x_1, \ldots, x_n] \).

The number \( k \) is called degree of algebraic function \( y \). If \( k = 1 \), an algebraic function is a rational function \( y = -P_0(x_1, \ldots, x_n)/P_1(x_1, \ldots, x_n) \). For \( k = 2, 3, 4 \), an algebraic function can be expressed by square and cube roots of rational functions in the variables \( x_1, \ldots, x_n \). If \( k \geq 5 \), this is impossible in general (18).

If \( k \geq 2 \) an algebraic function is multivalued (like for example \( y = \sqrt{x} \)) and in an open dense subset of \( \mathbb{C}^n \), it locally admits holomorphic (analytic) determinations called also branches. This follows from complex implicit function theorem (34, 51).

Let us also note that any non-zero complex polynomial \( (4.1) \) can be factorized in irreducible factors (18). Thus, the equation \( (4.1) \) defines algebraic functions even if the polynomial \( (4.1) \) is not irreducible.

Let us note for short \( x = (x_1, \ldots, x_n) \). Let us compute the partial derivatives \( \frac{\partial y}{\partial x_i}(x) \), \( 1 \leq i \leq n \), for an algebraic function of degree \( k \). By deriving the formula \( (4.1) \) with respect to \( x_i \), \( 1 \leq i \leq n \), one easily deduces that

\[
\frac{\partial y}{\partial x_i}(x) = \frac{-\frac{\partial P_k}{\partial x_i}(x)y^k + \frac{\partial P_{k-1}}{\partial x_i}(x)y^{k-1} + \cdots + \frac{\partial P_0}{\partial x_i}(x)}{kP_k(x)y^{k-1} + (k-1)P_{k-1}(x)y^{k-2} + \cdots + P_1(x)} \tag{4.2}
\]

The partial derivatives of higher order of the algebraic function \( y = y(x) \) can be computed by consecutive derivations of the formula \( (4.2) \).

As the degree of algebraic function \( y = y(x) \) is \( k \), the denominator of \( (4.2) \) which is a non-vanishing algebraic function is non-zero on open dense subset of \( \mathbb{C}^n \), where the formula \( (4.2) \) gives the searched derivative, that is also an algebraic function of \( x = (x_1, \ldots, x_n) \).

Now, let us consider on some open subset \( U \) of \( \mathbb{C}^n \), some holomorphic determination of multivalued algebraic function \( y = y(x) \), that we shall note \( f = f(x) \). Then, if in formula \( (4.2) \) instead of \( y \) one takes the function \( f \), the formula remains valid.

Consequently, instead of analyzing separately all holomorphic determinations of an algebraic function \( y = y(x) \), it suffices to consider the multivalued algebraic function \( y = y(x) \) as a whole, the derivatives of which are given by the formula \( (4.2) \).

We shall also apply the following well known and easy to prove Proposition.

**Proposition 4.3.** Let \( n \geq 2 \) and let \( V \in \mathbb{C}[x_1, \ldots, x_n] \) be a polynomial that is not a square of another polynomial. Then \( \sqrt{V} \notin \mathbb{C}(x_1, \ldots, x_n) \) that means that \( \sqrt{V} \) is not a rational function of \( x_1, \ldots, x_n \).

5. Five-dimensional invariant manifolds \( \{H_i=U_i\} \), \( 1 \leq i \leq 3 \).

Goryachev-Chaplygin and Sretenskii cases

5.1. Extraction procedure. In this section we study the existence of a local partial first integral of the Euler-Poisson equations \( (1.1) \) restricted to the invariant complex five-
dimensional manifolds $\{H_1 = U_1\}$ and $\{H_3 = U_3\}$. We study when on each of them there exists a local partial first integral that depends on at most four variables and such that on $\{H_1 = U_1\}$ it is functionally independent of $H_2$ and $H_3$ and on $\{H_3 = U_3\}$ of $H_1$ and $H_2$ respectively. The same problem can be stated also for manifold $\{H_2 = U_2\}$ where the functional independence of $H_1$ and $H_3$ is required. For $U_2 = 1$ this case has been considered in Sec. 5 of [59] and the general case of $U_2 \neq 0$ can easily be reduced to the case $U_2 = 1$. Thus it remains to study only the case $\{H_2 = 0\}$.

Let us fix $i$, $1 \leq i \leq 3$. According to (2.5)

$$M(U_0, U_i, Ic) = \{x \in \mathbb{C}^6; H_i((\omega, \gamma), Ic) = U_i\},$$

where $(\omega, \gamma) = (\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2, \gamma_3)$ and $\dim M(U_0, U_i, Ic) = 5$.

We search all functions $F$ of four variables $F = F(s_1, s_2, s_3, s_4)$ where $(s_1, s_2, s_3, s_4) \in (\omega, \gamma)$, of class $C^1$, such that $\text{grad} F$ does not vanish identically on each open subset of $M(U_0, U_i, Ic)$, which are local partial first integrals of the Euler-Poisson equations (1.1) restricted to $M(U_0, U_i, Ic)$.

Let $i = 1$. The unique intrinsic property of $C^1$ function $F$ that is a local first integral is that grad $F$ does not vanish identically on any open subset of its domain of definition, that in this case is equal to $M(U_0, U_1, Ic)$. This implies that some of the partial derivatives of $F$ may be identically zero. Thus the results of Sec. 5.2 also remain valid for the functions of at most four variables.

As $\frac{\partial F}{\partial s_1} \frac{ds_1}{dt} + \frac{\partial F}{\partial s_2} \frac{ds_2}{dt} + \frac{\partial F}{\partial s_3} \frac{ds_3}{dt} + \frac{\partial F}{\partial s_4} \frac{ds_4}{dt} = 0$, where $\frac{ds_i}{dt}$, $1 \leq i \leq 4$, are given by the right hand sides of the equations of Euler-Poisson (1.1), then the order of variables $s_i$, $1 \leq i \leq 4$, in $F(s_1, s_2, s_3, s_4)$ is irrelevant for $F$ to be a first integral.

We have exactly 15 different four elements subsets of $(\omega, \gamma)$ and thus 15 cases of functions of four elements to examine. We will describe now an extraction procedure based on permutational symmetries which reduces the above 15 cases to only four.

These 15 functions of four variables (up to the order of variables) are shown in the table below.

<table>
<thead>
<tr>
<th>Functions</th>
<th>Case</th>

<tr>
<td>$F(\omega_1, \omega_3, \gamma_1, \gamma_3), F(\omega_1, \omega_2, \gamma_1, \gamma_2), F(\omega_2, \omega_3, \gamma_2, \gamma_3)$</td>
<td>(ii)</td>
</tr>
<tr>
<td>$F(\omega_1, \omega_2, \gamma_1, \gamma_3), F(\omega_1, \omega_3, \gamma_1, \gamma_2), F(\omega_2, \omega_3, \gamma_1, \gamma_2)$, $F(\omega_1, \omega_2, \gamma_2, \gamma_3), F(\omega_1, \omega_3, \gamma_2, \gamma_3), F(\omega_2, \omega_3, \gamma_1, \gamma_3)$</td>
<td>(iii)</td>
</tr>
<tr>
<td>$F(\omega_1, \gamma_1, \gamma_2, \gamma_3), 1 \leq i \leq 3$</td>
<td>(iv)</td>
</tr>
</tbody>
</table>

It is easy to see that under the group of permutational symmetries (2.3) of the Euler-Poisson equations for every case (i)–(iv) from Table 5.1, each function from the case is consequently transformed into all remaining functions from the same case.

Thus in virtue of Theorem 2.2 we can restrict ourselves to the study of only four functions where every one belongs to a different case from Table 5.1 and is chosen arbitrary.
from the functions of this case.

We will call such four functions $F_i$, $1 \leq i \leq 4$, (up to the order of variables) a **basis**.

As Table 5.1 shows, the functions

$$F(\omega_1, \omega_2, \omega_3, \gamma_3), \ F(\omega_1, \omega_3, \gamma_1, \gamma_3), \ F(\omega_1, \omega_2, \gamma_1, \gamma_3), \ F(\omega_1, \gamma_1, \gamma_2, \gamma_3)$$

(5.1)

form a basis.

To be a local first integral of some vector field, first integral defined in some open subset of some manifold, is an intrinsic property, that is independent of the system of coordinates used. Thus in $M(U_0, U_i, Ic)$ instead of coordinates $(\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2, \gamma_3)$ inherited from the Euler-Poisson equations, we can consider for example the system of coordinates $(\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_3)$, where the coordinate (variable) $\gamma_2$ can be eliminated thanks to identity $H_1 = U_1$. The same concerns all remaining coordinates.

Using coordinates $(\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_3)$ on $M(U_0, U_i, Ic)$ we can verify if the first three functions of the basis (5.1) are partial first integrals or not. For the last function of basis (5.1) we will use the coordinates $(\omega_1, \omega_3, \gamma_1, \gamma_2, \gamma_3)$.

The following general remark concerns also Sec. 8 and Sec. 9. If we are interested in partial first integrals that depend on at most three variables, for instance $F(\omega_2, \omega_3, \gamma_3)$, we can consider it as a particular case of $F(\omega_1, \omega_2, \omega_3, \gamma_3)$ (case (i)), of $F(\omega_2, \omega_3, \gamma_2, \gamma_3)$ (case (ii)) and of $F(\omega_2, \omega_3, \gamma_1, \gamma_3)$ (case (iii)). From the study of each of these functions, we can conclude about the existence of the sought partial first integral $F(\omega_2, \omega_3, \gamma_3)$.

5.2. Invariant manifold {H1=U1}. Determination of the Goryachev-Chaplygin case. Here we show the method we use on the example {H1 = U1}. This invariant manifold gives not only results for non-existing of the sought partial first integrals at $U_1 \neq 0$ but when $U_1 = 0$ it also gives a nice derivation of the Goryachev-Chaplygin case.

5.2.1. Elimination of $\gamma_2$. Let us express $\gamma_2$ from the equation $H_1 = U_1$. We have

$$\gamma_2 = \frac{U_1 - I_1 \omega_1 \gamma_1 - I_3 \omega_3 \gamma_3}{I_2 \omega_2}.$$  

(5.2)

We put the expression for $\gamma_2$ from (5.2) in the Euler-Poisson equations (1.1) and remove the fifth equation. In this way we obtain

$$\frac{d\omega_1}{dt} = c_3 U_1 + I_2 (I_2 - I_3) \omega_2^2 \omega_3 - I_1 c_3 \omega_1 \gamma_1 - I_2 c_2 \omega_2 \gamma_3 - I_3 c_3 \omega_3 \gamma_3,$$

$$\frac{d\omega_2}{dt} = (I_3 - I_1) \omega_1 \omega_3 + c_1 \gamma_3 - c_3 \gamma_1,$$

$$\frac{d\omega_3}{dt} = -c_1 U_1 + I_2 (I_1 - I_2) \omega_1 \omega_2^2 + I_1 c_1 \omega_1 \gamma_1 + I_2 c_2 \omega_2 \gamma_1 + I_3 c_1 \omega_3 \gamma_3,$$

$$\frac{d\gamma_1}{dt} = -I_1 \omega_1 \omega_3 \gamma_1 - I_2 \omega_2^2 \gamma_3 - I_3 \omega_3^2 \gamma_3 + \omega_3 U_1,$$

$$\frac{d\gamma_3}{dt} = I_1 \omega_1^2 \gamma_1 + I_2 \omega_2^2 \gamma_1 + I_3 \omega_1 \omega_3 \gamma_3 - \omega_1 U_1.$$
Looking for a partial first integral of system (5.3) which depends on four variables indicated in brackets, we come to the following five possible cases:

1. $F(\omega_1, \omega_2, \omega_3, \gamma_1)$, (case (i))
2. $F(\omega_1, \omega_2, \omega_3, \gamma_3)$, (case (i))
3. $F(\omega_1, \omega_2, \gamma_1, \gamma_3)$, (case (iii))
4. $F(\omega_1, \omega_3, \gamma_1, \gamma_3)$, (case (iii))
5. $F(\omega_2, \omega_3, \gamma_1, \gamma_3)$, (case (iii))

where “case(*)” indicates in which case of Table 5.1 the corresponding partial first integral appears.

The functions of types 2, 3 and 4 belong to the basis (5.1). We should study all of them. We start with a partial first integral of type 2.

**Type 2.** Let us look for a partial first integral of system (5.3) that does not depend on $\gamma_1$, i.e. of type 2. Moreover we want this integral to be functionally independent of $H_2$ and $H_3$. Let us suppose that the function

$$F(\omega_1, \omega_2, \omega_3, \gamma_3)$$

is such a partial first integral of (5.3). It satisfies the following identity

$$\frac{dF}{dt} = \frac{c_3U_1 + I_2(I_2 - I_3)\omega_2^2\omega_3 - I_1c_3\omega_1\gamma_1 - I_2c_2\omega_2\gamma_3 - I_3c_3\omega_3\gamma_3}{I_1I_2\omega_2} \frac{\partial F}{\partial \omega_1}$$

$$+ \frac{(I_3 - I_1)\omega_1\omega_3 + c_1\gamma_3 - c_3\gamma_1}{I_2} \frac{\partial F}{\partial \omega_2}$$

$$+ \frac{-c_1U_1 + I_2(I_1 - I_2)\omega_1\omega_2^2 + I_1c_1\omega_1\gamma_1 + I_2c_2\omega_2\gamma_1 + I_3c_1\omega_3\gamma_3}{I_2I_3\omega_2} \frac{\partial F}{\partial \omega_3}$$

$$+ \frac{I_1\omega_1^2\gamma_1 + I_2\omega_2^2\gamma_1 + I_3\omega_1\omega_3\gamma_3 - \omega_1U_1}{I_2\omega_2} \frac{\partial F}{\partial \gamma_3} = 0,$$

or equivalently

$$I_1I_2I_3\omega_2 \frac{dF}{dt} = I_1\gamma_1Y_1(F) + Y_2(F) = 0,$$  

(5.5)

where $Y_1$ and $Y_2$ are the following vector fields defined in $\mathbb{C}^4 = \mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_3)$

$$Y_1 = -I_3c_3\omega_1 \frac{\partial}{\partial \omega_1} - I_3c_3\omega_2 \frac{\partial}{\partial \omega_2} + (I_1c_1\omega_1 + I_2c_2\omega_2) \frac{\partial}{\partial \omega_3} + I_3(I_1\omega_1^2 + I_2\omega_2^2) \frac{\partial}{\partial \gamma_3},$$

$$Y_2 = I_3[I_2(I_2 - I_3)\omega_2^2\omega_3 - I_2c_2\omega_2\gamma_3 - I_3c_3\omega_3\gamma_3 + c_3U_1] \frac{\partial}{\partial \omega_1}$$

$$- I_1I_3\omega_2[(I_1 - I_3)\omega_1\omega_3 - c_1\gamma_3] \frac{\partial}{\partial \omega_2}$$

$$- I_1[I_2(I_2 - I_1)\omega_1\omega_2^2 - I_3c_1\omega_1\gamma_3 + c_1U_1] \frac{\partial}{\partial \omega_3} + I_1I_3\omega_1(I_3\omega_3\gamma_3 - U_1) \frac{\partial}{\partial \gamma_3}.$$

As (5.5) is an identity with respect to all the variables and as $Y_1(F)$ and $Y_2(F)$ do not depend on $\gamma_1$ we have

$$Y_1(F) = Y_2(F) = 0.$$  

(5.6)
We compute the Lie brackets $Y_3 = [Y_1, Y_2]/I_3$ and $Y_4 = [Y_1, Y_3]$ and obtain

$$Y_3 = m_{31} \frac{\partial}{\partial \omega_1} + m_{32} \frac{\partial}{\partial \omega_2} + m_{33} \frac{\partial}{\partial \omega_3} + m_{34} \frac{\partial}{\partial \gamma_3},$$

$$Y_4 = m_{41} \frac{\partial}{\partial \omega_1} + m_{42} \frac{\partial}{\partial \omega_2} + m_{43} \frac{\partial}{\partial \omega_3} + m_{44} \frac{\partial}{\partial \gamma_3},$$

where

$$m_{31} = -I_1 I_2 I_3 c_2 \omega_1^2 \omega_2 - I_1 I_3^2 c_3 \omega_1 \omega_3 - I_2^2 I_3 c_3 \omega_2^2 \omega_3 + I_1 I_2 (I_2 - I_3) c_1 \omega_1 \omega_2^2$$

$$- I_1 I_3 c_1 \omega_1 \gamma_3 + I_2^2 (I_2 - 2 I_3) c_2 \omega_3^2 - I_2 I_3 c_2 \omega_2 \gamma_3 - I_3^2 c_2 \omega_3^2 \gamma_3 + I_3 c_2 U_1,$$

$$m_{32} = I_1 \omega_2 [I_2 I_3 c_1 \omega_2^2 - I_1 (I_1 - 2 I_3) c_1 \omega_1^2 - I_2 (I_1 - I_3) c_2 \omega_1 \omega_2 + I_3 (I_1 - I_3) c_3 \omega_1 \omega_3]$$

$$m_{33} = I_1 [I_1 I_3 c_1 \omega_1^2 \omega_3 + I_1 c_1 \omega_1 \gamma_3 + I_2 c_1 c_2 \omega_2 \gamma_3 - I_2 (I_2 - 2 I_3) c_1 \omega_2 \omega_3$$

$$+ I_2 (I_1 - I_3) c_2 \omega_1 \omega_3 - 3 I_2 (I_1 - I_2) c_3 \omega_1 \omega_2^2 + I_3 c_1 c_3 \omega_3 \gamma_3 - c_1 c_3 U_1],$$

$$m_{34} = I_1 [I_1 I_3 \omega_3^2 \omega_3 + I_1 c_1 \omega_1 \gamma_3 - 2 I_2 c_2 \omega_2 \gamma_3 + 3 I_2 c_2 \omega_1 \omega_2 \gamma_3$$

$$+ I_2 (2 I_1 - 2 I_2 + I_3) \omega_1 \omega_2 \omega_3 + I_3 c_3 \omega_3 \gamma_3 - c_1 U_1 \omega_1],$$

$$m_{41} = I_3 c_2 [- 2 I_2^2 I_3 c_1 \omega_1^3 - I_1 I_2 (3 I_2 - I_3) c_1 \omega_1 \omega_2^2 - I_1 I_3 c_1 c_2 \omega_1 \gamma_3 - 3 I_2^2 (I_2 - I_3) c_2 \omega_3^2$$

$$- I_2 I_3 c_2 \omega_2 \gamma_3 + I_2 I_3 (I_2 - I_3) c_2 \omega_2 \omega_3 - I_3^2 c_2 \omega_3 \gamma_3 + U_1 c_2],$$

$$m_{42} = I_1 \omega_2 I_3 c_3 [- 2 I_2 I_3 c_1 \omega_2^2 + (3 I_1 - 5 I_3) I_1 c_1 \omega_1^2$$

$$+ 3 (I_1 - I_3) I_2 c_2 \omega_1 \omega_2 - (I_1 - I_3) I_3 c_3 \omega_1 \omega_3],$$

$$m_{43} = I_1 [2 I_1^2 I_3 c_2 \omega_1^2 \omega_2 + 2 I_2^2 I_3 c_1 \omega_1^2 + I_1 I_3 c_3 \omega_1 \gamma_3 - 2 I_2^2 (I_2 - 2 I_3) c_1 c_2 \omega_1^2$$

$$+ I_2 I_3 c_2 \omega_2 \gamma_3 + 3 I_2 I_3 (I_2 - I_3) c_1 c_2 \omega_2 \omega_3 - 3 I_2 I_3 (I_1 - I_3) c_2 \omega_1 \omega_2 \omega_3$$

$$+ I_3^2 c_3 \omega_2 \gamma_3 - I_2 \omega_1 \omega_2^2 (2 I_1 I_3 c_1^2 - 2 I_1 I_2 c_1^2 - 2 I_1 \omega_2 c_1 - 4 I_1 I_3 c_1^2 - 9 I_1 I_3 c_1^2 + 2 I_2 I_3 c_1^2$$

$$+ 9 I_2 I_3 c_1^2 - I_3 c_1 c_2 U_1]$$

$$m_{44} = I_1 I_3 [2 I_1^2 I_3 c_1 \omega_2^4 + 6 I_1 I_2 I_3 c_2 \omega_1^2 \omega_2^2 - 4 I_2^2 I_3 c_1 \omega_2^4 + 2 I_1 I_2 (2 I_1 - 2 I_2 - I_3) c_1 \omega_2 \omega_2^2$$

$$+ I_1 I_3 c_1 c_2 \omega_2 \gamma_3 + 2 I_2 (2 I_1 - 2 I_2 + 3 I_3) c_2 \omega_1 \omega_2 \omega_3 + 4 I_2 I_3 c_1 c_3 \omega_2 \gamma_3$$

$$- 3 I_2 I_3 c_2 \omega_2 \omega_2 \gamma_3 - 8 I_2 I_3 (I_1 - I_2) c_3 \omega_1 \omega_2 \omega_3 + I_3^2 c_3 \omega_1 \omega_3 \gamma_3 - I_3 c_2^2 U_1 \omega_1].$$

Equations (5.6) imply that

$$Y_3(F) = Y_4(F) = 0. \quad (5.7)$$

Equations (5.6) and (5.7) can be considered as a system of four homogeneous linear algebraic equations with unknowns grad $F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_3} \right)$, which do not vanish identically on any open subset of domain of definition of $F$, because $F$ is non-constant on any such open subset.

If a new integral $F$ exists, system (5.6)–(5.7) has at least one non-zero solution. Let us consider the $4 \times 4$ matrix $A$ whose rows are the coefficients of vector fields $Y_1$, $Y_2$, $Y_3$ and $Y_4$. The condition under which system (5.6)–(5.7) has at least one non-zero solution is

$$\text{rank } A \leq 3.$$
where the expression for monomials and thus with 72 coefficients depending on $I$. (5.8) is equivalent of finding all values of the parameters $I$ and $U_1$. It is clear that to solve (5.8) is equivalent of finding all values of the parameters $I$ and $U_1$ for which the 72 coefficients of $D$ are zero. The expression for $D$ is too long and that is why we do not write it here. To solve this system of 72 equations we proceed as described in Sec. 3.

After four consecutive simplifications of the source system of 72 equations we obtain the reduced system having only nine equations:

\[(I_2 - I_3)c_2c_3 = 0, \quad (I_1 - I_3)c_2c_3 = 0, \]
\[(I_2 - I_3)c_1c_3 = 0, \quad (I_1 - I_3)c_1c_3 = 0, \quad (I_1 - I_2)c_1c_2 = 0, \]
\[(I_2 - 4I_3)(I_1 - I_3)c_2 = 0, \quad (I_1 - I_3)(I_1 - 4I_3)c_2 = 0, \]
\[(I_2 - I_3)(I_2 - 4I_3)c_1 = 0, \quad (I_2 - I_3)(I_1 - 4I_3)c_1 = 0. \]

We solve these nine equations by the MAPLE command `solve` and obtain five solutions. Two of them lead to the Lagrange case and one - to the kinetic symmetry case. In this way we come to the following two cases that should be studied separately:

1. $I_1 = I_2 = 4I_3$, $c_3 = 0$, $(c_1, c_2) \neq (0, 0)$ and $U_1$ are arbitrary,
2. $c_1 = c_2 = 0$, $c_3 \neq 0$, $I_1 \neq 0$, $I_2 \neq 0$, $I_3 \neq 0$ and $U_1$ are arbitrary.

Let us study these cases.

**Case 1.** $I_1 = I_2 = 4I_3$, $c_3 = 0$, $(c_1, c_2) \neq (0, 0)$ and $U_1$ are arbitrary. At this condition we have $D = 0$ and therefore the vector fields $Y_i$, $1 \leq i \leq 4$, are linearly dependent.

Let us note by $D_{ab}$ the determinant of $3 \times 3$ matrix obtained from $4 \times 4$ matrix $A$ by canceling row $a$ and column $b$. Elementary MAPLE computations show that the determinant $D_{43}$:

\[D_{43} = 768I_3 I_1^2 I_2^2 I_3^2 (\omega_1^2 + \omega_2^2)(-c_2 \omega_1 + c_1 \omega_2)(I_3 \omega_1^2 \omega_3 + I_3 \omega_2^2 \omega_3 - c_1 \omega_1 \gamma_3 - c_2 \omega_2 \gamma_3)\]

never vanishes identically unless $c_1 = c_2 = 0$, i.e. the Euler case. Thus the vector fields $Y_i$, $1 \leq i \leq 3$, are linearly independent on open dense subset of the space $\mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_3)$ for every $U_1 \in \mathbb{C}$, in particular for $U_1 = 0$.

We compute the Lie bracket $Y_5 = [Y_2, Y_3]$ and obtain

\[Y_5 = m_{51} \frac{\partial}{\partial \omega_1} + m_{52} \frac{\partial}{\partial \omega_2} + m_{53} \frac{\partial}{\partial \omega_3} + m_{54} \frac{\partial}{\partial \gamma_3},\]

where

\[m_{51} = I_3 \omega_2 [9I_3 c_1 \omega_1^2 \omega_2 \omega_3 - 9I_3 c_1 \omega_3^2 \omega_3 - 4I_3 c_2 \omega_1^2 \omega_1^3 + 14I_3 c_2 \omega_1 \omega_2^2 \omega_3 + 2c_1 c_2 \omega_2^2 \gamma_3 + c_1 c_2 \omega_2^2 \gamma_3 - (3c_1^2 + 2c_2^2) \omega_1 \omega_2 \gamma_3],\]
\[m_{52} = I_3 \omega_2 [-2I_3 c_1 \omega_1^3 \omega_3 + 16I_3 c_1 \omega_1 \omega_2 \omega_3^2 - 15I_3 c_2 \omega_1^2 \omega_2 \omega_3 + 3I_3 c_2 \omega_3^2 \omega_3 - 2c_1^2 \omega_1^2 \gamma_3 - c_1 c_2 \omega_1 \omega_2 \gamma_3 + (4c_1^2 - 3c_2^2) \omega_2^2 \gamma_3],\]
$$m_{53} = I_3^2 c_1 \omega_1^3 \omega_2^2 - 17I_3^2 c_1 \omega_1 \omega_2^2 \omega_3^2 + 9I_3^2 c_2 \omega_1^3 \omega_2^2 \omega_3 - 9I_3^2 c_2 \omega_2^3 \omega_3^2$$

$$+ 4I_3 c_1 c_2 \omega_1 \omega_2 \omega_3 \gamma_3 + c_1^3 \omega_1 \gamma_3^2 + c_1^2 c_2 \omega_2 \gamma_3^2 - (c_1^2 - 3c_2^2)I_3 \omega_2^2 \omega_3 \gamma_3$$

$$+ 2c_1^2 U_1 \omega_1^2 - 2c_1^2 U_2 \omega_2^2 + 4c_1 c_2 U_1 \omega_1 \omega_2,$$

$$m_{54} = I_3 [I_3^2 \omega_1^4 \omega_2^2 - 2I_3^2 \omega_1^2 \omega_2^4 \omega_3^2 - 3I_3^4 \omega_2^2 \omega_3^2 - 20I_3 c_1 \omega_1 \omega_2 \omega_3 \gamma_3$$

$$+ 14I_3 c_2 \omega_1^2 \omega_2 \omega_3 \gamma_3 - 6I_3 c_2 \omega_2^3 \omega_3 \gamma_3 + c_1^2 \omega_1^2 \gamma_3^2 + 2c_1 U_1 \omega_1^3$$

$$- 4c_1 U_1 \omega_1 \omega_2^2 + 4c_2 U_1 \omega_1^2 \omega_2 - 2c_2 U_1 \omega_2^3 + (4c_1^2 + 3c_2^2) \omega_2^2 \gamma_3^2].$$

Equations (5.6)–(5.7) imply that $Y_5(F) = 0$. In this way we obtain the following four equations

$$Y_1(F) = Y_2(F) = Y_3(F) = Y_5(F) = 0. \tag{5.9}$$

If a supplementary partial first integral $F$ exists, system (5.9) has at least one non-zero solution. We consider the $4 \times 4$ matrix $B$ of the coefficients of this system and look for such values of the parameters for which

$$\text{rank } B \leq 3. \tag{5.10}$$

We have

$$\det(B) = -3840I_3^7 \omega_1^4 U_1(c_2 \omega_1 - c_1 \omega_2)^3(I_3 \omega_1^2 \omega_3 - c_1 \omega_1 \gamma_3 + I_3 \omega_2^2 \omega_3 - c_2 \omega_2 \gamma_3).$$

Thus (5.10) will be fulfilled if and only if $U_1 = 0$, because $(c_1, c_2) \neq (0, 0)$.

Let $U_1 = 0$. Thus (5.10) is fulfilled. As $Y_1$, $Y_2$, $Y_3$ are linearly independent, then $Y_5$ is linearly dependent on them. Moreover, as we have already mentioned, $Y_4$ is also linearly dependent on $Y_1$, $1 \leq i \leq 3$ (see (5.8)). Thus equations

$$Y_i(F) = 0, \quad 1 \leq i \leq 3, \tag{5.11}$$

are in involution. They give a system of three first order linear homogeneous partial differential equations for determining the function $F$. We note here that the local solvability of system (5.11) around any point $(\omega_1, \omega_2, \omega_3, \gamma_3)$ where vector fields $Y_1$, $Y_2$ and $Y_3$ are linearly independent, follows from the Frobenius Integrability Theorem (see [51, 52]). Hence equations (5.11) have, at least locally, a non-trivial solution. We shall now present two ways, (a) and (b), to identify $F$.

(a) We solve system (5.11) by the MAPLE command pdsolve. In this way we obtain the solution

$$F = G [I_3 \omega_3 (\omega_1^2 + \omega_2^2) - (c_1 \omega_1 + c_2 \omega_2) \gamma_3], \tag{5.12}$$

where $G$ is an arbitrary smooth function. By direct computations one can verify that function $I_3 \omega_3 (\omega_1^2 + \omega_2^2) - (c_1 \omega_1 + c_2 \omega_2) \gamma_3$ that corresponds to $G(x) = x$ is really a first integral of system (5.3) at the conditions $I_1 = I_2 = 4I_3$, $c_3 = 0$, $U_1 = 0$, which is functionally independent of first integrals $H_2$ and $H_3$ both restricted to $\{H_1 = 0\}$. In this way, by our approach we recover the Goryachev–Chaplygin partially integrable case (1.8).

(b) Although the use of the MAPLE command pdsolve immediately gives a solution of system (5.11), it is not difficult to solve it by hand starting from the following simple remark.
Let us consider the following linear partial differential equation with constant coefficients

\[ p \frac{\partial f}{\partial x} + q \frac{\partial f}{\partial y} = 0, \quad (5.13) \]

where \( p \neq 0 \), \( q \) are constants and \( f = f(x, y) \) is a smooth function defined on some open subset of \( \mathbb{C}^2 \).

A linear change of variables \( u = qx - py, \ v = x \) transforms equation (5.13) into

\[ \frac{\partial \varphi(u, v)}{\partial v} = 0, \]

where \( f(x, y) = f(v, \frac{qv - u}{p}) = \varphi(u, v) \). Equation (5.13) is then transformed into \( \frac{\partial \varphi(u, v)}{\partial v} = 0 \). The general solution of this equation is \( \varphi(u, v) = \Phi(u) \), where \( \Phi \) is an arbitrary smooth function. Consequently, the general solution of (5.13) is

\[ f(x, y) = \Phi(qx - py). \quad (5.14) \]

Let us return to system (5.11). When \( I_1 = I_2 = 4I_3, \ c_3 = 0 \) and \( U_1 = 0 \), one has \( I_3 \omega_2 Y_1 = Z \), where

\[ Z = (c_1 \omega_1 + c_2 \omega_2) \frac{\partial}{\partial \omega_3} + I_3 (\omega_1^2 + \omega_2^2) \frac{\partial}{\partial \gamma_3}. \]

\( Y_1(F) = 0 \) if and only if \( Z(F) = 0 \). The equation \( Z(F) = 0 \) is of type (5.13), with \( x = \omega_3, \ y = \gamma_3, \ p = c_1 \omega_1 + c_2 \omega_2 \) and \( q = I_3(\omega_1^2 + \omega_2^2) \). Thus by (5.14) the general solution of equation \( Z(F) = 0 \) is given by formula (5.12). Now, all the rest is exactly the same as in (a).

Let us stress that in fact we never used the Frobenius theorem. Indeed, the desired partial first integral was obtained by direct computation.

**Case 2.** \( c_1 = c_2 = 0, \ c_3 \neq 0, \ I_1 \neq 0, \ I_2 \neq 0, \ I_3 \neq 0 \) and \( U_1 \) are arbitrary. Now the first integral \( H_3 \) is of type (5.4). If a new integral \( F \) of this type exists, system (5.6)–(5.7) has at least two non-zero solutions. The condition under which system (5.6)–(5.7) has at least two linearly independent solutions is

\[ \text{rank } A \leq 2. \quad (5.15) \]

We compute the determinant \( D_{44} \) of the matrix obtained from \( A \) by crossing out its last row and last column and obtain

\[ D_{44} = -I_1I_2I_3^2(I_1 - I_2)c_3^2\omega_1\omega_2^2\omega_3 \left[ I_1(2I_1 - 3I_3)\omega_1^2 + I_2(2I_2 - 3I_3)\omega_2^2 - 4I_3c_3\gamma_3 \right]. \]

Condition (5.15) implies that \( D_{44} \) is identically equal to zero. One easily sees that as \( c_3 \neq 0 \), the last is possible only when \( I_1 = I_2 \), i.e. \( Ic \in \mathcal{L} \). Thus a new partial first integral of the studied type does not exist for system (5.3).

**Type 3.** Here we look for a first integral of system (5.3) of type 3 \( F(\omega_1, \omega_2, \gamma_1, \gamma_3) \), i.e. a first integral that does not depend on \( \omega_3 \) requiring that it is functionally independent of \( H_2 \) and \( H_3 \). It satisfies the following identity

\[
\frac{dF}{dt} = \frac{c_3U_1 + I_2(2I_2 - I_3)\omega_2^2\omega_3 - I_1c_3\omega_1\gamma_1 - I_2c_3\omega_2\gamma_3 - I_3c_3\omega_3\gamma_3}{I_1I_2\omega_2} \frac{\partial F}{\partial \omega_1} \\
+ \frac{(I_3 - I_1)\omega_1\omega_3 + c_1\gamma_3 - c_3\gamma_1}{I_2} \frac{\partial F}{\partial \omega_2}
\]

Let us return to system (5.11). When \( I_1 = I_2 = 4I_3, \ c_3 = 0 \) and \( U_1 = 0 \), one has \( I_3 \omega_2 Y_1 = Z \), where

\[ Z = (c_1 \omega_1 + c_2 \omega_2) \frac{\partial}{\partial \omega_3} + I_3 (\omega_1^2 + \omega_2^2) \frac{\partial}{\partial \gamma_3}. \]

\( Y_1(F) = 0 \) if and only if \( Z(F) = 0 \). The equation \( Z(F) = 0 \) is of type (5.13), with \( x = \omega_3, \ y = \gamma_3, \ p = c_1 \omega_1 + c_2 \omega_2 \) and \( q = I_3(\omega_1^2 + \omega_2^2) \). Thus by (5.14) the general solution of equation \( Z(F) = 0 \) is given by formula (5.12). Now, all the rest is exactly the same as in (a).

Let us stress that in fact we never used the Frobenius theorem. Indeed, the desired partial first integral was obtained by direct computation.

**Case 2.** \( c_1 = c_2 = 0, \ c_3 \neq 0, \ I_1 \neq 0, \ I_2 \neq 0, \ I_3 \neq 0 \) and \( U_1 \) are arbitrary. Now the first integral \( H_3 \) is of type (5.4). If a new integral \( F \) of this type exists, system (5.6)–(5.7) has at least two non-zero solutions. The condition under which system (5.6)–(5.7) has at least two linearly independent solutions is

\[ \text{rank } A \leq 2. \quad (5.15) \]

We compute the determinant \( D_{44} \) of the matrix obtained from \( A \) by crossing out its last row and last column and obtain

\[ D_{44} = -I_1I_2I_3^2(I_1 - I_2)c_3^2\omega_1^2\omega_2^2\omega_3 \left[ I_1(2I_1 - 3I_3)\omega_1^2 + I_2(2I_2 - 3I_3)\omega_2^2 - 4I_3c_3\gamma_3 \right]. \]

Condition (5.15) implies that \( D_{44} \) is identically equal to zero. One easily sees that as \( c_3 \neq 0 \), the last is possible only when \( I_1 = I_2 \), i.e. \( Ic \in \mathcal{L} \). Thus a new partial first integral of the studied type does not exist for system (5.3).

**Type 3.** Here we look for a first integral of system (5.3) of type 3 \( F(\omega_1, \omega_2, \gamma_1, \gamma_3) \), i.e. a first integral that does not depend on \( \omega_3 \) requiring that it is functionally independent of \( H_2 \) and \( H_3 \). It satisfies the following identity

\[
\frac{dF}{dt} = \frac{c_3U_1 + I_2(2I_2 - I_3)\omega_2^2\omega_3 - I_1c_3\omega_1\gamma_1 - I_2c_3\omega_2\gamma_3 - I_3c_3\omega_3\gamma_3}{I_1I_2\omega_2} \frac{\partial F}{\partial \omega_1} \\
+ \frac{(I_3 - I_1)\omega_1\omega_3 + c_1\gamma_3 - c_3\gamma_1}{I_2} \frac{\partial F}{\partial \omega_2}
\]
identically on any open subset of domain of definition of $F$ algebraic equations with unknowns grad
on any such open subset.

\[ Y_\omega \quad \text{where } Y \] or equivalently
\[ \frac{dF}{dt} = \omega^3 Y_1(F) + \omega^3 Y_2(F) + Y_3(F) = 0, \] (5.16)

where $Y_1$, $Y_2$ and $Y_3$ are the following vector fields defined in $\mathbb{C}^4 = \mathbb{C}^4(\omega_1, \omega_2, \gamma_1, \gamma_3)$

\[ Y_1 = -I_1I_3\gamma_3 \frac{\partial}{\partial \gamma_1}, \]

\[ Y_2 = (\omega_1^2 I_2^2 - I_2\omega_2^2 I_3 - c_3 I_3 \gamma_3) \frac{\partial}{\partial \omega_2} - I_1 \omega_1^2 \omega_2 (-I_3 + I_1) \frac{\partial}{\partial \omega_2} \]

\[ + (U_1 - I_1 \omega_1 \gamma_1)I_1 \frac{\partial}{\partial \gamma_1} + \omega_1 I_3 \gamma_3 I_1 \frac{\partial}{\partial \gamma_3}, \]

\[ Y_3 = (c_3 U_1 - c_3 I_1 \omega_1 \gamma_1 - c_2 I_2 \omega_2 \gamma_3) \frac{\partial}{\partial \omega_1} + I_1 \omega_2 (c_1 \gamma_3 - c_3 \gamma_1) \frac{\partial}{\partial \omega_1} \]

\[ - I_1 \omega_2^2 \gamma_3 I_2 \frac{\partial}{\partial \gamma_1} + (I_2 \omega_2^2 \gamma_1 - U_1 \omega_1 + I_1 \omega_1^2 \gamma_1) I_1 \frac{\partial}{\partial \gamma_3}. \]

As (5.16) is an identity with respect to all the variables and as $Y_1(F)$, $Y_2(F)$ and $Y_3(F)$
do not depend on $\omega_3$ we have

\[ Y_1(F) = Y_2(F) = Y_3(F) = 0. \] (5.17)

We compute the Lie brackets $Y_4 = [Y_2, Y_3]/I_1$ and obtain

\[ Y_4 = \left[ I_2^2 c_3 \omega_2^2 \gamma_1 + I_1 (I_1 + I_3) c_3 \omega_1^2 \gamma_1 - 2 I_2 (I_2 - I_3) c_1 \omega_2^2 \gamma_3 ight] \frac{\partial}{\partial \omega_1} \]

\[ + I_2 (I_1 - 2 I_3) c_2 \omega_1 \omega_2 \gamma_3 + I_3 c_3 \omega_1^2 \gamma_1 - (I_1 + I_3) U_1 c_3 \omega_1 \right] \frac{\partial}{\partial \omega_2} \]

\[ + \left[ I_1 I_3 c_1 \omega_1 \omega_2 \gamma_3 + I_1 I_3 c_3 \omega_1^2 \omega_2 + I_2 (I_3 - I_1) c_2 \omega_3^2 \gamma_3 - I_3 c_3 U_1 \omega_2 \right] \frac{\partial}{\partial \gamma_1} \]

\[ + \left[ - I_1^2 c_3 \omega_1^2 \gamma_1^2 - I_1 I_2 c_2 \omega_2 \gamma_1 \gamma_3 + I_1 I_2 (I_1 - 3 I_3) \omega_1^2 \omega_3^2 \gamma_3 + I_1 c_3 U_1 \gamma_1 \right] \frac{\partial}{\partial \gamma_3}, \]

\[ - I_2 I_3 c_2 \omega_2^2 \gamma_3^2 - I_1 (I_1 + I_3) U_1 \omega_1 - I_2 (I_1 - I_2 + I_3) U_1 \omega_2 \right] \frac{\partial}{\partial \gamma_3}. \]

Equations (5.17) imply that

\[ Y_4(F) = 0. \] (5.18)

Equations (5.17) and (5.18) can be considered as a system of four homogeneous linear
algebraic equations with unknowns grad $F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_3} \right)$, which do not vanish
identically on any open subset of domain of definition of $F$, because $F$ is non-constant
on any such open subset.

If a new integral $F$ exists then system (5.17)-(5.18) has at least one non-zero solution.
Let us consider the $4 \times 4$ matrix $A$ whose rows are the coefficients of vector fields $Y_1$, $Y_2$, $Y_3$,
Y_3 and Y_4. We know that the condition under which system (5.17)–(5.18) has at least
one non-zero solution is
\[ D = \det(A) \equiv 0. \] (5.19)

We compute D and obtain
\[ D = I_1^2 I_2^2 I_3 \omega_2^2 \gamma_3 \hat{D}. \]

The expression for \( \hat{D} \) is long and we do not show it here. This expression is a polynomial in variables \( \omega_1, \omega_2, \gamma_1 \) and \( \gamma_3 \) having 26 monomials and thus with 26 coefficients depending on \( \mathcal{I} \) and \( U_1 \). It is clear that solving (5.19) is equivalent to finding all values of the parameters \( \mathcal{I} \) and \( U_1 \) for which the 26 coefficients of \( \hat{D} \) are zero. To solve this system of 26 equations we proceed as described in Sec. 3.

After three consecutive simplifications of the source system we obtain the reduced system consisting of the following five equations:
\[ c_2 c_3 = 0, \quad c_1 c_3 = 0, \quad (I_1 - I_2)c_3 = 0, \quad (I_1 - I_3)c_2 = 0, \quad (I_2 - I_3)c_1 = 0. \]

We solve these five equations by the MAPLE command `solve` and obtain five solutions. Three of them give the Lagrange case, one - the Euler case and one - the kinetic symmetry case.

Thus a new partial first integral of type 3 does not exist.

**Type 4.** Now let us study the existence of a first integral of system (5.3) of type 4, i.e. \( F(\omega_1, \omega_3, \gamma_1, \gamma_3) \) requiring that it is functionally independent of \( H_2 \) and \( H_3 \). We have the following identity
\[ \frac{dF}{dt} = \frac{c_3 U_1 + I_2 (I_2 - I_3) \omega_2^2 \omega_3 - I_1 c_3 \omega_1 \gamma_1 - I_2 c_2 \omega_2 \gamma_3 - I_3 c_3 \omega_3 \gamma_3}{I_1 I_2 \omega_2} \frac{\partial F}{\partial \omega_1} + \frac{I_2 (I_1 - I_2) \omega_1 \omega_2^2 + I_1 c_1 \omega_1 \gamma_1 + I_2 c_2 \omega_2 \gamma_1 + I_3 c_1 \omega_3 \gamma_3 - c_1 U_1}{I_2 I_3 \omega_2} \frac{\partial F}{\partial \omega_3} + \frac{-I_1 \omega_1 \omega_3 \gamma_1 - I_2 \omega_2^2 \gamma_3 - I_3 \omega_3^2 \gamma_3 + U_1 \omega_3}{I_2 \omega_2} \frac{\partial F}{\partial \gamma_1} + \frac{I_1 \omega_2^2 \gamma_1 + I_2 \omega_2^2 \gamma_1 + I_3 \omega_1 \omega_3 \gamma_3 - \omega_1 U_1}{I_2 \omega_2} \frac{\partial F}{\partial \gamma_3} = 0, \]

or equivalently
\[ I_1 I_2 I_3 \omega_2 \frac{dF}{dt} = I_2 \omega_2^2 Y_1(F) + I_2 \omega_2 Y_2(F) + (U_1 - I_1 \omega_1 \gamma_1 - I_3 \omega_3 \gamma_3) Y_3(F) = 0, \] (5.20)

where \( Y_1, Y_2 \) and \( Y_3 \) are the following vector fields defined in \( \mathbb{C}^4 = \mathbb{C}^4(\omega_1, \omega_3, \gamma_1, \gamma_3) \):
\[
Y_1 = \omega_3 I_3 (I_2 - I_3) \frac{\partial}{\partial \omega_1} + I_1 \omega_1 (I_1 - I_2) \frac{\partial}{\partial \omega_3} - \gamma_3 I_1 I_3 \frac{\partial}{\partial \gamma_1} + \gamma_1 I_1 I_3 \frac{\partial}{\partial \gamma_3},
\]
\[
Y_2 = c_2 \left( -I_3 \gamma_3 \frac{\partial}{\partial \omega_1} + I_1 \gamma_1 \frac{\partial}{\partial \omega_3} \right),
\]
\[
Y_3 = I_3 c_3 \frac{\partial}{\partial \omega_1} - I_1 c_1 \frac{\partial}{\partial \omega_3} + I_1 I_3 \omega_3 \frac{\partial}{\partial \gamma_1} - I_1 I_3 \omega_1 \frac{\partial}{\partial \gamma_3}.
\]
As \(5.20\) is an identity with respect to all the variables and as \(Y_1(F), Y_2(F)\) and \(Y_3(F)\) do not depend on \(\omega_2\) we have

\[
Y_1(F) = Y_2(F) = Y_3(F) = 0. \tag{5.21}
\]

We compute the Lie brackets \(Y_4 = [Y_1, Y_2]/I_1I_2I_3\) and obtain

\[
Y_4 = -c_2 \left( \gamma_1 \frac{\partial}{\partial \omega_1} + \gamma_3 \frac{\partial}{\partial \omega_3} \right).
\]

Equations \(5.21\) imply that

\[
Y_4(F) = 0. \tag{5.22}
\]

Equations \(5.21\) and \(5.22\) can be considered as a system of four homogeneous linear algebraic equations with unknowns \(\text{grad } F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_3} \right)\), which do not vanish identically on any open subset of domain of definition of \(F\), because \(F\) is non-constant on any such open subset.

If a new integral \(F\) exists then system \(5.21\)–\(5.22\) has at least one non-zero solution. Let us consider the \(4 \times 4\) matrix \(A\) whose rows are the coefficients of vector fields \(Y_1, Y_2, Y_3\) and \(Y_4\). We know that the condition under which system \(5.21\)–\(5.22\) has at least one non-zero solution is

\[
D = \det(A) \equiv 0.
\]

We compute \(D\) and obtain

\[
D = -I_1^2 I_3^2 c_2^2 \gamma_3 \omega_1 (I_1 \gamma_1^2 + I_3 \gamma_3^2).
\]

This determinant is not zero if \(c_2 \neq 0\). Thus in this case a new partial first integral cannot exist. We should consider the case \(c_2 = 0\).

Therefore let \(c_2 = 0\). We compute the Lie brackets \(Y_5 = [Y_1, Y_3]/(I_1I_3)\) and \(Y_6 = [Y_1, Y_5]\). We have

\[
Y_5 = (I_2 - I_3)c_1 \frac{\partial}{\partial \omega_1} - (I_1 - I_2)c_3 \frac{\partial}{\partial \omega_3}
\]

\[
+ I_1(I_1 - I_2 - I_3) \omega_1 \frac{\partial}{\partial \gamma_1} - I_3(I_1 + I_2 - I_3) \omega_3 \frac{\partial}{\partial \gamma_3},
\]

\[
Y_6 = I_3(I_2 - I_3)(I_1 - I_2)c_3 \frac{\partial}{\partial \omega_1} - I_1(I_1 - I_2)(I_2 - I_3)c_1 \frac{\partial}{\partial \omega_3}
\]

\[
- I_1 I_3(I_2^2 - I_1 I_2 + 2I_1 I_3 + I_2 I_3 - 2I_3^2) \omega_3 \frac{\partial}{\partial \gamma_1}
\]

\[
- I_1 I_3(2I_1^2 - I_1 I_2 - 2I_1 I_3 - I_2^2 + I_2 I_3) \omega_1 \frac{\partial}{\partial \gamma_3}.
\]

We consider the system

\[
Y_1(F) = 0, \quad Y_3(F) = 0, \quad Y_5(F) = 0, \quad Y_6(F) = 0.
\]

As we know its determinant \(\delta\) should be zero. We compute \(\delta\) and obtain

\[
\delta = I_1^2 I_3^2 \delta,
\]

where

\[
\hat{\delta} = I_1^2 (I_1 - I_2)(I_1 - I_2 - I_3)(2I_1 - 2I_2 - I_3)c_3 \omega_1^3
\]
5.2.2. Elimination of $\omega$. Let us express $\omega$ from the equation $H_1 = U_1$. We have

$$\omega = \frac{U_1 - I_1 \omega_1 \gamma_1 - I_3 \omega_3 \gamma_3}{I_2 \gamma_2}. \quad (5.23)$$
We put the expression for $\omega_2$ from \[ \text{(5.23)} \] in the Euler-Poisson equations \[ \text{(1.1)} \] and remove the second equation. In this way we obtain

\[
\begin{align*}
\frac{d\omega_1}{dt} &= (I_2 - I_3)\omega_3\left[ -I_1\omega_1\gamma_1 - I_3\omega_3\gamma_3 + U_1 \right] + c_3 I_2\gamma_2^2 - c_2 I_2\gamma_2\gamma_3, \\
\frac{d\omega_3}{dt} &= (I_1 - I_2)\omega_1\left[ -I_1\omega_1\gamma_1 - I_3\omega_3\gamma_3 + U_1 \right] + c_2 I_2\gamma_1\gamma_2 - c_1 I_2\gamma_2^2, \\
\frac{d\gamma_1}{dt} &= I_1\omega_1\gamma_1\gamma_3 + I_2\omega_3\gamma_2^2 + I_3\omega_3\gamma_3^2 - U_1\gamma_3, \\
\frac{d\gamma_2}{dt} &= \omega_1\gamma_3 - \omega_3\gamma_1, \\
\frac{d\gamma_3}{dt} &= -I_1\omega_1\gamma_1^2 - I_2\omega_1\gamma_2^2 - I_3\omega_3\gamma_1\gamma_3 + U_1\gamma_1 \quad \text{\[ \text{(5.24)} \]}
\end{align*}
\]

Looking for a first integral of system \[ \text{(5.24)} \] which depends on four variables indicated in brackets, we come to the following five possible cases:

1. $F(\omega_1, \omega_3, \gamma_1, \gamma_2)$, (case (iii))
2. $F(\omega_1, \omega_3, \gamma_1, \gamma_3)$, (case (ii))
3. $F(\omega_1, \omega_3, \gamma_2, \gamma_3)$, (case (iii))
4. $F(\omega_1, \gamma_1, \gamma_2, \gamma_3)$, (case (iv))
5. $F(\omega_3, \gamma_1, \gamma_2, \gamma_3)$, (case (iv))

In Sec. 5.2.1 we have already studied cases (i), (ii) and (iii) from Table 5.1. It remains only case (iv). The functions of types 4 and 5 belong to this not yet studied case. We should examine one of these two partial first integrals, it does not matter which. We choose type 4, because their study is exactly of the same nature.

**Type 4.** Let us study the existence of a first integral of system \[ \text{(5.24)} \] of type 4, i.e. $F(\omega_1, \gamma_1, \gamma_2, \gamma_3)$ requiring that it is functionally independent of $H_2$ and $H_3$. We have

\[
\begin{align*}
\frac{dF}{dt} &= (I_2 - I_3)\omega_3\left[ -I_1\omega_1\gamma_1 - I_3\omega_3\gamma_3 + U_1 \right] + c_3 I_2\gamma_2^2 - c_2 I_2\gamma_2\gamma_3 \frac{\partial F}{\partial \omega_1} \\
&\quad + I_1\omega_1\gamma_1\gamma_3 + I_2\omega_3\gamma_2^2 + I_3\omega_3\gamma_3^2 - U_1\gamma_3 \frac{\partial F}{\partial \gamma_1} + (\omega_1\gamma_3 - \omega_3\gamma_1) \frac{\partial F}{\partial \gamma_2} \\
&\quad + -I_1\omega_1\gamma_1^2 - I_2\omega_1\gamma_2^2 - I_3\omega_3\gamma_1\gamma_3 + U_1\gamma_1 \frac{\partial F}{\partial \gamma_3} = 0,
\end{align*}
\]

or equivalently

\[
I_1 I_2\gamma_2 \frac{dF}{dt} = \omega_3^2Y_1(F) + \omega_3 Y_2(F) + Y_3(F) = 0, \quad \text{\[ \text{(5.25)} \]}
\]

where $Y_1, Y_2$ and $Y_3$ are the following vector fields defined in $\mathbb{C}^4 = \mathbb{C}^4(\omega_1, \gamma_1, \gamma_2, \gamma_3)$:

\[
\begin{align*}
Y_1 &= -I_3(I_2 - I_3)\gamma_3 \frac{\partial}{\partial \omega_1}, \\
Y_2 &= (I_2U_1 - I_2I_1\omega_1\gamma_1 + I_3I_1\omega_1\gamma_1 - I_3U_1) \frac{\partial}{\partial \omega_1} + I_1(I_2\gamma_2^2 + I_3\gamma_3^2) \frac{\partial}{\partial \gamma_1} \\
&\quad - \gamma_1 I_2\gamma_2 I_1 \frac{\partial}{\partial \gamma_2} - I_3\gamma_1\gamma_3 I_1 \frac{\partial}{\partial \gamma_3},
\end{align*}
\]
A necessary condition for the fulfillment of (5.27) is

\[ Y_3 = -I_2 \gamma_2 (-c_3 \gamma_2 + c_2 \gamma_3) \frac{\partial}{\partial \omega_1} - \gamma_3 I_1 (-I_1 \omega_1 \gamma_1 + U_1) \frac{\partial}{\partial \gamma_1} \]

\[ + I_2 \gamma_2 I_1 \omega_1 \gamma_3 \frac{\partial}{\partial \gamma_2} + (-I_1 \omega_1 \gamma_1^2 - I_2 \omega_1 \gamma_2^2 + U_1 \gamma_1) I_1 \frac{\partial}{\partial \gamma_3} \]

As \((5.25)\) is an identity with respect to all the variables and as \(Y_1(F), Y_2(F)\) and \(Y_3(F)\) do not depend on \(\omega_3\) we have

\[ Y_1(F) = Y_2(F) = Y_3(F) = 0. \quad (5.26) \]

Equations \((5.26)\) can be considered as a system of three homogeneous linear algebraic equations with unknowns \(\text{grad} F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_2}, \frac{\partial F}{\partial \gamma_3} \right)\), which do not vanish identically on any open subset of domain of definition of \(F\), because \(F\) is non-constant on any such open subset.

It is clear that the first integral \(H_2\) is of type 4 and therefore \(\text{grad} H_2\) is a solution of system \((5.26)\). If a new integral \(F\) exists then system \((5.26)\) has at least two non-zero solutions. This is possible if and only if

\[ \text{rank } A \leq 2, \quad (5.27) \]

where \(A\) is the \(3 \times 4\) matrix whose rows are the coefficients of vector fields \(Y_1, Y_2\) and \(Y_3\).

Let us consider the \(3 \times 3\) matrix \(A_{123}\) obtained from \(A\) by crossing out its last column. A necessary condition for the fulfillment of \((5.27)\) is

\[ D_{123} = \det(A_{123}) = 0. \]

We compute \(D_{123}\) and obtain

\[ D_{123} = I_1^2 I_2 I_3 (I_2 - I_3) \gamma_2 \gamma_3^2 (-I_1 \omega_1 \gamma_1^2 - I_2 \omega_1 \gamma_2^2 - I_3 \omega_1 \gamma_3^2 + U_1 \gamma_1). \]

It is easily seen that \(D_{123} = 0\) is possible if and only if \(I_2 = I_3\). At this last condition we compute the Lie bracket \(Y_4 = [Y_2, Y_3]/(I_1 I_3)\) and obtain

\[ Y_4 = 2I_3 (-c_3 \gamma_2 + c_2 \gamma_3) \gamma_1 \gamma_2 \frac{\partial}{\partial \omega_1} + I_1 \gamma_3 \left[ I_1 \omega_1 (\gamma_1^2 + \gamma_2^2 + \gamma_3^2) - U_1 \gamma_1 \right] \frac{\partial}{\partial \gamma_1} \]

\[ + I_1 \gamma_2 \gamma_3 \left[ \omega_1 \gamma_1 (I_1 - I_3) - U_1 \right] \frac{\partial}{\partial \gamma_2} \]

\[ + I_1 \left[ (I_3 - 2I_1) \omega_1 \gamma_1 \gamma_2^2 - I_1 \omega_1 \gamma_1 (\gamma_1^2 + \gamma_3^2) + U_1 (\gamma_1^2 + \gamma_2^2) \right] \frac{\partial}{\partial \gamma_3}. \]

Now \(Y_1 = 0\) and we consider the following system:

\[ Y_2(F) = Y_3(F) = Y_4(F) = 0. \]

By the same reason as above we should require that

\[ \text{rank } B \leq 2, \quad (5.28) \]

where \(B\) is the \(3 \times 4\) matrix whose rows are the coefficients of vector fields \(Y_2, Y_3\) and \(Y_4\).

We consider the \(3 \times 3\) matrix \(B_{123}\) obtained from \(B\) by crossing out its last column. Condition \((5.28)\) implies

\[ \hat{D}_{123} = \det(B_{123}) = 0. \quad (5.29) \]
Computing $\hat{D}_{123}$ we obtain
\[ \hat{D}_{123} = I_1^2 I_2^2 (c_3 \gamma_2 - c_2 \gamma_3) \gamma_2^3 \gamma_3 \left[ -3I_1 \omega_1 \gamma_1^3 - (2I_1 + I_3) \omega_1 \gamma_1 (\gamma_2^2 + \gamma_3^2) + U_1 (3\gamma_1^2 + \gamma_2^2 + \gamma_3^2) \right]. \]

One immediately sees that the condition (5.29) leads to $c_2 = c_3 = 0$ which together with $I_2 = I_3$ leads to the Lagrange case. Thus a new partial first integral of type 4 does not exist.

The results from Secs. 5.2.1 and 5.2.2 show that we have completely studied all the four cases of the basis (5.1). Now from Theorem 2.2 we conclude that outside of the four integrable cases of the Euler-Poisson equations (1.1), outside of the Goryachev-Chaplygin case ($I_1 = I_2 = 4I_3$, $(c_1, c_2) \neq (0, 0)$, $c_3 = 0$ or $I_1 = I_3 = 4I_2$, $(c_1, c_3) \neq (0, 0)$, $c_2 = 0$ or $I_2 = I_3 = 4I_1$, $(c_2, c_3) \neq (0, 0)$, $c_1 = 0$), the Euler-Poisson equations restricted to the invariant manifold \{$H_1 = U_1$\} never have a local partial first integral depending on at most four variables and functionally independent of $H_2$ and $H_3$.

5.3. Invariant manifold \{H_2=0\}. We will now study what happens on submanifold \{H_2 = 0\}. Here we proceed as in Sec. 5.2. We should stress the following easily seen but important fact that now a first integral belonging to case (iv) from Table 5.1 does not exist because all possible eliminations from the equation $H_2 = 0$ are eliminations of some $\gamma_i$, $1 \leq i \leq 3$. We consider here the elimination of $\gamma_3$. The completely analogous results concerning the elimination of $\gamma_1$ or $\gamma_2$ follows from Theorem 2.2. But they can also be obtained by exactly the same way as the elimination of $\gamma_3$ that we describe below.

Let us express $\gamma_3$ from the equation $H_2 = 0$. We obtain
\[ \gamma_3 = \sqrt{-\gamma_1^2 - \gamma_2^2}. \] \tag{5.30}

$\gamma_3$ is now considered as an algebraic function (see Sec. 4) of variables $(\gamma_1, \gamma_2)$.

Putting the expression for $\gamma_3$ from (5.30) in the Euler-Poisson equations (1.1) and removing the sixth equation we have
\begin{align*}
\frac{d\omega_1}{dt} &= \frac{(I_2 - I_3) \omega_2 \omega_3 + c_3 \gamma_2 - c_2 \sqrt{-\gamma_1^2 - \gamma_2^2}}{I_1}, \\
\frac{d\omega_2}{dt} &= \frac{(I_3 - I_1) \omega_1 \omega_3 + c_1 \sqrt{-\gamma_1^2 - \gamma_2^2} - c_3 \gamma_1}{I_2}, \\
\frac{d\omega_3}{dt} &= \frac{(I_1 - I_2) \omega_1 \omega_2 + c_2 \gamma_1 - c_1 \gamma_2}{I_3}, \\
\frac{d\gamma_1}{dt} &= \omega_3 \gamma_2 - \omega_2 \sqrt{-\gamma_1^2 - \gamma_2^2}, \\
\frac{d\gamma_2}{dt} &= \omega_1 \sqrt{-\gamma_1^2 - \gamma_2^2} - \omega_3 \gamma_1.
\end{align*} \tag{5.31}

Looking for a first integral of system (5.31) which depends on at most four variables we come to the following five possible cases:

1. $F(\omega_1, \omega_2, \omega_3, \gamma_1)$, (case (i))
2. $F(\omega_1, \omega_2, \omega_3, \gamma_2)$, (case (i))
3. $F(\omega_1, \omega_2, \gamma_1, \gamma_2)$, (case (ii))
4. $F(\omega_1, \omega_3, \gamma_1, \gamma_2)$, (case (iii))
5. \(F(\omega_2, \omega_3, \gamma_1, \gamma_2)\). (case (iii))

Then it suffices to examine here the functions of types 1, 3 and 5.

**Type 1.** Here we use the idea from [59] applied there for the proof of Theorem 1.1.B. Let us look for a first integral of system (5.31) that is of type 1, \(F(\omega_1, \omega_2, \omega_3, \gamma_1)\), i.e. which does not depend on \(\gamma_2\) and which is functionally independent of \(H_1\) and \(H_3\). Thus \(F\) satisfies the following identity

\[
\frac{dF}{dt} = \frac{(I_2 - I_3)\omega_2\omega_3 + c_3\gamma_2 - c_2\sqrt{-\gamma_1^2 - \gamma_2^2}}{I_1} \frac{\partial F}{\partial \omega_1} + \frac{(I_3 - I_1)\omega_1\omega_3 + c_1\sqrt{-\gamma_1^2 - \gamma_2^2} - c_3\gamma_1}{I_2} \frac{\partial F}{\partial \omega_2} + \frac{(I_1 - I_2)\omega_1\omega_2 + c_2\gamma_1 - c_1\gamma_2}{I_3} \frac{\partial F}{\partial \omega_3} + \left(\omega_3\gamma_2 - \omega_2\sqrt{-\gamma_1^2 - \gamma_2^2}\right) \frac{\partial F}{\partial \gamma_1} = 0,
\]

or equivalently

\[
\frac{dF}{dt} = \gamma_2 Y_1(F) + \sqrt{-\gamma_1^2 - \gamma_2^2} Y_2(F) + Y_3(F) = 0,
\]

where \(Y_1, Y_2\) and \(Y_3\) are the following vector fields defined in \(C^4 = C_4(\omega_1, \omega_2, \omega_3, \gamma_1)\)

\[
Y_1 = \frac{c_3}{I_1} \frac{\partial}{\partial \omega_1} - \frac{c_1}{I_3} \frac{\partial}{\partial \omega_3} + \omega_3 \frac{\partial}{\partial \gamma_1},
\]

\[
Y_2 = -\frac{c_2}{I_2} \frac{\partial}{\partial \omega_1} + \frac{c_1}{I_2} \frac{\partial}{\partial \omega_2} - \omega_2 \frac{\partial}{\partial \gamma_1},
\]

\[
Y_3 = \frac{(I_2 - I_3)\omega_2\omega_3}{I_1} \frac{\partial}{\partial \omega_1} + \frac{(I_3 - I_1)\omega_1\omega_3 - c_3\gamma_1}{I_2} \frac{\partial}{\partial \omega_2} + \frac{(I_1 - I_2)\omega_1\omega_2 + c_2\gamma_1}{I_3} \frac{\partial}{\partial \omega_3}.
\]

Let us write (5.32) in the following way

\[
\gamma_2 Y_1(F) + Y_3(F) = -\sqrt{-\gamma_1^2 - \gamma_2^2} Y_2(F).
\]

Raising the last equation to the second degree we obtain

\[
\gamma_2^2 [Y_1(F)^2 + Y_2(F)^2] + 2\gamma_2 Y_1(F)Y_3(F) + \gamma_1^2 Y_2(F)^2 + Y_3(F)^2 = 0,
\]

where \(Y_1(F), Y_2(F)\) and \(Y_3(F)\) depend only on \((\omega_1, \omega_2, \omega_3, \gamma_1)\).

As (5.32) is an identity with respect to all the variables \(\omega_1, \omega_2, \omega_3, \gamma_1\) and \(\gamma_2\) the same concerns (5.34). Moreover (5.34) is a polynomial with respect to \(\gamma_2\) because the coefficients of the powers of \(\gamma_2\) do not depend on \(\gamma_2\).

Let us fix \(\omega_1, \omega_2, \omega_3\) and \(\gamma_1 \neq 0\). We prove that

\[
Y_1(F) = Y_2(F) = Y_3(F) = 0.
\]

For this purpose, we examine the polynomial (5.34) studying separately two cases.

A) The first two coefficients of (5.34) vanish. That means that

\[
Y_1(F)^2 + Y_2(F)^2 = 0, \quad Y_1(F)Y_3(F) = 0.
\]

Thus either \(Y_1(F) = 0\) or \(Y_3(F) = 0\). If \(Y_1(F) = 0\), then from first equation of (5.34) one obtains \(Y_2(F) = 0\) and thus from (5.34), \(Y_3(F) = 0\). If \(Y_3(F) = 0\), then from (5.34) one
has \( \gamma_1^2 Y_2(F)^2 = 0 \). As \( \gamma_1^2 \neq 0 \), \( Y_2(F) = 0 \) and thus also \( Y_1(F) = 0 \). Thus in case (A) (5.35) holds.

B) At least one of the first two coefficients of (5.34) is non-vanishing. In this case (5.34) is a first or second order non-zero polynomial in \( \gamma_2 \). For fixed \((\omega, \gamma_1)\) such a polynomial admits at most two roots. But this contradicts the fact that for these \((\omega, \gamma_1)\), (5.34) is identically satisfied for all \( \gamma_2 \).

This proves that case (B) cannot occur and consequently that (5.34) implies (5.35).

Let us compute the Lie bracket \( Y_4 = \{Y_2, Y_3\} \). We obtain

\[
Y_4 = \frac{(I_2 - I_3)c_1 \omega_3}{I_1 I_2} \frac{\partial}{\partial \omega_1} + \frac{(I_1 - I_3)c_2 \omega_3 + I_1 c_3 \omega_2}{I_1 I_2} \frac{\partial}{\partial \omega_2} + \frac{I_1 (I_1 - I_2)c_1 \omega_1 + I_2 (I_2 - 2I_1)c_2 \omega_2}{I_1 I_2 I_3} \frac{\partial}{\partial \omega_3} + \frac{(I_3 - I_1)\omega_1 \omega_3 - c_3 \gamma_1}{I_2} \frac{\partial}{\partial \gamma_1}.
\]

Equations (5.35) imply that \( Y_4(F) = 0 \) so that we have the following system

\[
Y_1(F) = Y_2(F) = Y_3(F) = Y_4(F) = 0.
\] (5.37)

Equations (5.37) can be considered as a system of four homogeneous linear algebraic equations with unknowns \( \operatorname{grad} F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_1} \right) \), which do not vanish identically.

As in Sec. 5.2 we should equate to zero the determinant \( D \) of the \( 4 \times 4 \) matrix \( A \) of the coefficients of system (5.37). We compute \( D \) and obtain

\[
D = \frac{1}{I_1^2 I_2^2 I_3^2} \left[ I_1 I_2 (I_1 - I_2) c_2^2 \omega_1 \omega_2^3 - I_1 I_2 (2I_1 - I_2 - I_3) c_2 c_3 \omega_1^2 \omega_2 \omega_3 
+ I_1 I_2 (I_1 - I_3) c_2^2 \omega_1 \omega_2 \omega_3^2 + I_1 I_2 (I_2 - I_3) c_1 c_3 \omega_2^3 \omega_3
+ I_1 (I_1 - I_3) (I_2 - I_3) c_1 c_2 \omega_1^2 \omega_2^2 + I_1 (I_2 - I_3) c_1 c_2 \omega_1 \omega_2 \gamma_1
- I_2 (I_2 - I_3) (I_1 - I_2 + I_3) c_1 c_2 \omega_2^2 \omega_3^2 - I_2 (I_1 - I_2 - I_3) c_2 \omega_2^2 \omega_3 \gamma_1
+ I_2 (2I_1 - I_2 - I_3) c_2^2 c_3 \omega_2 \omega_3 \gamma_1 - (I_1 I_2 c_1^2 + I_1 I_2 c_2^2 - I_2 I_3 c_1^2 - I_2 I_3 c_2^2) c_2 \omega_2 \gamma_1 \right].
\]

It is identically equal to zero and therefore all of its coefficients should be zero. \( D \) is a polynomial in variables \( \omega_1, \omega_2, \omega_3 \) and \( \gamma_1 \) having ten monomials and thus with ten coefficients depending on \( Ic \). It is clear that to solve equation \( D = 0 \) is equivalent to finding all values of the parameters \( Ic \) for which the ten coefficients of \( D \) are zero. To solve this system of ten equations we proceed as in Sec. 5.2.

After three consecutive simplifications of the source system we obtain the reduced system having five equations:

\[
(I_1 - I_2)c_3 = 0, \quad (I_1 - I_3)c_2 = 0, \quad (I_2 - I_3)c_2c_3 = 0,
(I_2 - I_3)c_1c_3 = 0, \quad (I_2 - I_3)c_1c_2 = 0.
\]

We solve these five equations by the MAPLE command \texttt{solve} and obtain the following four solutions:

1. \( I_1 = I_2, \ c_1 = c_2 = 0 \),
2. \( I_1 = I_3, \ c_1 = c_3 = 0 \),
3. \( I_1 = I_2 = I_3 \),
4. \( c_2 = c_3 = 0 \).
The first three of them lead to the Lagrange and kinetic symmetry cases. We should study only the fourth solution.

Let \( c_2 = c_3 = 0 \). In this case \( Y_4 \) is dependent on \( Y_1, Y_2 \) and \( Y_3 \) and system \((5.35)\) has a solution \( \text{grad} H_3 \). However, \( H_3 \) is not a fourth integral. Thus, if a fourth integral \( F \) exists, system \((5.35)\) has at least two linearly independent solutions. We consider the possible determinants of order three which can be obtained from the matrix \( A \).

Now we are going to study when \((5.38)\) is fulfilled. For this purpose we calculate all \( 1 \leq i \leq 4 \), by \( D_i \), we denote the determinant obtained from matrix \( A \) by crossing out its \( i \)-th column. We have

\[
D_1 = -\frac{(I_2 - I_3)}{I_2 I_3} c_1 \omega_1 \omega_2 \omega_3, \quad D_2 = \frac{(I_2 - I_3)}{I_1 I_3} c_1 \omega_2 \omega_3, \\
D_3 = -\frac{(I_2 - I_3)}{I_1 I_2} c_1 \omega_2 \omega_3, \quad D_4 = \frac{(I_2 - I_3)}{I_1 I_2 I_3} c_1 \omega_2 \omega_3.
\]

It is easy to see that the equations \( D_i = 0, 1 \leq i \leq 4 \), are satisfied only if either \( c_1 = 0 \) which with the condition \( c_2 = c_3 = 0 \) leads to the Euler case or \( I_2 = I_3 \) which leads to the Lagrange case.

Thus a new partial first integral of type 1, i.e. \( F(\omega_1, \omega_2, \omega_3, \gamma_1) \) does not exist.

**Type 3.** Let us look for a first integral of the system \((5.31)\) that is of type 3, \( F(\omega_1, \omega_2, \gamma_1, \gamma_2) \), i.e. which does not depend on \( \omega_3 \) and which is functionally independent of \( H_1 \) and \( H_3 \). Thus \( F \) satisfies the following identity

\[
\frac{dF}{dt} = \frac{(I_2 - I_3)}{I_1} \omega_2 \omega_3 - c_2 \sqrt{-\gamma_1^2 - \gamma_2^2} + c_3 \gamma_2 \frac{\partial F}{\partial \omega_1} \\
+ \frac{(I_3 - I_1)}{I_2} \omega_1 \omega_3 + c_1 \sqrt{-\gamma_1^2 - \gamma_2^2} - c_3 \gamma_1 \frac{\partial F}{\partial \omega_3}
\]

\[
+ \left( \omega_3 \gamma_2 - \omega_2 \sqrt{-\gamma_1^2 - \gamma_2^2} \right) \frac{\partial F}{\partial \gamma_1} + \left( \omega_1 \sqrt{-\gamma_1^2 - \gamma_2^2} - \omega_3 \gamma_1 \right) \frac{\partial F}{\partial \gamma_2} = 0,
\]

which can be presented in the following way

\[
\frac{dF}{dt} = \omega_3 Y_1(F) + Y_2(F) = 0, \quad (5.39)
\]

where \( Y_1 \) and \( Y_2 \) are the following vector fields defined in \( \mathbb{C}^4 = \mathbb{C}^4(\omega_1, \omega_2, \gamma_1, \gamma_2) \)

\[
Y_1 = \frac{(I_2 - I_3)}{I_1} \omega_2 \frac{\partial}{\partial \omega_1} + \frac{(I_3 - I_1)}{I_2} \omega_1 \frac{\partial}{\partial \omega_2} + \gamma_2 \frac{\partial}{\partial \gamma_1} - \gamma_1 \frac{\partial}{\partial \gamma_2},
\]

\[
Y_2 = -c_2 \sqrt{-\gamma_1^2 - \gamma_2^2} - c_3 \gamma_2 \frac{\partial}{\partial \omega_1} + c_1 \sqrt{-\gamma_1^2 - \gamma_2^2} - c_3 \gamma_1 \frac{\partial}{\partial \omega_2}
\]

\[
- \omega_2 \sqrt{-\gamma_1^2 - \gamma_2^2} \frac{\partial}{\partial \gamma_1} + \omega_1 \sqrt{-\gamma_1^2 - \gamma_2^2} \frac{\partial}{\partial \gamma_2}.
\]
As (5.39) is an identity with respect to all the variables and as \( Y_1(F) \) and \( Y_2(F) \) do not depend on \( \omega_3 \) we have

\[
Y_1(F) = Y_2(F) = 0. \tag{5.40}
\]

We compute the Lie brackets \( Y_3 = [Y_1, Y_2] \) and \( Y_4 = [Y_1, Y_3] \) and obtain

\[
\begin{align*}
Y_3 &= \frac{(I_3 - I_2)c_1\sqrt{-\gamma_1^2 - \gamma_2^2} - I_3c_3\gamma_1}{I_1I_2} \frac{\partial}{\partial \omega_1} - \frac{(I_1 - I_3)c_2\sqrt{\gamma_1^2 - \gamma_2^2} + I_3c_3\gamma_2}{I_1I_2} \frac{\partial}{\partial \omega_2} \\
&+ \frac{(I_1 - I_2 - I_3)\omega_1\sqrt{-\gamma_1^2 - \gamma_2^2}}{I_2} \frac{\partial}{\partial \gamma_1} - \frac{(I_1 - I_2 + I_3)\omega_2\sqrt{\gamma_1^2 - \gamma_2^2}}{I_1} \frac{\partial}{\partial \gamma_2}, \\
Y_4 &= \frac{I_3c_3(I_2 - I_1 - I_3)\gamma_2 + (I_1 - I_3)(I_2 - I_3)c_2\sqrt{-\gamma_1^2 - \gamma_2^2}}{I_1I_2} \frac{\partial}{\partial \omega_1} \\
&+ \frac{I_3c_3(I_2 - I_1 + I_3)\gamma_1 - (I_1 - I_3)(I_2 - I_3)c_1\sqrt{\gamma_1^2 - \gamma_2^2}}{I_1I_2} \frac{\partial}{\partial \omega_2} \\
&+ \frac{(2I_1I_2 + I_2I_3 - 2I_2^2 + I_3^2 - I_1I_3)\omega_2\sqrt{\gamma_1^2 - \gamma_2^2}}{I_1I_2} \frac{\partial}{\partial \gamma_1} \\
&+ \frac{(2I_2^2 - 2I_1I_2 - I_2^3 - I_1I_3 + I_2I_3)\omega_1\sqrt{-\gamma_1^2 - \gamma_2^2}}{I_1I_2} \frac{\partial}{\partial \gamma_2}.
\end{align*}
\]

Equations (5.40) imply that

\[
Y_3(F) = Y_4(F) = 0. \tag{5.41}
\]

Equations (5.40) and (5.41) can be considered as a system of four homogeneous linear algebraic equations with unknowns \( \text{grad} F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_2} \right) \), which do not vanish identically, because \( F \) is non-constant on any open subset of its domain of definition.

If a new integral \( F \) exists, system (5.40)–(5.41) has at least one non-zero solution. As in Sec. 5.2 we consider the 4 \times 4 matrix \( A \) of the coefficients of this system. The condition under which system (5.40)–(5.41) has at least one non-zero solution is rank \( A \leq 3 \).

Therefore we equate to zero the determinant \( D = \det(A) \) and study when identity

\[
D = 0 \tag{5.42}
\]

is fulfilled. We compute \( D \) and obtain

\[
D = \frac{\gamma_1^2 + \gamma_2^2}{I_3^2 I_2^2} \hat{D},
\]

where

\[
\hat{D} = D_1 \sqrt{-\gamma_1^2 - \gamma_2^2} + D_2.
\]

The expressions for \( D_1 \) and \( D_2 \) are polynomials in variables \( \omega_1, \omega_2, \gamma_1 \) and \( \gamma_2 \).

It is clear that (5.42) is equivalent to \( \hat{D} = 0 \), that is \( D_1 \sqrt{-\gamma_1^2 - \gamma_2^2} + D_2 = 0 \). If \( D_1 = 0 \) identically, \( D_2 = 0 \) identically too. Let us suppose that \( D_1 \neq 0 \). Then we have

\[
\sqrt{-\gamma_1^2 - \gamma_2^2} = -\frac{D_2}{D_1}. \tag{5.43}
\]

Applying Proposition 4.3 to \( V = -\gamma_1^2 - \gamma_2^2 \) one sees that (5.43) can never occur because \( \sqrt{V} \notin C(\gamma_1, \gamma_2) \). Consequently \( D_1 = D_2 = 0 \). Thus we require that all the coefficients of \( D_1 \) and \( D_2 \) be zero. First we consider polynomial \( D_1 \). It has six monomials and thus six
coefficients depending on $\mathcal{I}c$. We want to find all values of the parameters $\mathcal{I}c$ for which the six coefficients of $D_1$ are zero, i.e.

\[
\begin{align*}
I_1^2 (I_1 - I_3) (2I_1 - I_2 - 2I_3) (I_1 - I_2 - I_3) c_2 &= 0, \\
I_1 I_2 (I_2 - I_3) (3I_1^2 - 3I_1 I_2 - I_1 I_3 + 2I_2 I_3 - 2I_2^2) c_1 &= 0, \\
I_1 I_2 (I_1 - I_3) (3I_1 I_2 - 2I_1 I_3 - 3I_2^2 + I_2 I_3 + 2I_3^2) c_2 &= 0, \\
& - I_1 (2I_1^2 I_2 c_1^2 + 2I_1^2 I_2 c_2^2 - 2I_1^2 I_3 c_1^2 - I_1 I_2^2 c_1^2 - I_1 I_2 I_3 c_1^2) \\
& - 4I_1 I_2 I_3 c_2^2 + 2I_1 I_2 I_3 c_3^2 + 2I_1 I_3^2 c_1^2 + I_2^2 I_3 c_2^2 - 2I_2 I_3^2 c_3^2 + 2I_2 I_3^2 c_2^2) &= 0, \\
& - I_2 (I_1 I_2 c_1^2 + I_1^2 I_2 c_2^2 - I_1^2 I_3 c_1^2 + 2I_1^2 I_3 c_3^2 - 2I_1 I_2^2 c_1^2 - 2I_1 I_2^2 c_2^2) &= 0, \\
& + I_1 I_2 I_3 c_2^2 - 2I_1 I_2 I_3 c_3^2 + 4I_1 I_2 I_3 c_1^2 - 2I_1 I_3^2 c_1^2 + 2I_2 I_3^2 c_2^2 - 2I_2 I_3^2 c_3^2) &= 0.
\end{align*}
\]

After five consecutive simplifications we obtain the reduced system that consists of seven equations, that is

\[
\begin{align*}
(I_1 - I_2) c_3 &= 0, & (I_1 - I_2) c_1 c_2 &= 0, & (I_1 - I_3)(I_2 - 2I_3) c_2 &= 0, \\
(I_1 - I_3)(I_1 - 2I_3) c_2 &= 0, & (I_2 - I_3)(I_2 - 2I_3) c_1 &= 0, & (I_2 - I_3)(I_1 - 2I_3) c_1 &= 0, \\
(I_2 - I_3)(I_2 - 2I_3) c_2 c_3 &= 0.
\end{align*}
\]

Solving this system by the MAPLE command `solve` we obtain six solutions. Removing the solutions that lead to the Euler, Lagrange, Kovalevskaya and kinetic symmetry cases it remains only one solution

\[
I_1 = 2I_3, \quad I_2 = 2I_3, \quad I_3, \quad c_1, \quad c_2, \quad c_3 \text{ are arbitrary.}
\]

Thus we should consider only the case

\[
I_1 = I_2 = 2I_3. \tag{5.44}
\]

At the condition (5.44) we have also $D_2 = 0$ and therefore vector fields $Y_i, 1 \leq i \leq 4$, are linearly dependent (they satisfy equation $4Y_4 + Y_2 = 0$). That is why we compute the Lie bracket $Y_5 = [Y_2, Y_3]$ and obtain

\[
Y_5 = \omega_1 (c_2 \gamma_1 + c_1 \gamma_2) + 2c_3 \omega_2 \sqrt{-\gamma_1^2 - \gamma_2^2} + \omega_2 (c_2 \gamma_1 - c_1 \gamma_2) \frac{\partial}{\partial \omega_1} \\
- \omega_1 (c_1 \gamma_1 - c_2 \gamma_2) + 2c_3 \omega_1 \sqrt{-\gamma_1^2 - \gamma_2^2} + \omega_2 (c_2 \gamma_1 + c_1 \gamma_2) \frac{\partial}{\partial \omega_2} \\
+ I_3 \omega_1^2 + I_3 \omega_2^2 - c_3 \sqrt{-\gamma_1^2 - \gamma_2^2} \left( \gamma_2 \frac{\partial}{\partial \gamma_1} - \gamma_1 \frac{\partial}{\partial \gamma_2} \right)
\]

and consider the following four equations:

\[
Y_4(F) = 0, \quad 1 \leq i \leq 3, \quad Y_5(F) = 0. \tag{5.45}
\]

As above we equate to zero the determinant $\Delta = \det(B)$, where $B$ is the matrix of the coefficients of system (5.45) and study when the identity

\[
\Delta = 0
\]
is fulfilled. We compute $\Delta$ and obtain

$$
\Delta = -\frac{\sqrt{-\gamma_1^2 - \gamma_2^2}}{8I_3^2} \tilde{\Delta},
$$

where

$$
\tilde{\Delta} = c_3 \left( c_2 \omega_1^2 \gamma_1 + c_1 \omega_1 \gamma_1 \gamma_2 + c_2 \omega_1^2 \gamma_1 \gamma_2 + c_1 \omega_1 \omega_2 \gamma_1^2 - 2c_1 \omega_1 \omega_2 \gamma_1^2 + 2c_2 \omega_1 \omega_2 \gamma_1^2 \gamma_2 - 2c_1 \omega_1 \omega_2 \gamma_1^2 \gamma_2 + 2c_2 \omega_1 \omega_2 \gamma_1^2 \gamma_2 - c_2 \omega_1 \omega_2 \gamma_1^2 \gamma_2 - c_2 \omega_1 \omega_2 \gamma_1^2 \gamma_2 \right).
$$

It is clear that the equation $\Delta = 0$ is equivalent to $\tilde{\Delta} = 0$. It is easily seen from the expression for $\tilde{\Delta}$ that $\tilde{\Delta}$ vanishes identically only if $c_3 = 0$ or if $c_1 = c_2 = 0$. Taking into account the condition (5.44) we see that if $c_3 = 0$ we come to the Kovalevskaya case and if $c_1 = c_2 = 0$ - to the Lagrange case.

Thus a new partial first integral of type 3, i.e. $F(\omega_1, \omega_2, \gamma_1, \gamma_2)$ can only exist in the two cases known above.

**Type 5.** Let us look for a first integral of the system (5.31) that is of type 5, $F(\omega_2, \omega_3, \gamma_1, \gamma_2)$, i.e. which does not depend on $\omega_1$ and which is functionally independent of $H_1$ and $H_3$. Thus $F$ satisfies the following identity

$$
\frac{dF}{dt} = \frac{(I_3 - I_1) \omega_1 \omega_3 + c_1 \sqrt{-\gamma_1^2 - \gamma_2^2} - c_3 \gamma_1}{I_2} \frac{\partial F}{\partial \omega_2} + \frac{(I_1 - I_2) \omega_1 \omega_2 + c_2 \gamma_1 - c_1 \gamma_2}{I_3} \frac{\partial F}{\partial \omega_3} + \left( \omega_3 \gamma_2 - \omega_2 \sqrt{-\gamma_1^2 - \gamma_2^2} \right) \frac{\partial F}{\partial \gamma_1} + \left( \omega_1 \sqrt{-\gamma_1^2 - \gamma_2^2} - \omega_3 \gamma_1 \right) \frac{\partial F}{\partial \gamma_2} = 0,
$$

which can be presented in the following way

$$
\frac{dF}{dt} = \omega_1 Y_1(F) + Y_2(F) = 0,
$$

(5.46)

where $Y_1$ and $Y_2$ are the following vector fields defined in $\mathbb{C}^4 = \mathbb{C}^4(\omega_2, \omega_3, \gamma_1, \gamma_2)$

$$
Y_1 = \frac{(I_3 - I_1) \omega_3}{I_2} \frac{\partial}{\partial \omega_2} + \frac{(I_1 - I_2) \omega_2}{I_3} \frac{\partial}{\partial \omega_3} + \sqrt{-\gamma_1^2 - \gamma_2^2} \frac{\partial}{\partial \gamma_2},
$$

$$
Y_2 = \frac{c_1 \sqrt{-\gamma_1^2 - \gamma_2^2} - c_3 \gamma_1}{I_2} \frac{\partial}{\partial \omega_2} + \frac{c_1 \gamma_1 - c_1 \gamma_2}{I_3} \frac{\partial}{\partial \omega_3} + \left( \omega_3 \gamma_2 - \omega_2 \sqrt{-\gamma_1^2 - \gamma_2^2} \right) \frac{\partial}{\partial \gamma_1} - \omega_3 \gamma_1 \frac{\partial}{\partial \gamma_2}.
$$

As (5.46) is an identity with respect to all the variables and as $Y_1(F)$ and $Y_2(F)$ do not depend on $\omega_1$ we have

$$
Y_1(F) = Y_2(F) = 0.
$$

(5.47)

We compute the Lie brackets $Y_3 = [Y_1, Y_2]$ and $Y_4 = [Y_1, Y_3]$ and obtain

$$
Y_3 = \frac{(I_1 - I_3) c_2 \gamma_1 - I_1 c_1 \gamma_2}{I_2 I_3} \frac{\partial}{\partial \omega_2} + \frac{(I_1 - I_2) c_1 \sqrt{-\gamma_1^2 - \gamma_2^2} - c_3 \gamma_1}{I_2 I_3} \frac{\partial}{\partial \omega_3} + \frac{I_2 (I_1 - I_2 + I_3) \omega_2 \gamma_2 + I_3 (I_1 + I_2 - I_3) \omega_3 \sqrt{-\gamma_1^2 - \gamma_2^2}}{I_2 I_3} \frac{\partial}{\partial \gamma_1}.
$$
We compute $D$ in Sec. 5.2 we consider the 4 coefficients depending on $I$

the 11 coefficients of $A$ under which system (5.47)–(5.48) has at least one non-zero solution is rank $F$ identically, because $D$ is non-constant on any open subset of its domain of definition.

Equations (5.47) imply that

$$Y_3(F) = Y_4(F) = 0.$$ (5.48)

Equations (5.47) and (5.48) can be considered as a system of four homogeneous linear algebraic equations with unknowns $\nabla F = \left(\frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_2}\right)$, which do not vanish identically, because $F$ is non-constant on any open subset of its domain of definition.

If a new integral $F$ exists, system (5.47)–(5.48) has at least one non-zero solution. As in Sec. 5.2 we consider the $4 \times 4$ matrix $A$ of the coefficients of this system. The condition under which system (5.47)–(5.48) has at least one non-zero solution is rank $A \leq 3$.

Therefore we equate to zero the determinant $D = \det(A)$ and study when identity

$$D \equiv 0$$ (5.49)

is fulfilled. We compute $D$ and obtain

$$D = \frac{\gamma_1 \sqrt{-\gamma_1^2 - \gamma_2^2}}{I_2 I_3^3} \hat{D},$$

where

$$\hat{D} = D_1 \sqrt{-\gamma_1^2 - \gamma_2^2} + D_2.$$

The expressions for $D_1$ and $D_2$ are polynomials in variables $\omega_2, \omega_3, \gamma_1$ and $\gamma_2$.

It is clear that (5.49) is equivalent to $\hat{D} = 0$, that is $D_1 \sqrt{-\gamma_1^2 - \gamma_2^2} + D_2 = 0$. If $D_1 = 0$ identically, $D_2 = 0$ identically too. Let us suppose that $D_1 \neq 0$. Then we have

$$\sqrt{-\gamma_1^2 - \gamma_2^2} = -\frac{D_2}{D_1}.$$ (5.50)

Applying Proposition 4.3 to $V = -\gamma_1^2 - \gamma_2^2$ one sees that (5.50) can never occur because $\sqrt{V} \notin \mathbb{C}(\gamma_1, \gamma_2)$. Consequently $D_1 = D_2 = 0$. Thus we require that all the coefficients of $D_1$ and $D_2$ be zero. First we consider polynomial $D_2$. It has 11 monomials and thus 11 coefficients depending on $\mathcal{I}c$. We want to find all values of the parameters $\mathcal{I}c$ for which the 11 coefficients of $D_2$ are zero, i.e.

$$I_2^2(I_1 - I_2)(2I_1 - 2I_2 + I_3)(I_1 - I_2 + I_3)c_3 = 0,$$

$$2I_2 I_3(I_2 - I_3)(I_1 - I_2)(I_1 + I_2 - I_3)c_1 = 0,$$
\[ 2I_3^2(I_2 - I_3)(I_1 - I_3)(I_1 + I_2 - I_3)c_1 = 0, \quad I_2I_3(I_2 - I_3)(I_1 - I_3)c_1c_2 = 0, \]
\[ I_2I_3(2I_1^2 - 4I_1I_2 + 3I_1I_3 + 2I_2^2 - 2I_2I_3)c_1c_3 = 0, \]
\[ I_3(2I_1^2I_2^2 - 4I_1I_2I_3^2 - 2I_1I_2I_3c_3^2 + 2I_1I_2I_3c_1^2 + 2I_2^2I_3c_3^2 + 2I_2I_3^2c_3^2 - 2I_1I_2^2c_3^2 + I_1I_2^2c_3^2 - I_2^2I_3c_3^2 + 2I_2I_3^2c_3^2 - I_1I_2I_3c_3^2) = 0, \]
\[ I_2I_3(2I_1 - I_3)(I_1 + I_2 - I_3)c_1c_2 = 0, \]
\[ I_2I_3(I_1 - I_2)(2I_1^2 - 2I_1I_2 + I_1I_3 + 3I_2I_3 - 3I_2^2)c_3 = 0, \]
\[ I_2I_3(I_1 - I_3)(2I_1^2 + I_1I_2 - 2I_1I_3 - 3I_2^2 + 3I_2I_3)c_2 = 0. \]

After six consecutive simplifications we obtain the reduced system that consists of eight equations, that is
\[
(I_2 - I_3)c_1 = 0, \quad (I_2 - I_3)c_3c_2 = 0, \quad (2I_1 - I_3)c_3c_1 = 0,
(I_2 - I_3)(I_1 - I_2)c_3 = 0, \quad (I_1 - I_2)(2I_1 + 2I_2 - 3I_3)c_3 = 0, \quad (2I_1 - I_3)c_1c_2 = 0,
(I_2 - I_3)(I_1 - I_3)c_2 = 0, \quad (2I_1 - I_3)(I_1 - I_3)c_2 = 0.
\]

Solving this system by the MAPLE command solve we obtain seven solutions. Removing the solutions that lead to the Euler, Lagrange, Kovalevskaya and kinetic symmetry cases we obtain only one solution
\[ I_2 = 2I_1, \quad I_3 = 2I_1, \quad I_1, \quad c_1, \quad c_2, \quad c_3 \text{ are arbitrary.} \]

Thus we should consider only the case
\[ I_2 = I_3 = 2I_1. \tag{5.51} \]

Under condition (5.51) we also have \( D_1 = 0 \) and therefore vector fields \( Y_i, \ 1 \leq i \leq 4, \) are linearly dependent (they satisfy equation \( 4Y_4 + Y_2 = 0 \)). That is why we compose the Lie bracket \( Y_5 = [Y_2, Y_3] \) and obtain
\[
Y_5 = \frac{c_2\omega_2\gamma_1 + \omega_3(2c_1\gamma_1 - c_2\gamma_2) + (c_2\omega_2 + c_3\omega_3)\sqrt{-\gamma_1^2 - \gamma_2^2}}{4I_1} \frac{\partial}{\partial \omega_2}
- \frac{\omega_2(2c_1\gamma_1 + c_2\gamma_2) + c_3\omega_3\gamma_2 - (c_3\omega_2 - c_2\omega_3)\sqrt{-\gamma_1^2 - \gamma_2^2}}{4I_1} \frac{\partial}{\partial \omega_3}
+ \frac{I_1\omega_2^2 + I_1\omega_3^2 - c_1\gamma_1}{2I_1} \sqrt{-\gamma_1^2 - \gamma_2^2} \frac{\partial}{\partial \gamma_2},
\]
and consider the following four equations:
\[ Y_1(F) = 0, \quad 1 \leq i \leq 3, \quad Y_5(F) = 0. \tag{5.52} \]

As above we equate to zero the determinant \( \Delta = \text{det}(B) \), where \( B \) is the matrix of the coefficients of system (5.52) and study when identity
\[ \Delta \equiv 0 \]
is fulfilled. We compute \( \Delta \) and obtain
\[ \Delta = -\frac{\gamma_1^2}{8I_1^2} \Delta, \]
where
\[ \Delta = \Delta_1 \sqrt{-\gamma_1^2 - \gamma_2^2 + \Delta_2}. \]
The expressions for \( \Delta_1 \) and \( \Delta_2 \) are the following polynomials in variables \( \omega_2, \omega_3, \gamma_1 \) and \( \gamma_2 \):
\[ \Delta_1 = c_1 \gamma_1 (c_2 \omega_2 \omega_3 + c_3 \omega_3^2), \quad \Delta_2 = c_1 (\gamma_1^2 + \gamma_2^2) (c_2 \omega_2^2 + 2c_3 \omega_2 \omega_3 - c_2 \omega_3^2). \]

As \( \Delta = 0 \), by Proposition 4.3 we have \( \Delta_1 = \Delta_2 = 0 \). As it is easily seen the last equations can be satisfied only in two cases: when \( c_1 = 0 \) which together with condition \( (5.51) \) leads to the Kovalevskaya case and when \( c_2 = c_3 = 0 \) that leads to the Lagrange case. The conclusion is that a partial first integral of type 5 does not exist.

5.4. Invariant manifold \( \{H_3=U_3\} \). Here we proceed as in Sec. 5.2. We first eliminate \( \omega_3 \) from the equation
\[ H_3 = U_3. \]  
Then we study the elimination of \( \gamma_3 \) from \( (5.53) \). The results of these investigations are presented in the next two subsections.

5.4.1. Elimination of \( \omega_3 \). We express \( \omega_3 \) from \( (5.53) \) and obtain
\[ \omega_3 = \sqrt{\frac{U_3 - I_1 \omega_1^2 - I_2 \omega_2^2 - 2c_1 \gamma_1 - 2c_2 \gamma_2 - 2c_3 \gamma_3}{I_3}}. \]  
\( \omega_3 \) is now considered as an algebraic function of all its variables.

To shorten the formulas, we denote the square root of \( (5.54) \) by \( \Omega_3 \) so that we have
\[ \omega_3 = \Omega_3. \]

Now we insert this form of \( \omega_3 \) in the Euler-Poisson equations \( (1.1) \) and remove the third equation. In this way we obtain the following system of five differential equations:
\[
\begin{align*}
\frac{d\omega_1}{dt} &= \frac{I_2 - I_3}{I_1} \omega_2 \Omega_3 + c_3 \gamma_2 - c_3 \gamma_3, \\
\frac{d\omega_2}{dt} &= \frac{I_3 - I_1}{I_2} \omega_1 \Omega_3 + c_1 \gamma_3 - c_3 \gamma_1, \\
\frac{d\gamma_1}{dt} &= \Omega_3 \gamma_2 - \omega_2 \gamma_3, \\
\frac{d\gamma_2}{dt} &= \omega_1 \gamma_3 - \Omega_3 \gamma_1, \\
\frac{d\gamma_3}{dt} &= \omega_2 \gamma_1 - \omega_1 \gamma_2.
\end{align*}
\]  

There are five possible types of first integrals of this system which depend on at most four variables. They are:

1. \( F(\omega_1, \omega_2, \gamma_1, \gamma_2) \), (case (ii))
2. \( F(\omega_1, \omega_2, \gamma_1, \gamma_3) \), (case (iii))
3. \( F(\omega_1, \omega_2, \gamma_2, \gamma_3) \), (case (iii))
4. \( F(\omega_1, \gamma_1, \gamma_2, \gamma_3) \), (case (iv))
5. \( F(\omega_2, \gamma_1, \gamma_2, \gamma_3) \). (case (iv))
It is then sufficient to examine here the functions of type 1, 2 and 4. Afterwards, eliminating \( \gamma_3 \), we will be able to study the functions belonging to case (i), the function \( F(\omega_1, \omega_2, \omega_3, \gamma_1) \) in this circumstance.

**Type 1.** Let us look for a first integral of system \((5.56)\) that does not depend on \( \gamma_3 \), i.e. of type 1. Moreover we want this integral to be functionally independent of \( H_1 \) and \( H_2 \) restricted to the invariant manifold \( \{H_3 = U_3\} \). Let us suppose that the function \( F(\omega_1, \omega_2, \gamma_1, \gamma_2) \) is such a first integral. Then we have

\[
I_1 I_2 \frac{dF}{dt} = I_2 [(I_2 - I_3)\omega_2 \Omega_3 + c_3 \gamma_2 - c_2 \gamma_3] \frac{\partial F}{\partial \omega_1} \\
+ I_1 [(I_3 - I_1)\omega_1 \Omega_3 + c_1 \gamma_3 - c_3 \gamma_1] \frac{\partial F}{\partial \omega_2} \\
+ I_1 I_2 (\Omega_3 \gamma_2 - \omega_2 \gamma_3) \frac{\partial F}{\partial \gamma_1} + I_1 I_2 (\omega_1 \gamma_3 - \Omega_3 \gamma_1) \frac{\partial F}{\partial \gamma_2} = Y_1(F) = 0, \tag{5.57}
\]

where \( Y_1 \) is the corresponding vector field, defined on \( \mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3) \).

Equation \((5.57)\) is an identity with respect to all the five variables. \( F \) does not depend on \( \gamma_3 \). Thus if we differentiate this identity with respect to \( \gamma_3 \) we again obtain a linear partial differential equation for \( F \). Let us note that from \((5.54)\) and \((5.55)\) it follows that

\[
\frac{\partial \Omega_3}{\partial \gamma_3} = -\frac{c_3}{I_3 \Omega_3}.
\]

In this way we obtain from \((5.57)\)

\[
I_3 \Omega_3 \frac{\partial Y_1(F)}{\partial \gamma_3} = -I_2 (I_3 c_2 \Omega_3 + I_2 c_3 \omega_2 - I_3 c_3 \omega_2) \frac{\partial F}{\partial \omega_1} \\
+ I_1 (I_1 c_3 \omega_1 - I_3 c_3 \omega_1 + I_3 c_1 \Omega_3) \frac{\partial F}{\partial \omega_2} - I_1 I_2 (c_3 \gamma_2 + I_3 \omega_2 \Omega_3) \frac{\partial F}{\partial \gamma_1} \\
+ I_1 I_2 (I_3 \omega_1 \Omega_3 + c_3 \gamma_1) \frac{\partial F}{\partial \gamma_2} = Y_2(F) = 0, \tag{5.58}
\]

where \( Y_2 \) is the corresponding vector field, defined on \( \mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3) \).

We differentiate \((5.58)\) and obtain

\[
\Omega_3 \frac{\partial Y_2(F)}{\partial \gamma_3} = c_3 \left( I_2 c_2 \frac{\partial F}{\partial \omega_1} - I_1 c_1 \frac{\partial F}{\partial \omega_2} + I_1 I_2 \omega_2 \frac{\partial F}{\partial \gamma_1} - I_1 I_2 \omega_1 \frac{\partial F}{\partial \gamma_2} \right) = Y_3(F) = 0, \tag{5.59}
\]

where \( Y_3 \) is the corresponding vector field, defined on \( \mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3) \).

When \( c_3 = 0 \), \( Y_3 \) vanishes identically. That is why we consider separately two cases: \( c_3 \neq 0 \) and \( c_3 = 0 \).

First let \( c_3 \neq 0 \). Then we compute the Lie bracket \( Y_4 = [Y_2, Y_3]/(I_1 I_2 c_3^2) \) and obtain

\[
Y_4(F) = -c_1 (I_2 - I_3) \frac{\partial F}{\partial \omega_1} - c_2 (I_1 - I_3) \frac{\partial F}{\partial \omega_2} \\
+ I_1 \omega_1 (I_1 - I_2 - I_3) \frac{\partial F}{\partial \gamma_1} - I_2 \omega_2 (I_1 - I_2 + I_3) = 0. \tag{5.60}
\]

Equations \((5.57)\)–\((5.60)\) can be considered as a system of three homogeneous linear algebraic equations with unknowns \( \text{grad } F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_2} \right) \), which do not vanish identically, because \( F \) is non-constant on any open subset of its domain of definition.
Thus, if a new first integral $F$ exists, system (5.57)–(5.60) has a non-zero solution \( \text{grad } F \). This is possible if and only if the determinant $D$ of the coefficients of equations (5.57)–(5.60) is identically equal to zero. We compute this determinant and obtain

\[
D = I_1^2 I_2^2 c_3^3 \hat{D},
\]

where

\[
\hat{D} = I_1(I_1 - I_3)(I_1 - I_2 - I_3) \omega_1^3 \gamma_2 - I_1(I_2 - I_3)(I_1 - I_2 - I_3) \omega_1^2 \gamma_1 - I_2(I_1 - I_3)(I_1 - I_2 + I_3) \omega_2^2 \gamma_2 + I_1 c_1(I_1 - I_2 + I_3) \omega_1 \gamma_1^2 + I_2 c_2(I_1 - I_2 - I_3) \omega_2 \gamma_2 + I_1 c_1(I_1 - 2I_3) \omega_1 \gamma_2 - I_2 c_2(I_1 - I_3) \omega_2 \gamma_2 + I_2(I_1 - I_2 - I_3) \omega_2 \gamma_2^2 + I_1 c_1(I_1 - 2I_3) \omega_2 \gamma_2 + I_2 c_2(I_1 - 2I_3) \omega_2 \gamma_2 + I_2 c_1(I_2 - I_1 + I_3) \omega_2 \gamma_2^2.
\]

It is clear that the equation $D = 0$ is equivalent to $\hat{D} = 0$. $\hat{D} = 0$ has ten coefficients. The annulation of $\hat{D} = 0$ means that all of its coefficients should be zeros. In this way we obtain a system of ten equations for the parameters $Ic$.

After three consecutive simplifications we come to the reduced system:

\[
c_1 = 0, \quad c_2 = 0, \quad I_2 - I_3 = 0, \quad I_1 - I_3 = 0,
\]

which obviously leads to a particular case of the kinetic symmetry case. Thus a new partial first integral of type 1 does not exist when $c_3 \neq 0$.

Let $c_3 = 0$. Now $\Omega_3$ does not depend on $\gamma_3$ and $Y_1(F)$ is of the form (see (5.57))

\[
Y_1(F) = Z_1(F) \gamma_3 + Z_2(F) \Omega_3, \tag{5.61}
\]

where the vector fields $Z_1$ and $Z_2$, defined on $\mathbb{C}^4(\omega_1, \omega_2, \gamma_1, \gamma_2)$, are given as follows:

\[
Z_1 = -I_2 c_2 \frac{\partial}{\partial \omega_1} + I_1 c_1 \frac{\partial}{\partial \omega_2} - I_1 I_2 \omega_2 \frac{\partial}{\partial \gamma_1} + I_1 I_2 \omega_1 \frac{\partial}{\partial \gamma_2},
\]

\[
Z_2 = I_2(I_2 - I_3) \omega_2 \frac{\partial}{\partial \omega_1} + I_1(I_3 - I_1) \omega_1 \frac{\partial}{\partial \omega_2} + I_1 I_2 \gamma_2 \frac{\partial}{\partial \gamma_1} - I_1 I_2 \gamma_1 \frac{\partial}{\partial \gamma_2}.
\]

Equation (5.61) implies that

\[
Z_1(F) = Z_2(F) = 0. \tag{5.62}
\]

We compute the Lie brackets $Z_3 = [Z_1, Z_2]/(I_1 I_2)$ and $Z_4 = [Z_2, Z_3]$ and obtain

\[
Z_3 = (I_2 - I_3)c_1 \frac{\partial}{\partial \omega_1} + (I_1 - I_3)c_2 \frac{\partial}{\partial \omega_2}
\]

\[- I_1(I_1 - I_2 - I_3) \omega_1 \frac{\partial}{\partial \gamma_1} + I_2(I_1 - I_2 + I_3) \omega_2 \frac{\partial}{\partial \gamma_2},
\]

\[
Z_4 = -I_2 c_2(I_2 - I_3)(I_1 - I_3) \frac{\partial}{\partial \omega_1} + I_1 c_1(I_2 - I_3)(I_1 - I_3) \frac{\partial}{\partial \omega_2}
\]

\[- I_1 I_2(2I_1 I_2 - I_1 I_3 - 2I_2^2 + I_2 I_3 + I_3^2) \omega_2 \frac{\partial}{\partial \gamma_1},
\]

\[- I_1 I_2(2I_1^2 - 2I_1 I_2 - I_1 I_3 + I_2 I_3 - I_3^2) \omega_1 \frac{\partial}{\partial \gamma_2}.
\]

Equations (5.62) imply that

\[
Z_3(F) = Z_4(F) = 0. \tag{5.63}
\]
As in the case \( c_3 \neq 0 \), the system of equations (5.62) and (5.63) is a linear homogeneous system that has a non-zero solution. Thus the determinant \( \delta \) of its coefficients should vanish identically. We compute \( \delta \) and obtain
\[
\delta = I_1^2 I_2^2 \hat{\delta},
\]
where
\[
\hat{\delta} = I_1^2 (I_1 - I_3)(2I_1 - I_2 - 2I_3)(I_1 - I_2 - I_3)c_2 \omega_1^3 \\
+ I_1 I_2 (I_2 - I_3)(3I_1 I_2 - 3I_1 I_3 + 3I_2^2 - I_3 I_1 - 2I_3^2)c_1 \omega_1^2 \omega_2 \\
+ I_1 I_2 (I_1 - I_3)(3I_1 I_2 - 2I_1 I_3 + I_2 I_3 - 3I_2^2 + 2I_3^2)c_2 \omega_1 \omega_2^2 \\
- I_1 (2I_1 - I_2 - 2I_3)(I_1 I_2 c_1^2 + I_1 I_2 c_2^2 - I_1 I_3 c_1^2 - I_2 I_3 c_2^2) \omega_1 \gamma_2 \\
- I_2^2 (I_2 - I_3)(I_1 - 2I_2 + 2I_3)(I_1 - I_2 + I_3)c_1 \omega_3^3 \\
- I_2 (I_1 - 2I_2 + 2I_3)(I_1 I_2 c_1^2 + I_1 I_2 c_2^2 - I_1 I_3 c_1^2 - I_2 I_3 c_2^2) \omega_2 \gamma_1.
\]

Equation \( \delta = 0 \) is equivalent to the equation \( \hat{\delta} = 0 \). Thus the six coefficients of \( \hat{\delta} \) which should be zeros. In this way we have obtained a system of six equations for the parameters \( \mathcal{I}_c \). We subject it to simplification and after five consecutive simplifications we come to the reduced system consisting of the following five equations:
\[
(I_1 - I_2)c_1 c_2 = 0, \quad (I_1 - I_3)(I_2 - 2I_3)c_2 = 0, \quad (I_1 - I_3)(I_1 - 2I_3)c_2 = 0, \\
(I_2 - I_3)(I_2 - 2I_3)c_1 = 0, \quad (I_2 - I_3)(I_1 - 2I_3)c_1 = 0.
\]

We solve them by the MAPLE command `solve` and obtain five solutions:
\[
\{I_1 = I_1, I_2 = I_2, I_3 = I_3, c_1 = 0, c_2 = 0\} \\
\{I_1 = I_3, I_2 = I_2, I_3 = I_3, c_1 = 0, c_2 = c_2\} \\
\{I_1 = I_1, I_2 = I_3, I_3 = I_3, c_1 = c_1, c_2 = 0\} \\
\{I_1 = 2I_3, I_2 = 2I_3, I_3 = I_3, c_1 = c_1, c_2 = c_2\} \\
\{I_1 = I_3, I_2 = I_3, I_3 = I_3, c_1 = c_1, c_2 = c_2\}.
\]

Taking into account that now \( c_3 = 0 \) we see that the first of these solutions leads to the Euler case, the second and third ones - to the Lagrange case, the fourth solution leads to the Kovalevskaya case and the last one - to the kinetic symmetry case.

Thus a new partial first integral of type 1 does not exist also when \( c_3 = 0 \).

**Type 2.** Let us study now a first integral of type 2, i.e. \( F(\omega_1, \omega_2, \gamma_1, \gamma_3) \). We have
\[
I_1 I_2 \frac{dF}{dt} = I_2 [(I_2 - I_3) \omega_2 \Omega_3 + c_3 \gamma_2 - c_2 \gamma_3] \frac{\partial F}{\partial \omega_1} \\
+ I_1 [(I_3 - I_1) \omega_1 \Omega_3 + c_1 \gamma_3 - c_3 \gamma_1] \frac{\partial F}{\partial \omega_2} \\
+ I_1 I_2 (\Omega_3 \gamma_2 - \omega_2 \gamma_3) \frac{\partial F}{\partial \gamma_1} + I_1 I_2 (\omega_2 \gamma_1 - \omega_1 \gamma_2) \frac{\partial F}{\partial \gamma_3} = Y_1(F) = 0, \quad (5.64)
\]
where \( Y_1 \) is the corresponding vector field, defined on \( \mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3) \).

Equation (5.64) is an identity with respect to all the five variables. \( F \) does not depend on \( \gamma_2 \). Thus if we differentiate this identity with respect to \( \gamma_2 \) we again obtain a linear
partial differential equation for $F$. Let us note that

$$\frac{\partial \Omega_3}{\partial \gamma_2} = -\frac{c_2}{I_3 \Omega_3}.$$ 

In this way we have

$$I_3 \frac{\Omega_3}{\partial \gamma_2} \frac{\partial Y_1(F)}{\partial \gamma_2} = I_2 (I_3 c_3 \Omega_3 - I_2 c_2 \omega_2 + I_3 c_2 \omega_2) \frac{\partial F}{\partial \omega_1} + I_1 (I_1 - I_3) c_2 \omega_1 \frac{\partial F}{\partial \omega_2} + I_1 I_2 (c_2 \gamma_2 + I_3 \Omega_3^2) \frac{\partial F}{\partial \gamma_1} - I_1 I_2 I_3 \omega_1 \Omega_3 \frac{\partial F}{\partial \gamma_3} = Y_2(F) = 0,$$  

(5.65)

where $Y_2$ is the corresponding vector field, defined on $\mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3)$.

We differentiate (5.65) with respect to $\gamma_2$ and obtain

$$\frac{\Omega_3}{I_2} \frac{\partial Y_2(F)}{\partial \gamma_2} = -c_2 \left( c_3 \frac{\partial F}{\partial \omega_1} + 3 I_1 \Omega_3 \frac{\partial F}{\partial \gamma_1} - I_1 \omega_1 \frac{\partial F}{\partial \gamma_3} \right) = Y_3(F) = 0,$$  

(5.66)

where $Y_3$ is the corresponding vector field, defined on $\mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3)$.

When $c_2 = 0$, $Y_3$ vanishes identically. That is why we consider separately two cases: $c_2 \neq 0$ and $c_2 = 0$.

Let first $c_2 \neq 0$. Then we differentiate (5.66) with respect to $\gamma_2$ and obtain

$$\frac{I_3 \omega_3}{3 I_1 c_2} \frac{\partial Y_3(F)}{\partial \gamma_2} = \frac{\partial F}{\partial \gamma_1} = Y_4(F) = 0.$$  

(5.67)

Equations (5.64)–(5.67) can be considered as a system of four homogeneous linear algebraic equations with unknowns $\text{grad} F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_3} \right)$, which do not vanish identically, because $F$ is non-constant on any open subset of its domain of definition.

Thus, if a fourth integral $F$ exists, system (5.64)–(5.67) has a non-zero solution $\text{grad} F$. This is possible if and only if the determinant $D$ of the coefficients of equations (5.64)–(5.67) is identically equal to zero. We compute this determinant and obtain

$$D = I_1^2 I_2 c_2 \omega_1 \hat{D},$$

where

$$\hat{D} = c_2 (I_1 - I_3) \omega_1 \gamma_3 - c_3 (I_1 - I_2) \omega_2 \gamma_1 - c_1 (I_2 - I_3) \omega_2 \gamma_3.$$ 

The equation $D = 0$ is equivalent to $\hat{D} = 0$. Thus, as $c_2 \neq 0$, the first coefficient of $\hat{D}$ vanishes identically if and only if $I_1 = I_3$. At this condition the two remaining terms vanish either if $I_2 = I_3$ or if $c_1 = c_3 = 0$. The first possibility leads to the kinetic symmetry case and the second one - to the Lagrange case.

Thus a new partial first integral of type 2 does not exist when $c_2 \neq 0$.

Let $c_2 = 0$. Now $\Omega_3$ does not depend on $\gamma_2$ and $Y_1(F)$ is of the form (see (5.64))

$$Y_1(F) = Z_1(F) \gamma_2 + Z_2(F) \Omega_3,$$  

(5.68)

where the vector fields $Z_1$ and $Z_2$, defined on $\mathbb{C}^4(\omega_1, \omega_2, \gamma_1, \gamma_3)$, are given as follows:

$$Z_1 = I_2 c_3 \frac{\partial}{\partial \omega_1} + I_1 I_2 \Omega_3 \frac{\partial}{\partial \gamma_1} - I_1 I_2 \omega_1 \frac{\partial}{\partial \gamma_3},$$

$$Z_2 = I_2 (I_2 - I_3) \omega_2 \Omega_3 \frac{\partial}{\partial \omega_1} + I_1 [(I_3 - I_1) \omega_1 \Omega_3 + c_1 \gamma_3 - c_3 \gamma_1] \frac{\partial}{\partial \omega_2}.$$
where the expression for $\delta$ vanish identically. We compute $b$ where

$$
- I_1 I_2 \omega_2 \gamma_3 \frac{\partial}{\partial \gamma_1} + I_1 I_2 \omega_2 \gamma_1 \frac{\partial}{\partial \gamma_3}.
$$

Equation (5.68) implies that

$$
Z_1(F) = Z_2(F) = 0. \tag{5.69}
$$

We compute the Lie brackets $Z_3 = [Z_1, Z_2]/(I_1 I_2)$ and $Z_4 = [Z_2, Z_3]/I_2$ and obtain

$$
Z_3 = -I_2 (I_2 - I_3) c_1 \omega_2 \frac{\partial}{\partial \omega_1} + \left[ I_3 c_3 \Omega_3 (I_3 - 2 I_1) + I_1 c_1 \omega_1 (I_1 - 2 I_3) \right] \frac{\partial}{\partial \omega_2}
$$

$$
- I_1 I_2 (I_1 - I_2 - I_3) \omega_1 \omega_2 \frac{\partial}{\partial \gamma_1} + I_2 I_3 (I_1 + I_2 - I_3) \omega_2 \Omega_3 \frac{\partial}{\partial \gamma_3},
$$

$$
Z_4 = a_1 \frac{\partial}{\partial \omega_1} + a_2 \frac{\partial}{\partial \omega_2} - a_3 \frac{\partial}{\partial \gamma_1} - a_4 \frac{\partial}{\partial \gamma_2},
$$

where

$$
a_1 = (I_2 - I_3) [-I_1 (2 I_1 - I_3) c_3 \omega_1^2 + I_1 I_3 c_1 \omega_1 \Omega_3 - I_2 (3 I_1 - I_2 - I_3) c_3 \omega_2^2 - (3 I_1 - 2 I_3) c_1 c_3 \gamma_1 - (I_1 c_1^2 + 4 I_1 c_3^2 - 2 I_3 c_3^2) \gamma_3 + (2 I_1 - I_3) c_3 U_3],
$$

$$
a_2 = -I_1 \omega_2 [I_1 (2 I_1 - I_2 - I_3) c_3 \omega_1 + I_3 (I_1 + 2 I_2 - I_3) c_1 \Omega_3],
$$

$$
a_3 = I_1 [I_1 (I_1 - I_3) (I_1 - I_2 - I_3) \omega_3^2 \Omega_3 + I_1 (I_1 - I_2 - I_3) c_3 \omega_1 \gamma_1 + I_1 (I_1 - I_2 - I_3) c_1 \omega_1 \gamma_3 - I_2 (I_1 - 2 I_3 - I_2^2 - I_2 I_3 + 2 I_3^2) \omega_2 \Omega_3 - I_3 (2 I_1 - I_3) c_3 \gamma_3 \Omega_3],
$$

$$
a_4 = I_1 [I_1 (I_1 - I_3) (I_1 - I_2 - I_3) \omega_1^3 + I_2 (3 I_1^2 - 4 I_1 I_3 - I_2^2 + I_3^2) \omega_1 \gamma_2 + (I_1^2 + 2 I_1 I_2 - 2 I_1 I_3 - 2 I_2 I_3 + 2 I_3^2) c_1 \omega_1 \gamma_1 + 2 (I_1 - I_3) (I_1 + I_2 - I_3) c_3 \omega_1 \gamma_3 - (I_1 - I_3) (I_1 + I_2 - I_3) U_3 \omega_1 + I_3 (I_1 - I_2) c_3 \gamma_3 \Omega_3 + I_3 (I_1 + I_2 - I_3) c_3 \gamma_3 \Omega_3].
$$

Equations (5.69) imply that

$$
Z_3(F) = Z_4(F) = 0. \tag{5.70}
$$

As in the case $c_2 \neq 0$, the system of equations (5.69) and (5.70) is a linear homogeneous system that has a non-zero solution. Thus the determinant $\delta$ of its coefficients should vanish identically. We compute $\delta$ and obtain

$$
\delta = I_1^2 I_2^3 \omega_2^3 \Omega_3 \hat{\delta},
$$

where the expression for $\hat{\delta}$ has the following form:

$$
\hat{\delta} = I_3 \Omega_3 b_1 + I_1 \omega_1 b_2.
$$

$b_1$ and $b_2$ are polynomials of the variables $\omega_1, \omega_2, \gamma_1$ and $\gamma_3$ with coefficients that depend on the parameters $I c$ and $U_3$. They are given by the following formulas:

$$
b_1 = -2 I_1 c_1 (I_2 - I_3) (I_1 - I_3) (2 I_1 + I_2 - I_3) \omega_1^2
$$

$$
- I_2 (I_2 - I_3) (I_1 + I_2 - I_3) (I_1 + 2 I_2 - 2 I_3) c_1 \omega_2^2
$$

$$
- (I_1 + 2 I_2 - 2 I_3) (I_1 I_2 c_2^2 - I_1 I_3 c_3^2 + I_1 I_3 c_3^2 + 2 I_2 c_1^2 - 4 I_2 I_3 c_1^2 - I_2 I_3 c_3^2 + 2 I_3 c_1^2) \gamma_1
$$

$$
- 2 c_3 c_1 (I_2 - I_3) (I_1 + I_2 - I_3) (I_1 + 2 I_2 - 2 I_3) c_1 U_3,
$$

$$
b_2 = 2 I_1 (I_1 - I_3) (I_1 - I_2) (I_1 - I_2 - 2 I_3) c_3 \omega_1^2
$$

$$
+ I_2 (I_1 - I_2) (2 I_1 I_2 - 3 I_1 I_3 - 2 I_2^2 - I_2 I_3 + 3 I_3^2) c_3 \omega_2^2
$$

- I_3 c_3 \omega_1 \gamma_1
$$

$$
- I_3 (I_1 + I_2 - I_3) (I_1 + 2 I_2 - 2 I_3) c_3 \omega_2
$$

$$
- I_3 (I_1 + I_2 - I_3) (I_1 + 2 I_2 - 2 I_3) c_3 \omega_2.
$$

- I_3 (I_1 + I_2 - I_3) (I_1 + 2 I_2 - 2 I_3) c_3 \omega_2
$$

- I_3 (I_1 + I_2 - I_3) (I_1 + 2 I_2 - 2 I_3) c_3 \omega_2.
system consisting of the following five equations:

\[ \begin{align*}
+ 2(I_1 - I_2)(-3I_1I_3 + 2I_1I_2 + 3I_3^2 - I_2I_3 - 2I_2^2)c_1c_3\gamma_1 \\
+ [(2I_1^2I_2(c_1^2 + 2c_3^2) - 2I_1^2I_3(c_1^2 + 4c_3^2) - 2I_1I_2^2(c_1^2 + 4c_3^2) + I_1I_2I_3(c_1^2 + 8c_3^2) \\
+ I_1I_3^2(c_1^2 + 7c_3^2) + 4I_2^3c_3^2 - 7I_2I_3^2c_3^2)]\gamma_3 \\
- (I_1 - I_2)(2I_1I_2 - 3I_1I_3 - 2I_2^2 - I_2I_3 + 3I_3^2)c_3U_3.
\end{align*} \]

The equation \( \delta = 0 \) is equivalent to \( \tilde{\delta} = 0 \). \( \tilde{\delta} \) depends on function \( \Omega_3 \) and it is easy to see that \( \Omega_3 \notin \mathbb{C}(\omega_1, \omega_2, \gamma_1, \gamma_3) \). Then according to Proposition 4.3, the coefficients \( b_1 \) and \( b_2 \) of \( \tilde{\delta} \) should be zeros. In this way we obtain a system of ten equations for the parameters \( \Gamma_c \) and \( U_3 \). After four consecutive simplifications we come to the reduced system consisting of the following five equations:

\begin{align*}
(I_1 - I_3)c_1c_3 & = 0, \\
(2I_2 - I_3)(I_1 - I_2)c_3 & = 0, \\
(I_1 - I_2)(2I_1 - 3I_1I_3 + 2I_2)c_3 & = 0, \\
(2I_2 - I_3)(I_2 - I_3)c_1 & = 0, \\
(I_2 - I_3)(I_1 - I_3)c_1 & = 0.
\end{align*}

We solve them by the MAPLE command `solve` and obtain six solutions:

\[
\begin{align*}
\{I_1 &= I_1, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_3 = 0 \} \\
\{I_1 &= I_2, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_3 = c_3 \} \\
\{I_1 &= I_1, \quad I_2 = I_3, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_3 = 0 \} \\
\{I_1 &= 2I_2, \quad I_2 = I_2, \quad I_3 = 2I_2, \quad c_1 = 0, \quad c_3 = c_3 \} \\
\{I_1 &= I_3, \quad I_2 = I_3, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_3 = c_3 \} \\
\{I_1 &= I_3, \quad I_2 = I_3, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_3 = c_3 \}.
\end{align*}
\]

Taking into account that now \( c_2 = 0 \) we see that the first solution leads to the Euler case, the second and third solutions lead to the Lagrange case, the fourth and fifth ones - to the Kovalevskaya case and the last one - to the kinetic symmetry case.

Thus a new partial first integral of type 2 does not exist also when \( c_2 = 0 \).

**Type 4.** Let \( F(\omega_1, \gamma_1, \gamma_2, \gamma_3) \) be a new first integral of type 4. Thus we have

\begin{align*}
I_1 \frac{dF}{dt} &= [(I_2 - I_3)\omega_2 \Omega_3 + c_3\gamma_2 - c_2\gamma_3] \frac{\partial F}{\partial \omega_1} + I_1 (\Omega_3 \gamma_2 - \omega_2 \gamma_3) \frac{\partial F}{\partial \gamma_1} \\
- I_1 (\Omega_3 \gamma_1 - \omega_1 \gamma_3) \frac{\partial F}{\partial \gamma_2} + I_1 (\omega_2 \gamma_1 - \omega_1 \gamma_2) \frac{\partial F}{\partial \gamma_3} = Y_1(F) = 0,
\end{align*}

where \( Y_1 \) is the corresponding vector field, defined on \( \mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3) \).

Equation (5.71) is an identity with respect to all the five variables. \( F \) does not depend on \( \omega_2 \). Thus if we differentiate this identity with respect to \( \omega_2 \) we again obtain a linear partial differential equation for \( F \). Let us note that

\[
\frac{\partial \Omega_3}{\partial \omega_2} = - \frac{I_2 \omega_2}{I_3 \Omega_3}.
\]

In this way we have

\begin{align*}
I_3 \Omega_3 \frac{\partial Y_1(F)}{\partial \omega_2} &= (I_2 - I_3)(I_3 \Omega_2^2 - I_2 \omega_2^2) \frac{\partial F}{\partial \omega_1} - I_1 (I_2 \omega_2 \gamma_2 + I_3 \gamma_3 \Omega_3) \frac{\partial F}{\partial \gamma_1} \\
+ I_1 \omega_2 \gamma_1 \frac{\partial F}{\partial \gamma_2} + I_1 \omega_2 \gamma_1 \Omega_3 \frac{\partial F}{\partial \gamma_3} = Y_2(F) = 0,
\end{align*}

where $Y_2$ is the corresponding vector field, defined on $\mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3)$.

We differentiate (5.72) with respect to $\omega_2$ and obtain
\[
\Omega_3 \frac{\partial Y_2(F)}{\partial \omega_2} = -4I_2(I_2 - I_3)\omega_2 \Omega_3 \frac{\partial F}{\partial \omega_1} - I_1 I_2(\gamma_2 \Omega_3 - \omega_2 \gamma_3) \frac{\partial F}{\partial \gamma_1} + I_1 I_2 \gamma_1 \Omega_3 \frac{\partial F}{\partial \gamma_2} - I_1 I_2 \omega_2 \gamma_1 \frac{\partial F}{\partial \gamma_3} = Y_3(F) = 0,
\]
where $Y_3$ is the corresponding vector field, defined on $\mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3)$.

Let us note that the first integral $H_2$ is of type 4, i.e. it satisfies system (5.71)–(5.73). Thus if a new first integral exists, then this system will have two non-zero linearly independent solutions $\text{grad} H_2$ and $\text{grad} F$. This is possible if and only if the $3 \times 4$ matrix $M$ of the coefficients of system (5.71)–(5.73) satisfies the condition
\[
\text{rank } M \leq 2.
\]

We compute the determinant $M_{124}$ obtained from matrix $M$ by crossing out its third column and obtain
\[
M_{124} = I_1^2 I_2 \gamma_2 \hat{M}_{124},
\]
where
\[
\hat{M}_{124} = \Omega_3 b_1 + b_2.
\]
Here the coefficients $b_1$ and $b_2$ are polynomials given by the formulas:
\[
b_1 = (I_2 - I_3)(-I_1 \omega_1^2 \gamma_2 + 3I_1 \omega_1^3 \omega_2 \gamma_3 + 2I_2 \omega_1 \omega_2^2 \gamma_2 - 2c_1 \omega_1 \gamma_1 \gamma_2 - 2c_3 \omega_1 \gamma_2 \gamma_3 + U_3 \omega_1 \gamma_2 + 6c_1 \omega_1 \gamma_1^2 + 6c_2 \omega_2 \gamma_1 \gamma_2 + 6c_3 \omega_2 \gamma_1 \gamma_3 - 3U_3 \omega_2 \gamma_1),
\]
\[
b_2 = -3I_1(I_2 - I_3) \omega_1^3 \omega_2 \gamma_3 - I_1 c_3 \omega_1 \gamma_1 \gamma_2 + I_1 c_2 \omega_1^2 \gamma_1 \gamma_3 - 2I_1(I_2 - I_3) \omega_1 \omega_2^2 \gamma_3
\]
\[- 6(I_2 - I_3) c_1 \omega_1 \omega_2 \gamma_1 \gamma_3 - 6(I_2 - I_3) c_2 \omega_1 \omega_2 \gamma_2 \gamma_3 - 6(I_2 - I_3) c_3 \omega_1 \omega_2 \gamma_3^2
\]
\[+ 3(I_2 - I_3) U_3 \omega_1 \omega_2 \gamma_3 - 2c_1 c_3 \gamma_1 \gamma_2 + 2c_1 c_2 \gamma_1 \gamma_3 - 2c_2 c_3 \gamma_1 \gamma_2 + 2(c^2 - c_3^2) \gamma_1 \gamma_2 \gamma_3
\]
\[+ c_3 U_3 \gamma_1 \gamma_2 + 2c_2 c_3 \gamma_1 \gamma_3 - 2c_3 U_3 \gamma_1 \gamma_3.
\]

Taking into account (5.74) $\hat{M}_{124}$ should vanish identically. According to Proposition 4.3 the coefficients $b_1$ and $b_2$ should be zeros because $\Omega_3 \notin \mathbb{C}(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3)$. Polynomial $b_1$ has 11 coefficients and $b_2$ - 15. We only use $b_2 = 0$. In this way we obtain a system of 15 equations for the parameters $Ic$ and $U_3$. After two consecutive simplifications we come to the reduced system
\[
c_2 = 0, \quad c_3 = 0, \quad I_2 - I_3 = 0.
\]

It leads to the Lagrange case, and therefore a new partial first integral of type 4 does not exist.

5.4.2. Elimination of $\gamma_3$. We now study the elimination of $\gamma_3$ from the equation (5.73). In this section we suppose that $c_3 \neq 0$ because otherwise the elimination under consideration is not possible. We obtain:
\[
\gamma_3 = \frac{U_3 - I_1 \omega_1^2 - I_2 \omega_2^2 - I_3 \omega_3^2 - 2c_1 \gamma_1 - 2c_2 \gamma_2}{2c_3}.
\]
To shorten the formulas, we denote the right-side of (5.75) by $\Gamma_3$ so that we have $\gamma_3 = \Gamma_3$. 

Now we put this value of $\gamma_3$ in the Euler-Poisson equations (1.1) and remove the sixth equation. In this way we obtain the following system of five differential equations:

\[
\begin{align*}
\frac{d\omega_1}{dt} &= \frac{(I_2 - I_3)\omega_2\omega_3 + c_3\gamma_2 - c_2\Gamma_3}{I_1}, \\
\frac{d\omega_2}{dt} &= \frac{(I_3 - I_1)\omega_1\omega_3 + c_1\Gamma_3 - c_3\gamma_1}{I_2}, \\
\frac{d\omega_3}{dt} &= \frac{(I_1 - I_2)\omega_1\omega_3 + c_2\gamma_1 - c_1\gamma_2}{I_3}, \\
\frac{d\gamma_1}{dt} &= \omega_3\gamma_2 - \omega_2\Gamma_3, \\
\frac{d\gamma_2}{dt} &= \omega_1\Gamma_3 - \omega_3\gamma_1.
\end{align*}
\]

(5.76)

There are five possible types of first integrals of this system which depend on at most four variables. They are:

1. $F(\omega_1, \omega_2, \omega_3, \gamma_1)$, (case (i))
2. $F(\omega_1, \omega_2, \omega_3, \gamma_2)$, (case (i))
3. $F(\omega_1, \omega_2, \gamma_1, \gamma_2)$, (case (ii))
4. $F(\omega_1, \omega_3, \gamma_1, \gamma_2)$, (case (iii))
5. $F(\omega_2, \omega_3, \gamma_1, \gamma_2)$. (case (iii))

Considering the fact that the functions belonging to cases (ii) and (iii) have already been examined, it only remains to study a function belonging to case (i).

**Type 1.** Let us look for a first integral of system (5.76) of type 1, i.e. $F(\omega_1, \omega_2, \omega_3, \gamma_1)$. Moreover we want this integral to be functionally independent of $H_1$ and $H_2$ restricted to the invariant manifold $\{H_3 = U_3\}$, but this condition will play no role here. Then we have

\[
I_1 I_2 I_3 \frac{dF}{dt} = I_1 I_3 [(I_2 - I_3)\omega_2\omega_3 + c_3\gamma_2 - c_2\Gamma_3] \frac{\partial F}{\partial \omega_1} \\
+ I_1 I_3 [(I_3 - I_1)\omega_1\omega_3 + c_1\Gamma_3 - c_3\gamma_1] \frac{\partial F}{\partial \omega_2} \\
+ I_1 I_2 [(I_1 - I_2)\omega_1\omega_2 + c_2\gamma_1 - c_1\gamma_2] \frac{\partial F}{\partial \omega_3} \\
+ I_1 I_2 I_3 (\omega_3\gamma_2 - \omega_2\Gamma_3) \frac{\partial F}{\partial \gamma_1} = Z(F) = 0,
\]

(5.77)

where $Z$ is the corresponding vector field, defined on $\mathbb{C}^5(\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2)$.

Vector field $Z$ is of the form $Z = 2Y_1\gamma_2 + Y_2$, where the polynomial vector fields $Y_1$ and $Y_2$ are defined on $\mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1)$ as follows:

\[
Y_1 = I_2 I_3 (c_2^2 + c_3^2) \frac{\partial}{\partial \omega_1} - I_1 I_3 c_1 c_2 \frac{\partial}{\partial \omega_2} - I_1 I_2 c_1 c_3 \frac{\partial}{\partial \omega_3} + I_1 I_2 I_3 (c_2\omega_2 + c_3\omega_3) \frac{\partial}{\partial \gamma_1},
\]

\[
Y_2 = I_2 I_3 [c_2(I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2 + 2c_1\gamma_1 - U_3) + 2(I_2 - I_3)c_3\omega_2\omega_3] \frac{\partial}{\partial \omega_1} \\
- I_1 I_3 [c_1(I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2 + 2c_1\gamma_1 - U_3) + 2(I_1 - I_3)c_3\omega_1\omega_3 + 2c_3\gamma_1] \frac{\partial}{\partial \omega_2}.
\]
\[ + 2I_1I_2c_3[(I_1 - I_2)\omega_1\omega_2 + c_2\gamma_1]\frac{\partial}{\partial \omega_3} \]
\[ + I_1I_2I_3(I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2 + 2c_1\gamma_1 - U_3)\omega_2\frac{\partial}{\partial \gamma_1}. \]

Taking into account that (5.77) should be an identity with respect to all the variables and that \(F\) does not depend on \(\gamma_2\), we conclude that
\[ Y_1(F) = Y_2(F) = 0. \tag{5.78} \]

We compute the Lie bracket \(Y_3 = [Y_1, Y_2]/(2I_1I_2I_3)\) and obtain
\[
Y_3 = [I_2I_3c_2(c_2^2 + c_3^2)\omega_1 - I_2(I_2 - I_3)c_1c_3^2\omega_2 - I_3(I_2 - I_3)c_1c_2c_3\omega_3]\frac{\partial}{\partial \omega_1} \\
+ [I_1c_1(I_1c_3^2 - I_3c_2^2 - 2I_3c_3^2)\omega_1 - I_1I_3c_2c_3\omega_2] \\
- (I_3c_2^2 + 2I_1c_2^2 - I_3c_2^2 - I_3c_3^2)c_2\omega_2 \\
- c_3[I_1(I_1 - I_2)c_1c_2\omega_1 - I_2(2I_1c_2^2 + I_1c_3^2 - I_2c_2^2 - I_2c_3^2)\omega_2 - I_1I_2c_2c_3\omega_3]\frac{\partial}{\partial \omega_3} \\
- I_1[I_2c_2^2 - 2I_2c_3^2 - I_3c_2^2 - I_3c_3^2]\omega_1\omega_2 \\
- I_3(I_1 - I_3)c_2c_3\omega_1\omega_3 + (I_2 - I_3)c_2c_3^2\gamma_1]\frac{\partial}{\partial \gamma_1}.
\]

Then we compute \(Y_4 = [Y_2, Y_3]\). Unfortunately the expression for \(Y_4\) is too long to be shown here.

Equations (5.78) imply that
\[ Y_3(F) = Y_4(F) = 0. \tag{5.79} \]

System (5.78)–(5.79) can be considered as a homogeneous linear algebraic system with unknowns \(\text{grad } F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_1} \right)\), which do not vanish identically, because \(F\) is non-constant on any open subset of its domain of definition.

Thus, if a fourth integral \(F\) exists, system (5.78)–(5.79) has a non-zero solution \(\text{grad } F\). This is possible if and only if the determinant \(D\) of the coefficients of this system is identically equal to zero. We compute this determinant and obtain
\[ D = I_1^2I_2^2I_3^2c_3^4\hat{D}, \]
where \(\hat{D}\) is a very long expression that we cannot show here. This expression is a polynomial of the variables \(\omega_1, \omega_2, \omega_3\) and \(\gamma_1\) with 79 coefficients, which are polynomials of the parameters \(c_3\) and \(U_3\). As \(c_3 \neq 0\) the equation \(D = 0\) is equivalent to \(\hat{D} = 0\). Thus all the coefficients of \(\hat{D}\) should be zeros and we have to solve the corresponding system of 79 equations.

After three consecutive simplifications we come to the reduced system consisting of the following six equations:
\[
(I_2 - I_3)c_2 = 0, \quad (I_1 - I_3)c_2 = 0, \quad (I_1 - I_3)c_1 = 0, \quad (2I_2 - I_3)(I_1 - I_2) = 0, \\
(I_1 - I_2)(2I_1 + 2I_2 - 3I_3) = 0, \quad (2I_2 - I_3)(I_2 - I_3)c_1 = 0.
\]
Solving these equations by the MAPLE command \texttt{solve} we obtain four solutions
\begin{align*}
\{U_3 = U_3, \ I_1 = I_2, \ I_2 = I_2, \ I_3 = I_3, \ c_1 = 0, \ c_2 = 0, \ c_3 = c_3\}, \\
\{U_3 = U_3, \ I_1 = I_3, \ I_2 = I_3, \ I_3 = I_3, \ c_1 = c_1, \ c_2 = c_2, \ c_3 = c_3\}, \\
\{U_3 = U_3, \ I_1 = I_3, \ I_2 = 2I_2, \ I_3 = 2I_2, \ c_1 = 0, \ c_2 = 0, \ c_3 = c_3\}, \\
\{U_3 = U_3, \ I_1 = I_3, \ I_2 = I_3, \ I_3 = I_3, \ c_1 = c_1, \ c_2 = 0, \ c_3 = c_3\}.
\end{align*}

The first solution leads to the Lagrange case, the second one - to the kinetic symmetry case and the remaining two solutions - to the Kovalevskaya case.

Thus a new partial first integral of type 1 does not exist.

\section*{6. The gyrostat}

\subsection*{6.1. The gyrostat equations.} These equations (\ref{eq:gyrostat}) are only slightly modified Euler-Poisson equations (\ref{eq:eulerpoisson}).
\begin{align}
I_1 \frac{d\omega_1}{dt} &= (I_2 - I_3)\omega_2\omega_3 + b_3\omega_2 - b_2\omega_3 + Mg(c_3\gamma_2 - c_2\gamma_3), \\
I_2 \frac{d\omega_2}{dt} &= (I_3 - I_1)\omega_1\omega_3 + b_1\omega_3 - b_3\omega_1 + Mg(c_1\gamma_3 - c_3\gamma_1), \\
I_3 \frac{d\omega_3}{dt} &= (I_1 - I_2)\omega_1\omega_2 + b_2\omega_1 - b_1\omega_2 + Mg(c_2\gamma_1 - c_1\gamma_2), \\
\frac{d\gamma_1}{dt} &= \omega_3\gamma_2 - \omega_2\gamma_3, \\
\frac{d\gamma_2}{dt} &= \omega_1\gamma_3 - \omega_3\gamma_1, \\
\frac{d\gamma_3}{dt} &= \omega_2\gamma_1 - \omega_1\gamma_2.
\end{align}

As for the Euler-Poisson equations, we study them in complex domain and without any restriction of generality, we admit that $Mg = 1$.

Like for the Euler-Poisson equations, $H_2$ and $H_3$ defined by (\ref{eq:eulerpoisson}) continue to be first integrals of equations of gyrostat (\ref{eq:gyrostat}). This is no more true for $H_1$ defined by (\ref{eq:eulerpoisson}). The area first integral for gyrostat is
\begin{equation}
H_1 = I_1\omega_1\gamma_1 + I_2\omega_2\gamma_2 + I_3\omega_3\gamma_3 - b_1\gamma_1 - b_2\gamma_2 - b_3\gamma_3. \tag{6.2}
\end{equation}

Up to the end of Sec. 6, $H_1$ is defined by (6.2) and such $H_1$ is a first integral of gyrostat equations (6.1). The first integrals $H_1$, $H_2$ and $H_3$ are always functionally independent.

Formally the definition of permutational symmetries cannot be applied to the gyrostat equations because the number of variables and of parameters does not coincide. But in fact it is easy to see that all permutational symmetries of gyrostat equations, like for Euler-Poisson equations, coincide with symmetric group $S_3$, where the same permutation is simultaneously applied to variables $\{\omega_1, \omega_2, \omega_3\}$ and $\{\gamma_1, \gamma_2, \gamma_3\}$ and to parameters $\{I_1, I_2, I_3\}$, $\{b_1, b_2, b_3\}$ and $\{c_1, c_2, c_3\}$. It is easy to verify that property (2.2) remains
true. That is:

\[ V_k(\sigma(\omega), \sigma(\gamma), \sigma(I), \sigma(b), \sigma(c)) = \varepsilon V_{\sigma(k)}(\omega, \gamma, I, b, c), \]
\[ W_k(\sigma(\omega), \sigma(\gamma)) = \varepsilon W_{\sigma(k)}(\omega, \gamma), \quad 1 \leq k \leq 3. \]

Here \( \{V_k\}_{1 \leq k \leq 3} \) are the right sides of the first three gyrostat equations (6.1), \( \{W_k\}_{1 \leq k \leq 3} \) are the remaining three equations (6.1) and \( \varepsilon = \pm 1 \) only depends on the choice of permutation \( \sigma \in S_3 \). The same concerns the analogue of the Theorem 2.2. We leave the details to the reader.

The known integrable cases for the real gyrostat equations (6.1) are the same as for the Euler-Poisson equations (1.1) but with some additional restrictions on the constants \( b_i, 1 \leq i \leq 3 \). Up to permutational symmetry they are the following ones. These cases remains valid also for complex gyrostat equations.

The Zhukovskii case which is an extension of the Euler case [21, 24]. It is defined by the condition (1.3) without additional restrictions on \( b_i, 1 \leq i \leq 3 \). The fourth integral is

\[ H_4 = I_1^2 \omega_1^2 + I_2^2 \omega_2^2 + I_3^2 \omega_3^2 - 2(I_1 b_1 \omega_1 + I_2 b_2 \omega_2 + I_3 b_3 \omega_3). \]

When \( b_1 = b_2 = b_3 = 0 \) we recover the fourth integral of Euler case.

The Lagrange case for gyrostat [21, 24] is defined by the conditions (1.4) and \( b_1 = b_2 = 0 \). The fourth integral in this case is the same as for the Euler-Poisson equations, i.e.

\[ H_4 = \omega_3. \]

The Yehia case [21, 28] which is an extension of the Kovalevskaya case is defined by the conditions (1.5) and \( b_1 = b_2 = 0 \). The fourth integral in this case is

\[ H_4 = [I_3(\omega_1^2 - \omega_2^2) - c_1 \gamma_1 + c_2 \gamma_2]^2 + (2I_3 \omega_1 \omega_2 - c_1 \gamma_2 - c_2 \gamma_1)^2 + 4b_3 \gamma_3(c_1 \omega_1 + c_2 \omega_2) - 2b_3(\omega_1^2 + \omega_2^2)(I_3 b_3 + b_3). \] (6.3)

When \( b_3 = 0 \) we recover Kovalevskaya fourth integral (1.7).

The kinetic symmetry case for gyrostat is defined by the conditions (1.6) together with condition that the vectors \( (c_1, c_2, c_3) \) and \( (b_1, b_2, b_3) \) are proportional, i.e.

\[ b_1 c_3 = b_3 c_1, \quad b_2 c_3 = b_3 c_2, \quad b_2 c_1 = b_1 c_2, \]

and the fourth integral is the same as for the Euler-Poisson equations, i.e.

\[ H_4 = c_1 \omega_1 + c_2 \omega_2 + c_3 \omega_3. \]

Let us note that except the Yehia case, in all remaining three cases, the fourth integral can be found along the same lines as in [59], where fourth integrals are computed for integrable cases of the Euler-Poisson equations.

This is not so for the Yehia fourth integral because even if \( c_2 = 0 \), it depends on all variables. When \( c_2 = 0 \), this fourth integral can be found in [21] and in [78]. Comparing formula (1.7) of fourth integral in Kovalevskaya case when \( c_2 \neq 0 \) and when \( c_2 = 0 \) with formula (6.3) when \( c_2 = 0 \), it is natural to conjecture that formula (6.3) with an arbitrary \( c_2 \) defines a fourth integral in the general Yehia case. Simple MAPLE computation confirms this.
Like for the Euler-Poisson equations, we will call these four cases \textit{classical} integrable cases.

\subsection*{6.2. The Sretenskii case.}
In 1963 L. N. Sretenskii discovered an extension of the Goryachev-Chaplygin partial first integral \textup{(}1.8\textup{)} of the Euler-Poisson equations to the gyrostat case \cite{62, 63}.

Now we apply the method used in Sec. 5.2 that led to the successful derivation of the Goryachev-Chaplygin case for the Euler-Poisson equations to the gyrostat equations \textup{(}6.1\textup{)}. The computations are almost the same, bigger but not so much. That is why we do not give details here.

We express $\gamma_2$ from equation $H_1 = U_1$, where $H_1$ is the function given by \textup{(}6.2\textup{)} and obtain

$$\gamma_2 = - \frac{(I_1 \omega_1 - b_1) \gamma_1 + (I_3 \omega_3 - b_3) \gamma_3 + U_1}{I_2 \omega_2 - b_2}.$$  \hfill (6.4)

We put this expression for $\gamma_2$ in the gyrostat equations \textup{(}6.1\textup{)} and remove the fifth equation. We study the obtained system of five equations for the existence of a new first integral $F(\omega_1, \omega_2, \omega_3, \gamma_3)$, i.e. which does not depend on $\gamma_1$. For this purpose we compute $\frac{dF}{dt}$ and take only its numerator. It is easily seen that the obtained expression can be represented in the following way:

$$\frac{dF}{dt} = Y_1(F) + Y_2(F) = 0,$$  \hfill (6.4)

where $Y_1$ and $Y_2$ are vector fields defined in $\mathbb{C}^4 = \mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_3)$. As \textup{(}6.4\textup{)} is an identity with respect to all the variables and as $Y_1(F)$ and $Y_2(F)$ do not depend on $\gamma_1$ we have

$$Y_1(F) = Y_2(F) = 0.$$  \hfill (6.5)

We compute the Lie brackets $Y_3 = [Y_1, Y_2]$ and $Y_4 = [Y_1, Y_3]$. Taking into account equations \textup{(}6.5\textup{)} we have that

$$Y_3(F) = Y_4(F) = 0.$$  \hfill (6.6)

Equations \textup{(}6.5\textup{)} and \textup{(}6.6\textup{)} can be considered as a system of four homogeneous linear algebraic equations with unknowns grad $F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_3} \right)$, which do not vanish identically on any open subset of domain of definition of $F$, because $F$ is non-constant on any such open subset.

If a new integral $F$ exists, system \textup{(}6.5\textup{)}–\textup{(}6.6\textup{)} has at least one non-zero solution. Let us consider the $4 \times 4$ matrix $A$ whose columns are the coefficients of vector fields $Y_1$, $Y_2$, $Y_3$ and $Y_4$. The condition under which system \textup{(}6.5\textup{)}–\textup{(}6.6\textup{)} has at least one non-zero solution is

$$\text{rank } A \leq 3.$$  \hfill (6.6)

We equate to zero the determinant $D$ of matrix $A$ and study when it is identically equal to zero.

$D$ is a polynomial of the variables $\omega_1, \omega_2, \omega_3$ and $\gamma_3$. We consider the system consisting of the coefficients of polynomial $D$ equated to zero. This system has 226 equations in unknowns $U_1$, $I_i$, $b_i$, $c_i$, $1 \leq i \leq 3$. After four consecutive simplifications we obtain the reduced system of 28 equations. Solving these equations by the \texttt{MAPLE} command \texttt{solve}
we obtain nine solutions. Two of them contain zero values of the moments of inertia, two
lead to the Lagrange case and three lead to the kinetic symmetry case. Thus only two
essential solutions remain. They are:
1. \( I_1 = 4I_3, \quad I_2 = 4I_3, \quad b_1 = 0, \quad b_2 = 0, \quad c_3 = 0; \)
2. \( c_1 = c_2 = 0. \)

Studying them exactly as in Sec. 5.2 we find that the first solution leads to a partial
first integral at additional restriction \( U_1 = 0, \) that is
\[
H_4 = (I_3 \omega_3 + b_3)(\omega_1^2 + \omega_2^2) - (c_1 \omega_1 + c_2 \omega_2) \gamma_3,
\]
which is the Sretenskii partial first integral of the equations of gyrostat (6.1). When
\( b_3 = 0 \) we recover the Goryachev-Chaplygin partial first integral. As noted in Sec. 1.3
this result was announced already in [16].

The second solution, during the investigations, imposes additional restrictions
\( I_1 = I_2 \) and \( b_1 = b_2 = 0, \) i.e. leads to the Lagrange case.

6.3. The new complex integrable cases. If we restrict ourselves to the real case, then
1906 E. Husson theorem [32] asserts that for the Euler-Poisson equations only in four
classical cases the fourth integral is an algebraic function [3, 17, 20, 54]. The completely
analogous assertion for real gyrostat equations was proved in 1992 by L. Gavrilov [21].

The main result of [59] can be formulated as follows. For complex Euler-Poisson
equations, the fourth integral that does not depend on all variables, exists only in the
four classical cases.

The theorem below proves that for complex gyrostat equations (6.1) the analog of
main result of [59] is not true. As consequence, it proves that in complex setting the
analog of Gavrilov theorem fails. Indeed, in the proof of this theorem we find two new
cases of integrability with not only algebraic but polynomial fourth integrals.

**Theorem 6.1.** Up to permutational symmetry the complex gyrostat equations (6.1) admit
exactly two new (non-classical) integrable cases with a fourth integral which does not
depend on all variables. These cases are
\[
I_1 = I_2 = 2I_3, \quad b_1 = -i\varepsilon b_2, \quad b_3 = 0, \quad c_1 = i\varepsilon c_2, \quad c_3 = 0, \quad \varepsilon = \pm 1.
\]

where \( \varepsilon = \pm 1. \) In both cases, the fourth integral can be found as a quadratic polynomial.

**Proof.** Let us look for example for a fourth integral \( F \) of the gyrostat equations (6.1)
that does not depend on \( \omega_3, \) i.e. \( F = F(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3). \)

We compute the derivative of \( F \) with respect to the gyrostat equations and obtain
\[
I_1 I_2 \frac{dF}{dt} = I_2 \left[ (I_2 - I_3) \omega_2 \omega_3 + b_3 \omega_2 - b_2 \omega_3 + c_3 \gamma_2 - c_2 \gamma_3 \right] \frac{\partial F}{\partial \omega_1} \\
+ I_1 \left[ (I_3 - I_1) \omega_1 \omega_3 + b_1 \omega_3 - b_3 \omega_1 + c_1 \gamma_3 - c_3 \gamma_1 \right] \frac{\partial F}{\partial \omega_2} \\
+ I_1 I_2 \left[ (\omega_3 \gamma_2 - \omega_2 \gamma_3) \frac{\partial F}{\partial \gamma_1} + (\omega_1 \gamma_3 - \omega_3 \gamma_1) \frac{\partial F}{\partial \gamma_2} + (\omega_2 \gamma_1 - \omega_1 \gamma_2) \frac{\partial F}{\partial \gamma_3} \right] = 0.
\]
It is easily seen that
\[ I_1 I_2 \frac{dF}{dt} = \omega_3 Y_1(F) + Y_2(F) = 0, \tag{6.8} \]
where \( Y_1 \) and \( Y_2 \) are the following not depending on \( \omega_3 \) vector fields, defined on \( \mathbb{C}^5 = \mathbb{C}^5(\omega_1, \omega_2, \gamma_1, \gamma_2, \gamma_3) \):
\[
Y_1 = I_2 \left[ (I_2 - I_3)\omega_2 - b_2 \right] \frac{\partial}{\partial \omega_1} + I_1 \left[ (I_3 - I_1)\omega_1 + b_1 \right] \frac{\partial}{\partial \omega_2} + I_1 I_2 \gamma_2 \frac{\partial}{\partial \gamma_1} - I_1 I_2 \gamma_1 \frac{\partial}{\partial \gamma_2},
\]
\[
Y_2 = I_2 \left[ (I_2 - I_3)\omega_2 + c_3 \gamma_2 - c_2 \gamma_3 \right] \frac{\partial}{\partial \omega_1} + I_1 \left[ -b_3 \omega_1 + c_1 \gamma_3 - c_3 \gamma_1 \right] \frac{\partial}{\partial \omega_2}
+ I_1 I_2 \left[ -\omega_2 \gamma_3 \frac{\partial}{\partial \gamma_1} + \omega_1 \gamma_3 \frac{\partial}{\partial \gamma_2} + (\omega_2 \gamma_1 - \omega_1 \gamma_2) \frac{\partial}{\partial \gamma_3} \right].
\]
As \( Y_1(F) \) and \( Y_2(F) \) do not depend on \( \omega_3 \) then identity (6.8) implies that
\[ Y_1(F) = Y_2(F) = 0. \tag{6.9} \]

We consider the Lie brackets \( Y_3 = [Y_1, Y_2]/(I_1 I_2) \) and \( Y_4 = [Y_1, Y_3] \) and obtain
\[
Y_3 = \left[ (I_2 - I_1) b_3 \omega_1 - I_3 c_3 \gamma_1 + (I_3 - I_2) c_1 \gamma_3 + b_1 b_3 \right] \frac{\partial}{\partial \omega_1}
+ \left[ (I_1 - I_2) b_3 \omega_2 - I_3 c_3 \gamma_2 + (I_3 - I_1) c_2 \gamma_3 + b_2 b_3 \right] \frac{\partial}{\partial \omega_2}
+ I_1 \gamma_3 \left[ (I_1 - I_2 - I_3) \omega_1 - b_1 \right] \frac{\partial}{\partial \gamma_1}
+ I_2 \gamma_3 \left[ (I_2 - I_1 - I_3) \omega_2 - b_2 \right] \frac{\partial}{\partial \gamma_2}
+ \left[ -I_1 (I_1 - I_2 - I_3) \omega_1 \gamma_1 - I_2 (I_2 - I_1 - I_3) \omega_2 \gamma_2 + I_1 b_1 \gamma_1 + I_2 b_2 \gamma_2 \right] \frac{\partial}{\partial \gamma_3},
\]
\[
Y_4 = -I_2 \left[ 2 (I_2 - I_3) (I_1 - I_2) b_3 \omega_2 + I_3 (-I_2 + I_1 + I_3) c_3 \gamma_2
- (I_2 - I_3) (I_1 - I_3) c_2 \gamma_3 - (I_1 - 2 I_2 + I_3) b_2 b_3 \right] \frac{\partial}{\partial \omega_1}
- I_1 \left[ 2 (I_1 - I_3) (I_1 - I_2) b_3 \omega_1 + I_3 (I_1 - I_2 - I_3) c_3 \gamma_1 \right]
+ (I_2 - I_3) (I_1 - I_3) c_1 \gamma_3 - (2 I_1 - I_2 - I_3) b_1 b_3 \right] \frac{\partial}{\partial \omega_2}
+ I_1 I_2 \left\{ \gamma_3 \left[ (2 I_2 I_1 + I_2 I_3 - 2 I_2^2 + I_3^2 - I_1 I_3) \omega_2 - (I_1 - 2 I_2 - I_3) b_2 \right] \frac{\partial}{\partial \gamma_1}
+ \gamma_3 \left[ (I_2 I_3 + 2 I_1^2 - 2 I_1 I_2 - I_3^2 - I_1 I_3) \omega_1 - (2 I_1 - I_2 + I_3) b_1 \right] \frac{\partial}{\partial \gamma_2}
- \left[ (I_2 I_3 + 2 I_1^2 - 2 I_1 I_2 - I_3^2 - I_1 I_3) \omega_1 \gamma_2 + (2 I_1 I_2 + I_2 I_3 - 2 I_2^2 + I_3^2 - I_1 I_3) \omega_2 \gamma_1
-(I_1 - 2 I_2 - I_3) b_2 \gamma_1 - (2 I_1 - I_2 + I_3) b_1 \gamma_2 \right] \frac{\partial}{\partial \gamma_3} \right\}.
\]

Equations (6.9) imply that
\[ Y_3(F) = Y_4(F) = 0. \tag{6.10} \]

The system (6.9), (6.10) is a linear homogeneous system in unknowns \( \text{grad} F = \)}
\[
\left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_2}, \frac{\partial F}{\partial \gamma_3} \right),
\]
which do not vanish identically on any open subset of domain of definition of \( F \), because \( F \) is non-constant on any such open subset.

As \( H_2 \) is a first integral of the sought type, i.e. it does not depend on \( \omega_3 \), then if a new integral \( F \) exists, system (6.9)–(6.10) should have at least two non-zero solutions. Let us consider the 4 \( \times \) 5 matrix \( A \) whose rows are the coefficients of vector fields \( Y_1, Y_2, Y_3 \) and \( Y_4 \). The condition under which system (6.9)–(6.10) has at least two non-zero solutions is

\[
\text{rank } A \leq 3.
\]

We compute all the five 4 \( \times \) 4 minors of matrix \( A \) and require that they be identically equal to zero. Denoting them by \( D_{ijkl} \), where the index contains the numbers of the included columns of matrix \( A \), we see that \( D_{1345} = D_{2345} = 0 \). Thus it remains to study when minors \( D_{1234}, D_{1235} \) and \( D_{1245} \) vanish identically. These three minors are polynomials of \( \omega_1, \omega_2, \gamma_1, \gamma_2 \) and \( \gamma_3 \) with coefficients that are polynomials of the parameters \( I_i, b_i \) and \( c_i, 1 \leq i \leq 3 \). We cannot write here the expressions for \( D_{1234}, D_{1235} \) and \( D_{1245} \) because they are too long. They have non-zero factors which we remove by setting

\[
d_{1234} = \frac{D_{1234}}{I_1^2 I_2^2 I_3^2 \gamma_3}, \quad d_{1235} = \frac{D_{1235}}{I_1^2 I_2^2 \gamma_2}, \quad d_{1245} = \frac{D_{1245}}{I_1^2 I_2^2 I_3^2 \gamma_1}.
\]

After this cancellation of the non-zero factors it turns out that

\[
d_{1234} = -d_{1235} = -d_{1245}.
\]

We can therefore restrict ourselves to considering only the identity \( d_{1234} = 0 \).

The polynomial \( d_{1234} \) has 83 monomials and therefore 83 coefficients which should vanish. We consider the system consisting of the coefficients of \( d_{1234} \) equated to zero, i.e. the system of 83 equations in unknowns \( I_i, b_i \) and \( c_i, 1 \leq i \leq 3 \). After six consecutive simplifications we obtain the reduced system consisting of 29 equations. Solving that system by the MAPLE command solve we obtain the following ten solutions:

1. \( \{ I_1 = I_3, I_2 = I_2, I_3 = I_3, b_1 = 0, b_2 = b_2, b_3 = 0, c_1 = 0, c_2 = c_2, c_3 = 0 \} \)
2. \( \{ I_1 = I_1, I_2 = I_2, I_3 = I_3, b_1 = b_1, b_2 = b_2, b_3 = 0, c_1 = 0, c_2 = 0, c_3 = 0 \} \)
3. \( \{ I_1 = I_1, I_2 = I_3, I_3 = I_3, b_1 = b_1, b_2 = 0, b_3 = 0, c_1 = c_1, c_2 = 0, c_3 = 0 \} \)
4. \( \{ I_1 = 0, I_2 = 0, I_3 = 0, b_1 = b_1, b_2 = b_2, b_3 = 0, c_1 = c_1, c_2 = c_2, c_3 = 0 \} \)
5. \( \{ I_1 = I_3, I_2 = I_3, I_3 = I_3, b_1 = c_1 b_2, b_2 = b_2, b_3 = 0, c_1 = c_1, c_2 = c_2, c_3 = 0 \} \)
6. \( \{ I_1 = 2I_3, I_2 = 2I_3, I_3 = I_3, b_1 = -i\varepsilon b_2, b_2 = b_2, b_3 = 0, c_1 = i\varepsilon c_2, c_2 = c_2, c_3 = 0 \} \)
7. \( \{ I_1 = I_3, I_2 = I_3, I_3 = I_3, b_1 = 0, b_2 = 0, b_3 = b_3, c_1 = c_1, c_2 = c_2, c_3 = 0 \} \)
8. \( \{ I_1 = -I_3, I_2 = -I_3, I_3 = I_3, b_1 = b_1, b_2 = b_2, b_3 = 0, c_1 = 0, c_2 = 0, c_3 = c_3 \} \)
9. \( \{ I_1 = 2I_3, I_2 = 2I_3, I_3 = I_3, b_1 = 0, b_2 = 0, b_3 = 0, c_1 = c_1, c_2 = c_2, c_3 = c_3 \} \)
10. \( \{ I_1 = I_2, I_2 = I_2, I_3 = I_3, b_1 = 0, b_2 = 0, b_3 = b_3, c_1 = 0, c_2 = 0, c_3 = c_3 \} \),

where \( \varepsilon = \pm 1 \).

A careful study of this list shows that only three solutions are essential. They are the sixth, seventh and eighth solutions. All other solutions lead to some of the classical cases of integrability of gyrostat equations. Let us stress that the ninth solution implies
\( b_1 = b_2 = b_3 = 0 \) and therefore the gyrostat equations become the Euler-Poisson equations whose fourth integrals not depending on all variables have been studied in \textsuperscript{[59]}. Note that the sixth solution leads to the condition (6.7). Below we examine these three essential solutions.

**Solution 6+:** \( I_1 = I_2 = 2I_3, \ b_1 = -i\varepsilon b_2, \ b_3 = 0, \ c_1 = i\varepsilon c_2, \ c_3 = 0, \ \varepsilon = 1. \)

At these conditions \( Y_i, \ 1 \leq i \leq 4, \) are linearly dependent as \( d_{1234} = 0. \) More precisely we have

\[
(I_3\omega_1 - iI_3\omega_2 - ib_2)Y_4 + I_3^2(I_3\omega_1 - iI_3\omega_2 - 4ib_2)Y_2 + 6I_3^2b_2Y_3 = 0.
\]

We compute \( Y_5 = [Y_2,Y_3]/[4I_3^2(I_3\omega_1 - iI_3\omega_2 - ib_2)] \) and obtain

\[
Y_5 = -c_2(\gamma_1 + i\gamma_2) \left( \frac{\partial}{\partial \omega_1} - i \frac{\partial}{\partial \omega_2} \right) - 2I_3(\omega_1 + i\omega_2) \left( \gamma_2 \frac{\partial}{\partial \gamma_1} - \gamma_1 \frac{\partial}{\partial \gamma_2} \right).
\]

Like \( Y_4, \ Y_5 \) is also linearly dependent on \( Y_2 \) and \( Y_3. \) Indeed, we have

\[
2I_3(I_3\omega_1 - iI_3\omega_2 - ib_2)\gamma_3Y_5 - (I_3\omega_1\gamma_1 + I_3\omega_2\gamma_2 - ib_2\gamma_1 + b_2\gamma_2)Y_2
+2I_3(\omega_1\gamma_2 - \omega_2\gamma_1)Y_3 = 0.
\]

Moreover, easy computations show that vector fields \( Y_i, \ 1 \leq i \leq 3, \) are linearly independent. Thus system \( Y_i(F) = 0, \ 1 \leq i \leq 3, \) is in involution and according to the Frobenius Integrability Theorem should have two functionally independent solutions. The first one is function \( H_2. \) Finding another one, functionally independent of \( H_2 \) is not feasible with crude use of the MAPLE command \texttt{pdsolve}. To overcome this difficulty we add the fourth equation \( Y_0(F) = 0, \) where \( Y_0 = \frac{\partial}{\partial \gamma_3}. \) We choose such \( Y_0 \) because \( Y_0(H_2) \neq 0. \) The MAPLE command \texttt{pdsolve} applied to the system of four equations \( Y_i(F) = 0, \ 0 \leq i \leq 3, \) gives as an answer the solution:

\[
F = G \left[ -\frac{(I_3\omega_1^2 + 2iI_3\omega_1\omega_2 - I_3\omega_2^2 - 2ic_2\gamma_1 + 2c_2\gamma_2)(I_3\omega_1 - iI_3\omega_2 + 2ib_2)^2}{2c_2} \right],
\]

where \( G \) is an arbitrary smooth function. As a second solution of system \( Y_i(F) = 0, \ 1 \leq i \leq 3, \) we take the function

\[
H_{4+} = (I_3\omega_1^2 + 2iI_3\omega_1\omega_2 - I_3\omega_2^2 - 2ic_2\gamma_1 + 2c_2\gamma_2)(I_3\omega_1 - iI_3\omega_2 + 2ib_2)^2,
\]

that corresponds to \( G(x) = -2c_2x. \)

**Solution 6-:** \( I_1 = I_2 = 2I_3, \ b_1 = -i\varepsilon b_2, \ b_3 = 0, \ c_1 = i\varepsilon c_2, \ c_3 = 0, \ \varepsilon = -1. \)

In this case in a completely analogous way we find

\[
H_{4-} = (I_3\omega_1^2 - 2iI_3\omega_1\omega_2 - I_3\omega_2^2 + 2ic_2\gamma_1 + 2c_2\gamma_2)(I_3\omega_1 + iI_3\omega_2 - 2ib_2)^2.
\]

It is easy to verify at the hand that \( H_{4+} \) and \( H_{4-} \) are functionally independent of the first integrals \( H_1 \) (see (6.2)), \( H_2 \) and \( H_3 \) (see (1.2)) and thus they are fourth integrals of gyrostat equations (6.1), for \( \varepsilon = 1 \) and \( \varepsilon = -1 \) respectively.

**Solution 7:** \( I_1 = I_2 = I_3, \ b_1 = b_2 = 0, \ c_3 = 0. \)

As in the previous case, due to the equality \( d_{1234} = 0, \) the \( Y_i, \ 1 \leq i \leq 4, \) are linearly dependent. Indeed, we have

\[
(\omega_1\gamma_1 + \omega_2\gamma_2)Y_4 - I_3^3(\omega_1^2 + \omega_2^2)\gamma_3Y_1 - I_3^3(\omega_1\gamma_2 - \omega_2\gamma_1)Y_3 = 0.
\]
We compute \( Y_5 = [Y_2, Y_3]/I_3^3 \) and obtain
\[
Y_5 = (\omega_1 \gamma_1 + \omega_2 \gamma_2) \left( c_2 \frac{\partial}{\partial \omega_1} - c_1 \frac{\partial}{\partial \omega_2} \right) + \left[ I_3(\omega_1^2 + \omega_2^2) \gamma_2 - (b_3 \omega_2 - c_2 \gamma_3) \gamma_3 \right] \frac{\partial}{\partial \gamma_1} \\
- \left[ I_3(\omega_1^2 + \omega_2^2) \gamma_1 - (b_3 \omega_1 - c_1 \gamma_3) \gamma_3 \right] \frac{\partial}{\partial \gamma_2} \\
- \left[ (b_3 \omega_1 - c_1 \gamma_3) \gamma_2 - (b_3 \omega_2 - c_2 \gamma_3) \gamma_1 \right] \frac{\partial}{\partial \gamma_3}.
\]

As \( H_2 \) is a first integral of the sought type then the existence of a fourth integral of the gyrostat equations requires that the vector fields \( Y_i, 1 \leq i \leq 3 \), and \( Y_5 \) be linearly dependent. We compute the determinant \( V_{1234} \) consisting of the first four columns of the matrix of the coefficients of these vector fields and obtain
\[
V_{1234} = I_3^5 b_3 \gamma_3 (\omega_1 \gamma_1 + \omega_2 \gamma_2)^2 (c_2 \omega_1 - c_1 \omega_2).
\]

If the vector fields \( Y_i, 1 \leq i \leq 3 \), and \( Y_5 \) are linearly dependent then \( V_{1234} \) should be identically zero. It is clear that this happens either if \( b_3 = 0 \) which leads to the Euler-Poisson equations or if \( c_1 = c_2 = 0 \) which leads to the Zhukovskii case. Thus a new integral for Solution 7 does not exists.

**Solution 8:** \( I_1 = I_2 = -I_3, \ b_3 = 0, \ c_1 = c_2 = 0. \)

In this case \( Y_4 = -Y_2 \). We compute \( Y_5 = [Y_2, Y_3]/I_3^2 \) and obtain
\[
Y_5 = c_3 \gamma_3 (2I_3 \omega_2 + b_2) \frac{\partial}{\partial \omega_1} - c_3 \gamma_3 (2I_3 \omega_1 + b_1) \frac{\partial}{\partial \omega_2} \\
- I_3(I_3 \omega_1^2 + I_3 \omega_2^2 + b_1 \omega_1 + b_2 \omega_2 + 2c_3 \gamma_3) \left( \gamma_2 \frac{\partial}{\partial \gamma_1} - \gamma_1 \frac{\partial}{\partial \gamma_2} \right).
\]

As in Solution 7, we compute the determinant \( W_{1234} \) consisting of the first four columns of the matrix of the coefficients of vector fields \( Y_i, 1 \leq i \leq 3 \), and \( Y_5 \) and we obtain
\[
W_{1234} = I_3^4 c_3 (I_3 \omega_2^2 + I_3 \omega_1^2 + b_1 \omega_1 + 3c_3 \gamma_3 + b_2 \omega_2) \gamma_3 w,
\]
where
\[
w = I_3(b_2 \omega_1 \gamma_1^2 - 2b_1 \omega_1 \gamma_1 \gamma_2 - b_2 \omega_1 \gamma_2^2 + b_1 \omega_2 \gamma_1^2 + 2b_2 \omega_2 \gamma_1 \gamma_2 - b_1 \omega_2 \gamma_2^2) \\
+ b_2b_1 \gamma_1^2 - (b_1^2 - b_2^2) \gamma_1 \gamma_2 - b_1b_2 \gamma_2^2.
\]

If a new first integral exists then \( W_{1234} = 0 \) should be fulfilled. To avoid the Zhukovskii case we consider that \( c_3 \neq 0 \). In such a case it is clear that \( W_{1234} = 0 \) is equivalent to \( w = 0 \). The last is possible if and only if \( b_1 = b_2 = 0 \) which leads to the Euler-Poisson equations. Thus a new first integral of the sought type does not exist for Solution 8 too.

All the above considerations lead to the conclusion that the gyrostat equations (6.1) admit a local fourth integral which does not depend on \( \omega_3 \) either in certain classical cases or else only when the conditions (6.7) are fulfilled.

Now let us look for a fourth integral \( F \) of the gyrostat equations (6.1) that does not depend on \( \gamma_3 \), i.e. \( F = F(\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2) \).

We compute the derivative of \( F \) with respect to the gyrostat equations and obtain
\[
I_1 I_2 I_3 \frac{dF}{dt} = I_2 I_3 \left[ (I_2 - I_3) \omega_2 \omega_3 - b_3 \omega_2 - b_2 \omega_3 + c_3 \gamma_2 - c_2 \gamma_3 \right] \frac{\partial F}{\partial \omega_1}.
\]
\[ I_1 I_3 \left[ (I_3 - I_1)\omega_1 \omega_3 + b_1 \omega_3 - b_3 \omega_1 + c_1 \gamma_3 - c_3 \gamma_1 \right] \frac{\partial F}{\partial \omega_2} \\
+ I_1 I_2 \left[ (I_1 - I_2)\omega_1 \omega_2 + b_2 \omega_1 - b_1 \omega_2 + (c_2 \gamma_1 - c_1 \gamma_2) \right] \frac{\partial F}{\partial \omega_3} \\
+ I_1 I_2 I_3 \left[ (\omega_3 \gamma_2 - \omega_2 \gamma_3) \frac{\partial F}{\partial \gamma_1} + (\omega_1 \gamma_3 - \omega_3 \gamma_1) \frac{\partial F}{\partial \gamma_2} \right] = 0. \]

It is easily seen that
\[ I_1 I_2 I_3 \frac{dF}{dt} = I_3 \gamma_3 Z_1(F) + Z_2(F) = 0, \quad (6.11) \]

where \( Z_1 \) and \( Z_2 \) are the following not depending on \( \gamma_3 \) vector fields, defined on \( \mathbb{C}^5 = \mathbb{C}^5(\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2) \):
\[
Z_1 = -I_2 c_2 \frac{\partial}{\partial \omega_1} + I_1 c_1 \frac{\partial}{\partial \omega_2} - I_1 I_2 \left( \omega_2 \frac{\partial}{\partial \gamma_1} - \omega_1 \frac{\partial}{\partial \gamma_2} \right),
\]
\[
Z_2 = I_2 I_3 \left[ (I_2 - I_3)\omega_2 \omega_3 + b_3 \omega_2 - b_2 \omega_3 + c_3 \gamma_2 \right] \frac{\partial}{\partial \omega_1} \\
+ I_1 I_3 \left[ (I_3 - I_1)\omega_1 \omega_3 + b_1 \omega_3 - b_3 \omega_1 - c_3 \gamma_1 \right] \frac{\partial}{\partial \omega_2} \\
+ I_1 I_2 \left[ (I_1 - I_2)\omega_1 \omega_2 + b_2 \omega_1 - b_1 \omega_2 + c_2 \gamma_1 - c_1 \gamma_2 \right] \frac{\partial}{\partial \omega_3} \\
+ I_1 I_2 I_3 \omega_3 \left( \gamma_2 \frac{\partial}{\partial \gamma_1} - \gamma_1 \frac{\partial}{\partial \gamma_2} \right).
\]

As \( Z_1(F) \) and \( Z_2(F) \) do not depend on \( \gamma_3 \) then identity \( (6.11) \) implies that
\[ Z_1(F) = Z_2(F) = 0. \quad (6.12) \]

We consider the Lie brackets \( Z_3 = [Z_1, Z_2]/(I_1 I_2), Z_4 = [Z_1, Z_3] \) and \( Z_5 = [Z_2, Z_3]/I_3 \) and obtain
\[
Z_3 = I_3 \left[ (I_2 - I_3)c_1 \omega_3 + I_2 c_3 \omega_1 + c_1 b_3 \right] \frac{\partial}{\partial \omega_1} + I_3 \left[ (I_1 - I_3)c_2 \omega_3 + I_1 c_3 \omega_2 + c_2 b_3 \right] \frac{\partial}{\partial \omega_2} \\
+ \left[ I_1 (I_1 - 2I_2)c_1 \omega_1 + (I_2 - 2I_1)I_2 c_2 \omega_2 - I_2 b_2 c_2 - I_1 b_1 c_1 \right] \frac{\partial}{\partial \omega_3} \\
- I_1 I_3 \left[ (I_1 - I_2 - I_3)\omega_1 \omega_3 + b_3 \omega_1 - b_1 \omega_3 + c_3 \gamma_1 \right] \frac{\partial}{\partial \gamma_1} \\
+ I_3 I_2 \left[ (I_1 - I_2 + I_3)\omega_2 \omega_3 - b_3 \omega_2 + b_2 \omega_3 - c_3 \gamma_2 \right] \frac{\partial}{\partial \gamma_2},
\]
\[
Z_4 = -I_3^2 c_2 c_3 \frac{\partial}{\partial \omega_1} + I_3^2 c_1 c_3 \frac{\partial}{\partial \omega_2} - 3I_1 I_2 (I_1 - I_2)c_2 c_1 \frac{\partial}{\partial \omega_3} \\
+ I_1 I_3 I_2 \left[ (2I_1 - I_2 - 2I_3)c_2 \omega_3 + 2I_1 c_3 \omega_2 + 2b_3 c_2 \right] \frac{\partial}{\partial \gamma_1} \\
+ I_1 I_2 I_3 \left[ (I_1 - I_2 + 2I_3)c_1 \omega_3 - 2I_2 c_3 \omega_1 - 2b_3 c_1 \right] \frac{\partial}{\partial \gamma_2},
\]
\[
Z_5 = a_1 \frac{\partial}{\partial \omega_1} + a_2 \frac{\partial}{\partial \omega_2} + a_3 \frac{\partial}{\partial \omega_3} + a_4 \frac{\partial}{\partial \gamma_1} + a_5 \frac{\partial}{\partial \gamma_2},
\]
where
\[ a_1 = I_2 \left[ I_1 I_2 (I_2 - I_3) c_1 \omega_1 \omega_2 + I_1 (I_1 - I_2 - I_3) b_2 c_1 \omega_1 + I_2 (I_2 - I_3) (2I_1 - I_2) c_2 \omega_2^2 \right. \\
- I_3 (2I_2 I_3 - I_1 I_3 - 2I_2^2 + 2I_1 I_2) c_3 \omega_2 \omega_3 \\
- (2I_1 b_2 c_2 I_2 I_3 b_3 c_2 + I_1 I_3 b_3 c_3 - 2I_2 I_3 b_3 c_3 - 2I_2^2 b_2 c_2) \omega_2 \\
- I_3 (I_2 - I_3) (I_1 - I_3) c_2 \omega_3^2 - I_3 (I_1 b_3 c_2 - 2I_3 b_3 c_2 + 2I_2 b_2 c_3 + I_2 b_2 c_2) \omega_3 \\
+ I_1 (I_2 - I_3) c_1 c_2 \gamma_1 + (2I_2 I_3^2 - I_1 I_2 c_1 + I_1 I_3 c_1^2) \gamma_2 - b_2 I_1 c_1 b_1 - I_3 b_3^2 c_2 - I_2 c_2 b_2^2], \\
\]
\[ a_2 = I_1 \left[ (I_1 - I_2)(I_2 - I_2) c_1 \omega_1^2 - I_1 I_2 (I_1 - I_3) c_2 \omega_1 \omega_2 \\
- I_3 (2I_2^2 c_1 - 2I_1 I_2 b_1 c_1 - I_1 I_3 b_3 c_1 + 2I_1 I_3 b_3 c_3 - I_2 I_3 b_3 c_3) \omega_1 \\
+ I_2 (I_1 - I_2 + I_3) b_1 c_2 \omega_2 + I_3 (I_2 - I_3) (I_1 - I_3) c_1 \omega_3^2 \\
+ I_3 (2I_1 b_3 c_1 + I_1 b_3 c_1 + I_3 b_3 c_1 - 2I_3 b_3 c_1) \omega_3 + (I_1 I_2 c_3^2 - 2I_1 I_3 c_3^2 - I_2 I_3 c_3^2) \gamma_1 \\
- I_2 (I_1 - I_3) c_1 c_2 \gamma_1 + I_1 b_2^2 c_1 + I_2 b_2 c_1 c_2 + I_3 b_3^2 c_1], \\
\]
\[ a_3 = I_1 I_2 \left[ - (I_1 - I_2)(I_1 + I_2) c_3 \omega_1 \omega_2 + I_1 (2I_1 - I_2 - I_3) c_2 \omega_1 \omega_3 + (2I_1 b_3 c_2 - I_2 b_2 c_3) \omega_1 \\
+ I_2 (I_1 - I_2 + 2I_3) c_1 \omega_2 \omega_3 + (I_1 b_1 c_3 - 2I_2 b_2 c_1) \omega_2 \\
+ (I_3 b_2 c_1 - 2I_1 b_1 c_2 + I_2 b_1 c_2 - I_1 b_2 c_1 - I_3 b_3 c_2 + 2I_2 b_2 c_1) \omega_3 + c_3 (3I_1 - I_2) c_2 \gamma_1 \\
+ (I_1 - 3I_2) c_1 c_2 \gamma_2 + b_3 (b_1 c_2 - b_2 c_1)], \\
\]
\[ a_4 = -I_1 I_2 \left[ I_1 (I_1 - I_2)(I_1 - I_2 - I_3) \omega_1^2 \omega_2 + I_1 (I_1 - I_2 - I_3) b_2 \omega_1^2 \\
- I_1 (2I_1 - I_3 - 2I_2) b_1 \omega_1 \omega_2 + I_1 (I_1 - I_2 - I_3) c_2 \omega_1 \gamma_1 - I_1 (I_2 - I_3) c_1 \omega_1 \gamma_2 \\
- I_1 b_2 b_1 \omega_1 + I_3 (I_2^2 + I_2 I_3 - I_1 I_3 + 2I_1 I_2 - 2I_2^2) \omega_2 \omega_3^2 + I_3 (I_1 - I_2 - 2I_3) b_3 c_2 \omega_3 \\
- I_2 (2I_1 - I_2) c_2 \omega_2 \gamma_2 + (I_1 b_1^2 + I_3 b_3^2) \omega_2 - I_3 (I_1 - I_2 - I_3) b_2 \omega_3^2 \\
+ I_3 (2I_1 - 2I_2 - I_3) c_3 \omega_3 \gamma_2 - I_3 b_3 b_3 c_3 - I_1 b_1 c_2 \gamma_1 + (I_3 b_3 c_3 - I_2 b_2 c_2) \gamma_2], \\
\]
\[ a_5 = I_1 I_2 \left[ I_2 (I_1 - I_2)(I_1 - I_2 + I_3) \omega_1 \omega_3^2 + I_3 (2I_1 - 2I_2 + I_3) b_2 \omega_1 \omega_2 \\
- I_3 (2I_1^2 - 2I_1 I_2 - I_1 I_3 + 2I_2 I_3 - I_3^2) \omega_1 \omega_3^2 - I_3 (I_1 - I_2 + 2I_3) b_3 \omega_1 \omega_3 \\
+ I_1 (I_1 - 2I_2) c_1 \omega_1 \gamma_1 + (I_2 b_2^2 + I_3 b_3^2) \omega_1 - I_2 (I_1 - I_2) b_1 \omega_2^2 - c_2 I_2 (I_1 - I_3) \omega_2 \gamma_1 \\
- I_2 (I_1 - I_2 + 2I_3) c_1 \omega_2 \gamma_2 - I_2 b_1 b_2 \omega_2 + I_3 (2I_1 + -I_2 I_3) b_3 \omega_3^2 \\
- I_3 (2I_1 - 2I_2 + I_3) c_3 \omega_3 \gamma_1 - I_3 b_3 b_3 \omega_3 - (I_1 b_1 c_1 - I_3 b_3 c_3) \gamma_1 - I_2 c_1 b_2 \gamma_2], \\
\]

Equations (6.12) imply that
\[ Z_3(F) = Z_4(F) = Z_5(F) = 0. \quad (6.13) \]

If a first integral \( F = F(\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2) \) exists then the system of five equations (6.12) and (6.13) should have a non-zero solution \( \text{grad} F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_2} \right) \). This is possible if and only if the determinant \( D \) of the coefficients of that system vanishes identically.

We compute \( D \) and obtain a very long polynomial whose presentation here is impossible. But \( D \) has a factor \( I_1^3 I_2^3 I_3^2 c_3 \). Thus we should consider two cases: \( c_3 \neq 0 \) and \( c_3 = 0 \).
Let us start with $c_3 \neq 0$. We remove the non-zero factor of $D$ and note
\[ \hat{D} = \frac{D}{I_3^2 I_3^2 c_3}. \]

The equation $D = 0$ is equivalent to $\hat{D} = 0$. Polynomial $\hat{D}$ has 253 coefficients depending on the parameters $I_i$, $b_i$ and $c_i$, $1 \leq i \leq 3$. To satisfy the equation $\hat{D} = 0$ we should consider the system consisting of the coefficients of $\hat{D}$ equated to zero, i.e. the system of 253 equations for the parameters. After three consecutive simplifications we obtain the reduced system consisting of seven equations. Solving that system by the Maple command solve we obtain the following two solutions:

\[ \{ I_1 = I_2, I_2 = I_2, I_3 = I_3, b_1 = b_1, b_2 = b_2, b_3 = b_3, c_1 = 0, c_2 = 0, c_3 = c_3 \} \]
\[ \{ I_1 = I_3, I_2 = I_3, I_3 = I_3, b_1 = b_1, b_2 = b_2, b_3 = b_3, c_1 = \frac{b_1 c_2}{b_2}, c_2 = c_2, c_3 = \frac{b_3 c_2}{b_2} \}. \]

The second solution leads to the kinetic symmetry case. Thus only the first solution should be studied. For this, let $I_1 = I_2$, $c_1 = c_2 = 0$. Under these conditions we have $Z_4 + 2I_2 I_3 c_3 Z_1 = 0$. We compute $Z_6 = [Z_3, Z_5]/(I_2^2 I_3 c_3)$ and the determinant $M$ of the coefficients of the vector fields $Z_i$, $1 \leq i \leq 3$, $Z_5$ and $Z_6$. We know that if the sought first integral exists then $M = 0$. We have

\[ M = -I_2^8 I_3^2 c_3^2 (b_2 \omega_1 - b_1 \omega_2)^2 \hat{M}, \]

where

\[ \hat{M} = -3I_3(2 - 3I_3)\omega_1^4 \omega_2 - 9I_3 b_3 \omega_1^4 - 2(I_2 - 11I_3) b_1 \omega_1^3 \omega_3 - 15I_3 c_3 \omega_1^3 \gamma_1 - 7b_1 b_3 \omega_1^3 \]
\[ - 6I_3(2 - 3I_3) \omega_1^3 \omega_2^2 \omega_3 - 18I_3 b_3 \omega_1^3 \omega_2 - 2(I_2 - 11I_3) b_2 \omega_1^2 \omega_2 \omega_3 - 15I_3 c_3 \omega_1^2 \omega_2 \gamma_2 \]
\[ - 7b_2 b_3 \omega_1^2 \omega_2^2 - 12b_1 c_3 \omega_1^2 \gamma_1 - 2(I_2 - 11I_3) b_1 \omega_1 \omega_2^2 \omega_3 - 15I_3 c_3 \omega_1 \omega_2 \gamma_1 \]
\[ - 7b_1 b_3 \omega_1 \omega_2^2 - 24b_1 b_2 \omega_1^2 \omega_2 - 12b_2 c_3 \omega_1 \omega_2 \gamma_1 - 12b_1 c_3 \omega_1 \gamma_2 \gamma_2 - 3I_3(2 - 3I_3) \omega_1^2 \omega_3 \]
\[ - 9I_3 b_3 \omega_2 - 2(I_2 - 11I_3) b_2 \omega_2 \omega_3 - 15I_3 c_3 \omega_2 \gamma_2 - 7b_2 b_3 \omega_2^3 - 12b_2 c_3 \omega_2 \gamma_2 \].

Let us consider, for example, the coefficient of $\hat{M}$ in front of $\omega_1^3 \gamma_1$, that is $-15I_3 c_3$. However $-15I_3 c_3 \neq 0$, therefore $\hat{M}$ never vanishes either. Thus the only possibility to satisfy the equation $M = 0$ is to put $b_1 = b_2 = 0$. Taking into account that now $I_1 = I_2$, $c_1 = c_2 = 0$ we come to the Lagrange case. Thus a new first integral $F = F(\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2)$ does not exist when $c_3 \neq 0$.

We now study the case $c_3 = 0$. Under this condition, the first integral $H_3$ does not depend on $\gamma_3$, i.e. it is of the type sought. If a fourth integral $F = F(\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2)$ exists then system (6.12)–(6.13) should have at least two non-zero solutions. This is possible if and only if the matrix $B$ of its coefficients satisfies the condition rank $B \leq 3$. This condition means that all four equations of system (6.12)–(6.13) should be linearly dependent. We chose to consider the system

\[ Z_i(F) = 0, \ 1 \leq i \leq 3, \quad Z_5(F) = 0. \]  

(6.14)

This choice is appropriate because if we choose, for example, $Z_i(F) = 0$, $1 \leq i \leq 4$, then we come to a great number of cases which should be studied.
We compute all the five $4 \times 4$ minors of the $4 \times 5$ matrix consisting of the coefficients of system (6.14) and require that they be identically equal to zero. These five minors are polynomials of $\omega_1, \omega_2, \gamma_1, \gamma_2$ and $\gamma_3$ with coefficients that are polynomials of the parameters $I_i, b_i, 1 \leq i \leq 3, c_1$ and $c_2$. Like before we note them by $\Delta_{ijkl}$ and see that they have some non-zero factors. To remove these factors we introduce the following notations:

\[
\delta_{1234} = \frac{\Delta_{1234}}{I_1^2 I_2^2 I_3^2}, \quad \delta_{1235} = \frac{\Delta_{1235}}{I_1^2 I_2^2 I_3^2}, \quad \delta_{1245} = \frac{\Delta_{1245}}{I_1^2 I_2^2 I_3^2 \omega_2},
\]

\[
\delta_{1345} = \frac{\Delta_{1345}}{I_1^2 I_2^2 I_3^2 \omega_2}, \quad \delta_{2345} = \frac{\Delta_{2345}}{I_1^2 I_2^2 I_3^2 \omega_1}.
\]

Let us note that $\delta_{1234}$ has a factor $c_2$ and $\delta_{1235}$ has a factor $c_1$. We have left them intentionally at the above cancellation because we do not know whether $c_1$ or $c_2$ is zero. But, as we consider now the case $c_3 = 0$, we know that $(c_1, c_2) \neq (0, 0)$ because otherwise we come to the Zhukovskii case.

It turns out that

\[
\delta_{1245} = -\delta_{1345} = \delta_{2345}.
\]

Moreover if $c_1 \neq 0$

\[
\frac{\delta_{1235}}{c_1} = -\delta_{1245},
\]

independently of the value of $c_2$. If $c_2 \neq 0$

\[
\frac{\delta_{1234}}{c_2} = \delta_{1245},
\]

independently of the value of $c_1$. If $c_1 \neq 0$ and $c_2 \neq 0$ we have

\[
\frac{\delta_{1234}}{c_2} = -\frac{\delta_{1235}}{c_1}.
\]

Thus if the identity $\delta_{1245} = 0$ is satisfied equations (6.14) will be linearly dependent. Indeed, from (6.15) it follows that $\delta_{1345} = \delta_{2345} = 0$ independently of the values of $c_1$ and $c_2$.

Let $c_1 \neq 0$ and $c_2 = 0$. Then $\delta_{1234} = 0$ because it has a factor $c_2$ and $\delta_{1235} = 0$ follows from (6.16).

Let $c_1 \neq 0$ and $c_2 \neq 0$. Then $\delta_{1235} = 0$ follows from (6.16) and $\delta_{1234} = 0$ - from (6.18).

Let $c_1 = 0$ and $c_2 \neq 0$. Then $\delta_{1235} = 0$ because it has a factor $c_1$ and $\delta_{1234} = 0$ follows from (6.17).

The polynomial $\delta_{1245}$ has 84 monomials and therefore 84 coefficients which should vanish. We consider the system consisting of the coefficients of $\delta_{1245}$ equated to zero, i.e. the system of 84 equations in unknowns $I_i, b_i, 1 \leq i \leq 3, c_1$ and $c_2$. After eight consecutive simplifications we obtain the reduced system consisting of 15 equations. Solving that system by the MAPLE command solve we obtain the following seven solutions:

\[
\{I_1 = 2I_3, \ I_2 = 2I_3, \ I_3 = I_3, \ b_1 = 0, \ b_2 = 0, \ b_3 = 0, \ c_1 = c_1, \ c_2 = c_2\}
\]

\[
\{I_1 = I_3, \ I_2 = I_2, \ I_3 = I_3, \ b_1 = 0, \ b_2 = b_2, \ b_3 = 0, \ c_1 = 0, \ c_2 = c_2\}
\]

\[
\{I_1 = I_1, \ I_2 = I_2, \ I_3 = I_3, \ b_1 = b_1, \ b_2 = b_2, \ b_3 = 0, \ c_1 = 0, \ c_2 = 0\}
\]

\[
\{I_1 = I_1, \ I_2 = I_3, \ I_3 = I_3, \ b_1 = b_1, \ b_2 = 0, \ b_3 = 0, \ c_1 = c_1, \ c_2 = 0\}
\]
\{I_1 = 0, I_2 = 0, I_3 = 0, b_1 = b_1, b_2 = b_2, b_3 = 0, c_1 = c_1, c_2 = c_2\}
\{I_1 = I_3, I_2 = I_3, I_3 = I_3, b_1 = \frac{c_1 b_2}{c_2}, b_2 = b_2, b_3 = 0, c_1 = c_1, c_2 = c_2\}
\{I_1 = 2I_3, I_2 = 2I_3, I_3 = I_3, b_1 = -i\varepsilon b_2, b_2 = b_2, b_3 = 0, c_1 = i\varepsilon c_2, c_2 = c_2\},

where \(\varepsilon = \pm 1\).

Examining this list we see that only the last solution is essential. All the other solutions lead either to the classical cases of gyrostat equations, or to the Euler-Poisson equations or to the excluded cases with values zero of the moments of inertia.

Taking into account that now \(c_3 = 0\) we see that this last solution determines the conditions (6.7).

At these conditions the vector field \(Z_4\) vanishes identically and \(Z_5\) is linearly dependent on \(Z_i\), \(1 \leq i \leq 3\). Moreover the vector fields \(Z_i\), \(1 \leq i \leq 3\), are linearly independent. Thus system \(Z_i(F) = 0\), \(1 \leq i \leq 3\), is in involution and according to the Frobenius Integrability Theorem it has two functionally independent solutions. The first one is \(H_3\) and the second one is the fourth integral we look for. But it is not necessary to look for this fourth integral. We should only notice that the fourth integrals \(H_{4+}\) from Case 6+ and \(H_{4-}\) from Case 6- not only do not depend of \(\omega_3\), they do not depend on \(\gamma_3\) too. \(\blacksquare\)

Thus the problem of characterization of all cases when complex gyrostat equations have a fourth integral that does not depend on all variables is solved.

7. Domain of the Sretenskii partial first integral

7.1. Definition of the domain. Given that the gyrostat equations (6.1) are polynomial with polynomial first integrals, in this section we will restrict ourselves exclusively to polynomial systems of ordinary differential equations and their polynomial first integrals, although this is not necessary.

Let us consider a polynomial system of ordinary differential equations

\[
\frac{dx_i}{dt} = f_i(x), \ 1 \leq i \leq n,
\]

\(x = (x_1, \ldots, x_n) \in \mathbb{C}^n, f_1, \ldots, f_n \in \mathbb{C}[x]\). To consider system (7.1) and its solutions is equivalent to consider the associate polynomial vector field \(V(x) = (f_1, \ldots, f_n)\) and its orbits.

A subset of \(\mathbb{C}^n\) is \(V\)-invariant if it is filled with whole orbits of vector field \(V\).

A differentiable function \(\Phi\) such that the set \(\{x; \ \Phi(x) = 0\}\) is filled by the whole orbits of system (7.1) is called invariant relation \([20, 38\text{ Chapt. X, §4}]\).

Let \(F \in \mathbb{C}[x] \setminus \mathbb{C}\) be some non-constant polynomial that is not a first integral of system (7.1), or equivalently that is not \(V\)-invariant. Let \(M \subset \mathbb{C}^n\) be a \(V\)-invariant subset such that \(F|_M\) (\(F\) restricted to \(M\)) is non-constant on any open subset of \(M\). When \(F|_M\) is a local first integral of system (7.1) (or vector field \(V\)) restricted to \(M\)?
For this aim let us compute
\[
\frac{dF}{dt}(x) = \sum_{i=1}^{n} \frac{\partial F}{\partial x_i}(x) \frac{dx_i}{dt}(x) = \sum_{i=1}^{n} \frac{\partial F}{\partial x_i}(x)f_i(x) \overset{df}{=} A(x).
\]

A(x) is a polynomial, because F and \( \{f_i\}_{1 \leq i \leq n} \) are polynomials. F is not a first integral of system (7.1) on \( \mathbb{C}^n \), then A does not vanishes identically, but \( A(x) = 0 \) for \( x \in M \).

Let us note \( \hat{A} = \{ x \in \mathbb{C}^n ; A(x) = 0 \} \), \( \hat{A} \not\subset\mathbb{C}^n \). Thus \( M \subset \hat{A} \) and the problem is reduced to the study of \( V \)-invariant subsets of the algebraic subset \( \hat{A} \) of \( \mathbb{C}^n \).

Let \( M \subset \hat{A} \) be a \( V \)-invariant smooth submanifold such that \( F|_M \) is a partial first integral of system (7.1) restricted to \( M \). Any such submanifold will be called a domain of \( F \). In what follows we will consider exclusively the case when submanifold \( M \) is of codimension one. Nevertheless the case of smaller codimension also deserves the study. In what follows we will be interested of the identification of maximal domains of \( F \).

### 7.2. Determination of the maximal domain

Now we shall determine codimension one maximal domains of the Sretenskii partial first integral
\[
F = (I_3 \omega_3 + b_3)(\omega_1^2 + \omega_2^2) - (c_1 \omega_1 + c_2 \omega_2)\gamma_3.
\]

(7.2)

To avoid the Zhukovskii and Lagrange cases, we will suppose that \( (c_1, c_2) \neq (0, 0) \).

Let \( U \in \mathbb{C}^6 \) be an open subset. We want to find all invariant manifolds
\[
\hat{S} = \{ (\omega, \gamma) \in U ; S(\omega, \gamma) = 0 \},
\]

(7.3)

where \( S \) is a \( C^1 \) smooth function defined on \( U \), such that on \( \hat{S} \), \( F \) is a partial first integral of equations (6.1).

We will consider five distinct cases.

1) Let us suppose that \( \frac{\partial S}{\partial \gamma_1} \neq 0 \) in some point of \( U \), and by continuity also in some open subset of \( U \). We express \( \gamma_1 \) from equation (7.3) and obtain that locally
\[
\gamma_1 = \Gamma_1(\omega_1, \omega_2, \omega_3, \gamma_2, \gamma_3).
\]

(7.4)

We compute \( \frac{dF}{dt} \) and replace \( \gamma_1 \) with \( \Gamma_1 \) everywhere.

\[
\frac{dF}{dt} = \frac{2(I_3 \omega_3 + b_3)\omega_1 - c_1 \gamma_3}{I_1} \left[ (I_2 - I_3)\omega_2 \omega_3 + b_3 \omega_2 - b_2 \omega_3 + c_3 \gamma_2 - c_2 \gamma_3 \right] + \frac{2(I_3 \omega_3 + b_3)\omega_2 - c_2 \gamma_3}{I_2} \left[ (I_3 - I_1)\omega_1 \omega_3 - b_3 \omega_1 + b_1 \omega_3 + c_1 \gamma_3 - c_3 \Gamma_1 \right] + \omega_1^2 + \omega_2^2 \left[ (I_1 - I_2)\omega_1 \omega_2 + b_2 \omega_1 - b_1 \omega_2 + c_2 \Gamma_1 - c_1 \gamma_2 \right] - (c_1 \omega_1 + c_2 \omega_2)(\omega_2 \Gamma_1 - \omega_1 \gamma_2).
\]

As we suppose that \( F \) is a partial first integral on invariant manifold (7.3) we have
\[
\frac{dF}{dt} = 0.
\]

(7.5)

We solve equation (7.5) with respect to \( \Gamma_1 \) and obtain a rational function depending on \( \omega_1, \omega_2, \omega_3, \gamma_2 \) and \( \gamma_3 \):

\[
\Gamma_1 = \frac{1}{I_1(-I_2 c_2 \omega_1^2 + I_2 c_1 \omega_1 \omega_2 + 2 b_3 c_3 \omega_2 + 2 I_3 c_3 \omega_2 \omega_3 - c_2 c_3 \gamma_3)} \left[ I_1 I_2 (I_1 - I_2) \omega_1^3 \omega_2 \right]
\]
This only occurs in the following three cases:

\( \gamma \) with respect to taking into account that the right-hand sides of Euler-Poisson equations (1.1) are linear. Indeed, as the expression for \( \Gamma \) from (7.6) does not depend on \( \gamma \) then its derivative \( \frac{d\Gamma}{dt} \) is a linear function of \( \gamma \) which is easily seen from (7.6) does identically zero. This only occurs in the following three cases:

Case 1.  
\[
I_1 = \frac{I_2(I_2 - I_3)}{2I_3 + I_2}, \quad b_2 = 0, \quad b_3 = 0, \quad c_2 = 0, \quad c_3 = 0,
\]

Case 2.  
\[
I_1 = 2I_3, \quad I_2 = 4I_3, \quad b_2 = 0, \quad c_2 = 0, \quad c_3 = 0,
\]

Case 3.  
\[
I_1 = 4\text{RootOf}(8Z^2 + 78 - 51Z)I_3 - 12I_3, \quad I_2 = \text{RootOf}(8Z^2 + 78 - 51Z)I_3,
\]
\[
b_1 = 0, \quad b_2 = 0, \quad b_3 = 0, \quad c_1 = 0, \quad c_3 = 0.
\]

In the last case the gyrostat equations (6.1) are reduced to the Euler-Poisson equations (1.1).

The two values of \( \text{RootOf}(8Z^2 + 78 - 51Z) \) are \( \frac{51 + \sqrt{105}}{16} \). In fact Case 3 presents two different solutions, where in \( I_1 \) and \( I_2 \) the same sign + or - appears and so it will be in what follows.

Let \( F \) be the Sretenskii partial first integral (7.2).

Let us compute \( \frac{dF}{dt} \) along the orbits of gyrostat equations (6.1). In above three cases we obtain:

Case 1.  
\[
\frac{dF}{dt} = -3I_2I_3^3\omega_1^3\omega_2 - b_1\omega_1^2\omega_2 - c_1\omega_1\omega_2\gamma_1 + \frac{12I_3^2(I_2 + I_3)\omega_1\omega_2\omega_3^2}{I_2(I_2 + 2I_3)}
\]
\[
- \frac{3I_2I_3\omega_1^2\omega_2^2}{I_2 + 2I_3} - b_1\omega_2^3 - c_1\omega_2^2\gamma_2 + \frac{2I_3b_1\omega_2\omega_3^2}{I_2} - c_1\omega_2\omega_3\gamma_3,
\]

Case 2.  
\[
\frac{dF}{dt} = -2I_3\omega_1^3\omega_2 - b_1\omega_1^2\omega_2 - 2I_3\omega_1\omega_2^3 + \frac{5I_3\omega_1\omega_2\omega_3^2}{2} + 3b_3\omega_1\omega_2\omega_3 + \frac{b_2^3\omega_1\omega_2}{2I_3}
\]
and its denominator is

\[ W \]

The expression for \( \partial S \) when

\[ I \]

is

\[ 1 \]

that is

\[ \gamma \]

with respect to

\[ \gamma \]

the domain of the Sretenskii partial first integral and we will ignore them.

Outside of these three cases the MAPLE command \texttt{degree} gives that the degree of \( W \) with respect to \( \gamma_1 \) is 1.

We solve equation (7.7) with respect to \( \gamma_1 \) and obtain

\[ \gamma_1 = \Gamma_1(\omega_1, \omega_2, \omega_3, \gamma_2, \gamma_3). \]

The expression for \( \Gamma_1 \) is too long to be written here and we skip it. Let us note however that \( W \) is a rational function of all variables \( (\omega, \gamma) \), whose numerator has 296 monomials and its denominator is

\[ I_1^2 I_3 (I_2 c_2 \omega_1^3 - I_2 c_1 \omega_1 \omega_2 - 2 b_2 c - 3 \omega_2 - 2 I_3 c_3 \omega_2 \omega_3 + c_2 c_3 \gamma_3)^2. \]

Thus \( \Gamma_1 - \hat{\Gamma}_1 = 0 \). Function \( \Gamma_1 - \hat{\Gamma}_1 \) is a rational function of variables \( \omega_1, \omega_2, \omega_3, \gamma_2 \) and \( \gamma_3 \). We only take its numerator which we denote by \( D \). We want to know when \( D \) is identically equal to zero with respect to all the variables \( \omega_1, \omega_2, \omega_3, \gamma_2 \) and \( \gamma_3 \). For the purpose we compute the coefficients of polynomial \( D \). They are 513. We should find the conditions on the parameters \( I \) at which all of these 513 coefficients are zero.

We apply simplification to the obtained system of 513 equations. After three consecutive simplifications we come to the reduced system consisting of nine equations:

\[ c_3 = 0, \quad b_2 c_2 = 0, \quad b_1 c_2 = 0, \quad (I_2 - 4 I_3) c_2 = 0, \quad (I_1 - 4 I_3) c_2 = 0, \]

\[ b_2 c_1 = 0, \quad b_1 c_1 = 0, \quad (I_2 - 4 I_3) c_1 = 0, \quad (I_1 - 4 I_3) c_1 = 0. \]

We solve it by the MAPLE command \texttt{solve} and obtain two solutions. The first one is \( c_1 = c_2 = c_3 = 0 \) and we remove it because it leads to the Zhukovskii case. The second solution is

\[ I_1 = I_2 = 4 I_3, \quad b_1 = b_2 = 0, \quad c_3 = 0. \]

Now \( D \) vanishes identically. Taking into account (7.4) we compute \( \gamma_1 \) from (7.6) at condition (7.9) and obtain

\[ \gamma_1 = -\frac{4 I_3 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - b_3 \gamma_3}{4 I_3 \omega_1}, \]

that is

\[ 4 I_3 \omega_1 \gamma_1 + 4 I_3 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - b_3 \gamma_3 = 0. \]

Let us note that the last equation is actually nothing but \( H_1 = 0 \) (see (6.2)) when \( I_1 = I_2 = 4 I_3, b_1 = b_2 = 0 \). \( \{H_1 = 0\} \) is an invariant manifold. Finally we conclude that when \( \frac{\partial S}{\partial \gamma_1} \neq 0 \) in some point of \( U \), when \( I_1 = I_2 = 4 I_3, b_1 = b_2 = 0, (c_1, c_2) \neq (0, 0), \)

\[ -c_1 \omega_1 \omega_2 \gamma_1 - b_1 \omega_2^3 - c_1 \omega_2^2 \gamma_2 + \frac{b_1 \omega_2 \omega_3^2}{2} - c_1 \omega_2 \omega_3 \gamma_3 + \frac{b_1 b_3 \omega_2 \omega_3}{2 I_3}, \]

Case 3.

\[ \frac{dF}{dt} = 3 \left( \frac{51 \pm \sqrt{105}}{16} - 4 \right) I_3 \omega_1^2 \omega_2 + c_2 \omega_1^2 \gamma_1 + 3 \left( \frac{51 \pm \sqrt{105}}{16} - 4 \right) I_3 \omega_1 \omega_3^3 \]

\[ + c_2 \omega_1 \omega_2 \gamma_2 + \frac{I_3 \omega_2 \omega_3^2}{2} \].

In all these cases, \( \frac{dF}{dt} \) does not vanish identically and thus these cases are outside of the domain of the Sretenskii partial first integral and we will ignore them.
$c_3 = 0$, $\{H_1 = 0\}$ is the searched maximal invariant manifold. Thus we remain in the framework of the Sretenskii case.

The gyrostat equations (6.1) admit permutational symmetry (see Sec. 2)

$$\sigma_4 = \{(2, 1, 3), (2, 1, 3)\}.$$  

Function $F$ (see (7.2)) and also first integral $H_1$ are $\sigma_4$ invariant. Thus the solution of the problem about maximal invariant manifold $S$ when $\frac{\partial S}{\partial \gamma_2} \neq 0$ in some point is exactly the same as in the just studied case when $\frac{\partial S}{\partial \gamma_2} \neq 0$ in some point of $U$.

2) Let us suppose now that $\frac{\partial S}{\partial \gamma_1}$ and $\frac{\partial S}{\partial \gamma_2}$ vanish identically on $U$ that means that $S$ does not depend on $\gamma_1$ and $\gamma_2$. Thus

$$S = S(\omega_1, \omega_2, \omega_3, \gamma_3).$$

Let us suppose that $\frac{\partial S}{\partial \gamma_3} \neq 0$ in some point of $U$, and by continuity also in some open subset of $U$. Like before we express $\gamma_3$ from equation (7.3) and obtain

$$\gamma_3 = \Gamma_3(\omega_1, \omega_2, \omega_3).$$

We compute $\frac{dF}{dt}$, replace $\gamma_3$ with $\Gamma_3$ everywhere and obtain

$$\frac{dF}{dt} = \frac{2(I_3\omega_3 + b_3)\omega_1 - c_1\Gamma_3}{I_1} [(I_2 - I_3)\omega_2\omega_3] + \frac{2(I_3\omega_3 + b_3)\omega_2 - c_2\Gamma_3}{I_2} [(I_3 - I_1)\omega_1\omega_3 - b_3\omega_1 + b_1\omega_3 + c_1\Gamma_3 - c_3\gamma_1]
+ (\omega_1^2 + \omega_2^2) [(I_1 - I_2)\omega_1\omega_2 + b_2\omega_1 - b_1\omega_2 + c_2\gamma_1 - c_1\gamma_2]
- (c_1\omega_1 + c_2\omega_2)(\omega_2\omega_1 - \omega_1\omega_2).$$

As we suppose that $F$ is a partial first integral on invariant manifold $\{S = 0\}$ we have $\frac{dF}{dt} = 0$. Let us denote the numerator of $\frac{dF}{dt}$ by $J$. In this way we obtain the following equation for $\Gamma_3$

$$J = -(I_1 - I_2)c_1c_2\Gamma_3^2 + [(I_2 - I_1)I_3 - 2I_2I_3]c_2\omega_1\omega_3 + (I_1 - 2I_2)b_3c_2\omega_1
+ (2I_1I_3 - I_2^2 + I_2I_3)c_1\omega_2\omega_3 + (2I_1 - I_2)b_3c_1\omega_2 + (I_2c_1b_2 - I_1b_1c_2)\omega_3
+ (I_1c_2c_3\gamma_1 - I_2c_1c_3\gamma_2)\Gamma_3 + I_1I_2(\omega_1\omega_3 - 2I_2^2) + I_1I_2b_2\omega_1\omega_2
+ I_1I_2c_2\omega_1\omega_1 + I_1I_2(\omega_1\omega_3 - 2I_2^2) + I_1I_2\omega_1\omega_2^2
- 2I_3(I_1 - I_2)(I_1 + I_2 - I_3)\omega_1\omega_2\omega_3 - 2(I_2^2 - I_3^2)b_3\omega_1\omega_2\omega_3 + I_1I_2c_2\omega_1\omega_2\gamma_3
+ (-I_1I_2c_1\gamma_1 + I_2b_3^2 - 2I_1b_3^2)\omega_1\omega_2 - 2I_2I_3b_2\omega_1\omega_2\omega_3^2 + 2I_2I_3c_3\omega_1\omega_3\gamma_2
- 2I_2b_3\omega_1\omega_3 + 2I_2b_3c_2\omega_1\gamma_2 - I_1I_2b_1\omega_3^2 - I_1I_2c_1\omega_2^2\gamma_2 + 2I_1I_3b_1\omega_2\omega_3^2
- 2I_1(I_3c_3\gamma_1 - b_1b_3)\omega_3\omega_3 - 2I_1b_3c_3\omega_2\gamma_1 = 0. $$

As $\Gamma_3 = \Gamma_3(\omega_1, \omega_2, \omega_3)$, after differentiation of $J$ with respect to $\gamma_1$ and $\gamma_2$ we have

$$\frac{\partial J}{\partial \gamma_1} = I_1I_2c_2\omega_1^2 - I_1I_2c_1\omega_1\omega_2 - 2I_1I_3c_3\omega_2\omega_3 - 2I_1b_3c_3\omega_2 + I_1c_2c_3\Gamma_3 = 0,$$

$$\frac{\partial J}{\partial \gamma_2} = I_1I_2c_2\omega_1\omega_2 + 2I_1I_3c_3\omega_1\omega_3 + 2I_2b_3c_3\omega_1 - I_1I_2c_1\omega_2^2 - I_2c_1c_3\Gamma_3 = 0.$$
Let us first suppose that $c_1$, $c_2$ and $c_3$ are all different from zero. Then excluding $\Gamma_3$ from (7.10) we obtain

$$(c_1\omega_2 - c_2\omega_1)(I_2c_1\omega_1 + I_1c_2\omega_2 + 2I_3c_3\omega_3 + 2b_3c_3) = 0,$$

which is obviously impossible.

Let now $c_1 = 0$. Then from second equation (7.10) we have the following identity

$I_1I_2c_2\omega_1\omega_2 + 2I_2I_3c_3\omega_1\omega_3 + 2I_2b_3c_3\omega_1 = 0,$

which is possible only when $c_2 = c_3 = 0$. But this is the Zhukovskii case.

Let now $c_2 = 0$. From first equation (7.10) we have

$$-I_1I_2c_1\omega_1\omega_2 - 2I_1I_3c_3\omega_2\omega_3 - 2I_1b_3c_3\omega_2 = 0,$$

which is possible only when $c_1 = c_3 = 0$, i.e. again we are in the Zhukovskii case.

Finally let $c_3 = 0$. Equations (7.10) give

$$I_1I_2(c_2\omega_1 - c_1\omega_2)\omega_1 = 0, \quad I_1I_2(c_2\omega_1 - I_1I_2c_1\omega_2)\omega_2 = 0.$$

The above two conditions can be fulfilled only when $c_1 = c_2 = 0$, i.e. only in the Zhukovskii case.

The conclusion is that the sought function $S(\omega_1, \omega_2, \omega_3, \gamma_3)$ does not exist.

3) Let us suppose now that all $\frac{\partial S}{\partial \gamma_i}$, $i = 1, 2, 3$, vanish identically on $U$, that means that $S$ does not depend on $\gamma_1$, $\gamma_2$ and $\gamma_3$. Thus

$$S = S(\omega_1, \omega_2, \omega_3).$$

Let us suppose that $\frac{\partial S}{\partial \omega_3} \neq 0$ in some point of $U$, and thus also in some open subset of $U$. We express $\omega_3$ from equation (7.3) and obtain

$$\omega_3 = \Omega_3(\omega_1, \omega_2).$$  \hspace{1cm} (7.11)

We compute $\frac{dF}{dt}$ and replace $\omega_3$ with $\Omega_3$ everywhere.

$$\frac{dF}{dt} = \left[2(I_3\Omega_3 + b_3)\omega_1 - c_1\gamma_3\right]\left[(I_2 - I_3)\omega_2\Omega_3 + b_2\omega_2 - b_2\Omega_3 + c_3\gamma_2 - c_2\gamma_3\right]

+ \left[2(I_3\Omega_3 + b_3)\omega_2 - c_2\gamma_3\right]\left[(I_3 - I_1)\omega_1\Omega_3 - b_1\omega_1 + b_1\Omega_3 + c_1\gamma_3 - c_3\gamma_1\right]

+ \left(\omega_1^2 + \omega_2^2\right)\left[(I_1 - I_2)\omega_1\omega_2 + b_2\omega_1 - b_1\omega_2 + c_2\gamma_1 - c_1\gamma_2\right]

- \left(c_1\omega_1 + c_2\omega_2\right)(\omega_2\gamma_1 - \omega_1\gamma_2).

As above $\frac{dF}{dt} = 0$. Denote the numerator of $\frac{dF}{dt}$ by $K$. In this way we obtain the following equation for $\Omega_3$

$$K = \left[-2I_3(I_1 - I_2)(I_1 + I_2 - I_3)\omega_1\omega_2 - 2I_2I_3b_2\omega_1 + 2I_1I_3b_1\omega_2\right]\Omega_3^2

+ \left[-2b_3(I_1^2 - I_2^2)\omega_1\omega_2 + 2I_2I_3c_3\omega_1\gamma_2 + (I_1^2 - I_1I_3 - 2I_2I_3)c_2\omega_1\gamma_3 - 2I_2b_2b_3\omega_1 - 2I_1I_3c_3\omega_2\gamma_1 + (2I_3 - I_2^2 + I_2I_3)c_1\omega_2\gamma_3 + 2I_1b_3\omega_2 + (I_2b_2c_1 - I_1b_1c_2)\gamma_3\right]\Omega_3

+ I_1I_2(I_1 - I_2)\omega_3^2\omega_1 + I_1I_2b_1\omega_3^2 - I_1I_2b_3\omega_3\omega_2 + I_1I_2c_2\omega_3\gamma_1 + I_1I_2(I_1 - I_2)\omega_1\omega_2^2

+ I_1b_3\omega_1\omega_2^2 - I_1I_2c_1\omega_1\omega_2\gamma_1 + I_1I_2c_2\omega_1\omega_2\gamma_2 - 2(I_1 - I_2)b_3\omega_1\omega_2 + 2I_2b_3c_3\omega_1\gamma_2 + (I_1 - I_2)b_3c_2\omega_3\gamma_3 - I_1I_2c_1\omega_2\gamma_2 - 2I_1b_3c_3\omega_2\gamma_1 + (2I_1 - I_2)b_3c_1\omega_2\gamma_3 + I_1c_2\gamma_1\gamma_3 - I_2c_1c_3\gamma_2\gamma_3 - (I_1 - I_2)c_1c_2\gamma_3^2 = 0.$
As $\Omega_3 = \Omega_3(\omega_1, \omega_2)$, then after differentiation of $K$ with respect to $\gamma_1$ and $\gamma_2$ we have

$$\begin{align*}
\frac{\partial K}{\partial \gamma_1} &= I_1I_2c_2\omega_1^2 - I_1I_2c_1\omega_1\omega_2 - 2I_1b_3c_3\omega_2 + I_1c_2c_3\gamma_3 - 2I_1I_3c_3\omega_2\Omega_3 = 0, \\
\frac{\partial K}{\partial \gamma_2} &= I_1I_2c_2\omega_1\omega_2 - I_1I_2c_1\omega_1^2 + 2I_2b_3c_3\omega_1 - I_2c_1c_3\gamma_3 + 2I_2I_3c_3\omega_1\Omega_3 = 0.
\end{align*}\tag{7.12}$$

If we suppose that $c_3 \neq 0$ then we come to the Lagrange case. Indeed, as $\Omega_3$ depends only on $\omega_1$ and $\omega_2$, then from first equation of (7.12) it follows that $c_2 = 0$. This is so because otherwise $\Omega_3$ would depend on $\gamma_3$ too. For the same reason second equation of (7.12) gives that $c_1 = 0$. However at the condition $c_1 = c_2 = 0$ and $c_3 \neq 0$ both first and second equations of (7.12) lead to the conclusion that $\Omega_3 = -b_3/I_3$, i.e., according to (7.11), $\omega_3 = -b_3/I_3$. In such a case we obtain from the third equation of the gyrostat equations (6.1) that $I_1 = I_2$, $b_1 = b_2 = 0$ and $c_1 = c_2 = 0$. Thus we come to the Lagrange case.

Let now $c_3 = 0$. Then the first and second equations of (7.12) become:

$$I_1I_2(c_2\omega_1 - c_1\omega_2)\omega_1 = 0, \quad I_1I_2(c_2\omega_1 - c_1\omega_2)\omega_2 = 0.$$  

The above two equations should be identities which is possible only when $c_1 = c_2 = 0$, i.e. we come to the Zhukovskii case.

The conclusion is that the sought function $S(\omega_1, \omega_2, \omega_3)$ does not exist.

4) Let now the function $S$ be

$$S = S(\omega_1, \omega_2)$$

and $\frac{\partial S}{\partial \omega_2} \neq 0$ in some point of $U$ and therefore in some open subset of $U$. We express $\omega_2$ from equation (7.3) and obtain

$$\omega_2 = \Omega_2(\omega_1). \tag{7.13}$$

We compute $\frac{dF}{dt}$, replace $\omega_2$ with $\Omega_2$ everywhere and obtain

$$\frac{dF}{dt} = \left[2(I_2 + b_3)\omega_1 - c_1\gamma_1\right]\left[(I_2 - I_3)\Omega_2\omega_3 + b_3\Omega_2 - b_2\omega_3 + c_3\gamma_2 - c_2\gamma_3\right]$$

$$+ \left[2(I_3 - I_1)I_3\omega_1\omega_3 - b_3\omega_1 + b_1\omega_3 + c_1\gamma_3 - c_3\gamma_1\right]$$

$$+ (\omega_1^2 + \Omega_2^2)\left[(I_1 - I_2)\omega_1\Omega_2 + b_2\omega_1 - b_1\Omega_2 + c_2\gamma_1 - c_1\gamma_2\right]$$

$$- (c_1\omega_1 + c_2\Omega_2)(\Omega_2\gamma_1 - \omega_1\gamma_2).$$

As above $\frac{dF}{dt} = 0$. Denote the numerator of $\frac{dF}{dt}$ by $L$. In this way we obtain the following equation for $\Omega_2$

$$L = I_1I_2[(I_1 - I_2)\omega_1 - b_1]\Omega_2^3 + I_1I_2(b_2\omega_1 - c_1\gamma_2)\Omega_2^2$$

$$+ [I_1I_2(I_1 - I_2)\omega_1^3 - I_1I_2b_1\omega_1^2 - 2I_3(I_1 - I_2)(I_1 + I_2 - I_3)\omega_1\omega_3^2 - 2(I_1^2 - I_2^2)b_3\omega_1\omega_3$$

$$- I_1I_2c_1\omega_1\gamma_1 + I_1I_2c_2\omega_1\gamma_2 - 2(I_1 - I_2)b_3\omega_1^2 + I_1I_3b_1\omega_3^2 - 2I_1I_3c_3\omega_3\gamma_1$$

$$+ (2I_1I_3 - I_2^2 + I_2I_3)c_1\omega_3\gamma_3 + 2I_1b_3b_1\omega_3 - 2I_1b_3c_3\gamma_1 + (I_1 - I_2)b_3c_1\gamma_1\right]\Omega_2$$

$$+ I_2b_2\omega_1^3 + I_1I_2c_2\omega_1^2\gamma_1 - 2I_2I_3b_2\omega_1\omega_3^2 + 2I_2I_3c_2\omega_1\omega_3\gamma_2$$

$$+ (I_1^2 - I_1I_3 - I_2I_3)c_2\omega_1\omega_3\gamma_3 - 2I_2b_2b_3\omega_1\omega_3 + 2I_2b_3c_3\omega_1\gamma_2 + (I_1 - I_2)b_3c_1\omega_1\gamma_3.$$
+ (I_2 b_2 c_1 - I_1 b_1 c_2) \omega_3 \gamma_3 + I_1 c_2 c_3 \gamma_1 \gamma_3 - I_2 c_1 c_3 \gamma_2 \gamma_3 - (I_1 - I_2) c_1 c_2 \gamma_3^2 = 0.

As \( \Omega_2 = \Omega_2(\omega_1) \), then after differentiation of \( L \) with respect to \( \gamma_1, \gamma_2 \) and \( \gamma_3 \) we have

\[
\frac{\partial L}{\partial \gamma_1} = I_1 c_2 (I_2 \omega_1^2 + c_3 \gamma_3) - I_1 (I_2 c_1 \omega_1 + 2I_3 c_3 \omega_3 + 2b_3 c_3) \Omega_2 = 0,
\]

\[
\frac{\partial L}{\partial \gamma_2} = I_2 c_3 (2I_3 \omega_1 \omega_3 + 2b_3 \omega_1 - c_1 \gamma_3) + I_1 I_2 c_2 \omega_1 \Omega_2 - I_1 I_2 c_1 \Omega_2^2 = 0,
\]

\[
\frac{\partial L}{\partial \gamma_3} = (I_1^2 - I_1 I_3 - 2I_2 I_3) c_2 \omega_1 \omega_3 + (I_1 - 2I_2) b_3 c_2 \omega_1 - I_1 c_2 b_1 \omega_3
\]

\[+ I_2 c_1 b_2 \omega_3 + I_1 c_2 c_3 \gamma_1 - I_2 c_1 c_3 \gamma_2 - 2(I_1 - I_2) c_1 c_2 \gamma_3
\]

\[+ [(2I_1 I_3 - I_2^2 + 2I_3) c_1 \omega_3 + (2I_1 - I_2) b_3] \Omega_2 = 0. \tag{7.14}
\]

From the first equation of (7.14) it follows that \( c_2 \neq 0 \). Indeed, if \( c_2 = 0 \) then either \( c_1 = c_3 = 0 \) that is the Zhukovskii case or \( \Omega_2 \) vanishes identically, that contradicts (7.13). From the same equation it is seen that \( c_3 = 0 \) because if \( c_3 \neq 0 \) then this equation contains only one monomial depending on \( \gamma_3 \) which cannot be canceled because \( \Omega_2 \) depends on \( \omega_1 \) only. Thus \( c_3 = 0 \).

In such a case the first equation of (7.14) is rewritten as follows:

\[I_1 I_2 \omega_1 (c_2 \omega_1 - c_1 \Omega_2) = 0. \tag{7.15}\]

Equation (7.15) imposes the restriction \( c_1 \neq 0 \) because otherwise \( I_1 I_2 c_2 \omega_1^2 = 0 \) which is impossible. We solve (7.15) with respect to \( \Omega_2 \) and obtain

\[\Omega_2 = \Omega_2(\omega_1) = \frac{c_2 \omega_1}{c_1}.
\]

At this condition the second equation of (7.14) is satisfied and the third one becomes

\[(I_1 - I_2)(I_1 + I_3 + I_2) c_2 \omega_1 \omega_3 + 3(I_1 - I_2) b_3 c_2 \omega_1 + (I_2 b_2 c_1 - I_1 b_1 c_2) \omega_3 - 2(I_1 - I_2) c_1 c_2 \gamma_3 = 0.
\]

Taking into account that \( c_1 \neq 0 \) and \( c_2 \neq 0 \), the last item of the above equation leads to \( I_1 = I_2 \). Thus

\[I_2 (b_2 c_1 - b_1 c_2) \omega_3 = 0.
\]

In this way we come to the case

\[I_1 = I_2, \quad c_1 \neq 0, \quad c_2 \neq 0, \quad c_3 = 0, \quad b_2 c_1 - b_1 c_2 = 0.
\]

In this case \( L \) vanishes identically and therefore we can take as function \( S \) the following function

\[S = c_1 \omega_2 - c_2 \omega_1.
\]

So far we have not yet examined when \( \{S = 0\} = \{c_1 \omega_2 - c_2 \omega_1 = 0\} \) is an invariant manifold. To do this we compute \( \frac{dS}{dt} \) and obtain

\[
\frac{dS}{dt} = \frac{(c_1 \omega_1 + c_2 \omega_2) [ (I_3 - I_2) c_2 \omega_3 - b_3 c_2 ] + (c_1^2 + c_2^2) (b_2 \omega_3 + c_2 \gamma_3) }{I_2 c_2}.
\]

It is seen that in generic case \( \{S = 0\} \) is not an invariant manifold. But let us put

\[c_1^2 + c_2^2 = 0,
\]
i.e. either \( c_1 = ic_2 \) or \( c_1 = -ic_2 \). Let us first consider the case \( c_1 = ic_2 \). We have

\[
S = c_2 S_1, \quad S_1 = i\omega_2 - \omega_1
\]

and

\[
\frac{dS_1(t)}{dt} = i \left[ (I_2 - I_3)\omega_3(t) + b_3 \right] (i\omega_2(t) - \omega_1(t)) = S_1(t) \frac{i \left[ (I_2 - I_3)\omega_3(t) + b_3 \right]}{I_2}.
\]

This equation admits the zero solution \( S_1(t) = 0 \) for all \( t \). Thus from the unicity of solutions for this equation one obtains that if \( S_1(t_0) = 0 \) for some \( t_0 \), then \( S_1(t) = 0 \) for all \( t \). In other words, if for some \( t_0 \), \( i\omega_2(t_0) - \omega_1(t_0) = 0 \), then \( i\omega_2(t) - \omega_1(t) = 0 \) for all \( t \). But this is precisely the invariance of manifold \( \hat{S}_1 = \{ S_1 = 0 \} \). In this way we come to the conclusion that when

\[
I_1 = I_2, \quad c_1 = ic_2 \neq 0, \quad c_3 = 0, \quad b_2 c_1 - b_1 c_2 = 0.
\]

the gyrostat equations (6.1) have an invariant manifold \( \{ i\omega_2 - \omega_1 = 0 \} \).

The case \( c_1 = -ic_2 \) is considered in the same way. The difference is that now \( S = c_2 S_2 \), where \( S_2 = -i\omega_2 - \omega_1 \) and the invariant manifold is \( \{ i\omega_2 + \omega_1 \} \).

But \( F \) is not a partial first integral of the gyrostat equations (6.1) on the invariant manifolds \( \hat{S}_1 = \{ S_1 = 0 \} \) and \( \hat{S}_2 = \{ S_2 = 0 \} \). In fact it is easy to see that on them \( F \) vanishes identically.

Finally, we conclude that the codimension one maximal domain of the Sretenskii partial first integral (7.2) coincides with the manifold \( \{ H_1 = 0 \} \) under the conditions

\[
I_1 = I_2 = 4I_3, \quad b_1 = b_2 = 0, \quad (c_1, c_2) \neq (0, 0), \quad c_3 = 0.
\]

In addition, when

\[
I_1 = I_2, \quad b_2 c_1 - b_1 c_2 = 0, \quad c_1^2 + c_2^2 = 0, \quad c_3 = 0,
\]

we found two invariant relations for gyrostat equations (6.1):

\[
S_1 = i\omega_2 - \omega_1 \text{ when } c_1 = ic_2 \quad \text{ and } \quad S_2 = -i\omega_2 - \omega_1 \text{ when } c_1 = -ic_2.
\]

We will prove that \( S_1 \) is functionally independent of first integrals \( H_1, H_2 \) and \( H_3 \). For this purpose we consider the Jacobi matrix \( J \) of functions \( H_1, H_2, H_3 \) and \( S_1 \). We prove that rank \( J = 4 \). Indeed, computing the determinant \( J_{14} \) composed from matrix \( J \) by crossing out its first and fourth columns we obtain

\[
J_{14} = -4iI_3(2\omega_2\omega_3\gamma_2 - I_3\omega_2^2\gamma_2 - c_2\gamma_3^2 - b_2\omega_3\gamma_3 + b_3\omega_3\gamma_2).
\]

It is clearly seen that \( J_{14} \) never vanishes identically. Thus functions \( H_1, H_2, H_3 \) and \( S_1 \) are functionally independent.

The study of the functional independence of \( H_1, H_2, H_3 \) and \( S_2 \) is the same. The only difference is that now the value of the determinant is \(-J_{14}\).

5) Finally let \( S = S(\omega, \gamma) = S(\omega_1) \), where \( S \) does not vanish identically. It is easy to see that then \( \hat{S} = \{ (\omega, \gamma) \in U; S(\omega_1) = 0 \} \) is a five-dimensional submanifold if and only if \( \hat{S} = \{ (\omega, \gamma) \in U; \omega_1 \in \Omega_1 \} \), where \( \Omega_1 \) is a set of zeros of \( S \). In complex case \( \Omega_1 \) is at most countable. In real case \( \Omega_1 \) is a subset of \( \mathbb{R} \) that does not contains an open interval. In both cases \( \frac{d\omega_1}{dt} = 0 \) and from the first of the gyrostat equations (6.1) one obtains that

\[
(I_2 - I_3)\omega_2\omega_3 + b_3\omega_2 - b_2\omega_3 + c_3\gamma_2 - c_2\gamma_3 = 0
\]
for all $\omega_2, \omega_3, \gamma_2, \gamma_3 \in \mathbb{C}$. Thus $I_2 = I_3$, $b_2 = b_3 = 0$ and $c_2 = c_3 = 0$ and we recover the Lagrange case. Thus in both cases, complex and real, the sought function $S(\omega_1)$ does not exist.

Let us recall that when in gyrostat equations (6.1) $b_1 = b_2 = b_3 = 0$, we recover the Euler-Poisson equations (1.1). The Sretenskii case of partial integrability becomes the Goryachev-Chaplygin case of partial integrability and the Sretenskii partial first integral (7.2) becomes the Goryachev-Chaplygin partial first integral (1.8).

Consequently, from the above, one deduces immediately that the maximal domain of the Goryachev-Chaplygin partial first integral (1.8) is

$$\{H_i = U_i, H_j = U_j\}, \quad 1 \leq i < j \leq 3,$$

where $I_1 = I_2 = 4I_3$, $(c_1, c_2) \neq (0, 0)$, $c_3 = 0$.

Finally let us note that the invariant relations are the same in Sretenskii and in Goryachev-Chaplygin cases.

8. Four-dimensional invariant manifolds. New integrals on

$$\{H_i = U_i, H_j = U_j\}, \quad 1 \leq i < j \leq 3.$$  

8.1. Extraction procedure. In this section we study the existence of a local partial first integral of the Euler-Poisson equations (1.1) restricted to the invariant complex four-dimensional level manifold $\{H_i = U_i, H_j = U_j\}, \quad 1 \leq i < j \leq 3$. We study when on each of them there exists a local partial first integral that depends on at most three variables and such that on $\{H_i = U_i, H_j = U_j\}$ it is functionally independent of $H_k$, $k \neq i, j$.

Let us fix $i$ and $j$, $1 \leq i < j \leq 3$. According to (2.5)

$$M(U_0, U_i, U_j, \mathcal{I}c) = \{x \in \mathbb{C}^6; H_i((\omega, \gamma), \mathcal{I}c) = U_i, H_j((\omega, \gamma), \mathcal{I}c) = U_j\},$$

where $(\omega, \gamma) = (\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2, \gamma_3)$.

We search all functions $F$ of three variables $F = F(s_1, s_2, s_3)$ where $(s_1, s_2, s_3) \in (\omega, \gamma)$, of class $\mathcal{C}^1$, such that grad $F$ does not vanish identically on each open subset of $M(U_0, U_i, U_j, \mathcal{I}c)$, which are local partial first integrals of the Euler-Poisson equations (1.1) restricted to $M(U_0, U_i, U_j, \mathcal{I}c)$. Like in Sec. 5 the unique intrinsic property of $\mathcal{C}^1$ function $F$ that is a local partial first integral is that grad $F$ does not vanish identically on any open subset of its domain of definition. This implies that some of the partial derivatives of $F$ may be identically zero. Thus the results of Sec. 8 also remain valid for the functions of at most three variables.

We follow the same way as in Sec. 5.1. As in Sec. 5.1 the order of variables $s_i, 1 \leq i \leq 3$, in $F(s_1, s_2, s_3)$ is irrelevant for $F$ to be a first integral.

We have exactly 20 different three elements subsets of $(\omega, \gamma)$ and thus 20 cases of functions of three elements to examine. We will describe now an extraction procedure based on permutational symmetries which reduces the above 20 cases to only six.

These 20 functions of three variables (up to the order of variables) are shown in Table 8.1.
It is easy to see that under the group of permutational symmetries \([2,3]\) of the Euler-Poisson equations for every case (i)–(vi) from Table \(8.1\) each function from the fixed case is consequently transformed into all remaining functions from the same case.

Thus in virtue of Theorem \([2,2]\) we can restrict ourselves to the study of only six functions where every one belongs to a different case from Table \(8.1\) and is chosen arbitrary from the functions of this case.

We will call such six functions \(F_i, 1 \leq i \leq 6\), (up to the order of variables) a basis.

### 8.2. Invariant manifold \(\{H_1 = U_1, \ H_2 = U_2\}\).

Here we continue the study of the existence of a partial first integral of the Euler-Poisson equations \((1.1)\) restricted to the complex four-dimensional level manifold

\[
\{H_1 = U_1, \ H_2 = U_2\}, \tag{8.1}
\]

supposing that this first integral depends on at most three variables and that is functionally independent of \(H_3\). For this aim we shall use the same approach as in Sec. \([5]\).

In the future when we refer to “some suitable open set” in space \(C^4(\alpha_1, \alpha_2, \alpha_3, \alpha_4)\) in Sec. \([8]\) where \(\{\alpha_1, \alpha_2, \alpha_3, \alpha_4\} \in \{\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2, \gamma_3\}\) or in space \(C^3(\alpha_1, \alpha_2, \alpha_3)\) in Sec. \([9]\) where \(\{\alpha_1, \alpha_2, \alpha_3\} \in \{\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2, \gamma_3\}\), we mean an open set such that all functions of the above variables never vanish on it when this is necessary for a proof. For example if such a function appears in some denominator or when we need to have a holomorphic branch of roots of some of these functions. In the future, we will use this terminology without any further discussion.

#### 8.2.1. Elimination of \(\gamma_2\) and \(\gamma_3\).

Using the MAPLE command \texttt{solve} we express \(\gamma_2\) and \(\gamma_3\) from the equations \(H_1 = U_1\) and \(H_2 = U_2\) and obtain the following solution:

\[
\gamma_2 = \frac{I_1 \omega_1 \gamma_1 + I_3 \omega_3 R - U_1}{I_2 \omega_2}, \quad \gamma_3 = R, \tag{8.2}
\]

where \(R\) is a root of equation

\[
Q(x) = Ax^2 + Bx + C = 0,
\]
that is
\[ Q(R) = AR^2 + BR + C = 0 \] (8.3)
and \( A = A(\omega_2, \omega_3), B = B(\omega_1, \omega_3, \gamma_1) \) and \( C = C(\omega_1, \omega_2, \gamma_1) \) are the following polynomials:
\[
A = I_2^2\omega_2^2 + I_3^2\omega_3^2, \quad B = 2I_3\omega_3(I_1\omega_1\gamma_1 - U_1), \\
C = I_1^2\omega_1^2\gamma_1^2 - 2I_1U_1\omega_1\gamma_1 - I_2^2U_2\omega_2^2 + I_2^2\omega_2^2\gamma_1^2 + U_1^2. \] (8.4)

Here MAPLE does not give an explicit formula for \( R \) but expresses \( R \) as a root of the following quadratic polynomial:
\[
RootOf((I_3^2\omega_3^2 + I_2^2\omega_2^2)Z^2 + 2I_3\omega_3(I_1\omega_1\gamma_1 - U_1)Z \\
+ I_1^2\omega_1^2\gamma_1^2 - 2I_1U_1\omega_1\gamma_1 - I_2^2U_2\omega_2^2 + I_2^2\omega_2^2\gamma_1^2 + U_1^2)^2 = RootOf(AZ^2 + BZ + C),
\]

Thus we can say that \( R \) is a root of equation \( [8.3] \) where the coefficients \( A, B \) and \( C \) are defined by \( [8.4] \).

Let us consider the four-dimensional vector space \( \mathbb{C}^4 = \mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1) \) and a point \((\omega_1, \omega_2, \omega_3, \gamma_1) \in \mathbb{C}^4 \) with \( \omega_i \neq 0, i = 1, 2, 3, \gamma_1 \neq 0 \).

All our considerations are local. Thus from the beginning we can restrict ourselves to some suitable open set \( \Omega \) in the space \( \mathbb{C}^4 = \mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1) \).

By their very definition the first integrals are not constant on any open subset of their domain of definition. As we consider \( C^1 \) first integrals, this means that their gradients are non-zero on any open subset of their domain of definition.

We put the values of \( \gamma_2 \) and \( \gamma_3 \) from \( [8.2] \) in the Euler-Poisson equations \( [1.1] \) and remove the fifth and sixth equations. In this way we have the following system of four equations in unknowns \( \omega_1, \omega_2, \omega_3 \) and \( \gamma_1 \):
\[
\frac{d\omega_1}{dt} = \frac{1}{I_1I_2\omega_2} \left[ I_2(I_2 - I_3)\omega_2^2\omega_3 - I_1c_1\omega_1\gamma_1 - (I_2c_2\omega_2 + I_3c_3\omega_3)R + c_1U_1 \right], \\
\frac{d\omega_2}{dt} = \frac{1}{I_2} \left[ (I_3 - I_1)\omega_1\omega_3 + c_1R - c_3\gamma_1 \right], \\
\frac{d\omega_3}{dt} = \frac{1}{I_2I_3\omega_2} \left[ I_2(I_2 - I_3)\omega_1\omega_2^2 + I_1c_1\omega_1\gamma_1 + I_2c_2\omega_2\gamma_1 + I_3c_1\omega_3R - c_1U_1 \right], \\
\frac{d\gamma_1}{dt} = \frac{1}{I_2\omega_2} \left[ -I_1\omega_1\omega_3\gamma_1 - (I_2\omega_2^2 + I_3\omega_3^2)R + \omega_3U_1 \right]. \] (8.5)

Here we study whether system \( [8.5] \) has a first integral that depends on at most three variables among the variables \((\omega_1, \omega_2, \omega_3, \gamma_1) \) and that is functionally independent of \( H_3 \) restricted to invariant manifold \( [8.1] \). Thus we should investigate the following four types of a new first integral:

1. \( F(\omega_1, \omega_2, \omega_3) \), (case (i))
2. \( F(\omega_1, \omega_2, \gamma_1) \), (case (iii))
3. \( F(\omega_1, \omega_3, \gamma_1) \), (case (iii))
4. \( F(\omega_2, \omega_3, \gamma_1) \). (case (ii))

Then, like in Sec. 5, it suffices to examine the functions of types 1, 2 and 4 respectively.
Type 1. Let us suppose that the sought first integral $F$ is of type 1, i.e. $F = F(\omega_1, \omega_2, \omega_3)$. As $F$ is a first integral of system (8.5) we have
\[
\frac{dF}{dt} = \frac{1}{I_1 I_2 \omega_2} \left[ I_2 (I_2 - I_3) \omega_2^2 \omega_3 - I_1 c_3 \omega_1 \gamma_1 - (I_2 c_2 \omega_2 + I_3 c_3 \omega_3) R + c_1 U_1 \right] \frac{\partial F}{\partial \omega_1} \\
+ \frac{1}{I_2} \left[ (I_3 - I_1) \omega_1 \omega_3 + c_1 R - c_3 \gamma_1 \right] \frac{\partial F}{\partial \omega_2} \\
+ \frac{1}{I_2 I_3 \omega_2} \left[ I_2 (I_1 - I_2) \omega_1 \omega_2^2 + I_1 c_1 \omega_1 \gamma_1 + I_2 c_2 \omega_2 \gamma_1 + I_3 c_1 \omega_3 R - c_1 U_1 \right] \frac{\partial F}{\partial \omega_3} = 0,
\]
or equivalently
\[
I_1 I_2 I_3 \omega_2 \frac{dF}{dt} = Y_1(F) = 0, \tag{8.6}
\]
where $Y_1$ is the corresponding vector field defined on $\Omega$.

Equation (8.6) should be an identity with respect to all the four variables $\omega_1$, $\omega_2$, $\omega_3$ and $\gamma_1$. As function $F$ does not depend on $\gamma_1$ then its partial derivatives will not depend on $\gamma_1$ too. Thus if we differentiate identity (8.6) with respect to $\gamma_1$ we shall obtain again a linear partial differential equation for function $F$. We obtain
\[
\frac{\partial Y_1(F)}{\partial \gamma_1} = Y_2(F) = 0, \tag{8.7}
\]
where $Y_2$ is the corresponding vector field defined on $\Omega$.

We differentiate one time more identity (8.7) with respect to $\gamma_1$ and obtain
\[
\frac{\partial Y_2(F)}{\partial \gamma_1} = I_3 \frac{\partial^2 R}{\partial \gamma_1^2} \left[ -(I_2 c_2 \omega_2 + I_3 c_3 \omega_3) \frac{\partial F}{\partial \omega_1} + I_2 c_1 \omega_1 \frac{\partial F}{\partial \omega_2} + I_1 c_1 \omega_3 \frac{\partial F}{\partial \omega_3} \right] = 0,
\]
i.e.
\[
1 \frac{\partial^2 R}{\partial \gamma_1^2} = Y_3(F) = 0, \tag{8.8}
\]
where $Y_3$ is the corresponding vector field defined on $\Omega$.

Let us suppose first that
\[
\frac{\partial^2 R}{\partial \gamma_1^2} \neq 0. \tag{8.9}
\]

Equations (8.6)–(8.8) can be considered as a system of three homogeneous linear algebraic equations with unknowns $\text{grad } F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3} \right)$, which do not vanish identically, because $F$ is non-constant on any open subset of $\Omega$.

Thus, if a fourth integral $F$ exists, system (8.6)–(8.8) has a non-zero solution $\text{grad } F$. This is possible if and only if the determinant $D$ of the coefficients of this system is identically equal to zero. We compute this determinant and obtain
\[
D = I_1^2 I_2 I_3 \omega_2^2 \frac{\partial^2 R}{\partial \gamma_1^2} D_1 D_2,
\]
where

\[
D_1 = (I_1 c_1 \omega_1 + I_2 c_2 \omega_2 + I_3 c_3 \omega_3),
\]

\[
D_2 = (I_2 - I_1) c_3 \omega_1 \omega_2 + (I_1 - I_3) c_2 \omega_1 \omega_3 + (I_3 - I_2) c_1 \omega_2 \omega_3.
\]

(8.10)

Note that \( D \) depends neither on \( R \) nor on \( \frac{\partial R}{\partial \gamma_1} \). Taking into account (8.9) it is clear that \( D \equiv 0 \) if and only if at least one of the expressions (8.10) is identically equal to zero. It is easily seen that this happens only in the Euler, Lagrange and kinetic symmetry cases.

Thus the restriction (8.9) leads to nothing new and we suppose now that

\[
\frac{\partial^2 R}{\partial \gamma_1^2} = 0.
\]

(8.11)

In such a case only equations (8.6) and (8.7) remain because \( Y_3 \equiv 0 \).

Let us study whether there are such values of parameters \( I, A, U_1 \) and \( U_2 \) at which (8.11) is fulfilled. For this purpose we differentiate (8.3) twice with respect to \( \gamma_1 \). Taking into account that polynomial \( A \) from (8.4) does not depend on \( \gamma_1 \) we have

\[
\frac{\partial Q}{\partial \gamma_1} = \frac{\partial B}{\partial \gamma_1} R + \frac{\partial C}{\partial \gamma_1} + \frac{dQ}{dR} \frac{\partial R}{\partial \gamma_1} = 0
\]

and

\[
\frac{\partial^2 Q}{\partial \gamma_1^2} = \frac{\partial^2 B}{\partial \gamma_1^2} R + \frac{\partial B}{\partial \gamma_1} \frac{\partial R}{\partial \gamma_1} + \frac{\partial^2 C}{\partial \gamma_1^2} + \frac{\partial}{\partial \gamma_1} \left( \frac{dQ}{dR} \right) \frac{\partial R}{\partial \gamma_1} + \frac{dQ}{dR} \frac{\partial^2 R}{\partial \gamma_1^2} = 0.
\]

(8.12)

(8.13)

First we prove that if \( R \) is a root of equation (8.3), then \( \frac{dQ}{dR} \neq 0 \). For this purpose we apply Proposition 4.1 to polynomial \( Q \). We consider the resultant \( \rho \) of polynomials \( Q(R) \) and \( \frac{dQ}{dR} \) and prove that \( \rho \neq 0 \). Indeed, we have

\[
\rho = A(4AC - B^2).
\]

As we are interested in cases where \( \rho \) vanishes identically with respect to \( \omega_1, \omega_2, \omega_3 \) and \( \gamma_1 \) only and as \( A \) never vanishes identically we do not consider \( \rho \) but \( \hat{\rho} = 4AC - B^2 \) instead. Putting in \( \hat{\rho} \) the expressions for \( A, B \) and \( C \) (see (8.4)) we obtain

\[
\hat{\rho} = 4I_2^2 \omega_3^2 (I_1^2 \omega_1^2 \gamma_1^2 + I_2^2 \omega_2^2 \gamma_1^2 + I_3^2 \omega_3^2 \gamma_1^2 - 2I_1 \omega_1 \gamma_1 U_1 - I_2^2 \omega_2^2 U_2 - I_3^2 \omega_3^2 U_2 + U_1^2),
\]

(8.14)

which, as one can easily see, never vanishes identically. Thus we can express \( \frac{\partial R}{\partial \gamma_1} \) from equation (8.12) and then determine \( \frac{\partial^2 R}{\partial \gamma_1^2} \) from (8.13) as follows:

\[
\frac{\partial^2 R}{\partial \gamma_1^2} = \frac{I_2^2 \omega_2^2 S}{[(I_2^2 \omega_2^2 + I_3^2 \omega_3^2)R + I_3 \omega_3 (I_1 \omega_1 \gamma_1 - U_1)]^3},
\]

(8.15)

where

\[
S = -(I_2^2 \omega_2^2 + I_3^2 \omega_3^2)(I_1^2 \omega_1^2 + I_2^2 \omega_2^2 + I_3^2 \omega_3^2)R^2
+ 2I_3 \omega_3 (I_1^2 \omega_1^2 + I_2^2 \omega_2^2 + I_3^2 \omega_3^2)(U_1 - I_1 \omega_1 \gamma_1)R
- I_1^4 \omega_1 \gamma_1 + 2I_1^3 \omega_3 \gamma_1 U_1 - 2I_1^2 I_2 \omega_1 \omega_2 \gamma_1^2 - I_1^2 I_2 \omega_1 \omega_3 \gamma_1^2 + I_1^2 \omega_2 \gamma_1^2
+ 2I_1 I_2 \omega_1 \omega_2 \gamma_1 U_1 + 2I_1 I_3 \omega_1 \omega_3 \gamma_1 U_1 - I_2^2 \omega_2 \gamma_1^2 - I_1^2 I_3 \omega_2 \omega_3 \gamma_1^2 - I_3^2 \omega_3 U_1^2.
\]
Equations (8.15) and (8.11) imply that $S = 0$. Taking into account that $Q = 0$ (see (8.3)) we can assert that
\[(I_1^2 \omega_1^2 + I_2^2 \omega_2^2 + I_3^2 \omega_3^2)Q + S = I_2^2 \omega_2^2 (U_1^2 - U_2 (I_1^2 \omega_1^2 + I_2^2 \omega_2^2 + I_3^2 \omega_3^2))\]
is also zero. This is possible if and only if
\[U_1 = U_2 = 0. \tag{8.16}\]

Let us consider the case defined by (8.16). In this case $R$ can be presented in the form $R = P \gamma_1$, where $P$ is a root of equation
\[(I_2^2 \omega_2^2 + I_3^2 \omega_3^2)P^2 + 2I_1 I_3 \omega_1 \omega_3 P + I_1^2 \omega_1^2 + I_2^2 \omega_2^2 = 0. \tag{8.17}\]

This fact is obtained very easily from (8.3) if we take into account condition (8.16). Indeed, it suffices to divide equation (8.3) by $\gamma_1^2$ and denote $\frac{R}{\gamma_1}$ by $P$. Moreover, being a root of equation (8.17), $P$ is a homogeneous function of degree zero and depends only on $\omega_1, \omega_2$ and $\omega_3$.

Thus vector field $Y_1$ (see (8.6)) is linear with respect to $\gamma_1$ and can be presented as follows
\[Y_1 = K_1 \gamma_1 + K_2,\]
where $K_1$ and $K_2$ are vector fields defined on $\Omega$ by the formulas
\[K_1 = -I_3 (I_1 c_3 \omega_1 + I_2 c_2 \omega_2 P + I_3 c_3 \omega_3 P) \frac{\partial}{\partial \omega_1} + I_1 I_3 \omega_2 (c_1 P - c_3) \frac{\partial}{\partial \omega_2} + I_1 (I_1 c_1 \omega_1 + I_2 c_2 \omega_2 + I_3 c_1 \omega_3) \frac{\partial}{\partial \omega_3},\]
\[K_2 = \omega_2 \left[ I_2 I_3 \omega_2 \omega_3 (I_2 - I_3) \frac{\partial}{\partial \omega_1} - I_1 I_3 \omega_1 \omega_3 (I_1 - I_3) \frac{\partial}{\partial \omega_2} + I_1 I_2 \omega_1 \omega_2 (I_1 - I_2) \frac{\partial}{\partial \omega_3} \right].\]

Equation (8.6) and the fact that first integral $F$ does not depend on $\gamma_1$ imply
\[K_1(F) = K_2(F) = 0. \tag{8.18}\]

Function $I_1^2 \omega_1^2 + I_2^2 \omega_2^2 + I_3^2 \omega_3^2$ is non-constant on all open subsets of $C_1(\omega_1, \omega_2, \omega_3, \gamma_1)$. Thus without any restriction of generality one can suppose that on our suitable open set the function $I_1^2 \omega_1^2 + I_2^2 \omega_2^2 + I_3^2 \omega_3^2 \neq 0$.

In order to simplify the formulas let us put
\[\alpha = I_2^2 \omega_2^2 + I_3^2 \omega_3^2, \quad \beta = \sqrt{-I_1^2 \omega_1^2 - I_2^2 \omega_2^2 - I_3^2 \omega_3^2}, \quad \text{Re}(\beta) > 0. \tag{8.19}\]

Equation (8.17) has two roots
\[P = \frac{-I_1 I_3 \omega_1 \omega_3 + \varepsilon I_2 \omega_2 \beta}{\alpha},\]
where $\varepsilon = \pm 1$. Substituting this value of $P$ in the expression for $K_1$ we obtain
\[\frac{\alpha K_1}{\omega_2} = -I_2 I_3 \left[ I_1 \omega_1 (I_2 c_3 \omega_2 - I_3 c_2 \omega_3) + \varepsilon \beta (I_2 c_2 \omega_2 + I_3 c_3 \omega_3) \right] \frac{\partial}{\partial \omega_1} + I_1 I_3 \left[ -I_1 I_3 c_1 \omega_1 \omega_3 - c_3 \alpha + \varepsilon \beta I_2 c_1 \omega_2 \right] \frac{\partial}{\partial \omega_2},\]
As we are interested in equations (8.18) we remove all the non-zero factors from \( K_1 \) and \( K_2 \), i.e. we shall work with the vector fields
\[
Z_1 = \frac{\alpha K_1}{\omega_2} \quad \text{and} \quad Z_2 = \frac{K_2}{\omega_2}.
\]

Therefore instead of (8.18) we consider the following equations:
\[
Z_1(F) = Z_2(F) = 0. \tag{8.20}
\]

We compute the commutator \( K_3 = [Z_1, Z_2] \) and obtain
\[
\frac{K_3}{I_1 I_2 I_3} = \left[ -(I_1 - I_2) I_1 I_2 I_3 c_2 \omega_1^2 \omega_2 - (I_1 - I_3) I_1 I_2 I_3 c_3 \omega_1^2 \omega_3 + (I_2 - I_3) I_1 I_2^2 c_1 \omega_1 \omega_2^2 - (I_2 - I_3) I_1 I_3^2 c_1 \omega_1 \omega_3^2 + \varepsilon \beta (I_1 - I_2) I_2 I_3 c_3 \omega_1 \omega_2 - \varepsilon \beta (I_1 - I_3) I_2 I_3 c_2 \omega_1 \omega_3 + (I_2 - I_3) I_2^2 c_2 \omega_1 \omega_2^2 + 2 \varepsilon \beta (I_2 - I_3) I_2 I_3 c_1 \omega_2 \omega_3 - (I_2 - I_3) I_3^3 c_3 \omega_2^3 \right] \frac{\partial}{\partial \omega_1}
+ \left[ -(I_1 - I_3) I_1 I_3^2 c_1 \omega_1^2 \omega_2^2 - (I_1 - I_3) I_1 I_2 I_3^2 c_2 \omega_1 \omega_2 - (I_2 - I_3) I_1 I_3 c_3 \omega_1 \omega_2 \omega_3 - 2 (I_1 - I_3) I_1 I_3^2 c_2 \omega_1 \omega_3^2 + (I_2 - I_3) I_1 I_3^2 c_1 \omega_2 \omega_3 + \varepsilon \beta (I_1 - I_3) I_2 I_3 c_2 \omega_2 \omega_3 + \varepsilon \beta (I_1 - I_3) I_2 I_3^2 c_3 \omega_2^3 \right] \frac{\partial}{\partial \omega_2}
+ \left[ (I_2 - I_3) I_1 I_3^2 c_1 \omega_1^2 \omega_3^2 - 2 (I_1 - I_2) I_1 I_3^2 c_3 \omega_1 \omega_3^2 + (2 I_1 I_2 - I_1 I_3 - I_2 I_3) I_1 I_3 c_2 \omega_1 \omega_2 \omega_3 - (I_1 - I_2) I_1 I_3^2 c_3 \omega_1 \omega_3^2 - (I_2 - I_3) I_1 I_2^2 c_1 \omega_2 \omega_3 - \varepsilon \beta (I_1 - I_2) I_1 I_2 c_2 \omega_2^2 - \varepsilon \beta (I_1 - I_2) I_1 I_2 I_3 c_3 \omega_2 \omega_3 \right] \frac{\partial}{\partial \omega_3}.
\]

We consider vector field
\[
Z_3 = \frac{K_3}{I_1 I_2 I_3}
\]
instead of \( K_3 \).

Equations (8.20) imply that \( Z_3(F) = 0 \). In this way we obtain the following three equations for determining function \( F \)
\[
Z_1(F) = Z_2(F) = Z_3(F) = 0. \tag{8.21}
\]

Equations (8.21) can be considered as a system of three homogeneous linear algebraic equations with unknowns \( \text{grad} F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3} \right) \), which do not vanish identically, because \( F \) is non-constant on any open subset of its domain of definition.

Thus, if a fourth integral \( F \) exists, system (8.21) has a non-zero solution \( \text{grad} F \). We know that this is possible if and only if the determinant \( D \) of the coefficients of equations (8.21) is identically equal to zero. We compute this determinant and obtain that on \( \Omega \)
\[
D = I_1 I_2 I_3 (f_1 \beta + f_2), \tag{8.22}
\]
where $f_1$ and $f_2$ are the following polynomials in $\omega_1$, $\omega_2$ and $\omega_3$:

$$\frac{f_1}{\varepsilon} = -(I_1 - I_2)(I_1 - I_3)I_1^2I_2^3c_1c_2\omega_3^3\omega_2^3 - (I_1 - I_2)(I_1 - I_3)I_1^2I_2^3c_1c_3\omega_1^3\omega_2^2\omega_3$$

$$- (I_1 - I_2)(I_1 - I_3)I_1^2I_2^3c_1\omega_1^3\omega_2^2\omega_3^2 - (I_1 - I_2)(I_1 - I_3)I_1^2I_3^3c_1\omega_1^3\omega_3^3$$

$$+ (I_1 - I_2)[(I_2 - I_3)I_1c_1^2 - (I_1 - I_3)I_2c_2^2 - (I_1 - I_2)I_3c_3^2]I_1I_2^3\omega_1^2\omega_2^2$$

$$- 2(I_1 - I_2)(I_2 - I_3)I_1^2I_2^3c_2c_3\omega_1^2\omega_2\omega_3$$

$$+ I_1I_2I_3[(I_2 - I_3)^2I_1^2c_1^2 + (I_1 - I_3)(I_1I_2 - 3I_1I_3 + 2I_2I_3)I_2c_2^2$$

$$- (I_1 - I_2)(3I_1I_2 - I_1I_3 - 2I_2I_3)I_3c_3^2]\omega_1^2\omega_2^2\omega_3^2$$

$$+ 2(I_1 - I_3)(I_2 - I_3)I_1^2I_2^3c_2c_3\omega_1^2\omega_2\omega_3^2$$

$$- \varepsilon^2(I_1 - I_3)(I_2 - I_3)I_1I_3^3c_3\omega_2^4.$$
occur because $\beta \notin \mathbb{C}(\omega_1, \omega_2, \omega_3)$. Consequently
\[ f_1 = f_2 = 0. \]

Note that $\varepsilon$ appears in $f_1$ as a factor and in $f_2$ only as $\varepsilon^2$. We replace $\varepsilon^2$ with 1 everywhere in $f_2$. As $\beta^2$ can never be identically equal to zero, we require that all the 18 coefficients of $f_1/\varepsilon$ and all the 13 coefficients of $f_2/\beta^2$ be zero, i.e. we obtain a system of 31 equations for the parameters $\mathcal{I}_c$.

After three consecutive simplifications we obtain the reduced system that contains eight equations:
\[
(I_2 - I_3)c_2c_3 = 0, \quad (I_1 - I_3)c_1c_3 = 0, \quad (I_1 - I_2)(I_1 - I_3)(I_2 - I_3)c_3 = 0,
\]
\[
(I_1 - I_2)(I_1 - I_3)(c_2^2 + c_3^2) = 0, \quad (I_1 - I_2)(I_2 - I_3)c_1c_2 = 0,
\]
\[
(I_1 - I_2)(I_1 + I_2 - 2I_3)c_1c_2 = 0,
\]
\[
(I_2 - I_3)[(I_2 - I_3)c_1^2 + (I_1 - I_3)c_2^2 + (I_2 - I_1)c_3^2] = 0,
\]
\[
(I_1 - I_3)(I_2 - I_3)(c_1^2 + c_2^2) = 0.
\]

We solve these eight equations by the MAPLE command `solve` and obtain a set of eight solutions. We remove the solutions that lead to the Euler, Lagrange and kinetic symmetry cases and obtain only three new solutions. They are:

I. $I_1 = I_2$, $c_1 = \pm ic_2$, $c_3 = 0$,
II. $I_1 = I_3$, $c_1 = \pm ic_3$, $c_2 = 0$,
III. $I_2 = I_3$, $c_1 = 0$, $c_2 = \pm ic_3$.

We describe here only solution I because solutions II and III are obtained from it by permutational symmetries $\sigma_2$ and $\sigma_3$, respectively.

We consider separately two cases:

1. $c_1 = ic_2$ with $\varepsilon = 1$ and with $\varepsilon = -1$.
2. $c_1 = -ic_2$ with $\varepsilon = 1$ and with $\varepsilon = -1$.

Let us remark that the above situation is exactly the one we met in Sec. 7.2 when finding invariant manifolds.

Case 1. Let $I_1 = I_2$, $c_1 = ic_2$, $c_3 = 0$ and $\varepsilon = 1$. Now vector field $Z_3$ is linearly dependent on $Z_1$ and $Z_2$ and therefore the local solvability of system (8.21) around any point $(\omega_1, \omega_2, \omega_3) \neq (0, 0, 0)$ follows from the Frobenius Integrability Theorem. Moreover, system (8.5) is quasi-homogeneous (we recall that $R = P\gamma_1$ and $P$ is a homogeneous function of degree zero). Thus from (11) it follows that the searched first integral $F$ can be chosen as a homogeneous function of the variables $(\omega_1, \omega_2, \omega_3)$. But in fact we shall compute $F$ by a crude computation, without any use of the Frobenius Integrability Theorem nor the results of (11). Nevertheless the above facts guide our approach to the problem.

Let us add to equations (8.20) the Euler “homogeneity equation”
\[
\omega_1 \frac{\partial F}{\partial \omega_1} + \omega_2 \frac{\partial F}{\partial \omega_2} + \omega_3 \frac{\partial F}{\partial \omega_3} = F. \quad (8.24)
\]

Dividing equations (8.20) and (8.24) by $F$ we obtain a system of three linear partial differential equations for determining function $V = \log F$. We solve this system as a linear
inhomogeneous algebraic system with respect to partial derivatives of $V$ and obtain

\[
\frac{\partial V}{\partial \omega_1} = \frac{(I_2^3 \omega_1^3 \omega_2 - iI_2^3 \omega_2^3 - iI_3^3 \omega_3^3 + I_3 \omega_3 \beta) \omega_1}{(I_2^3 \omega_1^3 \omega_2 + I_2^3 \omega_2^3 + I_3^3 \omega_3^3 + I_3 \omega_3 \beta) (\omega_1 - i\omega_2)},
\]

\[
\frac{\partial V}{\partial \omega_2} = \frac{(I_2^3 \omega_1^3 \omega_2 - iI_2^3 \omega_2^3 - iI_3^3 \omega_3^3 + I_3 \omega_3 \beta) \omega_2}{(I_2^3 \omega_1^3 \omega_2 + I_2^3 \omega_2^3 + I_3^3 \omega_3^3 + I_3 \omega_3 \beta) (\omega_1 - i\omega_2)},
\]

\[
\frac{\partial V}{\partial \omega_3} = \frac{iI_3 (I_3 \omega_1 \omega_3 - \omega_2 \beta)}{(I_2^3 \omega_1^3 \omega_2 + I_2^3 \omega_2^3 + I_3^3 \omega_3^3 + I_3 \omega_3 \beta) (\omega_1 - i\omega_2)}
\]

Now, by the standard procedure, we find function $V$.

We integrate $\frac{\partial V}{\partial \omega_1}$, $1 \leq i \leq 3$, with respect to $\omega_i$ and in this way we obtain three expressions for the function $V$.

\[
V = \int \frac{(I_2^3 \omega_1^3 \omega_2 - iI_2^3 \omega_2^3 - iI_3^3 \omega_3^3 + I_3 \omega_3 \beta) \omega_1}{(I_2^3 \omega_1^3 \omega_2 + I_2^3 \omega_2^3 + I_3^3 \omega_3^3 + I_3 \omega_3 \beta) (\omega_1 - i\omega_2)} d\omega_1 + G_1(\omega_2, \omega_3),
\]

\[
V = \int \frac{(I_2^3 \omega_1^3 \omega_2 - iI_2^3 \omega_2^3 - iI_3^3 \omega_3^3 + I_3 \omega_3 \beta) \omega_2}{(I_2^3 \omega_1^3 \omega_2 + I_2^3 \omega_2^3 + I_3^3 \omega_3^3 + I_3 \omega_3 \beta) (\omega_1 - i\omega_2)} d\omega_2 + G_2(\omega_1, \omega_3),
\]

\[
V = \int \frac{iI_3 (I_3 \omega_1 \omega_3 - \omega_2 \beta)}{(I_2^3 \omega_1^3 \omega_2 + I_2^3 \omega_2^3 + I_3^3 \omega_3^3 + I_3 \omega_3 \beta) (\omega_1 - i\omega_2)} d\omega_3 + G_3(\omega_1, \omega_2),
\]

where $G_1$, $G_2$ and $G_3$ are arbitrary functions of the corresponding variables.

The first two expressions for $V$ are too complicated and we do not use them. We only use the third expression which is rewritten as follows:

\[
V = \csgn(I_3)i \arctan \frac{\csgn(I_3)I_3 \omega_3}{\beta} + G_3(\omega_1, \omega_2),
\]

where the function $\csgn(z)$ is used to determine in which half-plane ("left" or "right") the complex-valued number $z$ lies. It is defined by

\[
\csgn(z) = \begin{cases} 
1 & \text{if } \Re(z) > 0, \\
-1 & \text{if } \Re(z) < 0, \\
\sgn(\Im(z)) & \text{if } \Re(z) = 0.
\end{cases}
\]

As $\arctan$ is an odd function we can write

\[
V = i \arctan \frac{I_3 \omega_3}{\beta} + G_3(\omega_1, \omega_2). \quad (8.25)
\]

In order to determine function $G_3(\omega_1, \omega_2)$ we differentiate $\text{(8.25)}$ with respect to $\omega_i$, $1 \leq i \leq 3$, and obtain

\[
\frac{\partial V}{\partial \omega_1} = -\frac{iI_3 \omega_1 \omega_3}{(\omega_1^2 + \omega_2^2) \beta} + \frac{\partial G_3}{\partial \omega_1},
\]

\[
\frac{\partial V}{\partial \omega_2} = -\frac{iI_3 \omega_2 \omega_3}{(\omega_1^2 + \omega_2^2) \beta} + \frac{\partial G_3}{\partial \omega_2},
\]

\[
\frac{\partial V}{\partial \omega_3} = \frac{iI_3}{\beta}.
\]

We know that function $V$ satisfies system $\text{(8.20)}$ so that we have

\[
Z_1(V) = Z_2(V) = 0. \quad (8.26)
\]
System [8.26] is a system of two linear partial differential equations with respect to function \( G_3(\omega_1, \omega_2) \). We solve it as a linear inhomogeneous algebraic system in unknowns \( \frac{\partial G_3}{\partial \omega_1} \) and \( \frac{\partial G_3}{\partial \omega_2} \) and obtain
\[
\frac{\partial G_3}{\partial \omega_1} = \frac{\omega_1}{\omega_1^2 + \omega_2^2}, \quad \frac{\partial G_3}{\partial \omega_2} = \frac{\omega_2}{\omega_1^2 + \omega_2^2}.
\]

After integration these expressions lead to
\[
G_3(\omega_1, \omega_2) = \frac{1}{2} \log (\omega_1^2 + \omega_2^2) + C,
\]
where \( C \) is a constant which can be considered as a zero because it is added to a first integral. Thus from (8.25) we have
\[
V = i \arctan \frac{I_3 \omega_3}{\beta} + \frac{1}{2} \log (\omega_1^2 + \omega_2^2).
\]
As \( V = \log F \) we have
\[
F = \exp V = \frac{-I_3 \omega_3 + i \beta}{\pm I_2}.
\]

We remove the constant denominator and change the sign of the function. Let us note the obtained function by \( F_1 \). We have
\[
F_1 = I_3 \omega_3 - i \beta.
\]

\( F_1 \) satisfies equations (8.20) that means that in Case 1 with \( \varepsilon = 1 \), \( F_1 \) is a first integral of system (8.5).

Let now \( \varepsilon = -1 \). The considerations are exactly the same as above however now
\[
V = -i \arctan \frac{I_3 \omega_3}{\beta} + \frac{1}{2} \log (\omega_1^2 + \omega_2^2)
\]
and \( F = \exp V \) is
\[
F = \frac{I_2(\omega_1^2 + \omega_2^2)}{I_3 \omega_3 - i \beta}.
\]
Function \( F \) can be simplified. Indeed, as according to (8.19)
\[
\beta^2 = -I_2^2 (\omega_1^2 + \omega_2^2) - I_3^2 \omega_3^2,
\]
then
\[
\omega_1^2 + \omega_2^2 = -\frac{I_2^2 \omega_3^2 + \beta^2}{I_2^2} = -\frac{(I_3 \omega_3 + i \beta)(I_3 \omega_3 - i \beta)}{I_2^2}.
\]

We put the obtained value for \( \omega_1^2 + \omega_2^2 \) in the above expression for \( F \) and obtain
\[
F = -\frac{I_3 \omega_3 + i \beta}{I_2}.
\]

By removing the constant denominator \( I_2 \) and changing the sign of \( F \) we obtain a new function noted by \( F_2 \)
\[
F_2 = I_3 \omega_3 + i \beta.
\]

\( F_2 \) satisfies equations (8.20). Thus in Case 1 with \( \varepsilon = -1 \), \( F_2 \) is a first integral of system (8.5).
Case 2. Let $I_1 = I_2$, $c_1 = -ic_2$, $c_3 = 0$. The only difference in this case in comparison with Case 1 is that when $\varepsilon = 1$, $F_2$ is a first integral of system (8.5) and when $\varepsilon = -1$ the first integral is $F_1$.

The functional independence of these partial first integrals with $H_3$ follows from the fact that they do not depend on $\gamma_1$ while $H_3$ does.

Let us note that the partial first integrals $F_1$ and $F_2$ are algebraic without being rational. This is a new fact. Up to now, the known first integrals or partial first integrals not depending on all variables, have been polynomials.

Type 2. Let us study the existence of a first integral of type 2, i.e. $F = F(\omega_1, \omega_2, \gamma_1)$. Now we have

$$
\frac{dF}{dt} = \frac{1}{I_1 I_2 \omega_2} \left[ I_2 (I_2 - I_3) \omega_3^2 - I_1 c_3 \omega_1 \gamma_1 - (I_2 c_2 \omega_2 + I_3 c_3 \omega_3) R + c_3 U_1 \right] \frac{\partial F}{\partial \omega_1} \\
+ \frac{1}{I_2} \left[ (I_3 - I_1) \omega_1 \omega_3 + c_1 R - c_3 \gamma_1 \right] \frac{\partial F}{\partial \omega_2} \\
+ \frac{1}{I_2 \omega_2} \left[ -I_1 \omega_1 \omega_3 \gamma_1 - (I_2 \omega_2^2 + I_3 \omega_3^2) R + \omega_3 U_1 \right] \frac{\partial F}{\partial \gamma_1} = 0,
$$

or equivalently

$$
I_1 I_2 \omega_2 \frac{dF}{dt} = Y_1(F) = 0, \quad (8.27)
$$

where $Y_1$ is the corresponding vector field defined on $\Omega$.

Equation (8.27) should be an identity with respect to all four variables ($\omega_1, \omega_2, \omega_3, \gamma_1$). Similarly to the consideration of a first integral of type 1 if we differentiate identity (8.27) with respect to $\omega_3$ we will again obtain a linear partial differential equation for function $F$. We obtain

$$
\frac{\partial Y_1(F)}{\partial \omega_3} = \left[ I_2 (I_2 - I_3) \omega_3^2 - I_3 c_3 R - (I_2 c_2 \omega_2 + I_3 c_3 \omega_3) \frac{\partial R}{\partial \omega_3} \right] \frac{\partial F}{\partial \omega_1} \\
- I_1 \omega_2 \left[ (I_3 - I_1) \omega_1 - c_1 \frac{\partial R}{\partial \omega_3} \right] \frac{\partial F}{\partial \omega_2} \\
- I_1 \left[ I_1 \omega_1 \gamma_1 + 2I_3 \omega_3 R + (I_2 \omega_2^2 + I_3 \omega_3^2) \frac{\partial R}{\partial \omega_3} - U \right] \frac{\partial F}{\partial \gamma_1} = 0,
$$

i.e.

$$
\frac{\partial Y_1(F)}{\partial \omega_3} = Y_2(F) = 0, \quad (8.28)
$$

where $Y_2$ is the corresponding vector field defined on $\Omega$.

After differentiating identity (8.28) with respect to $\omega_3$ we obtain

$$
\frac{\partial Y_2(F)}{\partial \omega_3} = - \left[ 2I_3 c_3 \frac{\partial R}{\partial \omega_3} + (I_2 c_2 \omega_2 + I_3 c_3 \omega_3) \frac{\partial^2 R}{\partial \omega_3^2} \frac{\partial F}{\partial \omega_1} + I_1 c_3 \omega_2 \frac{\partial^2 R}{\partial \omega_3 \partial \omega_2} \frac{\partial F}{\partial \omega_2} \right] \\
- I_1 \left[ 2I_3 R + 4I_3 \omega_3 \frac{\partial R}{\partial \omega_3} + (I_2 \omega_2^2 + I_3 \omega_3^2) \frac{\partial^2 R}{\partial \omega_3^2} \frac{\partial F}{\partial \gamma_1} \right] = 0,
$$

i.e.

$$
\frac{\partial Y_2(F)}{\partial \omega_3} = Y_3(F) = 0, \quad (8.29)
$$
where $Y_3$ is the corresponding vector field defined on $\Omega$.

We already know that if a fourth integral $F$ exists, system (8.27)–(8.29) has a non-zero solution $\text{grad } F$ and it is possible if and only if the determinant $D$ of the coefficients of this system is identically equal to zero.

We compute $D$ and obtain a long expression which we do not write here. Let us note that $D$ has a non-zero factor $I_2^2 \omega_2$ and we note

$$\hat{D}(R) = \frac{D(R)}{I_2^2 \omega_2}.$$ 

It is clear that the equation $D(R) = 0$ is equivalent to $\hat{D}(R) = 0$.

Derivatives $\frac{\partial R}{\partial \omega_3}$ and $\frac{\partial^2 R}{\partial \omega_3^2}$ appear in $\hat{D}(R)$. To determine them we differentiate equation (8.3) with respect to $\omega_3$ two times. Taking into account that polynomial $C$ from (8.4) does not depend on $\omega_3$ we obtain

$$\frac{\partial Q}{\partial \omega_3} = \frac{\partial A}{\partial \omega_3} R^2 + \frac{\partial B}{\partial \omega_3} R + \frac{dQ}{dR} \frac{\partial R}{\partial \omega_3} = 0. \quad (8.30)$$

and

$$\frac{\partial^2 Q}{\partial \omega_3^2} = \frac{\partial^2 A}{\partial \omega_3^2} R^2 + 2 \frac{\partial A}{\partial \omega_3} \frac{\partial R}{\partial \omega_3} R + \frac{\partial^2 B}{\partial \omega_3^2} R + \frac{\partial B}{\partial \omega_3} \frac{\partial R}{\partial \omega_3} R + \frac{dQ}{dR} \frac{\partial^2 R}{\partial \omega_3^2} + \frac{dQ}{dR} \frac{\partial R}{\partial \omega_3} + \frac{dQ}{dR} \frac{\partial^2 R}{\partial \omega_3^2} = 0. \quad (8.31)$$

Like in the investigation for a first integral of type 1, by Proposition 4.1 we prove that if $R$ is a root of equation (8.3), then $\frac{dQ}{dR} \neq 0$. Of course, the resultant $\rho$ of polynomials $Q(R)$ and $\frac{dQ}{dR}$ is the same and we make the conclusion that $\frac{dQ}{dR} \neq 0$ (see formula (8.14)).

Thus we can correctly determine $\frac{\partial R}{\partial \omega_3}$ from equation (8.30) and put its value in (8.31). Then we easily determine $\frac{\partial^2 R}{\partial \omega_3^2}$ from (8.31). This determination is also correct because the coefficient in front of $\frac{\partial^2 R}{\partial \omega_3^2}$ is also $\frac{dQ}{dR}$.

Then we put the obtained values for the derivatives of $R$ in the expression for $\hat{D}(R)$ and obtain that $\hat{D}(R)$ has a non-zero factor $8I_3 R$ and denominator $(\frac{dQ}{dR})^3$. We note

$$\delta(R) = \left( \frac{dQ}{dR} \right)^3 8I_3 R \hat{D}(R),$$

where $\delta(R)$ is a polynomial of $R$ of degree five with coefficients which are polynomials of $\omega_1$, $\omega_2$, $\omega_3$ and $\gamma_1$. It is clear that the equation $\hat{D}(R) = 0$ is equivalent to $\delta(R) = 0$.

We know that if $Q(R) = 0$, then if in addition some supplementary first integral $F(\omega_1, \omega_2, \gamma_1)$ of system (8.5) exists, then also $\delta(R) = 0$. Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring $K[x]$, where $K = \text{Alg}(\omega_1, \omega_2, \omega_3, \gamma_1)$, the polynomial $Q(x)$ divides the polynomial $\delta(x)$.

Using Maple command rem we divide $\delta$ by $Q$ and obtain a remainder which is a polynomial $r$ of the form:

$$r(x) = \frac{I_3^4 \omega_1^4}{I_2^2 \omega_2^2 + I_3^2 \omega_3^2} (a_0 x + a_1),$$

where $a_0$ and $a_1$ are polynomials of $\omega_1$, $\omega_2$, $\omega_3$ and $\gamma_1$. 

According to Proposition 4.2 we know that if $R$ is a root of equation (8.3), then $a_0$ and $a_1$ should be identically equal to zero. We use $a_0$ only because it turns out to be sufficient for our purposes.

Polynomial $a_0$ has 81 coefficients. Thus we should equate to zero all of them. In this way we obtain a system of 81 equations for parameters $I_3$, $U_1$ and $U_2$. After two consecutive simplifications we obtain the reduced system which is very simple:

$$
c_3 = 0, \quad (I_1 - I_3)c_2 = 0, \quad (I_2 - I_3)c_1 = 0.
$$

The solutions are obvious:

$$
\{c_1 = 0, \ c_2 = 0, \ c_3 = 0\}, \ U_1, \ U_2, \ I_1, \ I_2 \text{ and } I_3 \text{ are parameters},
$$

$$
\{I_2 = I_3, \ c_2 = 0, \ c_3 = 0\}, \ U_1, \ U_2, \ I_1, \ I_3 \text{ and } c_1 \text{ are parameters},
$$

$$
\{I_1 = I_3, \ c_1 = 0, \ c_3 = 0\}, \ U_1, \ U_2, \ I_2, \ I_3 \text{ and } c_2 \text{ are parameters},
$$

$$
\{I_1 = I_3, \ I_2 = I_3, \ c_3 = 0\}, \ U_1, \ U_2, \ I_3, \ c_1 \text{ and } c_2 \text{ are parameters}.
$$

It is easily seen that these solutions lead to the Euler, Lagrange and kinetic symmetry cases, respectively. Thus the sought partial first integral of type 2 cannot exist.

**Type 4.** Finally let us investigate the possibilities for the existence of a first integral of type 4, $F(\omega_2, \omega_3, \gamma_1)$, i.e. when it does not depend on $\omega_1$.

As $F$ is a first integral of system (8.5) we have

$$
\frac{dF}{dt} = \frac{1}{I_2} \left[(I_3 - I_1)\omega_1\omega_3 + c_1 R - c_3 \gamma_1\right] \frac{\partial F}{\partial \omega_2}
$$

$$
+ \frac{1}{I_2 I_3 \omega_2} \left[I_2 (I_1 - I_2)\omega_1^2 + I_1 c_1 \omega_1 \gamma_1 + I_2 c_2 \omega_2 \gamma_1 + I_3 c_1 \omega_3 R - c_1 U_1\right] \frac{\partial F}{\partial \omega_3}
$$

$$
+ \frac{1}{I_2 \omega_2} \left[-I_1 \omega_1 \omega_3 \gamma_1 - (I_2 \omega_2^2 + I_3 \omega_3^2) R + \omega_3 U_1\right] \frac{\partial F}{\partial \gamma_1} = 0,
$$

or equivalently

$$
I_2 I_3 \omega_2 \frac{dF}{dt} = Y_1(F) = 0,
$$

(8.32)

where $Y_1$ is the corresponding vector field defined on $\Omega$.

Equation (8.32) should be an identity with respect to all four variables $(\omega_1, \omega_2, \omega_3, \gamma_1)$. As in the previous considerations taking into account that $F$ does not depend on $\omega_1$, differentiating identity (8.32) with respect to $\omega_1$ we obtain again a linear partial differential equation for function $F$

$$
\frac{\partial Y_1(F)}{\partial \omega_1} = I_3 \omega_2 \left[(I_3 - I_1)\omega_3 + c_1 \frac{\partial R}{\partial \omega_1}\right] \frac{\partial F}{\partial \omega_2}
$$

$$
+ \left[I_2 (I_1 - I_2)\omega_2^2 + I_1 c_1 \gamma_1 + I_3 c_1 \omega_3 \frac{\partial R}{\partial \omega_1}\right] \frac{\partial F}{\partial \omega_3}
$$

$$
+ I_3 \left[-I_1 \omega_3 \gamma_1 - (I_2 \omega_2^2 + I_3 \omega_3^2) \frac{\partial R}{\partial \omega_1}\right] \frac{\partial F}{\partial \gamma_1} = Y_2(F) = 0,
$$

(8.33)

where $Y_2$ is the corresponding vector field defined on $\Omega$. 
We differentiate identity \([8.33]\) with respect to \(\omega_1\) and obtain
\[
\frac{1}{I_3} \frac{\partial Y_2(F)}{\partial \omega_1} = \frac{\partial^2 R}{\partial \omega_1^2} \left[ c_1 \omega_2 \frac{\partial F}{\partial \omega_2} + c_1 \omega_3 \frac{\partial F}{\partial \omega_3} - (I_2 \omega_2^2 + I_3 \omega_3^2) \frac{\partial F}{\partial \gamma_1} \right] = Y_3(F) = 0, \quad (8.34)
\]
where \(Y_3\) is the corresponding vector field defined on \(\Omega\).

Let us first suppose that \(\frac{\partial^2 R}{\partial \omega_1^2} \neq 0\). In such a case, if first integral \(F\) exists then the system \([8.32]\)–\([8.34]\) has a non-zero solution \(\text{grad} F\). This is possible if and only if the determinant \(D\) of the coefficients of this system is identically equal to zero.

Let us compute \(D\). We have
\[
D = I_2 I_3 \omega_2^2 \frac{\partial^2 R}{\partial \omega_1^2} \hat{D},
\]
where
\[
\hat{D} = I_2 (I_1 - I_2) c_3 \omega_2^3 \gamma_1 - I_2 (I_1 - I_3) c_2 \omega_2^3 \omega_3 \gamma_1 + I_3 (I_1 - I_2) c_3 \omega_2 \omega_3^2 \gamma_1
+ (I_2 - I_3) c_1 U_1 \omega_2 \omega_3 + I_1 c_2 c_3 \omega_2 \gamma_1^2 - I_3 (I_1 - I_3) c_2 \omega_2 \omega_3 \gamma_1 - I_1 c_1 \omega_2 \gamma_1^2 \omega_3.
\]
As \(I_2 I_3 \omega_2^2 \frac{\partial^2 R}{\partial \omega_1^2} \neq 0\) we use \(\hat{D}\) instead of \(D\).

Polynomial \(\hat{D}\) has 7 coefficients. Equating to zero all of them we obtain a system of 7 equations for parameters \(I_2c\) and \(U_1\). After two consecutive simplifications we obtain the reduction (see Sec. 3) of this system that consists of 6 equations as follows:
\[
\begin{align*}
&c_1 c_3 = 0, \quad (I_1 - I_2) c_3 = 0, \quad c_1 c_2 = 0, \quad (I_1 - I_3) c_2 = 0, \\
&(I_2 - I_3) c_2 c_3 = 0, \quad (I_2 - I_3) c_1 U_1 = 0.
\end{align*}
\]
\(8.35\)

A simple case analysis leads to a set of six solutions that the Maple command \texttt{solve} gives in the following way:
\[
\begin{align*}
&\{U_1 = 0, \quad I_1 = I_1, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_2 = 0, \quad c_3 = 0\}, \\
&\{U_1 = U_1, \quad I_1 = I_1, \quad I_2 = I_3, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_2 = 0, \quad c_3 = 0\}, \\
&\{U_1 = U_1, \quad I_1 = I_3, \quad I_2 = I_3, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = c_2, \quad c_3 = c_3\}, \\
&\{U_1 = U_1, \quad I_1 = I_3, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = c_2, \quad c_3 = 0\}, \\
&\{U_1 = U_1, \quad I_1 = I_2, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = 0, \quad c_3 = c_3\}, \\
&\{U_1 = U_1, \quad I_1 = I_1, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = 0, \quad c_3 = 0\}.
\end{align*}
\]

This list should be understood as follows. If an equation \(U_i = U_i\) or \(I_i = I_i\) or \(c_i = c_i\), \(1 \leq i \leq 3\), appears we should consider the corresponding parameter as an arbitrary complex number. For example, let us consider the third row. There \(U_1, I_3, c_2\) and \(c_3\) are arbitrary complex numbers but \(I_1, I_2\) and \(c_1\) have fixed values. Some of these fixed values can depend on the chosen value of some arbitrary parameter like in this example \(I_1\) and \(I_2\) depend on the arbitrary fixed value of \(I_3\).

We remove the solutions that lead to the Euler, Lagrange and kinetic symmetry cases and obtain only one new solution
\[
\{U_1 = 0, \quad I_1 = I_1, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_2 = 0, \quad c_3 = 0\}.
\]

Let us study this solution. Therefore we have \(U_1 = 0, \quad c_2 = c_3 = 0\) and \(I_i \neq 0, \quad 1 \leq i \leq 3\), and \(c_1\) are arbitrary parameters. In this case \(\hat{D} = 0\). Thus vector fields
Y_i \neq 0, 1 \leq i \leq 3$, (see (8.32)–(8.34)) are linearly dependent. More precisely the following equation

\[ Y_1 = \omega_1 Y_2 + I_3 \left( R - \omega_1 \frac{\partial R}{\partial \omega_1} \right) Y_3 \]

holds.

We remove vector field $Y_1$ because it is a linear combination of $Y_2$ and $Y_3$ and compute the Lie bracket $Z = [Y_2, Y_3]$

\[
Z = I_3 c_1 \omega_2 \left[ (I_2 \omega_2^2 + I_3 \omega_3^2) \frac{\partial^2 R}{\partial \omega_1 \partial \gamma_1} - c_1 \omega_2 \frac{\partial^2 R}{\partial \omega_1 \partial \omega_2} - c_1 \omega_3 \frac{\partial^2 R}{\partial \omega_1 \partial \omega_3} + (I_1 - I_3) \omega_3 \right] \frac{\partial}{\partial \omega_2} \\
+ c_1 \left\{ I_3 \omega_3 \left[ (I_2 \omega_2^2 + I_3 \omega_3^2) \frac{\partial^2 R}{\partial \omega_1 \partial \gamma_1} - c_1 \omega_2 \frac{\partial^2 R}{\partial \omega_1 \partial \omega_2} - c_1 \omega_3 \frac{\partial^2 R}{\partial \omega_1 \partial \omega_3} \right] \\
+ I_2^2 \omega_2^2 + I_1 I_3 \omega_3^2 + I_1 c_1 \gamma_1 \right\} \frac{\partial}{\partial \omega_3} \\
- I_3 \left\{ (I_2 \omega_2^2 + I_3 \omega_3^2) \left[ (I_2 \omega_2^2 + I_3 \omega_3^2) \frac{\partial^2 R}{\partial \omega_1 \partial \gamma_1} - c_1 \omega_2 \frac{\partial^2 R}{\partial \omega_1 \partial \omega_2} - c_1 \omega_3 \frac{\partial^2 R}{\partial \omega_1 \partial \omega_3} \right] \\
+ I_2 (I_1 - 2I_2 + 2I_3) \omega_2^2 \omega_3 + I_1 I_3 \omega_3^3 + I_1 c_1 \omega_3 \gamma_1 \right\} \frac{\partial}{\partial \gamma_1}.
\]

As we have already known if a first integral $F$ of the sought type exists, then it should satisfy the following system

\[ Y_2(F) = Y_3(F) = Z(F) = 0 \]

and the determinant of the coefficients of that system should be identically equal to zero. We compute the determinant and obtain the following expression

\[ -I_2 I_3 (I_2 - I_3) c_1 \omega_3^3 \omega_3 \left[ I_2 \omega_2^2 (3I_1 - 2I_2) + I_3 \omega_3^2 (3I_1 - 2I_3) + 4I_1 c_1 \gamma_1 \right]. \]

It is easily seen that this expression can be identically equal to zero only if $I_2 = I_3$ or if $c_1 = 0$. The first possibility leads to the Lagrange case and the second one - to the Euler case.

Thus if we suppose that $\frac{\partial^2 R}{\partial \omega_1^2} \neq 0$, then a first integral of type 4, i.e. $F(\omega_2, \omega_3, \gamma_1)$ does not exist.

Let us suppose now that $\frac{\partial^2 R}{\partial \omega_1^2} = 0$. In such a case we have

\[ R = f(\omega_2, \omega_3, \gamma_1) \omega_1 + g(\omega_2, \omega_3, \gamma_1), \quad (8.36) \]

where $f$ and $g$ are arbitrary smooth functions not depending on $\omega_1$.

We put the value of $R$ from (8.36) in (8.3) and obtain

\[
Q = \left[ (I_2^2 \omega_2^2 + I_3^2 \omega_3^2) f^2 + 2I_1 I_3 \omega_3 \gamma_1 f + I_1^2 \gamma_1^2 \right] \omega_1^2 \\
+ 2 \left[ (I_2^2 \omega_2^2 + I_3^2 \omega_3^2) g f - I_3 U_3 \omega_3 f + I_3 U_3 \omega_3 \gamma_1 g - I_1 U_1 \gamma_1 \right] \omega_1 \\
+ \left( I_2^2 \omega_2^2 + I_3^2 \omega_3^2 \right) g^2 + I_2^2 \omega_2^2 \gamma_1^2 + U_2 \omega_2^2 - U_2 \omega_2^2 - 2I_3 U_1 \omega_3 g + I_2^2 U_1^2 = 0,
\]

that is $Q$ is a polynomial of second degree of $\omega_1$ with coefficients depending on $\omega_2$, $\omega_3$ and $\gamma_1$. As $Q = 0$, then its three coefficients should be zeros.
We equate to zero the coefficient of \( Q \) in front of \( \omega_1^2 \) and determine \( f \) from the obtained equation. We have

\[
f = \frac{I_1(i\varepsilon I_2\omega_2 - I_3\omega_3)\gamma_1}{I_2^2\omega_2^2 + I_3^2\omega_3^2},
\]

where \( \varepsilon = \pm 1 \).

With this value of \( f \) we equate to zero the coefficient of \( Q \) in front of \( \omega_1 \) and determine \( g \) as follows

\[
g = -\frac{iU_1(I_2\omega_2 + iI_3\varepsilon\omega_3)\gamma_1}{\varepsilon(I_2^2\omega_2^2 + I_3^2\omega_3^2)}.
\]

Using these values of \( f \) and \( g \) and having in mind that \( \varepsilon^2 = 1 \), we equate to zero the constant term of polynomial \( Q \) developed in powers of \( \omega_1 \), that is the value of polynomial \( Q \) when \( \omega_1 = 0 \) and obtain

\[
\frac{I_2^2\omega_2^2(I_2^2\omega_2^2 + I_3^2\omega_3^2)(\gamma_1^2 - U_2)}{I_2^2\omega_2^2 + I_3^2\omega_3^2} = 0.
\]

Taking into account that \( I_2^2\omega_2^2, I_2^2\omega_2^2 + I_3^2\omega_3^2 \) and \( \gamma_1^2 - U_2 \) never vanish identically, we conclude that the last equality cannot be fulfilled.

Thus a first integral of type 4, i.e. \( F(\omega_2, \omega_3, \gamma_1) \) does not exist also in the case when \( \frac{\partial^2 R}{\partial \omega_1^2} = 0 \).

### 8.2.2. Elimination of \( \omega_1 \) and \( \gamma_1 \)

We eliminate variables \( \omega_1 \) and \( \gamma_1 \) from equations \( H_1 = U_1, \ H_2 = U_2 \) and obtain the following solution:

\[
\begin{align*}
\omega_1 &= -\frac{I_2\omega_2\gamma_2 + I_3\omega_3\gamma_3 - U_1}{I_1\sqrt{-\gamma_2^2 - \gamma_3^2 + U_2}}, & \gamma_1 &= \sqrt{-\gamma_2^2 - \gamma_3^2 + U_2}.
\end{align*}
\]

Further to simplify the formulas we note

\[
\Gamma = \sqrt{-\gamma_2^2 - \gamma_3^2 + U_2}.
\]

As all our considerations are local we can restrict ourselves to some suitable open set \( \Omega \subseteq C^4(\omega_2, \omega_3, \gamma_2, \gamma_3) \).

We put the values of \( \omega_1 \) and \( \gamma_1 \) from [8.37] in the Euler-Poisson equations (1.1) and remove the first and fourth equations. In this way we obtain the following system of four equations in unknowns \( \omega_2, \omega_3, \gamma_2 \) and \( \gamma_3 \):

\[
\begin{align*}
\frac{d\omega_2}{dt} &= \frac{\mathbf{I}_1 I_3}{I_1 I_2 \Gamma} (I_1 - I_3)(I_2\omega_2\gamma_2 + I_3\omega_3\gamma_3 - U_1)\omega_3 - I_1 c_3 \Gamma^2 + I_1 e_1 \gamma_3 \Gamma, \\
\frac{d\omega_3}{dt} &= -\frac{\mathbf{I}_1 I_3 \Gamma}{I_1 I_2 \Gamma} (I_1 - I_2)(I_2\omega_2\gamma_2 + I_3\omega_3\gamma_3 - U_1)\omega_2 - I_1 c_2 \Gamma^2 + I_1 e_1 \gamma_2 \Gamma, \\
\frac{d\gamma_2}{dt} &= -\frac{\mathbf{I}_1 I_3 \Gamma}{I_1 \Gamma} (I_2\omega_2\gamma_2 + I_3\omega_3\gamma_3 - U_1)\gamma_3 + I_1 \omega_3 \Gamma^2, \\
\frac{d\gamma_3}{dt} &= \frac{\mathbf{I}_1 I_3 \Gamma}{I_1 \Gamma} (I_2\omega_2\gamma_2 + I_3\omega_3\gamma_3 - U_1)\gamma_2 + I_1 \omega_2 \Gamma^2.
\end{align*}
\]

Here we study whether system (8.38) has a first integral that depends on at most three variables among the variables \( (\omega_2, \omega_3, \gamma_2, \gamma_3) \) and that is functionally independent
of $H_3$ restricted to invariant manifold (8.1). Thus we should investigate the following four types of a new first integral:

1. $F(\omega_2, \omega_3, \gamma_2)$, (case (iii))
2. $F(\omega_2, \omega_3, \gamma_3)$, (case (iii))
3. $F(\omega_2, \gamma_2, \gamma_3)$, (case (iv))
4. $F(\omega_3, \gamma_2, \gamma_3)$. (case (iv))

As local partial first integrals belonging to case (iii) were already excluded in Sec. 8.2.1, we will now study if the function of type 3, belonging to case (iv) can be a local partial first integral of the Euler-Poisson equations (1.1).

**Type 3.** Let us study the existence of a first integral $F$ of type 3, i.e. $F = F(\omega_2, \gamma_2, \gamma_3)$. $F$ being a first integral of system (8.38) satisfies the following equation

$$\frac{dF}{dt} = (I_1 - I_3)\omega_3(2I_2\omega_2\gamma_2 + I_3\omega_3\gamma_3 - U_1) - I_1c_3\Gamma^2 + I_1c_1\gamma_3\Gamma \frac{\partial F}{\partial \omega_2}$$

$$- \gamma_3(2I_2\omega_2\gamma_2 + I_3\omega_3\gamma_3 - U_1) + I_1\omega_3\Gamma \frac{\partial F}{\partial \gamma_2}$$

$$+ \gamma_2(2I_2\omega_2\gamma_2 + I_3\omega_3\gamma_3 - U_1) + I_1\omega_2\Gamma \frac{\partial F}{\partial \gamma_3} = 0,$$

or equivalently

$$I_1I_2\Gamma \frac{dF}{dt} = Y(F) = 0, \quad (8.39)$$

where $Y$ is the corresponding vector field defined on $\Omega$.

The left hand side of equation (8.39), i.e. $Y(F)$, is a polynomial of $\omega_3$ of degree two with coefficients depending on parameters $\mathcal{I}, U_1, U_2$ and variables $(\omega_2, \gamma_2, \gamma_3)$.

Let us write $Y(F)$ as follows

$$Y(F) = Y_1(F)\omega_3^2 + Y_2(F)\omega_3 + Y_3(F),$$

where $Y_i, 1 \leq i \leq 3$, are the following vector fields:

$$Y_1 = I_3\gamma_3(I_1 - I_3) \frac{\partial}{\partial \omega_2},$$

$$Y_2 = (I_1 - I_3)(2I_2\omega_2\gamma_2 - U_1) \frac{\partial}{\partial \omega_2} + I_2 \left[ I_1\gamma_2^2 + (I_1 - I_3)\gamma_3^2 - I_1U_2 \right] \frac{\partial}{\partial \gamma_2} + I_2I_3\gamma_2\gamma_3 \frac{\partial}{\partial \gamma_3},$$

$$Y_3 = I_1(c_3\gamma_2^2 + c_3\gamma_3^2 + c_1\gamma_3\Gamma - c_3U_2) \frac{\partial}{\partial \omega_2} - I_2\gamma_3(2I_2\omega_2\gamma_2 - U_1) \frac{\partial}{\partial \gamma_2}$$

$$- I_2 \left[ (I_1 - I_2)\omega_2\gamma_2^2 + I_1\omega_2\gamma_3^2 - I_1U_2\omega_2 + U_1\gamma_2 \right] \frac{\partial}{\partial \gamma_3},$$

defined on $\Omega$.

$Y(F)$ should be identically equal to zero with respect to all four variables $\omega_2, \omega_3, \gamma_2$ and $\gamma_3$. As $Y_i(F), 1 \leq i \leq 3$, do not depend on $\omega_3$ we have the following three equations:

$$Y_1(F) = Y_2(F) = Y_3(F) = 0. \quad (8.40)$$
If a first integral $F = F(\omega_2, \gamma_2, \gamma_3)$ exists then system (8.40) has a non-zero solution $\nabla F$. We know that this is possible if and only if the determinant $D$ of system (8.40) is identically equal to zero. We compute $D$ and obtain

$$D = I_1 I_2^2 I_3 (I_1 - I_3) \gamma_3 \Gamma^2 \left[ (I_1 - I_2) \omega_2 \gamma_2^2 + (I_1 - I_3) \omega_2 \gamma_3^2 - I_1 U_2 \omega_2 + \gamma_2 U_1 \right] = 0.$$ 

One can easily see that $D \equiv 0$ if and only if

$$I_1 = I_3. \quad (8.41)$$

Let us study this case. Now $Y_1 = 0$ but simple computations show that vector fields $Y_2$ and $Y_3$ are always linearly independent. We compute Lie bracket $Z = [Y_2, Y_3]/(I_2 I_3)$ and obtain

$$Z = 2I_3 \gamma_2 \Gamma (c_1 \gamma_3 - c_3 \Gamma) \frac{\partial}{\partial \omega_2} + I_2 (I_2 U_2 \omega_2 - U_1 \gamma_2) \gamma_3 \frac{\partial}{\partial \gamma_2}$$

$$+ I_2 \left\{ [(I_3 - I_2) \Gamma^2 - I_2 U_2] \omega_2 \gamma_2 - U_1 \gamma_3^2 + U_1 U_2 \right\} \frac{\partial}{\partial \gamma_3}.$$

Second and third equations (8.40) imply that $Z(F) = 0$ and we come to the following system for first integral $F$:

$$Y_2(F) = Y_3(F) = Z(F) = 0. \quad (8.42)$$

As above we should study when determinant $\hat{D}$ of system (8.42) is identically equal to zero. We compute $\hat{D}$ and obtain $\hat{D} = d_1 d_2 d_3$, where

$$d_1 = I_2^3 I_3^3 \Gamma^2,$$

$$d_2 = (c_1 \gamma_3 - c_3 \Gamma) \Gamma,$$

$$d_3 = (I_3 - I_2) \omega_2 \gamma_2^3 - (2I_2 + I_3) U_2 \omega_2 \gamma_2 + 2U_1 \gamma_2^2 + U_1 U_2.$$

It is clear that $d_1$ never vanishes identically. If $d_2$ vanishes then it follows that $c_1 = c_3 = 0$ which together with condition (8.41) leads to the Lagrange case. The third factor $d_3 = 0$ if and only if $I_2 = I_3$ and $U_1 = U_2 = 0$. But taking into account (8.41) this is a particular case of the kinetic symmetry case. Thus a partial first integral of type 3 does not exist.

It only remains to study the functions belonging to the cases (v) and (vi).

8.2.3. Elimination of $\omega_1$ and $\gamma_2$. Solving equations $H_1 = U_1$, $H_2 = U_2$ with respect to $\omega_1$ and $\gamma_2$ we obtain:

$$\omega_1 = - \frac{I_2 \omega_2 \sqrt{-\gamma_1^2 - \gamma_3^2 + U_2} + I_3 \omega_2 \gamma_3 - U_1}{I_1 \gamma_1}, \quad \gamma_1 = \sqrt{-\gamma_1^2 - \gamma_3^2 + U_2}. \quad (8.43)$$

To simplify the formulas we note

$$\Gamma = \sqrt{-\gamma_1^2 - \gamma_3^2 + U_2}.$$

As till now we restrict ourselves to some suitable open set $\Omega \subseteq \mathbb{C}^4(\omega_2, \omega_3, \gamma_1, \gamma_3)$.

We put the values of $\omega_1$ and $\gamma_2$ from (8.43) in the Euler-Poisson equations (1.1) and remove the first and fifth equations. In this way we obtain the following system of four
equations in unknowns $\omega_2$, $\omega_3$, $\gamma_1$ and $\gamma_3$:

\[
\begin{align*}
\frac{d\omega_2}{dt} &= \frac{(I_1 - I_3)(I_3\omega_2\gamma_3 + I_2\omega_2\Gamma - U_1)\omega_3 - (I_1c_3\gamma_1 - I_1c_1\gamma_3)\gamma_1}{I_1I_2\gamma_1}, \\
\frac{d\omega_3}{dt} &= -\frac{(I_1 - I_2)(I_3\omega_3\gamma_3 + I_2\omega_2\Gamma - U_1)\omega_2 - (I_1c_2\gamma_1 - I_1c_1\Gamma)\gamma_1}{I_1I_3\gamma_1}, \\
\frac{d\gamma_1}{dt} &= \omega_3\Gamma - \omega_2\gamma_3, \\
\frac{d\gamma_3}{dt} &= \frac{(I_1\gamma_1^2 + I_2\Gamma^2)\omega_2 + I_3\omega_3\gamma_3\Gamma - U_1\Gamma}{I_1\gamma_1}.
\end{align*}
\]

Here we look for first integrals of system (8.44) of the following four types:

1. $F(\omega_2, \omega_3, \gamma_1)$, case(ii)
2. $F(\omega_2, \omega_3, \gamma_3)$, case(iii)
3. $F(\omega_2, \gamma_1, \gamma_3)$, case(v)
4. $F(\omega_3, \gamma_1, \gamma_3)$, case(iv)

requiring in addition that they are functionally independent of $H_3$ restricted to invariant manifold (8.1). The functions from cases (ii), (iii) and (iv) was already examined. There remains only to examine case (v).

**Type 3.** Let us study the existence of a partial first integral of type 3 $F(\omega_2, \gamma_1, \gamma_3)$ belonging to case (v). Then we have

\[
\frac{dF}{dt} = \frac{(I_1 - I_3)(I_3\omega_3\gamma_3 + I_2\omega_2\Gamma - U_1)\omega_3 - (I_1c_3\gamma_1 - I_1c_1\gamma_3)\gamma_1 \partial F}{I_1I_2\gamma_1} \\
+ (\omega_3\Gamma - \omega_2\gamma_3) \frac{\partial F}{\partial \gamma_1} + \frac{(I_1\gamma_1^2 + I_2\Gamma^2)\omega_2 + I_3\omega_3\gamma_3\Gamma - U_1\Gamma \partial F}{I_1\gamma_1} \frac{\partial F}{\partial \gamma_3} = 0,
\]

or equivalently

\[
I_1I_2\gamma_1 \frac{dF}{dt} = Y(F) = 0,
\]

where $Y$ is the corresponding vector field defined on $\Omega$.

$Y(F)$ is a polynomial of $\omega_3$ of degree two with coefficients depending on parameters $Ic$, $U_1$, $U_2$ and variables $\omega_2$, $\gamma_1$ and $\gamma_3$.

Let us write $Y(F)$ in the following way

\[
Y(F) = Y_1(F)\omega_3^2 + Y_2(F)\omega_3 + Y_3(F),
\]

where $Y_i$, $1 \leq i \leq 3$, are:

\[
\begin{align*}
Y_1 &= I_3(I_1 - I_3)\gamma_3 \frac{\partial}{\partial \omega_2}, \\
Y_2 &= (I_1 - I_3)(I_2\omega_2\Gamma - U_1) \frac{\partial}{\partial \omega_2} + I_1I_2\gamma_1\Gamma \frac{\partial}{\partial \gamma_1} + I_2I_3\gamma_3 \frac{\partial}{\partial \gamma_3}, \\
Y_3 &= I_1\gamma_1(c_1\gamma_3 - c_3\gamma_1) \frac{\partial}{\partial \omega_2} - I_1I_2\omega_2\gamma_1\gamma_3 \frac{\partial}{\partial \gamma_1} + I_2 \left[ (I_2\Gamma^2 + I_1\gamma_1^2)\omega_2 - U_1\Gamma \right] \frac{\partial}{\partial \gamma_3}.
\end{align*}
\]

$Y(F)$ should be identically equal to zero with respect to all four variables $\omega_2$, $\omega_3$, $\gamma_2$
and \( \gamma_3 \). As \( Y_i(F) \), \( 1 \leq i \leq 3 \), do not depend on \( \omega_3 \) we have

\[
Y_1(F) = Y_2(F) = Y_3(F) = 0. \tag{8.45}
\]

If a first integral \( F = F(\omega_2, \gamma_2, \gamma_3) \) exists then the determinant \( D \) of system (8.45) is identically equal to zero. We compute \( D \) and obtain

\[
D = I_1 I_2^2 I_3 (I_1 - I_3) \gamma_1 \gamma_3 \Gamma \left\{ \omega_2 ((I_1 - I_2) \gamma_1^2 + (I_3 - I_2) \gamma_3^2 + I_2 U_2) - U_1 \Gamma \right\} = 0.
\]

It is easily seen that \( D \) vanishes identically if either

\[
I_1 = I_3 \tag{8.46}
\]

or the expression in the curly brackets vanishes. This expression is a linear function of \( \omega_2 \) and we should require that its two coefficients vanish. But this leads to the kinetic symmetry case with the additional restriction \( U_1 = U_2 = 0 \).

Thus we study only the case (8.46). Now \( Y_1 = 0 \) but simple computations show that outside of the particular case \( (U_1 = U_2 = 0) \) of the kinetic symmetry vector fields \( Y_2 \) and \( Y_3 \) are always linearly independent. We compute Lie bracket \( Z = [Y_2, Y_3] \) and obtain

\[
\frac{Z \Gamma}{I_2 I_3} = 2 I_3 \gamma_1 (c_1 \gamma_3 - c_3 \gamma_1) \Gamma^2 \frac{\partial}{\partial \omega_2} + I_2 \gamma_1 \gamma_3 \Gamma \left[ (I_2 - I_3) \omega_2 \Gamma - U_1 \right] \frac{\partial}{\partial \gamma_1}
\]

\[
+ I_2 \Gamma \left[ \omega_2 (I_3 \gamma_1^2 - I_2 \gamma_1^2 - I_2 U_2) - U_1 \gamma_3^2 + U_1 U_2 \right] \frac{\partial}{\partial \gamma_3}.
\]

Second and third equations (8.45) imply that \( Z(F) = 0 \) and thus

\[
\tilde{Z}(F) = \frac{Z \Gamma}{I_2 I_3} = 0.
\]

In this way we come to the following system for first integral \( F \):

\[
Y_2(F) = Y_3(F) = \tilde{Z}(F) = 0. \tag{8.47}
\]

As above we should find the cases when determinant \( \tilde{D} \) of system (8.47) is identically equal to zero. We compute \( \tilde{D} \) and obtain \( \tilde{D} = d_1 d_2 \), where

\[
d_1 = I_2^2 I_3^2 \gamma_1^2 (c_1 \gamma_3 - c_3 \gamma_1) \Gamma^2,
\]

\[
d_2 = [(I_3 - I_2) \gamma_1^2 + (I_3 - I_2) \gamma_3^2 + 3 I_2 U_2] \omega_2 \Gamma - U_1 (2 \Gamma^2 + U_2).
\]

It is clear that \( d_1 \) vanishes identically only when \( c_1 = c_3 = 0 \) which together with condition (8.46) leads to the Lagrange case. As \( d_2 \) is a linear function of \( \omega_2 \) equation \( d_2 = 0 \) is fulfilled if and only if its two coefficients with respect to \( \omega_2 \) vanish identically. Thus \( I_2 = I_3 \) and \( U_1 = U_2 = 0 \). Taking into account (8.46) this is a particular case of the kinetic symmetry case. Thus a partial first integral of type 3 does not exist.

**8.2.4. First integrals** \( F(\gamma_1, \gamma_2, \gamma_3) \). Finally it remains to study the existence of the partial first integral \( F(\gamma_1, \gamma_2, \gamma_3) \), that cannot be studied by elimination of variables like above.

We have \( H_2 = \gamma_1^2 + \gamma_2^2 + \gamma_3^2 = U_2 \), thus \( \gamma_1 = \sqrt{-\gamma_2^2 - \gamma_3^2 + U_2} \) and then

\[
F(\gamma_1, \gamma_2, \gamma_3) = F(\sqrt{-\gamma_2^2 - \gamma_3^2 + U_2}, \gamma_2, \gamma_3) = \tilde{F}(\gamma_2, \gamma_3).
\]
Our problem now is reduced to the study of partial first integrals of the form $\tilde{F} = \tilde{F}(\gamma_2, \gamma_3)$ on the submanifold \{\(H_1 = U_1\}\}. Absence of these partial first integrals follows from Sec. 8.2.2 where the absence of partial first integrals of more general form \(F(\omega_i, \gamma_2, \gamma_3), i = 2, 3, \) is proved for all \(U_1 \) and \(U_2\).

### 8.3. Invariant manifold \{\(H_1=U_1, \ H_3=U_3\)\}

Here we study the existence of a partial first integral of the Euler-Poisson equations (1.1) restricted to the complex four-dimensional level manifold

\[
\{H_1 = U_1, \ H_3 = U_3\}, \tag{8.48}
\]

supposing that this partial first integral depends on at most three variables and that is functionally independent of \(H_2\).

#### 8.3.1. Elimination of \(\omega_1\) and \(\omega_2\)

In the same way as in Sec. 8.2.1 we express \(\omega_1\) and \(\omega_2\) from the equations \(H_1 = U_1\) and \(H_3 = U_3\) and obtain the following solution:

\[
\omega_1 = -\frac{I_2 R\gamma_2 + I_3 \omega_3 \gamma_3 - U_1}{I_1 \gamma_1}, \quad \omega_2 = R, \tag{8.49}
\]

where \(R\) is a root of equation

\[
Q(x) = Ax^2 + Bx + C = 0,
\]

that is

\[
Q(R) = AR^2 + BR + C = 0. \tag{8.50}
\]

Here the functions \(A = A(\gamma_1, \gamma_2)\), \(B = B(\omega_3, \gamma_2, \gamma_3)\) and \(C = C(\omega_3, \gamma_1, \gamma_2, \gamma_3)\) are the following polynomials:

\[
A = I_2(I_1 \gamma_1^2 + I_2 \gamma_2^2), \quad B = 2I_2 \gamma_2(I_3 \omega_3 \gamma_3 - U_1),
\]

\[
C = I_1 I_3 \omega_3^2 \gamma_1^2 + I_3^2 \omega_5^2 \gamma_3^2 - 2I_3 U_1 \omega_3 \gamma_3 + 2I_1 c_1 \gamma_1^3 + 2I_1 c_2 \gamma_1^2 \gamma_2 + 2I_1 c_3 \gamma_1^2 \gamma_3 - I_1 U_3 \gamma_1^2 + U_2. \tag{8.51}
\]

We put the values of \(\omega_1\) and \(\omega_2\) from (8.49) in the Euler-Poisson equations (1.1) and remove the first and second equations. In this way we have the following system of four equations in unknowns \(\omega_3, \gamma_1, \gamma_2\) and \(\gamma_3\):

\[
\frac{d\omega_3}{dt} = -\frac{(I_1 - I_2)(I_2 \gamma_2 R + I_3 \omega_3 \gamma_3 - U_1)R - I_1(\gamma_1 c_2 - c_1 \gamma_2)\gamma_1}{I_1 I_3 \gamma_1},
\]

\[
\frac{d\gamma_1}{dt} = \omega_3 \gamma_2 - \gamma_3 R, \tag{8.52}
\]

\[
\frac{d\gamma_2}{dt} = -\frac{(I_2 R \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)\gamma_3 + I_1 \omega_3 \gamma_1^2}{I_1 \gamma_1},
\]

\[
\frac{d\gamma_3}{dt} = \frac{(I_1 \gamma_1^2 + I_2 \gamma_2^2)R + (I_3 \omega_3 \gamma_3 - U_1)\gamma_2}{I_1 \gamma_1}.
\]

Now we study the existence of a first integral of system (8.52) that depends on at most three variables among the variables \((\omega_3, \gamma_1, \gamma_2, \gamma_3)\) and that is functionally independent of \(H_2\) restricted to invariant manifold (8.48). Thus we should investigate the following four types of a first integral:

1. \(F(\omega_3, \gamma_1, \gamma_2), \) (case (iv))
2. \( F(\omega_3, \gamma_1, \gamma_3) \), (case (iv))
3. \( F(\omega_3, \gamma_2, \gamma_3) \), (case (iv))
4. \( F(\gamma_1, \gamma_2, \gamma_3) \). (case (vi))

Then, like in Sec. 5 it suffices to examine the functions of types 1 and 4 respectively.

**Type 1.** Let us consider the existence of a first integral \( F \) of system (8.52) which is of type 1, i.e. \( F = F(\omega_3, \gamma_1, \gamma_2) \). Thus

\[
\frac{dF}{dt} = -(I_1 - I_2)(I_2 \gamma_2 R + I_3 \omega_3 \gamma_3 - U_1)R - I_1(\gamma_1 c_2 - c_1 \gamma_2) \gamma_1 \frac{\partial F}{\partial \omega_3}
+ (\omega_3 \gamma_2 - \gamma_3 R) \frac{\partial F}{\partial \gamma_1} - \frac{(I_2 R \gamma_2 + I_3 \omega_3 \gamma_3 - U_1) \gamma_3 + I_1 \omega_3 \gamma_1^2}{I_1 \gamma_1} \frac{\partial F}{\partial \gamma_2} = 0.
\]

We rewrite the above equation as follows

\[
I_1 I_3 \gamma_1 \frac{dF}{dt} = Y_1(F) = 0,
\]

where \( Y_1 \) is the corresponding vector field defined on some suitable open set \( \Omega \subseteq \mathbb{C}^4(\omega_3, \gamma_1, \gamma_2, \gamma_3) \).

We differentiate identity (8.53) with respect to \( \gamma_3 \) and obtain a linear partial differential equation for function \( F \)

\[
\frac{\partial Y_1(F)}{\partial \gamma_3} = (I_1 - I_2) \left[ -2I_2 \gamma_2 R \frac{\partial R}{\partial \gamma_3} - I_3 \omega_3 R - (I_3 \omega_3 \gamma_3 - U_1) \frac{\partial R}{\partial \gamma_3} \right] \frac{\partial F}{\partial \omega_3}
- I_1 I_3 \gamma_1 \left( R + \gamma_3 \frac{\partial R}{\partial \gamma_3} \right) \frac{\partial F}{\partial \gamma_1}
- I_3 \left[ 2I_3 \omega_3 \gamma_3 + I_2 \gamma_2 \left( R + \gamma_3 \frac{\partial R}{\partial \gamma_3} \right) - U_1 \right] \frac{\partial F}{\partial \gamma_2} = Y_2(F) = 0,
\]

where \( Y_2 \) is the corresponding vector field defined on \( \Omega \).

After differentiating identity (8.54) with respect to \( \gamma_3 \) we obtain

\[
\frac{\partial Y_2(F)}{\partial \gamma_3} = (I_1 - I_2) \left[ -2I_2 \gamma_2 R \frac{\partial^2 R}{\partial \gamma_3^2} - 2I_2 \gamma_2 \left( \frac{\partial R}{\partial \gamma_3} \right)^2 \right]
- 2I_3 \omega_3 \frac{\partial R}{\partial \gamma_3} - (I_3 \omega_3 \gamma_3 - U_1) \frac{\partial^2 R}{\partial \gamma_3^2} \frac{\partial F}{\partial \omega_3}
- I_1 I_3 \gamma_1 \left( \frac{2 \partial R}{\partial \gamma_3} + \gamma_3 \frac{\partial^2 R}{\partial \gamma_3^2} \right) \frac{\partial F}{\partial \gamma_1}
- I_3 \left( 2I_2 \gamma_2 \frac{\partial R}{\partial \gamma_3} + I_2 \gamma_2 \gamma_3 \frac{\partial^2 R}{\partial \gamma_3^2} + 2I_3 \omega_3 \right) \frac{\partial F}{\partial \gamma_2} = Y_3(F) = 0,
\]

where \( Y_3 \) is the corresponding vector field defined on \( \Omega \).

If a first integral \( F \) exists, then the linear system (8.53)–(8.55) has a non-zero solution \( \text{grad} F = \left( \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_2} \right) \), which is possible if and only if the determinant \( D \) of the coefficients of this system is identically equal to zero.

We compute \( D \). It has a non-zero factor \( I_1 I_3^2 \gamma_1 \) and that is why we work with

\[
\hat{D} = \frac{D}{I_1 I_3^2 \gamma_1}.
\]
The expression for $\hat{D}$ is

$$\hat{D} = a_1 R^3 + a_2 R^2 \frac{\partial R}{\partial \gamma_3} + a_3 R^2 \frac{\partial^2 R}{\partial \gamma_3^2} + a_4 R^2 + a_5 R \left( \frac{\partial R}{\partial \gamma_3} \right)^2 + a_6 R \frac{\partial R}{\partial \gamma_3} + a_7 R \frac{\partial^2 R}{\partial \gamma_3^2} + a_8 R + a_9 \left( \frac{\partial R}{\partial \gamma_3} \right)^3 + a_{10} \left( \frac{\partial R}{\partial \gamma_3} \right)^2 + a_{11} \frac{\partial R}{\partial \gamma_3} + a_{12} \frac{\partial^2 R}{\partial \gamma_3^2}, \quad (8.56)$$

where

$$a_1 = -2I_2 I_3 (I_1 - I_2) \omega_3 \gamma_2, \quad a_2 = -2I_2 (I_1 - I_2) \gamma_2 (U_1 - 3I_3 \omega_3 \gamma_3),$$

$$a_3 = -I_2 (I_1 - I_2) \gamma_2 (-2\omega_3 \gamma_1 I_1 - 2\omega_3 \gamma_2 I_2 + \gamma_3 U_1), \quad a_4 = 2I_3 (I_1 - I_2) U_1 \omega_3,$$

$$a_5 = 2(I_1 - I_2) I_2 \gamma_2 (-\omega_3 \gamma_1 I_1 - \omega_3 \gamma_2 I_2 - 3I_3 \omega_3 \gamma_3^2 + 2\gamma_3 U_1),$$

$$a_6 = 2(I_1 - I_2) (-2I_2 I_3 \omega_3 \gamma_2^2 - 2I_3 U_1 \omega_3 \gamma_3 + U_1^2),$$

$$a_7 = (I_1 - I_2) (-U_1 \omega_3 \gamma_1 I_1 - 3\omega_3 \gamma_2 I_2 U_1 - I_3 \omega_3 \gamma_3^2 U_1 + U_1^2 \gamma_3 + 4I_3 \omega_3 \gamma_3 \gamma_2 I_2),$$

$$a_8 = -2I_3 \omega_3 (-3I_3 \omega_2 I_2 \gamma_2 + I_3 \omega_2 I_1 \gamma_2 - I_1 \gamma_2^2 c_2 + c_1 \gamma_2 I_1 \gamma_1),$$

$$a_9 = -2I_2 (I_1 - I_2) \gamma_2 \gamma_3 (-\omega_3 \gamma_1 I_1 - \omega_3 \gamma_2 I_2 - 3I_3 \omega_3 \gamma_3^2 + 3 \gamma_3 U_1),$$

$$a_{10} = -2(I_1 - I_2) (-U_1 \omega_3 \gamma_1 I_1 - 2I_3 \omega_3 \gamma_3 \gamma_2 I_2 - I_3 \omega_3 \gamma_3^2 U_1 + U_1^2 \gamma_3),$$

$$a_{11} = 2(-I_1 \gamma_1 c_2 I_3 \gamma_2 \omega_3 + I_1 \omega_3 \gamma_2 c_2 I_2 U_1 + c_1 \gamma_2 I_1 \gamma_1 I_3 \gamma_3 \omega_3$$

$$+ I_1 \gamma_2^2 c_2 U_1 - I_2 I_3 \omega_3 \gamma_2^2 c_2 I_2),$$

$$a_{12} = (U_1 - 2I_3 \omega_3 \gamma_3) (-U_1 I_2 \omega_3 \gamma_2 + U_1 I_1 \omega_3 \gamma_2 - c_1 \gamma_2 I_1 I_1 \gamma_1 \gamma_3 - I_3 \omega_3 \gamma_3 I_3 \gamma_2$$

$$+ I_1 \gamma_2^2 c_2 \gamma_3 + I_3 \omega_3 \gamma_3 I_2 \gamma_3 \gamma_2).$$

To determine the derivatives $\frac{\partial R}{\partial \gamma_3}$ and $\frac{\partial^2 R}{\partial \gamma_3^2}$ we differentiate equation (8.50) with respect to $\gamma_3$ two times. Taking into account that polynomial $A$ from (8.51) does not depend on $\gamma_3$ we obtain

$$\frac{\partial Q}{\partial \gamma_3} = \frac{\partial B}{\partial \gamma_3} R + \frac{\partial C}{\partial \gamma_3} + \frac{dQ}{dR} \frac{\partial R}{\partial \gamma_3} = 0. \quad (8.57)$$

and

$$\frac{\partial^2 Q}{\partial \gamma_3^2} = \frac{\partial^2 B}{\partial \gamma_3^2} R + \frac{\partial B}{\partial \gamma_3} \frac{\partial R}{\partial \gamma_3} + \frac{\partial C}{\partial \gamma_3} \left( \frac{dQ}{dR} \right) \frac{\partial R}{\partial \gamma_3} + \frac{dQ}{dR} \frac{\partial^2 R}{\partial \gamma_3^2} = 0. \quad (8.58)$$

By Proposition 1.1 we prove that if $R$ is a root of equation (8.50), then $\frac{dQ}{dR} \neq 0$. For the purpose we consider the resultant $\rho = A(4AC - B^2)$ of polynomials $Q(R)$ and $\frac{dQ}{dR}$ and prove that $\rho \neq 0$. As $A$ never vanishes identically we do not consider $\rho$ but $\rho = 4AC - B^2$. Putting in $\rho$ the expressions for $A$, $B$ and $C$ (see (8.51)) we obtain

$$\rho = 4I_1 I_2 \gamma_1^2 \left[I_3 \omega_3 \gamma_2^2 (I_1 \gamma_1^2 + I_2 \gamma_2^2 + I_3 \gamma_3^2) + 2(I_1 \gamma_1^2 + I_2 \gamma_2^2) (c_1 \gamma_1 + c_2 \gamma_2 + c_3 \gamma_3)$$

$$- 2I_3 U_1 \omega_3 \gamma_3 - U_3 I_3 \gamma_1^2 - I_2 U_3 \gamma_2^2 + U_1^2 \right],$$

which never vanishes identically at least because contains a monomial $4I_1^2 I_2 I_3 \omega_3^2 \gamma_4^4$.

Thus $\frac{dQ}{dR} \neq 0$ and $\frac{\partial R}{\partial \gamma_3}$ can be correctly determined from equation (8.57). Then by equation (8.58) we determine $\frac{\partial^2 R}{\partial \gamma_3^2}$ and put the obtained values for the derivatives of $R$.
in the expression for $\hat{D}$ (see (8.56)). In this way we obtain

$$
\hat{D}(R) = \frac{8I_2 \delta(R)}{(\frac{dQ}{dR})^3},
$$

where $\delta(R)$ is a polynomial of $R$ of degree six with coefficients depending on $\omega_3, \gamma_1, \gamma_2$ and $\gamma_3$.

It is clear that the equation $\hat{D}(R) = 0$ is equivalent to $\delta(R) = 0$. We know that if $Q(R) = 0$, then if in addition some supplementary first integral $F(\omega_3, \gamma_1, \gamma_2)$ of system (8.52) exists, then also $\delta(R) = 0$. Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring $\mathbb{K}[x]$, where $\mathbb{K} = \text{Alg}(\omega_3, \gamma_1, \gamma_2, \gamma_3)$, the polynomial $Q(x)$ divides the polynomial $\delta(x)$.

By the MAPLE command `rem` we compute remainder $r$ from the division of polynomial $\delta(x)$ by polynomial $Q(x)$. The remainder is of the form:

$$
r(R) = \frac{I_1^2 \gamma_1^4}{I_1 \gamma_1^2 + I_2 \gamma_2^2} (a_0 x + a_1),
$$

where $a_0$ and $a_1$ are polynomials of $\omega_3, \gamma_1, \gamma_2$ and $\gamma_3$.

According to Proposition 4.2 if $R$ is a root of equation (8.3), then $a_0$ and $a_1$ should be identically equal to zero. We shall use $a_1$ only.

Polynomial $a_1$ has 210 coefficients. Thus we should equate to zero all of them. In this way we obtain a system of 210 equations for parameters $I_1, I_2$ and $I_3$. The reduced system (see Sec. 3) that is obtained after two consecutive simplifications is very simple:

$$
c_1 = 0, \quad c_2 = 0, \quad I_1 - I_2 = 0.
$$

These equations lead to the Lagrange case. Thus the sought partial first integral of type 1 does not exist.

**Type 4.** The study of the existence of a first integral of type 4 is considerably different. Indeed, let us suppose that $F = F(\gamma_1, \gamma_2, \gamma_3)$ is a first integral of system (8.52). Then we have

$$
\frac{dF}{dt} = (\omega_3 \gamma_2 - \gamma_3 R) \frac{\partial F}{\partial \gamma_1} - \left( I_2 R \gamma_2 + I_3 \omega_3 \gamma_3 - U_1 \right) \gamma_3 + I_1 \omega_3 \gamma_1^2 \frac{\partial F}{\partial \gamma_2}
$$

$$
+ \left( I_1 \gamma_1^2 + I_2 \gamma_2^2 \right) R + \left( I_3 \omega_3 \gamma_3 - U_1 \right) \gamma_2 \frac{\partial F}{\partial \gamma_3} = 0,
$$

which we rewrite as follows

$$
I_1 \gamma_1 \frac{dF}{dt} = Y_1(F) = 0,
$$

where $Y_1$ is the corresponding vector field defined on $\Omega$.

After differentiation identity (8.59) with respect to $\omega_3$ one obtains again a linear partial differential equation for function $F$

$$
\frac{\partial Y_1(F)}{\partial \omega_3} = I_1 \gamma_1 \left( \gamma_2 - \gamma_3 \frac{\partial R}{\partial \omega_3} \right) \frac{\partial F}{\partial \gamma_1} - \left( I_2 \gamma_2 \gamma_3 \frac{\partial R}{\partial \omega_3} + I_3 \gamma_3^2 + I_1 \gamma_1^2 \right) \frac{\partial F}{\partial \gamma_2}
$$

$$
+ \left( I_1 \gamma_1^2 + I_2 \gamma_2^2 \right) \frac{\partial R}{\partial \omega_3} + I_3 \gamma_2 \gamma_3 \frac{\partial F}{\partial \gamma_3} = Y_2(F) = 0,
$$

where $Y_2$ is the corresponding vector field defined on $\Omega$. 
where $Y_2$ is defined on $\Omega$.

System (8.59)–(8.60) has one solution. This is first integral $H_2$. In order to have one more solution this system should consist of dependent equations. Let us study when this is possible.

We compute determinant $D_{23}$ corresponding to the square matrix obtained from the $2 \times 3$ matrix of the coefficients of system (8.59)–(8.60) by crossing out its first column. The result is

$$D_{23} = I_1 \gamma_1^2 \left[ (I_1 \gamma_1^2 + I_2 \gamma_2^2 + I_3 \gamma_3^2) \left( R - \omega_3 \frac{\partial R}{\partial \omega_3} \right) - U_1 \left( \gamma_2 - \gamma_3 \frac{\partial R}{\partial \omega_3} \right) \right].$$

The expression for $D_{23}$ depends on derivative $\frac{\partial R}{\partial \omega_3}$. We determine it by differentiating equation (8.50) with respect to $\omega_3$. Polynomial $A$ does not depend on $\omega_3$ (see (8.51)) and therefore

$$\frac{\partial Q}{\partial \omega_3} = \frac{\partial B}{\partial \omega_3} R + \frac{\partial C}{\partial \omega_3} + \frac{dQ}{dR} \frac{\partial R}{\partial \omega_3} = 0.$$

As in the studying of a first integral of type 1, using Proposition 4.1 we prove that if $R$ is a root of equation (8.50) then $\frac{dQ}{dR} \neq 0$ and obtain from the above equation

$$\frac{\partial R}{\partial \omega_3} = - \frac{I_3 \left( \gamma_3 (I_2 R \gamma_2 - U_1) + \omega_3 (I_1 \gamma_1^2 + I_3 \gamma_3^2) \right)}{I_2 \left[ R (I_1 \gamma_1^2 + I_2 \gamma_2^2) + \gamma_2 (I_3 \omega_3 \gamma_3 - U_1) \right]}.$$

We put this value of $\frac{\partial R}{\partial \omega_3}$ in the expression for $D_{23}$ and obtain

$$D_{23} = \frac{I_1 \gamma_1^2}{I_2 [R (I_1 \gamma_1^2 + I_2 \gamma_2^2) + \gamma_2 (I_3 \omega_3 \gamma_3 - U_1)]} \hat{D}_{23},$$

where $\hat{D}_{23}$ is

$$\hat{D}_{23} = I_2 (I_1 \gamma_1^2 + I_2 \gamma_2^2 + I_3 \gamma_3^2) \left[ (I_1 \gamma_1^2 + I_2 \gamma_2^2) R^2 + 2 \gamma_2 (I_3 \omega_3 \gamma_3 - U_1) R \right] + I_3 (I_1 \gamma_1^2 + I_2 \gamma_2^2 + I_3 \gamma_3^2) \left[ (I_1 \gamma_1^2 + I_3 \gamma_3^2) \omega_3^2 - 2 U_1 \gamma_3 \omega_3 \right] + U_1^2 (I_2 \gamma_2^2 + I_3 \gamma_3^2).$$

It is clear that $D_{23} = 0$ is equivalent to

$$\hat{D}_{23} = 0.$$

(8.61)

If first integral $F = F(\gamma_1, \gamma_2, \gamma_3)$ exists then equation (8.61) is fulfilled. Thus $R$ is simultaneously a root of equations (8.50) and (8.61). In such a case $\hat{D}_{23}$ and $Q$ as polynomials of $R$ should have a zero resultant.

Let us denote the resultant with $\rho$ and compute it. We obtain

$$\rho = I_1^2 I_2^2 \gamma_1 \left( I_1 \gamma_1^2 + I_2 \gamma_2^2 \right)^2 \tilde{\rho},$$

where

$$\tilde{\rho} = (2 c_1 \gamma_1 + 2 c_2 \gamma_2 + 2 c_3 \gamma_3 + U_3) (I_1 \gamma_1^2 + I_2 \gamma_2^2 + I_3 \gamma_3^2) + U_1^2.$$

Equation $\rho = 0$ implies $\tilde{\rho} = 0$. It is easily seen that this happens only if $c_1 = c_2 = c_3 = 0$ and $U_1 = U_3 = 0$, i.e. a particular case of the Euler case. Thus a new first integral of type 4 does not exist.
8.3.2. Elimination of $\omega_1$ and $\gamma_1$. Here we should study two cases: when $c_1 \neq 0$ and when $c_1 = 0$. This is necessary because when we express $\gamma_1$ from equation $H_1 = U_1$ we obtain
\[
\gamma_1 = -\frac{I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1}{I_1 \omega_1}
\]
(8.62)

independently of $c_1$. But putting $\gamma_1$ from (8.62) in equation $H_3 = U_3$, two different cases for determining $\omega_1$ arises. When $c_1 \neq 0$ the equation for $\omega_1$ is of degree three while when $c_1 = 0$ it is of degree two. That is why, to avoid any confusion, we consider separately two cases.

**Case A.** $c_1 \neq 0$. In the same way as in Sec. 8.2.1, taking into account the value of $\gamma_1$ from (8.62) we solve equation $H_3 = U_3$ with respect to $\omega_1$ and obtain
\[
\omega_1 = R,
\]
where $R$ is a root of equation
\[
Q(x) = I_1^2 x^3 + Ax + B = 0,
\]
that is
\[
Q(R) = I_1^2 R^3 + AR + B = 0
\]
(8.63)
and $A = A(\omega_2, \omega_3, \gamma_2, \gamma_3)$ and $B = B(\omega_2, \omega_3, \gamma_2, \gamma_3)$ are the following polynomials:
\[
A = I_1(I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_2 \gamma_2 + 2c_3 \gamma_3 - U_3),
\]
(8.64)
\[
B = -c_1(2I_3 \omega_2 \gamma_2 + 2I_3 \omega_3 \gamma_3 - 2U_1).
\]

In this way we come to the following values of the eliminated variables:
\[
\omega_1 = R, \quad \gamma_1 = -\frac{I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1}{I_1 R}.
\]
(8.65)

We put the values of $\omega_1$ and $\gamma_1$ from (8.65) in the Euler-Poisson equations (1.1), remove the first and fourth equations and obtain the following system of four equations in unknowns $\omega_2$, $\omega_3$, $\gamma_2$ and $\gamma_3$:
\[
\frac{d\omega_2}{dt} = -\frac{I_1(I_1 - I_3) \omega_3 R^2 - I_1 c_1 \gamma_3 R - c_3(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 I_2 R},
\]
\[
\frac{d\omega_3}{dt} = \frac{I_1(I_1 - I_2) \omega_2 R^2 - I_1 c_1 \gamma_2 R - c_2(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 I_3 R},
\]
\[
\frac{d\gamma_2}{dt} = \frac{I_1 \gamma_3 R^2 + \omega_3(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 R},
\]
\[
\frac{d\gamma_3}{dt} = -\frac{I_1 \gamma_2 R^2 + \omega_2(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 R}.
\]
(8.66)

**Case B.** $c_1 = 0$. We solve equation $H_3 = U_3$ with respect to $\omega_1$ at the value of $\gamma_1$ given from (8.62) and obtain $\omega_1 = R$, where $R$ is a root of equation
\[
Q(x) = I_1 x^2 + B,
\]
that is
\[
Q(R) = I_1 R^2 + B,
\]
(8.67)
and $B(\omega_2, \omega_3, \gamma_2, \gamma_3)$ is the following polynomial:

$$B = I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_2 \gamma_2 + 2c_3 \gamma_3 - U_3.$$ 

In fact, the values of the eliminated variables are determined as in Case A, i.e. by formula (8.65) but $R$ is a root of different equation.

The restricted Euler-Poisson equations are

$$\begin{align*}
\frac{d \omega_2}{dt} &= -\frac{I_1(I_1 - I_3)\omega_3 R^2 - c_3(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 I_2 R}, \\
\frac{d \omega_3}{dt} &= \frac{I_1(I_1 - I_2)\omega_2 R^2 - c_2(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 I_3 R}, \\
\frac{d \gamma_2}{dt} &= \frac{I_1 \gamma_3 R^2 + \omega_3(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 R}, \\
\frac{d \gamma_3}{dt} &= -\frac{I_1 \gamma_2 R^2 + \omega_2(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 R}.
\end{align*}$$

(8.68)

To study the existence of a first integrals of systems (8.66) and (8.68) that depend on at most three variables among the variables $\omega_2$, $\omega_3$, $\gamma_2$ and $\gamma_3$ and that are functionally independent of $H_2$ restricted to invariant manifold $\gamma_3$ we should consider the following four types of a first integral:

1. $F(\omega_2, \omega_3, \gamma_2)$, (case (iii))
2. $F(\omega_2, \omega_3, \gamma_3)$, (case (iii))
3. $F(\omega_2, \gamma_2, \gamma_3)$, (case (iv))
4. $F(\omega_3, \gamma_2, \gamma_3)$. (case (iv))

Thus we should study the first integral of type 1 only.

**Case A.1.** We consider a first integral of type 1, i.e. $F = F(\omega_2, \omega_3, \gamma_2)$. Thus

$$\frac{dF}{dt} = -\frac{I_1(I_1 - I_3)\omega_3 R^2 - I_1 c_1 \gamma_3 R - c_3(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 I_2 R} \frac{\partial F}{\partial \omega_2}$$

$$+ \frac{I_1(I_1 - I_2)\omega_2 R^2 - I_1 c_1 \gamma_3 R - c_2(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 I_3 R} \frac{\partial F}{\partial \omega_3}$$

$$+ \frac{I_1 \gamma_3 R^2 + \omega_3(I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1 R} \frac{\partial F}{\partial \gamma_2} = 0,$$

which is equivalent to

$$I_1 I_2 I_3 R \frac{dF}{dt} = Y_1(F) = 0.$$  

(8.69)

$Y_1$ from (8.69) is the corresponding vector field defined on some suitable open set $\Omega \subseteq \mathbb{C}^4(\omega_2, \omega_3, \gamma_2, \gamma_3)$.

We differentiate identity (8.69) with respect to $\gamma_3$ and obtain again a linear partial differential equation for function $F$

$$\frac{\partial Y_1(F)}{\partial \gamma_3} = I_3 \left[ -2I_1(I_1 - I_3)\omega_3 R \frac{\partial R}{\partial \gamma_3} + I_1 c_1 R + I_1 c_1 \gamma_3 \frac{\partial R}{\partial \gamma_3} + I_3 c_3 \omega_3 \right] \frac{\partial F}{\partial \omega_2}$$

$$+ I_2 \left[ 2I_1(I_1 - I_2)\omega_2 R \frac{\partial R}{\partial \gamma_3} - I_1 c_1 \gamma_2 \frac{\partial R}{\partial \gamma_3} - I_3 c_2 \omega_3 \right] \frac{\partial F}{\partial \omega_3}.$$
+ I_2 I_3 \left( I_1 R^2 + 2 I_1 \gamma_3 R \frac{\partial R}{\partial \gamma_3} + I_3 \omega_3^2 \right) \frac{\partial F}{\partial \gamma_2} = Y_2(F) = 0, \hspace{1cm} (8.70)

where $Y_2$ is the corresponding vector field defined on $\Omega$.

After differentiating identity \red{(8.70)} with respect to $\gamma_3$ we obtain

\[
\frac{\partial Y_2(F)}{\partial \gamma_3} = I_1 I_3 \left[ -2 (I_1 - I_3) \omega_3 R \frac{\partial^2 R}{\partial \gamma_3^2} - 2 (I_1 - I_3) \omega_3 \left( \frac{\partial R}{\partial \gamma_3} \right)^2 \right] + 2 c_1 \frac{\partial R}{\partial \gamma_3} + c_1 \gamma_3 \frac{\partial^2 R}{\partial \gamma_3^2} \frac{\partial F}{\partial \omega_2} \\
+ I_1 I_2 \left[ 2 (I_1 - I_2) \omega_2 R \frac{\partial^2 R}{\partial \gamma_3^2} + 2 (I_1 - I_2) \omega_2 \left( \frac{\partial R}{\partial \gamma_3} \right)^2 - c_1 \gamma_2 \frac{\partial^2 R}{\partial \gamma_3^2} \right] \frac{\partial F}{\partial \omega_3} \\
+ 2 I_1 I_2 I_3 \left[ \gamma_3 R \frac{\partial^2 R}{\partial \gamma_3^2} + \gamma_3 \left( \frac{\partial R}{\partial \gamma_3} \right)^2 + 2 R \frac{\partial R}{\partial \gamma_3} \right] \frac{\partial F}{\partial \gamma_3} = Y_3(F) = 0, \hspace{1cm} (8.71)
\]

where $Y_3$ is the corresponding vector field defined on $\Omega$.

If a first integral $F$ exists, system \red{(8.69)–(8.71)} has a non-zero solution $\text{grad} F = \left( \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_3} \right)$, which is possible if and only if the determinant $D$ of its coefficients is identically equal to zero.

We compute $D$. It has a non-zero factor $I_1^2 I_2^2 I_3^2$ and that is why we note

\[
\hat{D} = \frac{D}{I_1^2 I_2^2 I_3^2}.
\]

The expression for $\hat{D}$ is

\[
\hat{D} = a_1 R^4 \frac{\partial R}{\partial \gamma_3} + a_2 R^4 \frac{\partial^2 R}{\partial \gamma_3^2} + a_3 R^3 \left( \frac{\partial R}{\partial \gamma_3} \right)^2 + a_4 R^3 \frac{\partial R}{\partial \gamma_3} + a_5 R^3 \frac{\partial^2 R}{\partial \gamma_3^2} \\
+ a_6 R^2 \left( \frac{\partial R}{\partial \gamma_3} \right)^2 + a_7 R^2 \frac{\partial R}{\partial \gamma_3} + a_8 R^2 \frac{\partial^2 R}{\partial \gamma_3^2} + a_9 R \left( \frac{\partial R}{\partial \gamma_3} \right)^2 + a_{10} R \frac{\partial R}{\partial \gamma_3} \\
+ a_{11} R \frac{\partial^2 R}{\partial \gamma_3^2} + a_{12} \left( \frac{\partial R}{\partial \gamma_3} \right)^3 + a_{13} \left( \frac{\partial R}{\partial \gamma_3} \right)^2,
\]

where

\begin{align*}
  a_1 &= -2 I_1 c_1 \omega_2 (I_1 - I_2), & a_2 &= I_1 c_1 [-(I_1 + I_2) \omega_2 \gamma_3 + (I_1 - I_3) \omega_3 \gamma_2], \\
  a_3 &= -2 I_1 c_1 [(-I_1 + I_2) \omega_2 \gamma_3 + (I_1 - I_3) \omega_3 \gamma_2], \\
  a_4 &= 2 [2 I_3 (I_2 - I_1) c_3 \omega_2 \omega_3 + 2 I_3 (I_1 - I_3) c_2 \omega_3^2 + I_1 c_1^2 \gamma_2], \\
  a_5 &= -2 I_2 (I_1 - I_2) c_3 \omega_2 \gamma_2 + 2 I_2 (-I_3 + I_1) c_2 \omega_2 \omega_3 \gamma_2 - 2 I_3 (I_1 - I_2) c_3 \omega_2 \omega_3 \gamma_3 \\
  &\quad + 2 (I_1 - I_2) c_3 U_1 \omega_2 + 2 I_3 (-I_3 + I_1) c_2 \omega_3^2 \gamma_3 - 2 (-I_3 + I_1) c_2 U_1 \omega_3 + I_1 c_2 \gamma_2 \gamma_3, \\
  a_6 &= 6 [(I_2 - I_1) c_3 \omega_2 + (I_1 - I_3) c_2 \omega_3](-I_2 \omega_2 \gamma_2 - I_3 \omega_3 \gamma_3 + U_1), \\
  a_7 &= -2 c_1 (-I_3 (I_1 - I_2) \omega_2 \omega_3^2 - c_2 I_2 \omega_2 \gamma_2 - 2 c_3 I_3 \omega_3 \gamma_2 + c_2 U_1), \\
  a_8 &= -c_1 [-2 I_2 (I_1 - I_2) \omega_2 \omega_2 \gamma_2 - I_3 (I_1 - I_2) \omega_2 \omega_3 \gamma_3 + 2 (I_1 - I_2) U_1 \omega_2 \omega_3 \\
  &\quad - I_2 c_3 \omega_2 \gamma_2^2 - I_2 c_2 \omega_2 \gamma_2 \gamma_3 - I_3 (-I_3 + I_1) \omega_3^2 \gamma_2 - 2 I_3 c_3 \omega_3 \gamma_2 \gamma_3 + c_3 U_1 \gamma_2 + c_2 U_1 \gamma_3], \\
  a_9 &= 2 c_1 [-I_2 (I_1 - I_2) \omega_2 \omega_3 \gamma_2 - 2 I_3 (I_1 - I_2) \omega_2 \omega_3 \gamma_3 + U_1 (I_1 - I_2) \omega_2 \omega_3 - 2 c_3 I_3 \omega_2 \gamma_2^2.
\end{align*}
them we differentiate equation (8.63) with respect to $\gamma$ of $D$. Indeed, if
obtain a polynomial which we do not give here but it never vanishes identically as it has
and prove that $F$ then if in addition some supplementary first integral
$\partial \rho$

$106$ J. Moulin-Ollagnier, S. I. Popov and J.-M. Strelcyn

$L$

polynomial

$\delta$
in polynomial ring $K$

$\delta$

$\tau$

$\rho$

We prove that if $R$ is a root of equation $[8.63]$, then $\frac{dQ}{dR} \neq 0$. For the purpose we
consider the resultant $\rho = I_1^4(4A^3 + 27I_2^2B^2)$ of polynomials $Q(R)$ and $\frac{dQ}{dR} = 3I_1^2R^2 + A$
and prove that $\rho \neq 0$. Indeed, putting in $\rho$ the expressions for $A$ and $B$ from $[8.64]$ we
obtain a polynomial which we do not give here but it never vanishes identically as it has
a monomial $4I_1^3I_2^2\omega_2^6$.

Thus, by Proposition $4.1$ $\frac{dQ}{dR} \neq 0$ and $\frac{\partial R}{\partial \gamma_3}$ can be correctly determined from equation
$[8.72]$. Then by equation $[8.73]$ we determine $\frac{\partial^2 R}{\partial \gamma_3^2}$, put the obtained values for the
derivatives of $R$ in the expression for $\hat{D}(R)$ and obtain

$$
\hat{D}(R) = \frac{L\delta(R)}{\left(\frac{dQ}{dR}\right)^3},
$$

where $L = 4(I_1c_3R - I_3c_1\omega_3)$ and $\delta(R)$ is a polynomial of $R$ of degree eight with coefficients
depending on $\omega_2, \omega_3, \gamma_2$ and $\gamma_3$.

We prove that expression $L$ does not vanish identically provided that $R$ is a root of
$[8.63]$. Indeed, if $c_3 = 0$ then $L = -4I_3c_1\omega_3$ and as $c_1 \neq 0 L$ could not vanish identically. If
$c_3 \neq 0$ and we suppose that $L = 0$ then we have $R = I_1c_1\omega_3/(I_1c_3)$. Simple computations
show that this value of $R$ cannot be a root of $[8.63]$. Thus we can work with $\hat{D}$ instead of
$D$ because $L$ and $\frac{dQ}{dR}$ are non-zeros.

Thus the equation $\hat{D}(R) = 0$ is equivalent to $\delta(R) = 0$. We know that if $Q(R) = 0$, then if in addition some supplementary first integral $\hat{F}(\omega_2, \omega_3, \gamma_2)$ of system $[8.66]$ exists,
then also $\delta(R) = 0$. Thus all assumptions of Proposition $4.2$ are fulfilled. Consequently
in polynomial ring $K[x]$, where $K = \text{Alg}(\omega_2, \omega_3, \gamma_2, \gamma_3)$, the polynomial $Q(x)$ divides the
polynomial $\delta(x)$.

By the MAPLE command rem we compute remainder $r$ from the division of polynomial
$\delta(x)$ by polynomial $Q(x)$. The remainder is of the form:

$$
r(x) = 2I_1c_1a_0x^2 + a_1x + 4c_1(-I_2\omega_2\gamma_2 - I_3\omega_3\gamma_3 + U_1)a_2,
$$

where the coefficients $a_0, a_1$ and $a_2$ are polynomials of $\omega_2, \omega_3, \gamma_2$ and $\gamma_3$.

According to Proposition $4.2$ if $R$ is a root of equation $[8.63]$, then, as $2I_1c_1$ is not zero
and $4c_1(-I_2\omega_2\gamma_2 - I_3\omega_3\gamma_3 + U_1)$ does not vanish identically, we have $a_0 = a_1 = a_2 = 0$
We use only the last equation \( a_2 = 0 \).

\( a_2 \) is a polynomial with 51 monomials and therefore with 51 coefficients. We equate them to zeros and apply simplification on the obtained system. After three consecutive simplifications we come to the reduced system that consists of only one equation \( 1 = 0 \). Thus a first integral of type 1, \( F = F(\omega_2, \omega_3, \gamma_2) \) does not exist when \( c_1 \neq 0 \).

**Case B.1.** Here we consider Case B, i.e. \( c_1 = 0 \) and study the existence of a first integral of system (8.68) which is of type 1, \( F(\omega_2, \omega_3, \gamma_2) \).

In the same way as in Case A we obtain a system

\[
Y_1(F) = Y_2(F) = Y_3(F) = 0,
\]

where vector fields \( Y_i, 1 \leq i \leq 3 \), are defined on \( \Omega \).

System (8.74) coincides with system (8.69)–(8.71) if we substitute in the last one \( c_1 = 0 \). As we know the existence of the sought first integral is possible if and only if the determinant \( D \) of the coefficients of system (8.74) is identically equal to zero.

Let us compute this determinant. We obtain

\[
D(R) = 2I_1^2 I_2^2 I_3^2 R^2 \left[ (I_2 - I_1) c_3 \omega_2 + (I_1 - I_3) c_2 \omega_3 \right] \hat{D}(R),
\]

where

\[
\hat{D}(R) = (I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1) \left[ R \frac{\partial^2 R}{\partial \gamma_3^2} - 3 \left( \frac{\partial R}{\partial \gamma_3} \right)^2 \right] + 2I_3 \omega_3 R \frac{\partial R}{\partial \gamma_3}.
\]

Taking into account that now \( R = 0 \) cannot be a root of equation (8.67) and that \( c_1 = 0 \) we easily see that the factor before \( \hat{D}(R) \) in (8.75) can vanish identically only in the Euler, Lagrange and kinetic symmetry cases. Thus the equation \( D(R) = 0 \) is equivalent to the equation \( \hat{D}(R) = 0 \).

We compute the derivatives of \( R \) (see (8.67)) with respect to \( \gamma_3 \) and obtain

\[
\frac{\partial R}{\partial \gamma_3} = -\frac{c_3}{I_1 R}, \quad \frac{\partial^2 R}{\partial \gamma_3^2} = -\frac{c_3^2}{I_1^2 R^3}
\]

and determine \( \hat{D}(R) \) as follows

\[
\hat{D}(R) = -2c_3 \frac{I_1 I_3 \omega_3 R^2 + 2c_3 (I_2 \omega_2 \gamma_2 + I_3 \omega_3 \gamma_3 - U_1)}{I_1^2 R^2}.
\]

Let us suppose that \( c_3 \neq 0 \). It is clear that now \( \hat{D}(R) \) never vanishes identically and consequently the sought partial first integral does not exist.

Let \( c_3 = 0 \). In such a case \( \hat{D} = 0 \) and therefore equations (8.74) are linearly dependent. More precisely \( Y_3 \equiv 0 \) because when \( c_3 = 0 \) then \( R \) does not depend on \( \gamma_3 \) but every item of \( Y_3 \) contains either \( \frac{\partial R}{\partial \gamma_3} \) or \( \frac{\partial^2 R}{\partial \gamma_3^2} \) (see (8.71) under condition \( c_1 = 0 \)).

Thus we have only two partial differential equations for first integral \( F \). They are

\[
Y_1(F) = 0, \quad Y_2(F) = 0.
\]

Easy computations show that these equations are independent unless \( c_2 = 0 \) which leads to the Euler case or \( I_1 = I_3 \) - Lagrange case.
We compose the Lie bracket $Z = [Y_1, Y_2]$. Equations (8.76) imply that

$$Z(F) = 3(I_1 - I_3)I_2^2 c_2 \omega_3(I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_2 \gamma_2 - U_3) \frac{\partial F}{\partial \omega_2}$$

$$- I_2^2 I_3 c_2[I_2 I_1 \omega_2^3 + I_3(I_1 - I_2) \omega_2 \omega_3^2]$$

$$+ c_2(2I_1 - I_2) \omega_2 \gamma_2 - I_1 U_3 \omega_2 + c_2 U_1 \frac{\partial F}{\partial \omega_3}$$

$$+ I_2^2 I_3 \omega_3 [ - I_2(2I_1 - I_2 - 2I_3) \omega_3^2 - 2I_3(I_1 - I_3) \omega_2 \omega_3^2 ]$$

$$- c_2(4I_1 - I_2 - 4I_3) \omega_2 \gamma_2 + (2I_1 - I_2 - 2I_3) U_3 \omega_2 + c_2 U_1 \frac{\partial F}{\partial \gamma_2} = 0. \quad (8.77)$$

Determinant $\delta$ composed from the coefficients of equations (8.76) and (8.77) should be identically equal to zero. We compute it and obtain

$$\delta = \delta_1 \delta_2,$$

where

$$\delta_1 = I_2^2 I_3^2(I_1 - I_3)c_2 \omega_3(I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_2 \gamma_2 - U_3)^2,$$

$$\delta_2 = -I_2(2I_1 - 3I_2) \omega_3^2 - 2I_3(I_1 - I_3) \omega_2 \omega_3^2 - 2c_2(2I_1 - I_2) \omega_2 \gamma_2$$

$$+ U_3(2I_1 - 3I_2) \omega_2 + 4c_2 U_1.$$

It is easily seen that $\delta_1$ can vanish identically only in the Euler and Lagrange cases. The expression for $\delta_2$ contains a monomial $2I_3(I_1 - I_3) \omega_3^2 \omega_3^2$ and therefore the minimal requirement for $\delta_2$ to vanish identically is $I_1 = I_3$ - the Lagrange case.

Thus a new first integral of type 1 does not exist also when $c_1 = 0$.

### 8.3.3. Elimination of $\omega_1$ and $\gamma_2$

In the same way as in Sec. 8.2.1 we solve equations $H_1 = U_1$ and $H_3 = U_3$ with respect to $\omega_1$ and $\gamma_2$ and obtain

$$\omega_1 = R, \quad \gamma_2 = -\frac{I_1 \gamma_1 R + I_3 \omega_3 \gamma_3 - U_1}{I_2 \omega_2}, \quad (8.78)$$

where $R$ is a root of equation

$$Q(x) = Ax^2 + Bx + C = 0,$$

that is

$$Q(R) = AR^2 + BR + C = 0. \quad (8.79)$$

Functions $A = A(\omega_2), B = B(\gamma_1)$ and $C = C(\omega_2, \omega_3, \gamma_1, \gamma_3)$ are given by the following polynomials:

$$A = I_1 I_2 \omega_2, \quad B = -2I_1 c_2 \gamma_1,$$

$$C = I_2^2 \omega_2^3 + I_2 I_3 \omega_2 \omega_3^2 + 2I_2 c_2 \omega_2 \gamma_1 + 2I_2 c_3 \omega_2 \gamma_3$$

$$- I_2 U_3 \omega_2 - 2I_3 c_2 \omega_3 \gamma_3 + 2c_2 U_1. \quad (8.80)$$

We put the values of $\omega_1$ and $\gamma_2$ from (8.78) in the Euler-Poisson equations (1.1) and remove its first and fifth equations. In this way we obtain the following system of four
equations in unknowns $\omega_2$, $\omega_3$, $\gamma_1$ and $\gamma_3$:

\[
\begin{align*}
\frac{d\omega_2}{dt} &= -\frac{(I_1 - I_3)\omega_3 R - c_1 \gamma_3 + c_3 \gamma_1}{I_2}, \\
\frac{d\omega_3}{dt} &= \frac{I_2(I_1 - I_2)\omega_2^2 R + I_2 c_2 \omega_2 \gamma_1 + c_1(I_1 \gamma_1 R + I_3 \omega_3 \gamma_3 - U_1)}{I_2 I_3 \omega_2}, \\
\frac{d\gamma_1}{dt} &= -\frac{I_1 \omega_3 \gamma_1 R + I_3 \omega_2^2 \gamma_3 - U_1 \omega_3 + I_2 \omega_3^2 \gamma_3}{I_2 \omega_2}, \\
\frac{d\gamma_3}{dt} &= \frac{I_2 \omega_3^2 \gamma_1 + (I_1 \gamma_1 R + I_3 \omega_3 \gamma_3 - U_1) R}{I_2 \omega_2},
\end{align*}
\]  

(8.81)

We consider the following four possible types of a first integral of system (8.81) that depends on at most three variables among the variables $\omega_2$, $\omega_3$, $\gamma_1$ and $\gamma_3$:

1. $F(\omega_2, \omega_3, \gamma_1)$, (case (ii))
2. $F(\omega_2, \omega_3, \gamma_3)$, (case (iii))
3. $F(\omega_2, \gamma_1, \gamma_3)$, (case (v))
4. $F(\omega_3, \gamma_1, \gamma_3)$. (case (iv))

As we have already studied cases (iii) and (iv) now we should consider the first integrals of types 1 and 3.

We suppose that the studied partial first integral is functionally independent of $H_2$ restricted to invariant manifold (8.48).

**Type 1.** Let us start with a first integral of type 1, $F = F(\omega_2, \omega_3, \gamma_1)$. We have

\[
\frac{dF}{dt} = -\frac{(I_1 - I_3)\omega_3 R - c_1 \gamma_3 + c_3 \gamma_1}{I_2} \frac{\partial F}{\partial \omega_2} + \frac{I_2(I_1 - I_2)\omega_2^2 R + I_2 c_2 \omega_2 \gamma_1 + c_1(I_1 \gamma_1 R + I_3 \omega_3 \gamma_3 - U_1)}{I_2 I_3 \omega_2} \frac{\partial F}{\partial \omega_3} - \frac{I_1 \omega_3 \gamma_1 R + I_3 \omega_2^2 \gamma_3 - U_1 \omega_3 + I_2 \omega_3^2 \gamma_3}{I_2 \omega_2} \frac{\partial F}{\partial \gamma_1} = 0,
\]

which is equivalent to

\[
I_2 I_3 \omega_2 \frac{dF}{dt} = Y_1(F) = 0.
\]  

(8.82)

$Y_1$ from the above equation is the corresponding vector field defined on some suitable open set $\Omega \subseteq \mathbb{C}^4(\omega_2, \omega_3, \gamma_1, \gamma_3)$.

We differentiate identity (8.82) with respect to $\gamma_3$ and obtain again a linear partial differential equation for function $F$

\[
\frac{\partial Y_1(F)}{\partial \gamma_3} = I_3 \left[ (I_3 - I_1)\omega_2 \partial R + c_1 \omega_2 \partial R + I_1 c_1 \gamma_1 \partial R + I_3 c_1 \omega_3 \partial R \right] \frac{\partial F}{\partial \gamma_3} + \frac{I_2(I_1 - I_2)\omega_2^2 \partial R}{\omega_2} + \frac{I_2 c_2 \omega_2 \gamma_1 + c_1(I_1 \gamma_1 R + I_3 \omega_3 \gamma_3 - U_1)}{I_2 I_3 \omega_2} \frac{\partial F}{\partial \gamma_3} - \frac{I_1 \omega_3 \gamma_1 R + I_3 \omega_2^2 \gamma_3 - U_1 \omega_3 + I_2 \omega_3^2 \gamma_3}{I_2 \omega_2} \frac{\partial F}{\partial \gamma_1} = Y_2(F) = 0.
\]  

(8.83)
We differentiate $Y_2(F)$ with respect to $\gamma_3$ and obtain
\[
\frac{\partial Y_2(F)}{\partial \gamma_3} = \frac{\partial^2 R}{\partial \gamma_3^2} \left[ I_3(I_3 - I_1)\omega_2\omega_3 \frac{\partial F}{\partial \omega_2} + (I_1I_2\omega_2^2 - I_2^2\omega_2^2 + I_1c_1\gamma_1) \frac{\partial F}{\partial \omega_3} - I_1I_3\omega_3\gamma_1 \frac{\partial F}{\partial \gamma_1} \right] = Y_3(F) = 0, \tag{8.84}
\]
where $Y_2$ and $Y_3$ are the corresponding vector fields defined on $\Omega$.

If a first integral $F = F(\omega_2, \omega_3, \gamma_1)$ exists, system (8.82)–(8.84) has a non-zero solution $\nabla F = \left( \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_1} \right)$. This is possible if and only if the determinant $D$ of its coefficients is identically equal to zero.

We compute $D$ and obtain
\[
D(R) = -I_2I_3^2\omega_2^2 \frac{\partial^2 R}{\partial \gamma_3^2} \Delta,
\]
where
\[
\Delta = (I_2 - I_3)c_1U_1\omega_2\omega_3 + I_1c_1\gamma_1^2(c_3\omega_2 - c_2\omega_3) + (I_2\omega_2^2 + I_3\omega_3^2)(I_1 - I_2)c_3\omega_2 - (I_1 - I_3)c_2\omega_3\gamma_1.
\]

Let us first suppose that
\[
\frac{\partial^2 R}{\partial \gamma_3^2} \neq 0. \tag{8.85}
\]
In such a case $D(R) = 0$ if and only if $\Delta = 0$. Polynomial $\Delta$ has seven coefficients and they should be zeros, i.e. we have a system of seven equations for the parameters $Ic$ and $U_1$.

After two consecutive simplifications we come to the reduced system that consists of the following six equations:
\[
c_3c_1 = 0, \quad (I_1 - I_2)c_3 = 0, \quad c_1c_2 = 0, \quad (I_1 - I_3)c_2 = 0, \\
(I_2 - I_3)c_2c_3 = 0, \quad (I_2 - I_3)c_1U_1 = 0.
\]

The system obtained coincides with system (8.35) and therefore has the same six solutions. After removing the solutions that lead to the Euler, Lagrange and kinetic symmetry cases we obtain only one new solution
\[
\{U_1 = 0, \ I_1 = I_1, \ I_2 = I_2, \ I_3 = I_3, \ c_1 = c_1, \ c_2 = 0, \ c_3 = 0\},
\]
which is impossible because the condition $c_2 = c_3 = 0$ contradicts to (8.85). Indeed, equation (8.79) has no root that depends on $\gamma_3$ because the three its coefficients $A$, $B$ and $C$ (see (8.80)) do not depend on $\gamma_3$ when $c_2 = c_3 = 0$ and therefore $R$ does not depend too.

Thus a first integral of type 1 does not exist when condition (8.85) is fulfilled.

Let us study what happens when
\[
\frac{\partial^2 R}{\partial \gamma_3^2} = 0. \tag{8.86}
\]
Equation (8.86) implies that $R = M(\omega_2, \omega_3, \gamma_3) + N(\omega_2, \omega_3, \gamma_1)$, where $M$ and $N$ are some functions not depending on $\gamma_3$. Now equation (8.79) gives

$$Q = AM^2 \gamma_3^2 + M \gamma_3(2AN + B) + AN^2 + BN + C = 0.$$ 

Thus $Q$ is a polynomial of $\gamma_3$ of degree two. The coefficient of $\gamma_3^2$ is $AM^2$. As $Q = 0$ then $AM^2 = 0$. As $A$ cannot be zero (see (8.80)) it remains the only possibility $M = 0$ and equation (8.79) is transform in the form

$$Q = AN^2 + BN + C = 0,$$

i.e. $Q$ is already a polynomial of $\gamma_3$ of degree one. Its leading coefficient is $2(I_2c_3\omega_2 - I_3c_2\omega_3)$ (see the expression for $C$ in (8.80)). This coefficient should be identically equal to zero. Thus $c_2 = c_3 = 0$.

As function $B$ vanishes at this condition then $R$ takes the following simple form

$$R = \frac{\sqrt{I_1(-I_2 \omega_2^2 - I_3 \omega_3^2 - 2c_1 \gamma_1 + U_3)}}{I_1}. \quad (8.87)$$

Now $Y_3(F) \equiv 0$ and equations $Y_i(F) = 0$, $1 \leq i \leq 2$, are obtained from (8.82) and (8.83) where we put $c_2 = c_3 = 0$ and $\frac{\partial R}{\partial \gamma_3} = 0$, i.e.

$$Y_1(F) = -I_3 \omega_2 [(I_1 - I_3) \omega_3 R - c_1 \gamma_3] \frac{\partial F}{\partial \omega_2}$$

$$+ [I_2(I_1 - I_2) \omega_2^2 R + c_1(I_1 \gamma_1 R + I_3 \omega_3 \gamma_3 - U_1)] \frac{\partial F}{\partial \omega_3}$$

$$- I_3 [(I_2 \omega_2^2 + I_3 \omega_3^2) \gamma_3 + (I_1 \gamma_1 R - U_1) \omega_3] \frac{\partial F}{\partial \gamma_1} = 0,$$

$$Y_2(F) = I_3 c_1 \omega_2 \frac{\partial F}{\partial \omega_2} + I_3 c_1 \omega_3 \frac{\partial F}{\partial \omega_3} - I_3 (I_2 \omega_2^2 + I_3 \omega_3^2) \frac{\partial F}{\partial \gamma_1} = 0,$$

where $R$ is taken from (8.87).

Further we work with vector fields

$$Z_1 = Y_1 - \gamma_3 Y_2, \quad Z_2 = Y_2, \quad Z_3 = \frac{[Z_1, Z_2]}{I_3}.$$

We compute $Z_3$

$$Z_3 = I_3(I_1 - I_3)c_1 \omega_2 \omega_3 R \frac{\partial}{\partial \omega_2} + c_1 [(I_2^2 \omega_2^2 + I_1 I_3 \omega_3^2 + I_1 c_1 \gamma_1) R - c_1 U_1] \frac{\partial}{\partial \omega_3}$$

$$+ I_3 \omega_3 [(2I_2^2 \omega_2^2 - 2I_2 I_3 \omega_2^2 - I_1 I_2 \omega_2^2 - I_1 I_3 \omega_3^2 - I_1 c_1 \gamma_1) R + c_1 U_1] \frac{\partial}{\partial \gamma_1}.$$

In this way we obtain the following system of three equations for function $F$:

$$Z_i(F) = 0, \quad 1 \leq i \leq 3,$$

and we know that determinant $\delta$ of the coefficients of this system should vanish identically with respect to $\omega_2$, $\omega_3$ and $\gamma_1$. We compute $\delta$ and obtain

$$I_1^2 \delta = \delta_1 \delta_2,$$

where

$$\delta_1 = I_1 I_2 I_3^2 (I_2 - I_3)c_1 \omega_2^2 \omega_3$$

and

$$\delta_2 = I_1 I_2 I_3^2 (I_2 - I_3)c_1 \omega_2^2 \omega_3.$$
\[ \delta_2 = [I_2(2I_2 - 3I_1)\omega_2^2 + I_3(2I_3 - 3I_1)\omega_3^2 - 4I_1c_1\gamma_1](\omega_2^2 - I_3\omega_3^2 - 2c_1\gamma_1 + U_3) \]
\[ \quad + 4c_1U_1\sqrt{I_1(-I_2\omega_2^2 - I_3\omega_3^2 - 2c_1\gamma_1 + U_3)} \]

\( \delta_1 \) vanishes identically if \( I_2 = I_3 \) which leads to the Lagrange case or if \( c_1 = 0 \) which leads to the Euler case. Thus we suppose that \( I_2 \neq I_3 \) and \( c_1 \neq 0 \) and should study when \( \delta_2 \) vanishes.

According to Proposition 4.3 applied to \( V = I_1(\omega_2^2 - I_3\omega_3^2 - 2c_1\gamma_1 + U_3) \) we conclude that \( U_1 = 0 \). Thus

\[ \delta_2 = [I_2(2I_2 - 3I_1)\omega_2^2 + I_3(2I_3 - 3I_1)\omega_3^2 - 4I_1c_1\gamma_1](\omega_2^2 - I_3\omega_3^2 - 2c_1\gamma_1 + U_3) \]
and it is easily seen that if \( c_1 \neq 0 \) then neither the first factor in the square brackets nor the second one vanishes independently of the values of the moments of inertia.

Thus a new first integral of type 1, \( F(\omega_2, \omega_3, \gamma_1) \) does not exist.

**Type 3.** We go to the consideration of a first integral of type 3, \( F(\omega_2, \gamma_1, \gamma_3) \). Thus

\[ \frac{dF}{dt} = -\frac{(I_1 - I_3)\omega_3R - c_1\gamma_3 + c_3\gamma_1}{I_2} \frac{\partial F}{\partial \omega_2} \]
\[ - \frac{I_1\omega_3\gamma_1R + I_2\omega_2^2\gamma_3 + I_3\omega_3^2\gamma_3 - U_1\omega_3}{I_2\omega_2} \frac{\partial F}{\partial \gamma_1} \]
\[ + \frac{I_2\omega_2^2\gamma_1 + (I_1\gamma_1R + I_3\omega_3\gamma_3 - U_1)R}{I_2\omega_2} \frac{\partial F}{\partial \gamma_3} = 0, \]

which is equivalent to

\[ I_2\omega_2 \frac{dF}{dt} = Y_1(F) = 0, \quad (8.88) \]

where \( Y_1 \) is the corresponding vector field defined on a \( \Omega \).

We differentiate (8.88) with respect to \( \omega_3 \) two times and obtain

\[ \frac{\partial Y_1(F)}{\partial \omega_3} = \omega_2(I_3 - I_1) \left( \omega_3^2 \frac{\partial R}{\partial \omega_3} + R \right) \frac{\partial F}{\partial \omega_2} \]
\[ - \left[ I_1\gamma_1 \left( \omega_3^2 \frac{\partial R}{\partial \omega_3} + R \right) + 2I_3\omega_3\gamma_3 - U_1 \right] \frac{\partial F}{\partial \gamma_1} \]
\[ + \left[ I_3\gamma_3 \left( \omega_3 \frac{\partial R}{\partial \omega_3} + R \right) + 2I_1\gamma_1R \frac{\partial R}{\partial \omega_3} - U_1 \frac{\partial R}{\partial \omega_3} \right] \frac{\partial F}{\partial \gamma_3} = Y_2(F) = 0 \quad (8.89) \]

and

\[ \frac{\partial Y_2(F)}{\partial \omega_3} = \omega_2(I_3 - I_1) \left( \omega_3^2 \frac{\partial^2 R}{\partial \omega_3^2} + 2 \frac{\partial R}{\partial \omega_3} \right) \frac{\partial F}{\partial \omega_2} \]
\[ - \left[ I_1\gamma_1 \left( \omega_3^2 \frac{\partial^2 R}{\partial \omega_3^2} + 2 \frac{\partial R}{\partial \omega_3} \right) + 2I_3\gamma_3 \right] \frac{\partial F}{\partial \gamma_1} \]
\[ + \left[ I_3\gamma_3 \left( \omega_3 \frac{\partial^2 R}{\partial \omega_3^2} + 2 \frac{\partial R}{\partial \omega_3} \right) + 2I_1\gamma_1 \left( \frac{\partial R}{\partial \omega_3} \right)^2 \right. \]
\[ \left. + (2I_1\gamma_1R - U_1) \frac{\partial^2 R}{\partial \omega_3^2} \right] \frac{\partial F}{\partial \gamma_3} = Y_3(F) = 0, \quad (8.90) \]

where \( Y_2 \) and \( Y_3 \) are the corresponding vector fields defined on \( \Omega \).
If a first integral \( F(\omega_2, \gamma_1, \gamma_3) \) exists, system (8.88)–(8.90) has a non-zero solution \( \text{grad} \ F = \left( \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \gamma_1}, \frac{\partial F}{\partial \gamma_3} \right) \). This is possible if and only if the determinant \( D(R) \) of its coefficients is identically equal to zero.

\( D(R) \) has a factor \( \omega_2 \) and we note

\[
\hat{D}(R) = \frac{D(R)}{\omega_2}.
\]

The expression for \( \hat{D}(R) \) is

\[
\hat{D}(R) = a_1 R^3 + a_2 R^2 \frac{\partial R}{\partial \omega_3} + a_3 R^2 \frac{\partial^2 R}{\partial \omega_3^2} + a_4 R^2 + a_5 R \left( \frac{\partial R}{\partial \omega_3} \right)^2 + a_6 \frac{\partial^2 R}{\partial \omega_3^2} + a_7 R \frac{\partial^2 R}{\partial \omega_3^2} + a_8 R + a_9 \left( \frac{\partial R}{\partial \omega_3} \right)^3 + a_{10} \left( \frac{\partial R}{\partial \omega_3} \right)^2 + a_{11} \frac{\partial R}{\partial \omega_3} + a_{12} \frac{\partial^2 R}{\partial \omega_3^2},
\]

where

\[
\begin{align*}
    a_1 &= 2I_1 I_3 (I_1 - I_3) \gamma_1 \gamma_3, \\
    a_2 &= 2I_1 (I_1 - I_3) (-3I_3 \omega_3 \gamma_3 + U_1) \gamma_1, \\
    a_3 &= I_1 [-2I_2 (I_1 - I_3) \omega_2^2 \gamma_3 + U_1 (I_1 - I_3) \omega_3 + 2I_1 c_3 \gamma_1^2 - 2I_1 c_1 \gamma_1 \gamma_3] \gamma_1, \\
    a_4 &= -2I_3 (I_1 - I_3) U_1 \gamma_3 \\
    a_5 &= 2I_1 [I_2 (I_1 - I_3) \omega_2^2 \gamma_3 + 3I_3 (I_1 - I_3) \omega_2^2 \gamma_3 - 2U_1 (I_1 - I_3) \omega_3 - I_1 c_3 \gamma_1^2 + I_1 c_1 \gamma_1 \gamma_3] \gamma_1 \\
    a_6 &= 4I_3 (I_1 - I_3) U_1 \omega_3 \gamma_3 - 4I_3 c_3 \gamma_1 \gamma_3 + 4I_1 I_3 c_3 \gamma_1 \gamma_3^2 - 2(I_1 - I_3) U_1^2, \\
    a_7 &= I_2 (I_1 - I_3) U_1 \omega_2 \gamma_3 + I_3 (I_1 - I_3) U_1 \omega_3 \gamma_3 + 4I_1 I_3 c_3 \omega_3 \gamma_1 \gamma_3 - 4I_1 I_3 c_1 \omega_3 \gamma_1 \gamma_3 \\
    &\quad - (I_1 - I_3) U_1^2 \omega_3 - 3I_1 c_3 U_1 \gamma_1^2 + 3I_1 c_1 U_1 \gamma_1 \gamma_3, \\
    a_8 &= 2I_3 \gamma_3 [I_2 (I_1 - I_3) \omega_2 \gamma_1 - I_3 c_3 \gamma_1 \gamma_3 + I_3 c_1 \gamma_3^2], \\
    a_9 &= 2I_1 \omega_3 \gamma_1 [-I_2 (I_1 - I_3) \omega_2 \gamma_3 - I_3 (I_1 - I_3) \omega_2 \gamma_3 \\
    &\quad + (I_1 - I_3) U_1 \omega_3 + I_1 c_3 \gamma_1^2 - I_1 c_1 \gamma_1 \gamma_3], \\
    a_{10} &= -2I_2 (I_1 - I_3) U_1 \omega_2 \gamma_3 + 2I_3 (I_1 - I_3) U_1 \omega_3 \gamma_3 + 4I_1 I_3 c_3 \omega_3 \gamma_1 \gamma_3 - 4I_1 I_3 c_1 \omega_3 \gamma_1 \gamma_3 \\
    &\quad - 4I_1 I_3 c_1 \omega_3 \gamma_1 \gamma_3^2 + 2(I_1 - I_3) U_1^2 \omega_3, \\
    a_{11} &= -2I_2 I_3 (I_1 - I_3) \omega_2 \omega_3 \gamma_3 + 2I_2 (I_1 - I_3) U_1 \omega_2 \gamma_1 + 2I_3 c_3 \omega_3 \gamma_1 \gamma_3 - 2I_3 c_1 \omega_3 \gamma_3 \\
    a_{12} &= (U_1 - 2I_3 \omega_3 \gamma_3) [I_2 (I_1 - I_3) \omega_2 \omega_3 \gamma_1 - I_3 c_3 \omega_3 \gamma_1 \gamma_3 + I_3 c_1 \omega_3 \gamma_3^2 + c_3 U_1 \gamma_1 - c_1 U_1 \gamma_3].
\end{align*}
\]

\( \hat{D}(R) \) contains \( \frac{\partial R}{\partial \omega_3} \) and \( \frac{\partial^2 R}{\partial \omega_3^2} \). We determine them by the same method we used for a first integral of type 2 and obtain

\[
\begin{align*}
    \frac{\partial R}{\partial \gamma_1} &= -I_3 (I_2 \omega_2 \omega_3 - c_2 \gamma_3) \frac{I_3 (I_2 \omega_2 \omega_3 - c_2 \gamma_3)}{I_1 (I_2 \omega_2 \omega_3 - c_2 \gamma_1)}, \\
    \frac{\partial^2 R}{\partial \gamma_1^2} &= -I_1 I_3 \omega_2 \frac{I_3 (I_2 \omega_2 \omega_3 - c_2 \gamma_3)^3}{I_1 (I_2 \omega_2 \omega_3 - c_2 \gamma_1)^3} \bigg( I_2^2 I_3^2 \omega_2^2 \omega_3^2 - 2I_2 I_3 c_2 \omega_2 \omega_3 \gamma_3 + I_1 I_2^2 \omega_2 ^2 \omega_3^2 \\
    &\quad - 2I_1 I_2 c_2 \omega_2 \gamma_1 R + I_1 c_2 \gamma_1^2 + I_3 c_2^2 \gamma_3^3 \bigg).
\end{align*}
\]

We put these values of the derivatives of \( R \) in the expression (8.91) and obtain

\[
\hat{D}(R) = \frac{I_3}{I_1^3 (I_2 \omega_2 \omega_3 - c_2 \gamma_1)^3} \delta(R),
\]
where \( \delta(R) \) is a polynomial of \( R \) of degree six with coefficients that are polynomials of \( \omega_2, \omega_3, \gamma_1, \gamma_3 \) and parameters \( \mathcal{I}c \) and \( U_1 \).

It is clear that the equation \( \tilde{D}(R) = 0 \) is equivalent to \( \delta(R) = 0 \). We know that if \( Q(R) = 0 \), then if in addition some supplementary first integral \( F(\omega_2, \gamma_1, \gamma_3) \) of system (8.81) exists, then also \( \delta(R) = 0 \). Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring \( \mathbb{K}[x] \), where \( \mathbb{K} = \text{Alg}(\omega_2, \omega_3, \gamma_1, \gamma_3) \), the polynomial \( Q(x) \) divides the polynomial \( \delta(x) \).

By the MAPLE command \texttt{rem} we compute remainder \( r(x) \) from the division of polynomial \( \delta(x) \) by polynomial \( Q(x) \). It is of the form:

\[
r(x) = \frac{1}{I_2^2 \omega_2^2}(a_0 x + a_1),
\]

where the coefficients \( a_0 \) and \( a_1 \) are polynomials of \( \omega_2, \omega_3, \gamma_1 \) and \( \gamma_3 \) and parameters \( \mathcal{I}c \), \( U_1 \) and \( U_3 \).

According to Proposition 4.2 if \( R \) is a root of equation (8.79), then we have \( a_0 = a_1 = 0 \) identically. Although polynomial \( a_0 \) has 84 coefficients we use \( a_1 \) which has 160 ones. This is because if we use \( a_0 = 0 \) then the reduced system has one solution \( U_1 = 0, \ c_2 = 0 \) which should be studied separately whereas only two consecutive simplifications on the system with 160 equations coming from \( a_1 = 0 \) lead to the reduced system

\[
c_1 = 0, \ c_3 = 0, \ I_1 - I_3 = 0,
\]

which immediately implies the Lagrange case and leads to the conclusion that a new first integral of type 3 does not exist.

### 8.3.4. Elimination of \( \gamma_2 \) and \( \gamma_3 \)

Like in Sec. 8.2.1 we solve equations \( H_1 = U_1 \) and \( H_3 = U_3 \) with respect to \( \gamma_2 \) and \( \gamma_3 \) and obtain

\[
\begin{align*}
\gamma_2 &= \frac{I_3 \omega_3 (I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_1 \gamma_1 - U_3) - 2I_1 c_3 \omega_1 \gamma_1 + 2c_3 U_1}{2(I_2 c_3 \omega_2 - I_3 c_2 \omega_3)}, \\
\gamma_3 &= -\frac{I_2 \omega_2 (I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_1 \gamma_1 - U_3) - 2I_1 c_2 \omega_1 \gamma_1 + 2c_2 U_1}{2(I_2 c_3 \omega_2 - I_3 c_2 \omega_3)}.
\end{align*}
\]  

(8.92)

Let us note that the elimination of \( \gamma_2 \) and \( \gamma_3 \) from equations \( H_1 = U_1 \) and \( H_3 = U_3 \) is possible only if

\[
(c_2, c_3) \neq (0, 0).
\]

(8.93)

Further we suppose that this condition is fulfilled.

We put the values of \( \gamma_2 \) and \( \gamma_3 \) from (8.92) in the Euler-Poisson equations (1.1) and remove its fifth and sixth equations. In this way we obtain the following system of four equations in unknowns \( \omega_1, \ \omega_2, \ \omega_3 \) and \( \gamma_1 \):

\[
\frac{d\omega_1}{dt} = \frac{1}{2I_1 (I_2 c_3 \omega_2 - I_3 c_2 \omega_3)} \left[ I_1 I_2 c_2 \omega_1^2 \omega_2 + I_1 I_3 c_3 \omega_1 \omega_3 + I_2^2 c_2 \omega_2^3 + I_3^2 c_3 \omega_3^3 + 2I_2 c_1 c_2 \omega_2 \gamma_1 + I_2 (2I_2 - I_3) c_3 \omega_2^2 \omega_3 + 2I_3 c_1 c_3 \omega_3 \gamma_1 \right.
\]

\[
- I_3 (I_2 - I_3) c_2 \omega_2 \omega_3^2 - I_2 c_2 U_3 \omega_2 - I_3 c_3 U_3 \omega_3
\]

\[
- 2I_1 (c_2^2 + c_3^2) \omega_1 \gamma_1 + 2(c_2^2 + c_3^2) U_1 \right],
\]
\[
\frac{d\omega_2}{dt} = \frac{1}{2I_2(I_2c_3\omega_2 - I_3c_2\omega_3)} \left[ -I_1I_2c_1\omega_1^2\omega_2 - I_2^2c_1\omega_3^2 - I_2I_3c_1\omega_2\omega_3^2 \right. \\
+ 2I_1c_1c_2\omega_1\gamma_1 - 2I_2(I_1 - I_3)c_3\omega_1\omega_2\omega_3 + 2I_3c_2c_3\omega_3\gamma_1 \\
+ 2I_3(I_1 - I_3)c_2\omega_1\omega_3^2 + I_2c_1U_3\omega_2 - 2I_2(c_1^2 + c_3^2)\omega_2\gamma_1 - 2c_1c_2U_1], \\
(8.94)
\]
\[
\frac{d\omega_3}{dt} = \frac{1}{2I_3(I_2c_3\omega_2 - I_3c_2\omega_3)} \left[ -I_1I_3c_1\omega_1^2\omega_3 - I_2I_3c_1\omega_2\omega_3 - I_3^2c_1\omega_3^3 \right. \\
+ 2I_1c_1c_3\omega_1\gamma_1 + 2I_2c_2c_3\omega_2\gamma_1 + 2I_2(I_1 - I_2)c_3\omega_1\omega_2^2 \\
- 2I_3(I_1 - I_2)c_2\omega_1\omega_2\omega_3 + I_3c_1U_3\omega_3 - 2I_3(c_1^2 + c_2^2)\omega_2\gamma_1 - 2c_1c_3U_1], \\
(8.94)
\]
\[
\frac{d\gamma_1}{dt} = \frac{1}{2(I_2c_3\omega_2 - I_3c_2\omega_3)} \left[ I_1I_2\omega_1^3\omega_2^2 + I_1I_3\omega_1^2\omega_3^3 + I_2^2\omega_2^4 + 2I_2I_3\omega_2\omega_3^3 \right. \\
+ I_3^2\omega_3^4 - 2I_1c_2\omega_1\omega_3\gamma_1 - 2I_1c_3\omega_1\omega_3\gamma_1 + 2I_2c_1\omega_2\omega_3\gamma_1 + 2I_3c_1\omega_3^2\gamma_1 \\
- I_2U_3\omega_2^2 - I_3U_3\omega_3^2 + 2c_2U_1\omega_2 + 2c_3U_1\omega_3].
\]

We consider the following four possible types of a first integral of system (8.94) that depends on at most three variables among the variables \(\omega_1\), \(\omega_2\), \(\omega_3\) and \(\gamma_1\):

1. \(F(\omega_1, \omega_2, \omega_3)\), (case (i))
2. \(F(\omega_1, \omega_2, \gamma_1)\), (case (iii))
3. \(F(\omega_1, \omega_3, \gamma_1)\), (case (iii))
4. \(F(\omega_2, \omega_3, \gamma_1)\), (case (ii))

The only not yet studied case for the invariant manifold (8.48) is case (i). Thus here we should study the existence of a first integral of type 1 only.

We suppose that the studied partial first integral is functionally independent of \(H_2\) restricted to invariant manifold (8.48).

**Type 1.** Let us consider a first integral of type 1, \(F(\omega_1, \omega_2, \omega_3)\). Thus

\[
2I_1I_2I_3(I_2c_3\omega_2 - I_3c_2\omega_3) \frac{dF}{dt} = Z(F) = 0,
(8.95)
\]

where \(Z\) is the corresponding vector field defined on some suitable open set \(\Omega \subset \mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1)\).

Note that the right-hand sides of equations (8.94) are linear functions of \(\gamma_1\). Thus, as \(F\) does not depend on \(\gamma_1\), \(Z(F)\) is also a linear function of \(\gamma_1\), i.e. \(Z(F) = \gamma_1Y_1(F) + Y_2(F)\). Equation (8.95) which is an identity with respect to variables \(\omega_1\), \(\omega_2\), \(\omega_3\) and \(\gamma_1\) implies that coefficients \(Y_1(F)\) and \(Y_2(F)\) should vanish. The vector fields \(Y_1\) and \(Y_2\) are given by the following expressions:

\[
Y_1 = 2I_2I_3 \left[ I_2c_1c_2\omega_2 + I_3c_1c_3\omega_3 - I_1(c_1^2 + c_3^2)\omega_1 \right] \frac{\partial}{\partial \omega_1} \\
+ 2I_1I_3 \left[ I_1c_1c_2\omega_1 + I_3c_2c_3\omega_3 - I_2(c_1^2 + c_3^2)\omega_2 \right] \frac{\partial}{\partial \omega_2} \\
+ 2I_1I_2 \left[ 2I_1c_1c_3\omega_1 + 2I_2c_2c_3\omega_2 - 2I_3(c_1^2 + c_2^2)\omega_3 \right] \frac{\partial}{\partial \omega_3},
\]

\[
Y_2 = I_2I_3 \left[ I_2c_2\omega_2(I_1\omega_1^2 + I_2\omega_2^2) + I_3c_3\omega_3(I_1\omega_1^2 + I_3\omega_3^2) + I_2(2I_2 - I_3)c_3\omega_2^2\omega_3
\]
\[-I_3(I_2 - 2I_3)c_2\omega_2\omega_3^2 - I_2c_3U_3\omega_2 - I_3c_3U_3\omega_3 + 2(c_2^2 + c_3^2)U_1\frac{\partial}{\partial\omega_1} + I_1I_3\left[ -I_2c_1\omega_2(I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2) - 2I_2(I_1 - I_3)c_3\omega_1\omega_2\omega_3 + 2I_3(I_1 - I_3)c_2\omega_1\omega_3^2 + I_2c_1U_3\omega_2 - 2c_1c_2U_1\right]\frac{\partial}{\partial\omega_2} + I_1I_2\left[ -I_3c_1\omega_3(I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2) + 2I_2(I_1 - I_2)c_3\omega_1\omega_2^2 - 2I_3(I_1 - I_2)c_2\omega_1\omega_2\omega_3 + I_3c_1U_3\omega_3 - 2c_1c_3U_1\right]\frac{\partial}{\partial\omega_3}.

We compose the Lie bracket \(Y_3 = -[Y_1, Y_2]/(2I_1I_2I_3)\). The expression for \(Y_3\) is long and we do not write it here.

We consider equations

\[Y_i(F) = 0, \quad 1 \leq i \leq 3. \tag{8.96}\]

If a first integral \(F(\omega_1, \omega_2, \omega_3)\) exists, system (8.96) has a non-zero solution \(\text{grad} F = \left(\frac{\partial F}{\partial\omega_1}, \frac{\partial F}{\partial\omega_2}, \frac{\partial F}{\partial\omega_3}\right)\). This is possible if and only if the determinant \(D\) of its coefficients is identically equal to zero.

The expression for \(D\) is very long to be given here but our computations show that

\[D = 4I_1I_2I_3(I_2c_3\omega_2 - I_3c_2\omega_3)^2\hat{D}.\]

As the factor in front of \(\hat{D}\) never vanishes identically because of the condition (8.93), equation \(D = 0\) is equivalent to \(\hat{D} = 0\). \(\hat{D}\) is a polynomial of \(\omega_1, \omega_2\) and \(\omega_3\) with 37 coefficients depending on parameters \(\mathcal{I}c, U_1\) and \(U_3\).

Thus we should solve the system obtained by equating to zero the 37 coefficients of \(\hat{D}\). After four consecutive simplifications we obtain the following simple reduced system:

\[c_3(I_1 - I_2) = 0, \quad c_2(I_1 - I_3) = 0, \quad c_1(I_2 - I_3) = 0, \quad c_2c_3(I_2 - I_3) = 0.\]

We solve this system by the MAPLE command \texttt{solve} and obtain the following five solutions with arbitrary values of \(U_1\) and \(U_3\):

\[
\begin{align*}
\{&I_1 = I_1, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = 0, \quad c_3 = 0\} \\
\{&I_1 = I_1, \quad I_2 = I_3, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_2 = 0, \quad c_3 = 0\} \\
\{&I_1 = I_2, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = 0, \quad c_3 = c_3\} \\
\{&I_1 = I_3, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = c_2, \quad c_3 = 0\} \\
\{&I_1 = I_3, \quad I_2 = I_3, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_2 = c_2, \quad c_3 = c_3\}.
\end{align*}
\]

Taking into account condition (8.93), we remove the first and second solutions. The remaining three solutions lead either to the Lagrange case or to the kinetic symmetry.

Thus the sought first integral of type 1 does not exist.

### 8.4. Invariant manifold \(\{H_2=U_2, \ H_3=U_3\}\).

Here we study the existence of a partial first integral of the Euler-Poisson equations (1.1) restricted to the complex four-dimensional level manifold

\[\{H_2 = U_2, \ H_3 = U_3\}, \tag{8.97}\]
supposing that this first integral depends on at most three variables and that is functionally independent of $H_1$. $U_2$ and $U_3$ are arbitrary complex numbers, fixed once and for all.

Let us stress that the elimination of $\omega_1$ and $\omega_2$ is impossible on invariant manifold (8.97).

**8.4.1. Elimination of $\omega_1$ and $\gamma_1$.** We express $\gamma_1$ from the equation $H_2 = U_2$ and obtain

$$
\gamma_1 = \sqrt{-\gamma_2^2 - \gamma_3^2 + U_2}.
$$

(8.98)

Then we put $\gamma_1$ from (8.98) in the equation $H_3 = U_3$ and like in Sec. 8.2.1 solve it by the Maple command `solve`. In this way we obtain

$$
\omega_1 = R,
$$

(8.99)

where $R$ is a root of equation

$$
Q(x) = I_1 x^2 + B = 0,
$$

(8.100)

that is

$$
Q(R) = I_1 R^2 + B = 0,
$$

(8.101)

where $B = B(\omega_2, \omega_3, \gamma_2, \gamma_3)$ is the following function:

$$
B = I_2 \omega_2^2 + I_3 \omega_3^2 + 2 c_1 \sqrt{-\gamma_2^2 - \gamma_3^2 + U_2} + 2 c_2 \gamma_2 + 2 c_3 \gamma_3 - U_3.
$$

(8.102)

$R$ and $B$ are algebraic functions defined on $C^4(\omega_2, \omega_3, \gamma_2, \gamma_3)$. The equation (8.100) has only simple roots because the function $B$ does not vanish identically.

Further, to simplify the notations, we put

$$
\Gamma = \sqrt{-\gamma_2^2 - \gamma_3^2 + U_2}.
$$

We put the values of $\gamma_1$ and $\omega_1$ from (8.98) and (8.99) in the Euler-Poisson equations (1.1), remove the first and fourth equations and obtain the following system of four differential equations in unknowns $\omega_2$, $\omega_3$, $\gamma_2$ and $\gamma_3$:

$$
\frac{d\omega_2}{dt} = \frac{1}{I_2} [(I_3 - I_1) \omega_3 R + c_1 \gamma_3 - c_3 \Gamma], \quad \frac{d\gamma_2}{dt} = \gamma_3 R - \omega_3 \Gamma,
$$

$$
\frac{d\omega_3}{dt} = \frac{1}{I_3} [(I_1 - I_2) \omega_2 R - c_1 \gamma_2 + c_2 \Gamma], \quad \frac{d\gamma_3}{dt} = -\gamma_2 R + \omega_2 \Gamma.
$$

(8.103)

We want to study the existence of a first integral of system (8.103) that depends on at most three variables among the variables $\omega_2$, $\omega_3$, $\gamma_2$ and $\gamma_3$ and that is functionally independent of $H_1$ restricted to invariant manifold (8.97). The following four types of a first integral are possible:

1. $F(\omega_2, \omega_3, \gamma_2)$, (case (iii))
2. $F(\omega_2, \omega_3, \gamma_3)$, (case (iii))
3. $F(\omega_2, \gamma_2, \gamma_3)$, (case (iv))
4. $F(\omega_3, \gamma_2, \gamma_3)$, (case (iv))

Like in Sec. 5 we consider here only types 1 and 3.
**Type 1.** Let us suppose that there exists a first integral of type 1, $F(\omega_2, \omega_3, \gamma_2)$. Then

$$I_2 I_3 \frac{dF}{dt} = Y_1(F) = 0, \quad (8.104)$$

where $Y_1$ is the vector field

$$Y_1 = I_3 \left[ (I_3 - I_1) \omega_3 R + c_1 \gamma_3 - c_3 \Gamma \right] \frac{\partial}{\partial \omega_2}$$

$$+ I_2 \left[ (I_1 - I_2) \omega_2 R - c_1 \gamma_2 + c_2 \Gamma \right] \frac{\partial}{\partial \omega_3}$$

$$+ I_2 I_3 \left[ \gamma_3 R - \omega_3 \Gamma \right] \frac{\partial}{\partial \gamma_2},$$

defined on $\mathbb{C}^4(\omega_2, \omega_3, \gamma_2, \gamma_3)$.

As function $F$ does not depend on $\gamma_3$, then if we differentiate identity (8.104) with respect to $\gamma_3$ we obtain again a linear partial differential equation for function $F$

$$\Gamma \frac{\partial Y_1(F)}{\partial \gamma_3} = I_3 \left[ \frac{\partial R}{\partial \gamma_3} (I_3 - I_1) \omega_3 \Gamma + c_1 \Gamma + c_3 \gamma_3 \right] \frac{\partial F}{\partial \omega_2}$$

$$+ I_2 \left[ \frac{\partial R}{\partial \gamma_3} (I_1 - I_2) \omega_2 \Gamma - c_2 \gamma_3 \right] \frac{\partial F}{\partial \omega_3}$$

$$+ I_2 I_3 \left[ \frac{\partial R}{\partial \gamma_3} \gamma_3 \Gamma + R \Gamma + \omega_3 \gamma_3 \right] \frac{\partial F}{\partial \gamma_2} = Y_2(F) = 0, \quad (8.105)$$

where $Y_2$ is the corresponding vector field defined on $\mathbb{C}^4(\omega_2, \omega_3, \gamma_2, \gamma_3)$.

After differentiating identity (8.105) with respect to $\gamma_3$ we obtain

$$\Gamma \frac{\partial Y_2(F)}{\partial \gamma_3} = I_3 \left[ \frac{\partial^2 R}{\partial \gamma_3^2} (I_3 - I_1) \omega_3 \Gamma^2 - \frac{\partial R}{\partial \gamma_3} (I_3 - I_1) \omega_3 \gamma_3 - c_1 \gamma_3 + c_3 \Gamma \right] \frac{\partial F}{\partial \omega_2}$$

$$+ I_2 \left[ \frac{\partial^2 R}{\partial \gamma_3^2} (I_1 - I_2) \omega_2 \Gamma^2 - \frac{\partial R}{\partial \gamma_3} (I_1 - I_2) \omega_2 \gamma_3 - c_2 \Gamma \right] \frac{\partial F}{\partial \omega_3}$$

$$+ I_2 I_3 \left[ \frac{\partial^2 R}{\partial \gamma_3^2} \gamma_3 \Gamma^2 + \frac{\partial R}{\partial \gamma_3} (2 \Gamma^2 - \gamma_3^2) - R \gamma_3 + \omega_3 \Gamma \right] \frac{\partial F}{\partial \gamma_2}$$

$$= Y_3(F) = 0, \quad (8.106)$$

where $Y_3$ is the corresponding vector field defined on $\mathbb{C}^4(\omega_2, \omega_3, \gamma_2, \gamma_3)$.

If a first integral $F$ exists, linear system (8.104)–(8.106) has a non-zero solution $\text{grad} F = \left( \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_2} \right)$. This is possible if and only if the determinant $D(R)$ of its coefficients is identically equal to zero on $\mathbb{C}^4(\omega_2, \omega_3, \gamma_2, \gamma_3)$.

The expression for $D(R)$ is too long to be shown here. $D(R)$ has a non-zero factor $I_2^2 I_3^2$ so we remove it and note

$$\hat{D}(R) = \frac{D(R)}{I_2^2 I_3^2}.$$  

$\hat{D}(R)$ contains the partial derivatives $\frac{\partial R}{\partial \gamma_3}$ and $\frac{\partial^2 R}{\partial \gamma_3^2}$ as well. To determine them we use equation (8.101) which we differentiate with respect to $\gamma_3$ two times and obtain two
where $b$ and $\omega$.

If in addition some supplementary first integral $F$ is a huge polynomial of degree five, whose coefficients are algebraic functions of $(\omega_2, \omega_3, \gamma_2, \gamma_3)$.

Thus the derivatives of $R$ can be found. We obtain the following expressions

$$\frac{\partial R}{\partial \gamma_3} = \frac{c_1\gamma_3 - c_3 \Gamma}{I_1 R \Gamma},$$

$$\frac{\partial^2 R}{\partial \gamma_3^2} = -\frac{(c_1^2 \gamma_3^2 + c_3^2 \Gamma^2) \Gamma - 2c_1 c_3 \gamma_3 \Gamma^2 + I_1 c_1 R^2 (\gamma_3^2 - U_2)}{I_1^2 R^3 \Gamma^3}.$$\

We put the obtained values for the derivatives of $R$ in the expression for determinant $\hat{D}(R)$ and obtain

$$\hat{D}(R) = \frac{\delta(R)}{I_1^2 R^3},$$

where $\delta$ is a huge polynomial of $R$ of degree five, whose coefficients are algebraic functions of $(\omega_2, \omega_3, \gamma_2, \gamma_3)$.

It is clear that $\hat{D}(R) = 0$ is equivalent to $\delta(R) = 0$. We know that if $Q(R) = 0$, then if in addition some supplementary first integral $F(\omega_2, \omega_3, \gamma_2)$ of system (8.103) exists, then also $\delta(R) = 0$. Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring $\mathbb{K}[x]$, where $\mathbb{K} = \text{Alg}(\omega_2, \omega_3, \gamma_2, \gamma_3)$, the polynomial $Q(x)$ divides the polynomial $\delta(x)$.

Using the MAPLE command `rem` we compute the remainder $r$ from the division of polynomial $\delta(x)$ by polynomial $Q(x)$. We obtain

$$r(x) = a_0 x + a_1,$$

where $a_i = a_i(\omega_2, \omega_3, \gamma_2, \gamma_3)$, $i = 0, 1$, depend linearly on $\Gamma$.

According to Proposition 4.2, $a_0$ and $a_1$ should vanish identically with respect to $\omega_2$, $\omega_3$, $\gamma_2$ and $\gamma_3$. We use only $a_0$ which suffices for our aims. We have

$$a_0 = b_0 \Gamma + b_1,$$

where $b_0$ and $b_1$ are polynomials of variables $\omega_2$, $\omega_3$, $\gamma_2$ and $\gamma_3$.

According to Proposition 4.3, the coefficients $b_0$ and $b_1$ should vanish identically because $\Gamma \notin \mathbb{C}(\gamma_2, \gamma_3)$. Polynomial $b_0$ has 30 coefficients and $b_1$ has 68. Equating to zero all of them we obtain 98 equations for the parameters $Ic$, $U_2$ and $U_3$.

After three consecutive simplifications we come to the reduced system that consists of the following four equations:

$$c_1 = 0, \quad c_3(I_1 - I_2) = 0, \quad c_2(I_1 - I_3) = 0, \quad c_2 c_3(I_2 - I_3) = 0.$$\

We solve this system by the MAPLE command `solve` and obtain four solutions all of them with arbitrary values of $U_2$ and $U_3$:

$$I_1 = I_1, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = 0, \quad c_3 = 0;$$
\[ I_1 = I_2, \ I_2 = I_2, \ I_3 = I_3, \ c_1 = 0, \ c_2 = 0, \ c_3 = c_3; \]
\[ I_1 = I_3, \ I_2 = I_2, \ I_3 = I_3, \ c_1 = 0, \ c_2 = c_2, \ c_3 = 0; \]
\[ I_1 = I_3, \ I_2 = I_3, \ I_3 = I_3, \ c_1 = 0, \ c_2 = c_2, \ c_3 = c_3. \]

The first solution is the Euler case, the second and third ones are the Lagrange case and the fourth solution is a particular cases of the kinetic symmetry case.

Thus a sought partial first integral of type 1 \( F(\omega_2, \omega_3, \gamma_2) \) does not exist.

**Type 3.** The study of a new first integral of type 3, \( F(\omega_2, \gamma_2, \gamma_3) \) follows the algorithm already described in the considerations concerning a first integral of type 1. There are some differences of course. For example, the computations of vector fields \( Y_2 \) and \( Y_3 \) require differentiation with respect to \( \omega_3 \) instead of \( \gamma_3 \). By the way, as it is seen below, this considerably simplifies the computations because the differentiation does not affect the function \( \Gamma \).

Let us suppose that there exists a first integral of type 3, \( F(\omega_2, \gamma_2, \gamma_3) \). Then we have

\[ I_2 \frac{dF}{dt} = Y_1(F) = 0, \tag{8.107} \]

where \( Y_1 \) is the vector field

\[ Y_1 = [(I_3 - I_1)\omega_3 R + c_1\gamma_3 - c_3\Gamma] \frac{\partial}{\partial \omega_2} + I_2 (\gamma_3 R - \omega_3 \Gamma) \frac{\partial}{\partial \gamma_2} - I_2 (\gamma_2 R - \omega_2 \Gamma) \frac{\partial}{\partial \gamma_3}, \]

defined on \( \mathbb{C}^4(\omega_2, \omega_3, \gamma_2, \gamma_3) \).

As in the study of a first integral of type 1, we differentiate identity (8.107) with respect to \( \omega_3 \) and obtain

\[ \frac{\partial Y_1(F)}{\partial \omega_3} = (I_3 - I_1) \left( \frac{\partial R}{\partial \omega_3} \omega_3 + R \right) \frac{\partial F}{\partial \omega_2} + I_2 \left( \frac{\partial R}{\partial \omega_3} \gamma_3 - \Gamma \right) \frac{\partial F}{\partial \gamma_2} - I_2 \frac{\partial R}{\partial \omega_3} \gamma_2 \frac{\partial F}{\partial \gamma_3} = Y_2(F) = 0, \tag{8.108} \]

where \( Y_2 \) is the corresponding vector field defined on \( \mathbb{C}^4(\omega_2, \omega_3, \gamma_2, \gamma_3) \).

After differentiating identity (8.108) with respect to \( \omega_3 \) we obtain

\[ \frac{\partial Y_2(F)}{\partial \omega_3} = (I_3 - I_1) \left[ \frac{\partial^2 R}{\partial \omega_3^2} \omega_3 + 2 \frac{\partial R}{\partial \omega_3} \right] \frac{\partial F}{\partial \omega_2} + I_2 \frac{\partial^2 R}{\partial \omega_3^2} \gamma_3 \frac{\partial F}{\partial \gamma_2} - I_2 \frac{\partial^2 R}{\partial \omega_3^2} \gamma_2 \frac{\partial F}{\partial \gamma_3} = Y_3(F) = 0, \tag{8.109} \]

where \( Y_3 \) is the corresponding vector field defined on \( \mathbb{C}^4(\omega_2, \omega_3, \gamma_2, \gamma_3) \).

As in the investigation of a first integral of type 1, we require that the determinant \( D(R) \) of the coefficients of system (8.107)–(8.109) be identically equal to zero. Computing it we see that it has a non-zero factor \( I_2^2 \Gamma \). We remove it and note

\[ \hat{D}(R) = \frac{D(R)}{I_2^2 \Gamma}. \]

In this way we obtain

\[ \hat{D}(R) = - \left\{ [(I_1 - I_3)\omega_2 \omega_3 + c_3 \gamma_2] \frac{\partial^2 R}{\partial \omega_3^2} + 2 \omega_2 (I_1 - I_3) \frac{\partial R}{\partial \omega_3} \right\} \Gamma + c_1 \gamma_2 \gamma_3 \frac{\partial^2 R}{\partial \omega_3^2}. \]
+ 2\gamma_2(I_1 - I_3)R \frac{\partial R}{\partial \omega_3} + (\omega_2\gamma_3 - \omega_3\gamma_2)(I_1 - I_3) \left[ 2 \left( \frac{\partial R}{\partial \omega_3} \right)^2 - \frac{\partial^2 R}{\partial \omega_3^2} R \right]

\widehat{D}(R) \text{ contains the partial derivatives } \frac{\partial R}{\partial \omega_3} \text{ and } \frac{\partial^2 R}{\partial \omega_3^2}. \text{ We use equation (8.101) to determine them. For this aim we differentiate (8.101) with respect to } \omega_3 \text{ two times and obtain two equations for the sought derivatives of } R:

\frac{\partial Q}{\partial \omega_3} = 2I_1R \frac{\partial R}{\partial \omega_3} + \frac{\partial B}{\partial \omega_3} = 0,

\frac{\partial^2 Q}{\partial \omega_3^2} = 2I_1 \left( \frac{\partial R}{\partial \omega_3} \right)^2 + 2I_1R \frac{\partial^2 R}{\partial \omega_3^2} + \frac{\partial^2 B}{\partial \omega_3^2} = 0.

As we have mentioned studying the first integral of type 1, \( R = 0 \) cannot be a root of equation (8.101) and therefore the partial derivatives of \( R \) can be correctly determined from the above equations. We put the value of \( B \) taken from (8.102) in these equations and solve them. 

The solution is

\frac{\partial R}{\partial \omega_3} = -\frac{I_3 \omega_3}{I_1 R}, \quad \frac{\partial^2 R}{\partial \omega_3^2} = -\frac{I_3(I_3 \omega_3^2 + I_1 R^2)}{I_1^2 R^3}.

We put the above values of \( \frac{\partial R}{\partial \omega_3} \) and \( \frac{\partial^2 R}{\partial \omega_3^2} \) in the expression for determinant \( \widehat{D}(R) \) and obtain

\widehat{D}(R) = \frac{I_3 \delta(R)}{I_1^2 R^3},

where \( \delta(R) \) is the following polynomial of \( R \) of degree three:

\delta(R) = -I_1(I_1 - I_3)(3\omega_3\gamma_2 - \omega_2\gamma_3)R^3 + I_1 \left[ 3(I_1 - I_3)\omega_2\omega_3\Gamma + (c_3\Gamma - c_1\gamma_3)\gamma_2 \right] R^2

- 3I_3(I_1 - I_3)\omega_3^2(\omega_3\gamma_2 - \omega_2\gamma_3)R + I_3\omega_3^2 \left[ (I_1 - I_3)\omega_2\omega_3\Gamma + (c_3\Gamma - c_1\gamma_3)\gamma_2 \right].

It is clear that \( \widehat{D}(R) = 0 \) is equivalent to \( \delta(R) = 0 \). We know that if \( Q(R) = 0 \), then if in addition some supplementary first integral \( F(\omega_2, \gamma_2, \gamma_3) \) of system (8.103) exists, then also \( \delta(R) = 0 \). Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring \( \mathbb{K}[x] \), where \( \mathbb{K} = \text{Alg}(\omega_2, \omega_3, \gamma_2, \gamma_3) \), the polynomial \( Q(x) \) divides the polynomial \( \delta(x) \).

Using the MAPLE command \texttt{rem} we compute the remainder \( r \) from the division of polynomial \( \delta(x) \) by polynomial \( Q(x) \). We obtain

\[ r(x) = (a_0 + b_0 \Gamma)x + a_1 + b_1 \Gamma, \]

where

\[ a_0 = (I_3 - I_1)(I_3 \omega_3^2\gamma_3 - 3I_2 \omega_2^2\omega_3\gamma_2 - 2I_3 \omega_2\omega_3\gamma_3 + 2c_3 \omega_2\gamma_3^2 + 2c_2 \omega_2^2\gamma_2^2 - U_3 \omega_2\gamma_3

- 6c_2 \omega_3 \gamma_2^2 - 6c_3 \omega_3 \gamma_2 \gamma_3 + 3U_3 \omega_3 \gamma_2), \]
\[ b_0 = 2(I_3 - I_1)c_1(\omega_2 \gamma_3 - 3\omega_3 \gamma_2), \]
\[ a_1 = c_1 [I_2 \omega_2^2 \gamma_2 \gamma_3 - 6c_1(I_1 - I_3)\omega_2\omega_3 \Gamma^2 + 2c_3 \gamma_3^2 + 2c_2 \gamma_2^2 \gamma_3 + 4c_3 \gamma_3 \gamma_2^2

- U_3 \gamma_2 \gamma_3 - 2c_3 U_2 \gamma_2], \]
\[ b_1 = I_2 c_3 \omega_3^2 \gamma_2 - (I_1 - I_3)(3I_2 \omega_2^2 + 2I_3 \omega_3^2 + 2c_2 \gamma_2^2 + 6c_3 \gamma_2 + 6c_3 \gamma_3 - 3U_3) \omega_2 \omega_3

- 2c_2 c_3 \gamma_2^2 + 2(c_1^2 - c_3^2) \gamma_2 \gamma_3 + c_3 U_3 \gamma_2]. \]
According to Proposition 4.2, all the coefficients of the remainder \( r \) should vanish identically with respect to \( \omega_2, \omega_3, \gamma_2 \) and \( \gamma_3 \). We use only the coefficient \( a_1 + b_1 \Gamma \) which is sufficient for our aims.

According to Proposition 4.3, the coefficients \( a_1 \) and \( b_1 \) should vanish identically because \( \Gamma \not\in \mathbb{C}(\gamma_2, \gamma_3) \). We use only \( b_1 \). It has nine coefficients. Equating to zero all of them we obtain nine equations for the parameters \( I_1, U_2 \) and \( U_3 \) as follows:

\[
2I_3(I_3 - I_1) = 0, \quad 3I_2(I_3 - I_1) = 0, \quad -I_2c_3 = 0, \quad 3(I_1 - I_3)U_3, \quad c_3U_3 = 0,
\]
\[
2c_2c_3 = 0, \quad 2(c_1^2 - c_3^2) = 0, \quad 6(I_3 - I_1)c_2 = 0, \quad 6(I_3 - I_1)c_3 = 0.
\]

It is very easy to see that that equations imply that

\[
c_1 = 0, \quad c_3 = 0, \quad I_1 - I_3 = 0,
\]

which obviously leads to the Lagrange case.

Thus a sought partial first integral of type 3 does not exist.

8.4.2. Elimination of \( \omega_1 \) and \( \gamma_2 \). Like in Sec. 8.4.1, we express \( \gamma_2 \) from the equations \( H_2 = U_2 \) and obtain

\[
\gamma_2 = \sqrt{-\gamma_1^2 - \gamma_3^2 + U_2}.
\]

(8.110)

Then we put \( \gamma_2 \) from (8.110) in the equation \( H_3 = U_3 \) and like in Sec. 8.2.1 solve it by the MAPLE command \texttt{solve}. In this way we obtain

\[
\omega_1 = R,
\]

(8.111)

where \( R \) is a root of equation

\[
Q(x) = I_1x^2 + B = 0,
\]

(8.112)

that is

\[
Q(R) = I_1R^2 + B = 0,
\]

(8.113)

and \( B = B(\omega_2, \omega_3, \gamma_1, \gamma_3) \) is the following function:

\[
B = I_2\omega_2^2 + I_3\omega_3^2 + 2c_1\gamma_1 + 2c_2\sqrt{-\gamma_1^2 - \gamma_3^2 + U_2 + 2c_3\gamma_3 - U_3}.
\]

\( R \) and \( B \) are algebraic functions defined on \( \mathbb{C}^4(\omega_2, \omega_3, \gamma_1, \gamma_3) \). The equation (8.112) has only simple roots because the function \( B \) does not vanish identically.

Further, to simplify the notations, we put

\[
\Gamma = \sqrt{-\gamma_1^2 - \gamma_3^2 + U_2}.
\]

We put the values of \( \gamma_2 \) and \( \omega_1 \) from (8.110) and (8.111) in the Euler-Poisson equations (1.1), remove the first and fifth equations and obtain the following system of four differential equations in unknowns \( \omega_2, \omega_3, \gamma_1 \) and \( \gamma_3 \):

\[
\frac{d\omega_2}{dt} = \frac{1}{I_2} [(I_3 - I_1)\omega_3R + c_1\gamma_3 - c_3\gamma_1], \quad \frac{d\gamma_1}{dt} = \omega_3\Gamma - \omega_2\gamma_3,
\]
\[
\frac{d\omega_3}{dt} = \frac{1}{I_3} [(I_1 - I_2)\omega_2R + c_1\Gamma - c_2\gamma_1], \quad \frac{d\gamma_3}{dt} = \omega_2\gamma_1 - R\Gamma.
\]

(8.114)

We want to study the existence of a first integral of system (8.114) that depends on at most three variables among the variables \( \omega_2, \omega_3, \gamma_1 \) and \( \gamma_3 \) and that is functionally
independent of \( H_1 \) restricted to invariant manifold \( (8.97) \). The following four types of a first integral are possible:

1. \( F(\omega_2, \omega_3, \gamma_1) \), (case (ii))
2. \( F(\omega_2, \omega_3, \gamma_3) \), (case (iii))
3. \( F(\omega_2, \gamma_1, \gamma_3) \), (case (v))
4. \( F(\omega_3, \gamma_1, \gamma_3) \). (case (iv))

As the cases (iii) and (iv) were already examined, there remains only to examine cases (ii) and (v).

**Type 1.** Let us suppose that there exists a first integral of type 1, \( F(\omega_2, \omega_3, \gamma_1) \). Then

\[
I_2 I_3 \frac{dF}{dt} = Y_1(F) = 0,
\]

where \( Y_1 \) is the vector field

\[
Y_1 = I_3 \left[ (I_3 - I_1) \omega_3 R + c_1 \gamma_3 - c_3 \gamma_1 \right] \frac{\partial}{\partial \omega_2} + I_2 \left[ (I_1 - I_2) \omega_2 R + c_1 \Gamma - c_2 \gamma_1 \right] \frac{\partial}{\partial \omega_3} + I_2 I_3 (\omega_3 \Gamma - \omega_2 \gamma_3) \frac{\partial}{\partial \gamma_1},
\]

defined on \( C^4(\omega_2, \omega_3, \gamma_1, \gamma_3) \).

As function \( F \) does not depend on \( \gamma_3 \), then if we differentiate identity \( (8.115) \) with respect to \( \gamma_3 \) we obtain again a linear partial differential equation for function \( F \)

\[
\Gamma \frac{\partial Y_1(F)}{\partial \gamma_3} = I_3 \left[ \frac{\partial R}{\partial \gamma_3} (I_3 - I_1) \omega_3 + c_1 \right] \frac{\partial F}{\partial \omega_2} + I_2 \left[ \frac{\partial R}{\partial \gamma_3} (I_1 - I_2) \omega_2 \Gamma + c_1 \gamma_3 \right] \frac{\partial F}{\partial \omega_3} - I_2 I_3 [\omega_2 \Gamma + \omega_3 \gamma_3] \frac{\partial F}{\partial \gamma_1} = Y_2(F) = 0,
\]

where \( Y_2 \) is the corresponding vector field defined on \( C^4(\omega_2, \omega_3, \gamma_1, \gamma_3) \).

After differentiating identity \( (8.116) \) with respect to \( \gamma_3 \) we obtain

\[
\Gamma \frac{\partial Y_2(F)}{\partial \gamma_3} = I_3 \left[ \frac{\partial^2 R}{\partial \gamma_3^2} (I_3 - I_1) \omega_3 \Gamma^2 - \frac{\partial R}{\partial \gamma_3} (I_3 - I_1) \omega_3 \gamma_3 - c_1 \gamma_3 \right] \frac{\partial F}{\partial \omega_2} + I_2 \left[ \frac{\partial^2 R}{\partial \gamma_3^2} (I_1 - I_2) \omega_2 \Gamma^2 - \frac{\partial R}{\partial \gamma_3} (I_1 - I_2) \omega_2 \gamma_3 + c_1 \Gamma \right] \frac{\partial F}{\partial \omega_3} + I_2 I_3 (\omega_2 \gamma_3 - \omega_3 \Gamma) \frac{\partial F}{\partial \gamma_1} = Y_3(F) = 0,
\]

where \( Y_3 \) is the corresponding vector field defined on \( C^4(\omega_2, \omega_3, \gamma_1, \gamma_3) \).

If a first integral \( F \) exists, linear system \( (8.115)-(8.117) \) has a non-zero solution \( \text{grad} F = \left( \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_1} \right) \). This is possible if and only if the determinant \( D(R) \) of its coefficients is identically equal to zero on \( C^4(\omega_2, \omega_3, \gamma_1, \gamma_3) \).

The expression for \( D(R) \) has a non-zero factor \( I_2^2 I_3^2 \) so we remove it and note

\[
\hat{D}(R) = \frac{D(R)}{I_2^2 I_3^2}.
\]
In this way we obtain
\begin{align*}
\hat{D}(R) &= -\frac{\partial^2 R}{\partial \gamma_3^3} \left[ c_3(I_1 - I_2)\omega_2^2\gamma_1 \Gamma - c_1(I_2 - I_3)\omega_2\omega_3 \gamma_1^2 + c_3(I_1 - I_2)\omega_2\omega_3 \gamma_1 \gamma_3 \\
&\quad - c_2(I_1 - I_3)\omega_2\omega_3 \gamma_1 \Gamma + (I_2 - I_3)c_1 U_2\omega_2\omega_3 - c_2(I_1 - I_3)\omega_3^2 \gamma_1 \gamma_3 \right] \Gamma^2 \\
&\quad - \frac{\partial R}{\partial \gamma_3} \omega_3 [c_3(I_2 - I_1)\omega_2 \gamma_1 - c_1(I_2 - I_3)\omega_2 \gamma_3 + c_2(I_1 - I_3)\omega_3 \gamma_1] (U_2 - \gamma_1^2) \\
&\quad - c_1 [R(I_2 - I_3)\omega_2\omega_3 + c_3\omega_2 \gamma_1 - c_2\omega_3 \gamma_1] (U_2 - \gamma_1^2)
\end{align*}

\( \hat{D}(R) \) contains the partial derivatives \( \frac{\partial R}{\partial \gamma_2} \) and \( \frac{\partial^2 R}{\partial \gamma_3^2} \). To determine them we use equation (8.113) which we differentiate with respect to \( \gamma_3 \) two times and in the same way as in Sec. 8.4.1 obtain
\begin{align*}
\frac{\partial R}{\partial \gamma_3} &= \frac{c_2 \gamma_3 - c_3 \Gamma}{I_1 R \Gamma}, \\
\frac{\partial^2 R}{\partial \gamma_3^2} &= \frac{(c_2^2 \gamma_3^3 + c_3^2 \Gamma^2) \Gamma - 2c_2 c_3 \gamma_3 \Gamma^2 + I_1 c_2 R^2 (\gamma_1^2 - U_2)}{I_1^2 R^3 \Gamma^3}.
\end{align*}

We put the obtained values for the derivatives of \( R \) in the expression for determinant \( \hat{D}(R) \) and obtain
\[
\hat{D}(R) = \frac{\delta(R)}{I_1^2 R^3},
\]
where \( \delta \) is a long polynomial of \( R \) of degree four, whose coefficients are algebraic functions of \( (\omega_2, \omega_3, \gamma_1, \gamma_3) \).

The identity \( \hat{D}(R) = 0 \) is equivalent to \( \delta(R) = 0 \). We know that if \( Q(R) = 0 \), then if in addition some supplementary first integral \( F(\omega_2, \omega_3, \gamma_1) \) of system (8.114) exists, then also \( \delta(R) = 0 \). Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring \( \mathbb{K}[x] \), where \( \mathbb{K} = \text{Alg}(\omega_2, \omega_3, \gamma_1, \gamma_3) \), the polynomial \( Q(x) \) divides the polynomial \( \delta(x) \).

Using the MAPLE command \texttt{rem} we compute the remainder \( r \) from the division of polynomial \( \delta(x) \) by polynomial \( Q(x) \). We obtain:
\[
r(x) = a_0 x + a_1,
\]
where \( a_i = a_i(\omega_2, \omega_3, \gamma_1, \gamma_3) \), \( i = 0, 1 \), depend linearly on \( \Gamma \).

According to Proposition 4.2 \( a_0 \) and \( a_1 \) should vanish identically with respect to \( \omega_2, \omega_3, \gamma_1 \) and \( \gamma_3 \). We use only \( a_1 \) which suffices for our aims. We have
\[
a_1 = b_0 \Gamma + b_1,
\]
where \( b_0 \) and \( b_1 \) are polynomials of variables \( \omega_2, \omega_3, \gamma_1 \) and \( \gamma_3 \).

According to Proposition 4.3 the coefficients \( b_0 \) and \( b_1 \) should vanish identically because \( \Gamma \notin \mathbb{C}(\gamma_1, \gamma_3) \).

We use only polynomial \( b_1 \). It has 48 coefficients. Equating to zero all of them we obtain a system of 48 equations for the parameters \( I \), \( U_2 \) and \( U_3 \).

After four consecutive simplifications we come to the reduced system that consists of the following four equations:
\[
c_1(I_2 - I_3) = 0, \quad c_2(I_1 - I_3) = 0, \quad c_3(I_1 - I_2) = 0, \quad c_2 c_3(I_2 - I_3) = 0.
\]
We solve this system by the MAPLE command solve and obtain five solutions all of them with arbitrary values of $U_2$ and $U_3$:

$$I_1 = I_1, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = 0, \quad c_3 = 0;$$
$$I_1 = I_1, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_2 = 0, \quad c_3 = 0;$$
$$I_1 = I_2, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = 0, \quad c_3 = c_3;$$
$$I_1 = I_3, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = c_2, \quad c_3 = 0;$$
$$I_1 = I_3, \quad I_2 = I_3, \quad I_3 = I_3, \quad c_1 = c_1, \quad c_2 = c_2, \quad c_3 = c_3.$$

The first solution is the Euler case, the next three are the Lagrange case and the last one is the kinetic symmetry case.

Thus a partial first integral of type 1 $F(\omega_2, \omega_3, \gamma_1)$ does not exist.

**Type 3.** Let us suppose that there exists a first integral of type 3, $F(\omega_2, \gamma_1, \gamma_3)$. The independence of the first integral of $\omega_3$ considerably simplifies the computations because there is not need of differentiation of the function $\Gamma$.

So, let $F(\omega_2, \gamma_1, \gamma_3)$ be a first integral of system (8.114). Then we have

$$I_2 \frac{dF}{dt} = Y_1(F) = 0,$$

where $Y_1$ is the vector field

$$Y_1 = [(I_3 - I_1)\omega_3 R + c_1 \gamma_3 - c_3 \gamma_1] \frac{\partial}{\partial \omega_2} + I_2 (\omega_3 \Gamma - \omega_2 \gamma_3) \frac{\partial}{\partial \gamma_1} + I_2 (\omega_2 \gamma_1 - R \Gamma) \frac{\partial}{\partial \gamma_3},$$

defined on $C^4(\omega_2, \omega_3, \gamma_1, \gamma_3)$.

We differentiate identity (8.119) with respect to $\omega_3$ and obtain

$$\frac{\partial Y_1(F)}{\partial \omega_3} = (I_3 - I_1) \left( \frac{\partial R}{\partial \omega_3} \omega_3 + R \right) \frac{\partial F}{\partial \omega_2} + I_2 \Gamma \frac{\partial F}{\partial \gamma_1} - I_2 \frac{\partial R}{\partial \omega_3} \frac{\partial F}{\partial \gamma_3} = Y_2(F) = 0,$$

where $Y_2$ is the corresponding vector field defined on $C^4(\omega_2, \omega_3, \gamma_1, \gamma_3)$.

After differentiating identity (8.120) with respect to $\omega_3$ we obtain

$$\frac{\partial Y_2(F)}{\partial \omega_3} = (I_3 - I_1) \left( \frac{\partial^2 R}{\partial \omega_3^2} \omega_3 + 2 \frac{\partial R}{\partial \omega_3} \right) \frac{\partial F}{\partial \omega_2} - I_2 \frac{\partial^2 R}{\partial \omega_3^2} \Gamma \frac{\partial F}{\partial \gamma_3} = Y_3(F) = 0,$$

where $Y_3$ is the corresponding vector field defined on $C^4(\omega_2, \omega_3, \gamma_1, \gamma_3)$.

The existence of a first integral $F(\omega_2, \gamma_1, \gamma_3)$ implies that the determinant $D(R)$ of the coefficients of system (8.119)–(8.121) is identically equal to zero. Computing $D(R)$ we see that it has a non-zero factor $I_2^2 \Gamma$. We remove it and note

$$\hat{D}(R) = \frac{D(R)}{I_2^2 \Gamma}.$$

In this way we obtain

$$\hat{D}(R) = - \left\{ [(I_1 - I_3)\omega_3 R - c_3 \gamma_1 + c_1 \gamma_3] \frac{\partial^2 R}{\partial \omega_3^2} - 2\omega_3 (I_1 - I_3) \left( \frac{\partial R}{\partial \omega_3} \right)^2 + 2(I_1 - I_3)R \frac{\partial R}{\partial \omega_3} \right\} \Gamma$$

The Euler-Poisson equations; partial integrability 125

$$F$$
\[ + \omega_2(I_1 - I_3) \left[ (\omega_3 \gamma_1 + \gamma_3 R) \frac{\partial^2 R}{\partial \omega_3^2} - 2 \gamma_3 \left( \frac{\partial R}{\partial \omega_3} \right)^2 - 2 \gamma_1 \frac{\partial R}{\partial \omega_3} \right] \]

\( \hat{D}(R) \) contains the partial derivatives \( \frac{\partial R}{\partial \omega_3} \) and \( \frac{\partial^2 R}{\partial \omega_3^2} \). We use equation (8.113) to determine them. We differentiate (8.113) with respect to \( \omega \) as in Sec. 8.4.1 obtain
\[
\frac{\partial R}{\partial \omega_3} = -\frac{I_3 \omega_3}{I_1 R}, \quad \frac{\partial^2 R}{\partial \omega_3^2} = -\frac{I_3 (I_3 \omega_3^2 + I_1 R^2)}{I_1^2 R^3}.
\]

We put the above values of \( \frac{\partial R}{\partial \omega_3} \) and \( \frac{\partial^2 R}{\partial \omega_3^2} \) in the expression for determinant \( \hat{D}(R) \) and obtain
\[
\hat{D}(R) = \frac{I_3 \delta(R)}{I_1^2 R^3},
\]
where \( \delta \) is the following polynomial of \( R \) of degree three
\[
\delta(R) = I_1 (I_1 - I_3) (3 \omega_3 \Gamma - \omega_2 \gamma_3) R^3 + I_1 [3 (I_3 - I_1) \omega_2 \omega_3 \gamma_1 - (c_3 \gamma_1 - c_1 \gamma_3) \Gamma] R^2 + 3 I_1 (I_1 - I_3) \omega_3^2 (\omega_3 \Gamma - \omega_2 \gamma_3) R + I_3 \omega_3^3 [(I_3 - I_1) \omega_2 \omega_3 \gamma_1 - \Gamma (c_3 \gamma_1 - c_1 \gamma_3)],
\]
whose coefficients are algebraic functions of \( (\omega_2, \omega_3, \gamma_1, \gamma_3) \).

The identity \( \hat{D}(R) = 0 \) is equivalent to \( \delta(R) = 0 \). We know that if \( Q(R) = 0 \), then if in addition some supplementary first integral \( F(\omega_2, \gamma_1, \gamma_3) \) of system (8.114) exists, then also \( \delta(R) = 0 \). Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring \( \mathbb{K}[x] \), where \( \mathbb{K} = \text{Alg}(\omega_2, \omega_3, \gamma_1, \gamma_3) \), the polynomial \( Q(x) \) divides the polynomial \( \delta(x) \).

Using MAPLE we divide \( \delta \) by \( Q \) and obtain a remainder which is a polynomial \( r \) of the form \( 8.118 \) and coefficients \( a_i = a_i(\omega_2, \omega_3, \gamma_1, \gamma_3) \), \( i = 0, 1 \), which depend linearly on \( \Gamma \).

According to Proposition 4.2 \( a_0 \) and \( a_1 \) should vanish identically with respect to \( \omega_2, \omega_3, \gamma_1 \) and \( \gamma_3 \). We use only \( a_1 \) which suffices for our aims. We have
\[
a_1 = b_0 \Gamma + b_1,
\]
where \( b_0 \) and \( b_1 \) are polynomials of variables \( \omega_2, \omega_3, \gamma_1 \) and \( \gamma_3 \).

According to Proposition 4.3 the coefficients \( b_0 \) and \( b_1 \) should vanish identically because \( \Gamma \not\in \mathbb{C}(\gamma_1, \gamma_3) \).

We use only polynomial \( b_0 \). It has eight coefficients. Equating to zero all of them we obtain a system of eight equations for the parameters \( Ic, U_2 \) and \( U_3 \). These eight equations are:
\[
c_1^2 - c_3^2 = 0, \quad I_2 c_3 = 0, \quad I_2 c_1 = 0, \quad (I_1 - I_3) c_2 = 0, \quad c_3 U_3 = 0, \quad c_3 c_1 = 0, \quad c_1 U_3 = 0, \quad c_1 c_3 = 0.
\]

After two consecutive simplifications we come to the reduced system that is
\[
c_1 = 0, \quad c_3 = 0, \quad (I_1 - I_3) c_2 = 0
\]
and leads either to the Euler case or the Lagrange case.

Thus a partial first integral of type 3, \( F(\omega_2, \gamma_1, \gamma_3) \) does not exist.
8.4.3. Elimination of $\gamma_2$ and $\gamma_3$. Let us note that the elimination of $\gamma_2$ and $\gamma_3$ from equations $H_2 = U_2$ and $H_3 = U_3$ is possible only if
\[(c_2, c_3) \neq (0, 0). \tag{8.122}\]
Further we suppose that this condition is always fulfilled.

We start with the case $c_2 \neq 0$ and $c_3$ is arbitrary. The elimination is made in a similar way like in Sec. [8.4.1]. First we express $\gamma_2$ from equation $H_3 = U_3$ and put the obtained value of $\gamma_2$ in equation $H_2 = U_2$ from where we find $\gamma_3$. In this way we have:
\[
\gamma_2 = \frac{-I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_1 \gamma_1 - U_3 + 2c_3 R}{2c_2}, \quad \gamma_3 = R, \tag{8.123}\]
where, if $c_2^3 + c_3^3 \neq 0$, $R$ is a root of equation
\[
Q(x) = 4(c_2^3 + c_3^3)x^2 + Bx + C = 0,
\]
that is
\[
Q(R) = 4(c_2^3 + c_3^3)R^2 + BR + C = 0. \tag{8.124}\]
If $c_2^3 + c_3^3 = 0$ $R$ is a root of equation
\[
Q(x) = Bx + C = 0,
\]
that is
\[
Q(R) = BR + C = 0. \tag{8.125}\]

Functions $B = B(\omega_2, \omega_3, \gamma_1, \gamma_3)$ and $C = C(\omega_2, \omega_3, \gamma_1, \gamma_3)$ are the following polynomials:
\[
B = 4c_3(I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_1 \gamma_1 - U_3) \tag{8.126}
\]
\[
C = (I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2)^2 + 4c_1(I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2)\gamma_1 - 2U_3(I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2) + 4(c_1^2 + c_2^3)\gamma_1^2 - 4c_1 U_3 \gamma_1 - 4c_2^3 U_2 + U_3^2.
\]

Let us note that if $c_2^3 + c_3^3 = 0$ then $c_3 \neq 0$ because if $c_3 = 0$ the condition (8.122) will not be satisfied. Consequently $B \neq 0$ and therefore (8.125) is well defined.

We put the values of $\gamma_2$ and $\gamma_3$ from (8.123) in the Euler-Poisson equations (1.1) and remove its fifth and sixth equations. In this way we obtain the following system of four equations in unknowns $\omega_1$, $\omega_2$, $\omega_3$ and $\gamma_1$:
\[
\frac{d\omega_1}{dt} = \frac{1}{2I_1 c_2} [ -c_3(I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2) + 2(I_2 - I_3)c_2 \omega_2 \omega_3 - 2c_1 c_3 \gamma_1 + 2c_2^3 R + c_3 U_3],
\]
\[
\frac{d\omega_2}{dt} = \frac{1}{I_2} [(I_3 - I_1)\omega_1 \omega_3 + c_1 R - c_3 \gamma_1],
\]
\[
\frac{d\omega_3}{dt} = \frac{1}{2I_3 c_2} [c_1(I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2) + 2(I_1 - I_2)c_2 \omega_1 \omega_2 + c_1(2c_3 R - U_3) + 2(c_1^2 + c_2^3)\gamma_1],
\]
\[
\frac{d\gamma_1}{dt} = \frac{1}{2c_2} [(-I_1 \omega_1^2 - I_2 \omega_2^2 - I_3 \omega_3^2 - 2c_1 \gamma_1 - 2c_3 R + U_3)\omega_3 - 2c_2 \omega_2 R].
\]

We consider the following four possible types of a first integral of system (8.127) that depends on at most three variables among the variables $\omega_1$, $\omega_2$, $\omega_3$ and $\gamma_1$:
1. \( F(\omega_1, \omega_2, \omega_3) \), (case(i))
2. \( F(\omega_1, \omega_2, \gamma_1) \), (case(iii))
3. \( F(\omega_1, \omega_3, \gamma_1) \), (case(iii))
4. \( F(\omega_2, \omega_3, \gamma_1) \). (case(iii))

We suppose that the sought first integral is functionally independent of \( H_1 \) restricted to invariant manifold \( (8.97) \). As the case (iii) was already examined, there remains only to examine case (i).

**Type 1.** Let us consider a first integral of type 1, i.e. \( F(\omega_1, \omega_2, \omega_3) \). We have

\[
2I_1I_2I_3 c_2 \frac{dF}{dt} = Y_1(F) = 0, \quad (8.128)
\]

where the vector field \( Y_1 \), defined on \( \mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1) \), is:

\[
Y_1 = I_1I_3 \left[ - c_3(I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2) + 2(I_2 - I_3)c_2\omega_2\omega_3 - 2c_1c_3\gamma_1 \\
- 2(c_2^2 + c_3^2) + c_3U_3 \right] \frac{\partial}{\partial \omega_1} + 2I_1I_3c_2 \left[ (I_3 - I_1)\omega_1\omega_3 + c_1R - c_3\gamma_1 \right] \frac{\partial}{\partial \omega_2} \\
+ I_1I_2 \left[ c_1(I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2) + 2(I_1 - I_2)c_2\omega_2\omega_2 \right. \\
+ c_1(2c_3R - U_3) + 2(c_1^2 + c_2^2) \gamma_1 \frac{\partial}{\partial \omega_3}.
\]

We differentiate identity \( (8.128) \) with respect to \( \gamma_1 \) and obtain again a linear partial differential equation for function \( F \):

\[
\frac{1}{2} \frac{\partial Y_1(F)}{\partial \gamma_1} = -I_1I_3 \left[ (c_2^2 + c_3^2) \frac{\partial R}{\partial \gamma_1} + c_1c_3 \right] \frac{\partial F}{\partial \omega_1} + I_1I_3c_2 \left( c_1 \frac{\partial R}{\partial \gamma_1} - c_3 \right) \frac{\partial F}{\partial \omega_2} \\
+ I_1I_2 \left( c_1c_3 \frac{\partial R}{\partial \gamma_1} + c_1^2 + c_2^2 \right)^2 \frac{\partial F}{\partial \omega_3} = Y_2(F) = 0, \quad (8.129)
\]

where \( Y_2 \) is the corresponding vector field defined on \( \mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1) \).

The derivative of \( Y_2(F) \) with respect to \( \gamma_1 \) has a factor \( \frac{\partial^2 R}{\partial \gamma_1^2} \). Crude computations show that for the two roots of equation \( (8.124) \), i.e. when \( c_2^2 + c_3^2 \neq 0 \), and also for the single root of equation \( (8.125) \), i.e. when \( c_2^2 + c_3^2 = 0 \), one has

\[
\frac{\partial^2 R}{\partial \gamma_1^2} \neq 0.
\]

In this way differentiating identity \( (8.129) \) with respect to \( \gamma_1 \) we obtain

\[
\left( \frac{\partial^2 R}{\partial \gamma_1^2} \right)^{-1} \frac{\partial Y_2(F)}{\partial \gamma_1} = -I_1I_3(c_2^2 + c_3^2) \frac{\partial F}{\partial \omega_1} + I_1I_3c_1c_2 \frac{\partial F}{\partial \omega_2} + I_1I_2c_1c_3 \frac{\partial F}{\partial \omega_3} = Y_3(F) = 0, \quad (8.130)
\]

where \( Y_3 \) is the corresponding vector field defined on \( \mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1) \).

Instead of vector field \( Y_1 \) we consider \( Y_4 = Y_1 - 2RY_3 \) which implies that \( Y_4(F) = 0 \). We obtain

\[
Y_4(F) = I_2I_3 \left[ - c_3(I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2) + 2(I_2 - I_3)c_2\omega_2\omega_3 - 2c_1c_3\gamma_1 + c_3U_3 \right] \frac{\partial F}{\partial \omega_1}
\]
Note that $Y_4$ does not depend on $R$.

Instead of vector field $Y_2$ we consider $Y_5 = Y_2 - Y_3 \frac{\partial R}{\partial \gamma_1}$ which also does not depend on $R$. We have

$$Y_5(F) = -I_2 I_3 c_1 c_3 \frac{\partial F}{\partial \omega_1} - I_1 I_3 c_2 c_3 \frac{\partial F}{\partial \omega_2} + I_1 I_2 (c_1^2 + c_2^2) \frac{\partial F}{\partial \omega_3} = 0.$$  \hspace{1cm} (8.132)

We compute the Lie bracket $Y_6 = [Y_3, Y_4]/(2I_1 I_2 I_3)$. We know that $Y_6(F) = 0$ so we have

$$Y_6(F) = \left[ I_2 I_3 (c_2^2 + c_1^2) c_3 \omega_1 + I_2 (I_2 - 2I_3) c_1 c_2 c_3 \omega_2 + I_3 (I_2 c_2^2 - I_3 c_2^2 - I_2 c_3^2) c_1 \omega_3 \right] \frac{\partial F}{\partial \omega_1}$$

$$- (I_1 - I_3) c_2 \left[ I_1 c_1 c_3 \omega_1 - I_3 (c_2^2 + c_3^2) \omega_3 \right] \frac{\partial F}{\partial \omega_2} + \left[ I_1 (I_1 c_2^2 - 2I_2 c_2^2 - I_2 c_3^2) c_1 \omega_1 \right.$$  

$$+ I_2 (I_1 c_1^2 + I_2 c_2^2 - I_1 c_3^2 + I_2 c_3^2 - I_1 c_3^2) c_2 \omega_2 + I_2 I_1 c_1 c_3 \omega_3 \right] \frac{\partial F}{\partial \omega_3} = 0. \hspace{1cm} (8.133)$$

Thus we have obtained four linear homogeneous equations in unknowns $\text{grad } F = (\frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3})$, that is system (8.130)–(8.133). If a first integral $F$ exists, system (8.130)–(8.133) has a non-zero solution. This is possible if and only if

$$\text{rank } M < 3,$$  \hspace{1cm} (8.134)

where $M$ is the $(4 \times 3)$ matrix composed from the coefficients of system (8.130)–(8.133).

Let us compute the determinant $D_{345}$ that consists of the coefficients of $Y_3$, $Y_4$ and $Y_5$. It should be identically zero because of requirement (8.134).

We compute $D_{345}$ and obtain

$$D_{345} = -2I_1 I_2 I_3 c_2^2 \left[ c_3 (I_1 - I_2) \omega_1 \omega_2 + c_2 (I_3 - I_1) \omega_1 \omega_3 + c_1 (I_2 - I_3) \omega_2 \omega_3 \right] \delta_{345},$$

where

$$\delta_{345} = c_1^2 + c_2^2 + c_3^2.$$

The expression in the square brackets vanishes identically only in the kinetic symmetry case and in the Lagrange case $I_1 = I_3$, $c_1 = c_3 = 0$. The factor $-2I_1 I_2 I_3 c_2^2 \neq 0$. Thus $D_{345} = 0$ is equivalent to $\delta_{345} = 0$.

Now we compute the determinant $D_{346}$ that consists of the coefficients of $Y_3$, $Y_4$ and $Y_6$. It should be identically equal to zero too (see (8.134)). We have $D_{346} = I_1 I_2 I_3 c_2^3 \delta_{346}$, where

$$\delta_{346} = -I_1 I_2 I_3 c_1 c_3 (I_2 - I_3) \omega_3^3$$

$$- I_1 I_3 c_1 c_3 [(I_1 - I_2) (2I_1 - 3I_3) (c_2^2 + c_3^2) - I_1 (I_2 - I_3) c_1^2] \omega_1^2 \omega_2$$

$$+ I_1 I_3 c_1 c_3 [(I_1 - I_3) (2I_1 - 3I_2) (c_1^2 + c_3^2) + I_1 (I_2 - I_3) c_1^2] \omega_1^2 \omega_3$$

$$+ I_1 I_2 I_3 c_1 c_3 (I_1 I_2 - 3I_1 I_3 - 2I_2^2 + 4I_2 I_3) \omega_1^2 \omega_2$$

$$+ 2I_1 I_2 I_3 c_1^2 [(I_1 - I_2) - 2I_3) c_2^2 + (I_1 + I_2 - 2I_3) c_2^2] \omega_1 \omega_2 \omega_3$$

$$+ I_1 I_3 c_1 c_2 c_3 (3I_1 I_2 - I_1 I_3 - 4I_2 I_3 + 2I_3^2) \omega_1 \omega_3^2.$$
\[-2I_1^2c_1c_2c_3(c_1^2 + c_2^2 + c_3^2)(I_2 - I_3)\omega_1\gamma_1 + I_1^2(I_2 - I_3)c_1^2c_2c_3u_1\omega_1
\]
\[-I_2^2c_1c_2[I_3(I_1 - I_2)(c_2^2 + c_3^2) - I_1(I_2 - I_3)c_1^2]\omega_2^2
\[-I_2I_3c_1c_2[(-3I_1I_2 + 2I_1I_3 + 2I_2^2 - I_2I_3)(c_2^2 + c_3^2) + I_1(I_2 - I_3)c_1^2]\omega_3^2
\[-I_2I_3c_1c_3[(3I_1I_3 - 2I_1I_2 + 2I_2I_3 - 2I_2^2)(c_2^2 + c_3^2) + I_1(I_2 - I_3)c_1^2]\omega_3^2\omega_2
\[-2I_2c_2(c_1^2 + c_2^2 + c_3^2)[I_3(I_1 - I_2)(c_2^2 + c_3^2) - I_1(I_2 - I_3)c_1^2]\omega_3^2\omega_2
\[+I_2c_1c_3u_3[I_3(I_1 - I_2)(c_2^2 + c_3^2) - I_1(I_2 - I_3)c_1^2]\omega_2
\[+I_3^2c_1c_2[I_2(I_1 - I_3)(c_2^2 + c_3^2) + I_1(I_2 - I_3)c_1^2]\omega_3^2
\[+2I_3c_2(c_1^2 + c_2^2 + c_3^2)[I_2(I_1 - I_3)(c_2^2 + c_3^2) + I_1(I_2 - I_3)c_1^2]\omega_3\gamma_1
\[-I_3c_1c_2u_3[I_2(I_1 - I_3)(c_2^2 + c_3^2) + I_1(I_2 - I_3)c_1^2]\omega_3.
\]

As \(I_1I_2I_3c_2^2 \neq 0\) then \(D_{346} = 0\) is equivalent to \(\delta_{346} = 0\).

Thus we should find the conditions at which polynomials \(\delta_{345}\) and \(\delta_{346}\) vanish identically with respect to variables \((\omega_1, \omega_2, \omega_3, \gamma_1)\). This means to find the values of the parameters \(zc\) and \(U_3\) at which all the coefficients of \(\delta_{345}\) and \(\delta_{346}\) are zero.

Polynomial \(\delta_{345}\) has only one coefficient and \(\delta_{346}\) has 16 coefficients. In this way we obtain a system of 17 equations. To solve it we apply a simplification. At the fourth consecutive simplification we obtain the reduced system:

\[
c_3^2 + c_1^2 + c_2^2 = 0, \quad (I_2 - I_3)c_1 = 0, \quad (I_1 - I_3)c_1 = 0,
\]
\[
(I_2 - I_3)(c_2^2 + c_3^2) = 0, \quad (I_1 - I_3)(c_2^2 + c_3^2) = 0.
\]

The Maple command \texttt{solve} gives two solutions at an arbitrary value of \(U_3\):

\[
\{I_1 = I_1, \quad I_2 = I_2, \quad I_3 = I_3, \quad c_1 = 0, \quad c_2 = c_2, \quad c_3 = \text{RootOf}(Z^2 + 1)c_2\}
\]
\[
\{I_1 = I_3, \quad I_2 = I_3, \quad I_3 = I_3, \quad c_1 = \text{RootOf}(Z^2 + c_2^2 + c_3^2), \quad c_2 = c_2, \quad c_3 = c_3\}.
\]

The second solution is a particular case of the kinetic symmetry case so we remove it. We have to consider the first solution. Thus

\[c_1 = 0, \quad c_3 = \varepsilon ic_2,
\]
where \(\varepsilon = \pm 1\). We consider here only the case \(\varepsilon = 1\) because the final result is the same also when \(\varepsilon = -1\).

Let us study this case. Now \(Y_3(F)\) and \(Y_6(F)\) are identically zeros and therefore condition \((8.134)\) is fulfilled. \(Y_4(F)\) and \(Y_5(F)\) are:

\[
Y_4(F) = -iI_2I_3c_2\left[I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2 + 2i(I_2 - I_3)\omega_2\omega_3 - U_3\right]\frac{\partial F}{\partial \omega_1}
\[\quad -2I_1I_3c_2\left[(I_1 - I_3)\omega_1\omega_3 + ic_2\gamma_1\right]\frac{\partial F}{\partial \omega_2} + 2I_1I_2c_2\left[(I_1 - I_2)\omega_1\omega_2 + c_2\gamma_1\right]\frac{\partial F}{\partial \omega_3},
\]
\[
Y_5(F) = -I_1c_2^2\left(iI_3\frac{\partial F}{\partial \omega_3} - I_2\frac{\partial F}{\partial \omega_3}\right).
\]

We compute

\[
Y_7(F) = \frac{[Y_4(F), Y_5(F)]}{2I_1I_2I_3c_2^2} = \left[I_2(I_2 - 2I_3)\omega_2 - iI_3(I_3 - 2I_2)\omega_3\right]\frac{\partial F}{\partial \omega_1}
\]
\[- I_1(I_1 - I_3) \omega_1 \frac{\partial F}{\partial \omega_2} + iI_1(I_1 - I_2) \omega_1 \frac{\partial F}{\partial \omega_3}.\]

We compute the determinant $\Delta$ of the coefficients of equations $Y_4(F), Y_5(F)$ and $Y_7(F)$ and obtain $\Delta = I_1^2 I_2 I_3 c_2^3 \omega_1 \tilde{\Delta}$ where

$$\tilde{\Delta} = i I_1^2 (I_2 - I_3) \omega_2^2 + i I_2 (2I_1^2 - 4I_2 I_3 - I_1 I_2 + 3I_1 I_3) \omega_2^2$$

$$- 2 I_2 I_3 (2I_1 - I_2 - I_3) \omega_2 \omega_3 - i I_3 (2I_3^2 - 4I_2 I_3 - I_3 I_1 + 3I_1 I_2) \omega_3^2 - i I_1 (I_2 - I_3) U_3.$$ 

As the factor $I_1^2 I_2 I_3 c_2^3 \omega_1 \neq 0$, we require that $\tilde{\Delta} = 0$. Looking at the coefficient of $\omega_1^2$ in the expression for $\tilde{\Delta}$ we see that $I_2 = I_3$ should be fulfilled. At this condition we obtain

$$\tilde{\Delta} = 2I_3^2 (I_1 - I_3)(\omega_2 + i \omega_3)^2.$$ 

Thus $\tilde{\Delta} = 0$ only if $I_1 = I_2 = I_3$, i.e. we come to the kinetic symmetry case. Consequently the sought integral of type 1 does not exist when $c_2 \neq 0$.

Let us consider the case $c_2 = 0$. In this case, according to condition (8.122), $c_3 \neq 0$. First we express $\gamma_3$ from equation $H_3 = U_3$ and put the obtained value of $\gamma_3$ in equation $H_2 = U_2$ from where we find $\gamma_2$. In this way we have:

$$\gamma_2 = \frac{\tilde{R}}{2c_3}, \quad \gamma_3 = -\frac{I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_1 \gamma_1 - U_3}{2c_3}, \quad (8.135)$$

where $\tilde{R}$ is a root of equation

$$Q(x) = x^2 + \tilde{C} = 0,$$

that is

$$Q(\tilde{R}) = \tilde{R}^2 + \tilde{C} = 0. \quad (8.136)$$

Function $\tilde{C} = \tilde{C}(\omega_2, \omega_3, \gamma_1, \gamma_3)$ is the following polynomial:

$$\tilde{C} = (I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2)^2 + 4c_1 (I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2) \gamma_1$$

$$- 2U_3 (I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2) + 4(c_1 + c_3^2) \gamma_1^2 - 4c_1 U_3 \gamma_1 - 4c_3^2 U_2 + U_3^2.$$ 

We put the values of $\gamma_2$ and $\gamma_3$ from (8.135) in the Euler-Poisson equations (1.1) and remove its fifth and sixth equations. In this way we obtain the following system of four equations in unknowns $\omega_1, \omega_2, \omega_3$ and $\gamma_1$:

$$\frac{d\omega_1}{dt} = \frac{2(I_2 - I_3) \omega_2 \omega_3 + \tilde{R}}{2I_1},$$

$$\frac{d\omega_2}{dt} = -\frac{1}{2I_2 c_3} \left[ c_1 (I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2) + 2(I_1 - I_3) c_3 \omega_1 \omega_3ight.$$ 

$$+ 2(c_1^2 + c_3^2) \gamma_1 - c_1 U_3 \right], \quad (8.137)$$

$$\frac{d\omega_3}{dt} = \frac{2(I_1 - I_2) c_3 \omega_1 \omega_2 - c_1 \tilde{R}}{2I_3 c_3},$$

$$\frac{d\gamma_1}{dt} = \frac{1}{2c_3} \left[ (I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2 + 2c_1 \gamma_1 - U_3) \omega_2 + \omega_3 \tilde{R} \right].$$

Let $c_2 = 0$ and function $F(\omega_1, \omega_2, \omega_3)$ be a first integral of type 1. We have

$$2I_1 I_2 I_3 c_3 \frac{dF}{dt} = Y_1(F) = 0, \quad (8.138)$$
where the vector field $Y_1$, defined on $\mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1)$, is:

\[
Y_1 = I_2 I_3 c_3 \left[ 2(I_2 - I_3) \omega_2 \omega_3 + \hat{R} \right] \frac{\partial}{\partial \omega_1} \\
+ I_1 I_3 \left[ -c_1(I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2) + 2c_3(I_3 - I_1) \omega_1 \omega_3 - 2(c_1^2 + c_3^2) \gamma_1 + c_1 U_3 \right] \frac{\partial}{\partial \omega_2} \\
+ I_1 I_2 \left[ 2(I_1 - I_2) c_3 \omega_1 \omega_2 - c_1 \hat{R} \right] \frac{\partial}{\partial \omega_3}.
\]

We differentiate identity (8.138) with respect to $\gamma_1$ and obtain again a linear partial differential equation for function $F$

\[
\frac{\partial Y_1(F)}{\partial \gamma_1} = I_2 I_3 c_3 \frac{\partial \hat{R}}{\partial \gamma_1} \frac{\partial F}{\partial \omega_1} - 2I_1 I_3 (c_1^2 + c_3^2) \frac{\partial F}{\partial \omega_2} - I_1 I_2 c_1 \frac{\partial \hat{R}}{\partial \gamma_1} \frac{\partial F}{\partial \omega_3} = Y_2(F) = 0,
\]

where $Y_2$ is the corresponding vector field defined on $\mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1)$.

The derivative of $Y_2(F)$ with respect to $\gamma_1$ has a factor $I_2 \frac{\partial^2 \hat{R}}{\partial \gamma_1^2}$. We have verified that for the two roots of equation (8.136) this derivative is not zero. Thus differentiating identity (8.129) with respect to $\gamma_1$ we obtain

\[
\frac{1}{I_2} \left( \frac{\partial^2 \hat{R}}{\partial \gamma_1^2} \right)^{-1} \frac{\partial Y_2(F)}{\partial \gamma_1} = I_3 c_3 \frac{\partial F}{\partial \omega_1} - I_1 c_1 \frac{\partial F}{\partial \omega_3} = Y_3(F) = 0,
\]

where $Y_3$ is the corresponding vector field defined on $\mathbb{C}^4(\omega_1, \omega_2, \omega_3, \gamma_1)$.

Instead of vector field $Y_1$ we consider $Y_4 = Y_1 - I_2 R Y_3$ which implies that $Y_4(F) = 0$. We obtain

\[
Y_4(F) = 2I_2 I_3 (I_2 - I_3) c_3 \omega_2 \omega_3 \frac{\partial F}{\partial \omega_1} - I_1 I_3 \left[ c_1(I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2) \\
+ 2(I_1 - I_3) c_3 \omega_1 \omega_3 + 2(c_1^2 + c_3^2) \gamma_1 - c_1 U_3 \right] \frac{\partial F}{\partial \omega_2} \\
+ 2I_1 I_2 (I_1 - I_2) c_3 \omega_1 \omega_2 \frac{\partial F}{\partial \omega_3} = 0.
\]

Note that $Y_4$ does not depend on $\hat{R}$.

Instead of vector field $Y_2$ we consider

\[
Y_5 = \frac{I_2 Y_3 \frac{\partial \hat{R}}{\partial \gamma_1} - Y_2}{2I_1 I_3},
\]

which also does not depend on $\hat{R}$. We have

\[
Y_5(F) = (c_1^2 + c_3^2) \frac{\partial F}{\partial \omega_2} = 0.
\]

We compute the Lie bracket $Y_6 = [Y_5, Y_4]$. We know that $Y_6(F) = 0$ so we have

\[
Y_6(F) = -I_2(I_2 - I_3)c_1 c_3 \omega_2 \frac{\partial F}{\partial \omega_1} \\
+ \left[ I_1(I_1 - 2I_3)c_1 c_3 \omega_1 + I_3(I_1 c_1^2 - I_1 c_3^2 + I_3 c_3^2) \omega_3 \right] \frac{\partial F}{\partial \omega_2} \\
+ I_2 (I_1 - I_2) c_3^2 \omega_2 \frac{\partial F}{\partial \omega_3} = 0.
\]
Thus we have obtained four linear homogeneous equations in unknowns $\text{grad } F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2}, \frac{\partial F}{\partial \omega_3} \right)$, that is system (8.139)–(8.142). If a first integral $F$ exists, system (8.139)–(8.142) has a non-zero solution. This is possible if and only if

$$\text{rank } M < 3,$$

where $M$ is the $(4 \times 3)$ matrix composed from the coefficients of system (8.139)–(8.142).

Let us compute the determinant $D_{345}$ that consists of the coefficients of $Y_3$, $Y_4$ and $Y_5$. It should be identically zero because of requirement (8.143).

We compute $D_{345}$ and obtain

$$D_{345} = -2I_1I_2I_3c_3\omega_2[c_3(I_1 - I_2)\omega_1 + c_1(I_2 - I_3)\omega_3]\delta_{345},$$

where

$$\delta_{345} = c_1^2 + c_3^2.$$

As now $c_2 = 0$ then according to (8.122), $c_3 \neq 0$. Thus the expression in the square brackets vanishes identically only in the kinetic symmetry case and in the Lagrange case $I_1 = I_3$, $c_1 = c_2 = 0$. The factor $-2I_1I_2I_3c_3\omega_2 \neq 0$. Thus $D_{345} = 0$ is equivalent to $\delta_{345} = 0$.

We compute also the determinant $D_{346}$ that consists of the coefficients of $Y_3$, $Y_4$ and $Y_6$. It should be identically equal to zero too (see (8.134)). We have $D_{346} = I_1I_2I_3c_3\omega_2\delta_{346}$, where

$$\delta_{346} = I_1[I_1(I_2 - I_3)c_1^2 - (2I_1 - 3I_3)(I_1 - I_2)c_3^2]c_1\omega_1 - 2I_1I_3(I_1 + I_3 - 2I_2)c_1^2c_3\omega_1\omega_3 + I_2[I_3(I_2 - I_1)c_3^2 + I_1(I_2 - I_3)c_1^2]c_1\omega_2 - I_3[I_1(I_2 - I_3)c_1^2 + I_3(3I_1 - 2I_3)c_3^2 + I_2(I_3 - 2I_1)c_3^2]c_1\omega_3 + 2(c_1^2 + c_3^2)[I_1(I_2 - I_3)c_1^2 + I_3(I_2 - I_1)c_3^2]\gamma_1 - c_1[I_1(I_2 - I_3)c_1^2 + I_3(I_2 - I_1)c_3^2]U_3.$$

As $I_1I_2I_3c_3\omega_2 \neq 0$ then $D_{346} = 0$ is equivalent to $\delta_{346} = 0$.

Thus we should find the conditions at which polynomials $\delta_{345}$ and $\delta_{346}$ vanish identically with respect to variables $(\omega_1, \omega_2, \omega_3, \gamma_1)$. This means to find the values of the parameters $I_c$ and $U_3$ at which all the coefficients of $\delta_{345}$ and $\delta_{346}$ are zero.

Polynomial $\delta_{345}$ has only one coefficient and $\delta_{346}$ has six coefficients. In this way we obtain a system of seven equations. To solve it we apply a simplification. At the third consecutive simplification we obtain the reduced system:

$$I_2 - I_3 = 0, \quad I_1 - I_3 = 0 \quad c_1^2 + c_3^2 = 0.$$

This system obviously lead to the kinetic symmetry case. Thus the sought integral of type 1 does not exist also when $c_2 = 0$.

8.4.4. First integrals $F(\gamma_1, \gamma_2, \gamma_3)$. Finally it remains to study the existence of the partial first integral $F(\gamma_1, \gamma_2, \gamma_3)$, that cannot be studied by elimination of variables like above.

We proceed here in the same way as in Sec. 8.2.4.

$$F(\gamma_1, \gamma_2, \gamma_3) = \tilde{F}(\gamma_2, \gamma_3).$$

Our problem now is reduced to the study of partial first integrals of the form $\tilde{F} = \tilde{F}(\gamma_2, \gamma_3)$ on the submanifold $\{H_3 = U_3\}$. Absence of these
partial first integrals follows from Sec. 8.4.1 where the absence of partial first integrals of more general form $F(\omega_i, \gamma_2, \gamma_3), i = 2, 3,$ is proved for all $U_2$ and $U_3$.

This concludes the description of the four-dimensional invariant manifolds.

9. Three-dimensional invariant manifold \{\begin{align*} H_1 &= U_1, \\ H_2 &= U_2, \\ H_3 &= U_3 \end{align*}\}

9.1. Extraction procedure. In this section we study the existence of a local partial first integral of the Euler-Poisson equations (1.1) restricted to the invariant complex three-dimensional level manifold \begin{align*} \{ H_1 = U_1, & \quad H_2 = U_2, \quad H_3 = U_3 \}, \end{align*}

which depends on at most two variables.

According to (2.5)

$$M(U_0, U_1, U_2, U_3, Ic) = \{ x \in \mathbb{C}^6; \ H_1((\omega, \gamma), Ic) = U_1, \ H_2((\omega, \gamma), Ic) = U_2, \ H_3((\omega, \gamma), Ic) = U_3 \},$$

where $(\omega, \gamma) = (\omega_1, \omega_2, \omega_3, \gamma_1, \gamma_2, \gamma_3)$.

We search all functions $F$ of two variables $F = F(s_1, s_2)$ where $(s_1, s_2) \in (\omega, \gamma)$, of class $C^1$, such that grad $F$ does not vanish identically on each open subset of the manifold $M(U_0, U_1, U_2, U_3, Ic)$, which are local partial first integrals of the Euler-Poisson equations (1.1) restricted to this manifold.

As in Sec. 5.1 the order of variables $s_i, 1 \leq i \leq 2$, in $F(s_1, s_2)$ is irrelevant for $F$ to be a first integral.

We have exactly 15 different two elements subsets of $(\omega, \gamma)$ and thus 15 cases of functions of two elements to examine. We will describe now an extraction procedure based on permutational symmetries which reduces the above 15 cases to only four.

These 15 functions of two variables (up to the order of variables) are shown in Table 9.1. This Table can be easily obtained directly like Table 5.1. But it can be also easily deduced from Table 5.1 and reciprocally.

</table>

Like in Sec. 8, let us stress that the permutational symmetries act on variables
(ω, γ) and parameters \( Ic \) but not on the constants \( U_1, U_2, U_3 \) that define the manifold \( M(U_0, U_1, U_2, U_3, Ic) \).

It is easy to see that under the group of permutational symmetries \((2,3)\) of the Euler-Poisson equations for every case (i)–(iv) from Table 9.1 the first function from the case is consequently transformed into all remaining functions from the same case.

Thus in virtue of Theorem 2.2 we can restrict ourselves to the study of only four functions where every one belongs to a different case from Table 9.1 and is chosen arbitrary from the functions of this case.

Like in Secs. 5 and 8 we will call such four functions \( F_i, 1 \leq i \leq 4, \) (up to the order of variables) a basis.

### 9.2. Elimination of \( \omega_1, \omega_2, \gamma_1 \)

Here we study the existence of a partial first integral of the Euler-Poisson equations \((1,1)\) after expressing variables \( \omega_1, \omega_2 \) and \( \gamma_1 \) from equations

\[
H_i = U_i, \quad 1 \leq i \leq 3. \tag{9.1}
\]

First we express \( \gamma_1 \) from second equation of \((9.1)\) and obtain

\[
\gamma_1 = \sqrt{-\gamma_2^2 - \gamma_3^2} + U_2. \tag{9.2}
\]

Further, to simplify the notations, we put

\[
\Gamma = \sqrt{-\gamma_2^2 - \gamma_3^2} + U_2.
\]

Then, using the MAPLE command \texttt{solve}, we express \( \omega_1 \) and \( \omega_2 \) from first and third equations of \((9.1)\) and obtain the following solution:

\[
\omega_1 = R, \quad \omega_2 = -\frac{I_1 R \Gamma + I_3 \omega_3 \gamma_3 - U_1}{I_2 \gamma_2}, \tag{9.3}
\]

where \( R = R(\omega_3, \gamma_2, \gamma_3) \) is a root of equation

\[
Q(x) = Ax^2 + Bx + C = 0,
\]

that is

\[
Q(R) = AR^2 + BR + C = 0. \tag{9.4}
\]

Here \( A = A(\gamma_2, \gamma_3), \) \( B = B(\omega_3, \gamma_2, \gamma_3) \) and \( C = C(\omega_3, \gamma_2, \gamma_3) \) are the following functions:

\[
A = I_1 \left[ (I_2 - I_1) \gamma_2^2 - I_1 \gamma_3^2 + I_1 U_2 \right],
\]

\[
B = 2I_1 \Gamma (I_3 \omega_3 \gamma_3 - U_1),
\]

\[
C = I_3 \omega_3^2 (I_2 \gamma_2^2 + I_3 \gamma_3^2) - 2I_3 \omega_3 \gamma_3 U_1 \\
+ I_2 \gamma_2^2 (2c_i \gamma_2 + 2c_3 \gamma_3 + 2c_1 \Gamma - U_3) + U_1^2. \tag{9.5}
\]

\( R, A, B \) and \( C \) are algebraic functions defined on \( \mathbb{C}^3(\omega_3, \gamma_2, \gamma_3) \).

We put the values of \( \gamma_1, \omega_1 \) and \( \omega_2 \) from \((9.2)\) and \((9.3)\) in the Euler-Poisson equations \((1,1)\) and remove the first, second and fourth equations. In this way we have the following
system of three equations in unknowns $\omega_3$, $\gamma_2$ and $\gamma_3$:

$$\frac{d\omega_3}{dt} = \frac{1}{I_2 I_3 \gamma_2} \left[ I_1 (I_2 - I_1) \Gamma R^2 + (I_2 - I_1)(I_3 \omega_3 \gamma_3 - U_1) R + I_2 \gamma_2 (c_2 \Gamma - c_1 \gamma_2) \right],$$

$$\frac{d\gamma_2}{dt} = \gamma_3 R - \omega_3 \Gamma,$$

$$\frac{d\gamma_3}{dt} = \frac{1}{I_2 \gamma_2} \left[ (I_1 \gamma_2^2 - I_2 \gamma_2^2 + I_1 \gamma_3^2 - I_1 U_2) R - \Gamma (I_3 \omega_3 \gamma_3 - U_1) \right].$$

(9.6)

Now we study whether system (9.6) has a first integral that depends on at most two variables among the variables $(\omega_3, \gamma_2, \gamma_3)$. Thus we should investigate the following three types of a first integral:

1. $F(\gamma_2, \gamma_3)$, (case (i))
2. $F(\omega_3, \gamma_3)$, (case (ii))
3. $F(\omega_3, \gamma_2)$, (case (iii))

Then, like in Secs. 5 and 8 we should examine the three types given above because they belong to different cases (see Table 9.1).

Let us fix $U_2 \in \mathbb{C}$. Let us consider some suitable open set $\Omega \subseteq \mathbb{C}^3(\omega_3, \gamma_2, \gamma_3)$ belonging to the domain of definition of $F$.

From the now we consider system (9.6) and the first integral $F$ only on $\Omega$. System (9.6) restricted to $\Omega$ has $C^1$ right-hand sides.

We always suppose that the considered first integrals are not constant on any open subset of their domain of definition. As we consider $C^1$ first integrals, this means that their gradients do not vanish identically on any open subset of their domain of definition.

**Type 1.** Let us consider the existence of a first integral $F$ of system (9.6) which is of type 1, i.e. $F = F(\gamma_2, \gamma_3)$. Thus we have

$$\frac{dF}{dt} = \frac{d\gamma_2}{dt} \frac{\partial F}{\partial \gamma_2} + \frac{d\gamma_3}{dt} \frac{\partial F}{\partial \gamma_3} = Y_1(F) = 0,$$

(9.7)

where $Y_1$ is the corresponding vector field defined on $\Omega$.

Equation (9.7) should be an identity with respect to all the three variables $(\omega_3, \gamma_2, \gamma_3)$. As function $F$ does not depend on $\omega_3$ then its partial derivatives will not depend on $\omega_3$ too. Thus if we differentiate identity (9.7) with respect to $\omega_3$ we shall obtain again a linear partial differential equation for function $F$.

$$\frac{\partial Y_1(F)}{\partial \omega_3} = \frac{\partial}{\partial \omega_3} \left( \frac{d\gamma_2}{dt} \frac{\partial F}{\partial \gamma_2} + \frac{d\gamma_3}{dt} \frac{\partial F}{\partial \gamma_3} \right) = Y_2(F) = 0,$$

(9.8)

where $Y_2$ is the corresponding vector field defined on $\Omega$.

Equations (9.7) and (9.8) can be considered as a system of two homogeneous linear algebraic equations with unknowns $\text{grad} F = \left( \frac{\partial F}{\partial \gamma_2}, \frac{\partial F}{\partial \gamma_3} \right)$, which do not vanish identically, because $F$ is non-constant on any open subset of its domain of definition.

Thus, if first integral $F$ exists, system (9.7), (9.8) has a non-zero solution $\text{grad} F$. This is possible if and only if determinant $\Delta$ of this linear system satisfies identity $\Delta \equiv 0$ provided that $R$ is a root of equation (9.4).
We compute this determinant and obtain
\[
\Delta(R) = \frac{d\gamma_2}{dt} \frac{\partial}{\partial \omega_3} \left( \frac{d\gamma_3}{dt} \right) - \frac{d\gamma_3}{dt} \frac{\partial}{\partial \omega_3} \left( \frac{d\gamma_2}{dt} \right)
\]
\[
= \frac{\Gamma}{I_2 \gamma_2} \left\{ \left[ (I_1 - I_2)\gamma_2^2 + (I_1 - I_3)\gamma_3^2 - I_1 U_2 \right] \left( R - \omega_3 \frac{\partial R}{\partial \omega_3} \right) + U_1 \gamma_3 \frac{\partial R}{\partial \omega_3} - U_1 \Gamma \right\}.
\]

As we are interested in case \( \Delta = 0 \) we remove the denominator \( I_2 \gamma_2 \) and the non-zero factor \( \Gamma \) and note
\[
\Delta(R) = \frac{\Gamma}{I_2 \gamma_2} \delta(R),
\]
where
\[
\delta(R) = \left[ (I_1 - I_2)\gamma_2^2 + (I_1 - I_3)\gamma_3^2 - I_1 U_2 \right] \left( R - \omega_3 \frac{\partial R}{\partial \omega_3} \right) - U_1 \gamma_3 \frac{\partial R}{\partial \omega_3} + U_1 \Gamma. \tag{9.9}
\]

As \( \delta(R) \) contains \( \frac{\partial R}{\partial \omega_3} \) we should determine this derivative. For the purpose we use equation (9.4). We differentiate it with respect to \( \omega_3 \) and, as \( A \) does not depend on \( \omega_3 \) (see (9.5)), obtain
\[
\frac{\partial Q}{\partial \omega_3} = (2AR + B) \frac{\partial R}{\partial \omega_3} + \frac{\partial B}{\partial \omega_3} R + \frac{\partial C}{\partial \omega_3} = 0. \tag{9.10}
\]

The determination of \( \frac{\partial R}{\partial \omega_3} \) from the last equation is possible only if \( \frac{dQ(R)}{dR} = 2AR + B \neq 0 \). Using Proposition 4.1 we prove that if \( R \) is a root of equation (9.4) then \( 2AR + B = 0 \) only in a very particular case
\[
I_1 = I_2 = I_3, \quad c_1 = c_2 = c_3 = 0, \quad U_1 = U_2 = U_3 = 0. \tag{9.11}
\]

Indeed, let us compute the resultant \( \rho \) of \( Q(R) \) and \( 2AR + B \) with respect to \( R \). We obtain
\[
\rho = A(4AC - B^2).
\]

As we are interested only in the cases when \( \rho \) vanishes identically with respect to \( \omega_3, \gamma_2 \) and \( \gamma_3 \) and as \( A \) never vanishes identically we consider \( \hat{\rho} = 4AC - B^2 \) instead of \( \rho \). We compute \( \hat{\rho} \) with values of \( A, B \) and \( C \) from (9.5) and obtain
\[
\hat{\rho} = 4I_1I_2\gamma_2^2 (a_0 \Gamma + a_1),
\]
where
\[
a_0 = 2c_1(I_2\gamma_2^2 - I_1\gamma_2^2 - I_1\gamma_3^2 + I_1 U_2),
\]
\[
a_1 = -2(I_1 - I_2)\omega_3^2 \gamma_2^2 - 2(I_1 - I_3)\omega_3^2 \gamma_3^2 + I_1 I_3 U_2 \omega_3^2 - 2I_3 U_1 \omega_3 \gamma_3
\]
\[
- 2(I_1 - I_2)c_2 \gamma_3^3 - 2(I_1 - I_2)c_3 \gamma_2^2 \gamma_3 + (I_1 - I_2)U_3 \gamma_2^2 - 2I_1 c_2 \gamma_2 \gamma_3^2
\]
\[
+ 2I_1 c_2 U_2 \gamma_2 - 2I_1 c_3 \gamma_3^3 + I_1 U_3 \gamma_3^2 + 2I_1 c_3 U_2 \gamma_3 + U_2 - I_1 U_2 U_3.
\]

According to Proposition 4.3, if \( \hat{\rho} = 0 \) then \( a_0 = a_1 = 0 \) because \( \Gamma \notin \mathbb{C}(\gamma_2, \gamma_3) \). \( a_0 = 0 \) is possible if and only if \( c_1 = 0 \). One immediately sees that \( a_1 = 0 \) will be true if and only if \( I_1 = I_2 = I_3, \ c_2 = c_3 = 0 \) and \( U_1 = U_2 = U_3 = 0 \), i.e. we come to condition (9.11). Thus out of this case equations \( Q(R) = 0 \) and \( 2AR + B = 0 \) have no common roots, i.e. if \( Q(R) = 0 \) then \( 2AR + B \neq 0 \).
Thus the determination of \( \frac{\partial R}{\partial \omega_3} \) from (9.10) is possible and we obtain
\[
\frac{\partial R}{\partial \omega_3} = -\frac{\frac{\partial B}{\partial \omega_3} R + \frac{\partial C}{\partial \omega_3}}{2AR + B}
\]
and put it in the expression (9.9) for \( \delta(R) \). The non-zero expression \( 2AR + B \) appears as a denominator of \( \delta(R) \) and we note
\[
\delta(R) = \frac{\tilde{\delta}(R)}{2AR + B},
\]
where
\[
\tilde{\delta}(R) = \left[ (I_1 - I_2) \gamma_2^2 + (I_1 - I_3) \gamma_3^2 - I_1 U_2 \right] \left[ (2AR + B)R + \omega_3 \left( R \frac{\partial B}{\partial \omega_3} + \frac{\partial C}{\partial \omega_3} \right) \right]
+ U_1 \gamma_3 \left( R \frac{\partial B}{\partial \omega_3} + \frac{\partial C}{\partial \omega_3} \right) + U_1 (2AR + B) \Gamma.
\]
After substituting \( A, B \) and \( C \) with their values from (9.5) we obtain
\[
\tilde{\delta}(R) = 2 \left\{ [(I_1 - I_2) \gamma_2^2 + (I_1 - I_3) \gamma_3^2 - I_1 U_2] \left[ I_1 (I_1 U_2 + I_2 \gamma_2^2 - I_1 \gamma_2^2 - I_1 \gamma_3^2) R^2 
+ 2I_1 (I_3 \omega_3 \gamma_3 - U_1) R \Gamma \right] + I_2 I_3 (I_1 - I_2) \omega_3^2 \gamma_2^4 + I_3 (I_1 I_2 - I_1 I_3 - 2I_2 I_3 \omega_3^2 \gamma_2^2 \gamma_3^2 
- I_1 I_2 I_3 U_2 \omega_3^2 \gamma_2^4 + I_3 (I_1 - I_3) \omega_3^2 \gamma_3^4 - I_1 I_3^2 U_2 \omega_3^2 \gamma_3^2 - 2I_3 (I_1 - I_2) U_1 \omega_3 \gamma_2^2 \gamma_3 
- 2I_3 (I_1 - I_3) U_1 \omega_3 \gamma_3^3 + 2I_1 I_3 U_1 U_2 \omega_3 \gamma_3 + I_1 U_1^2 \gamma_2^2 + (I_1 - I_3) U_1^2 \gamma_3^2 - I_1 U_1^2 U_2 \right\}.
\]
Let us note the following observation. The expression in square brackets above, i.e.
\[
I_1 (I_1 U_2 + I_2 \gamma_2^2 - I_1 \gamma_2^2 - I_1 \gamma_3^2) R^2 + 2I_1 (I_3 \omega_3 \gamma_3 - U_1) R \Gamma = AR^2 + BR = Q(R) - C
\]
and, as \( Q(R) = 0 \) (cf. (9.4)), we replace this expression with \(-C\). In this way we obtain \( \tilde{\delta} \) as a function that does not depend on \( R \) as follows:
\[
\tilde{\delta} = b_0 \Gamma + b_1,
\]
where
\[
b_0 = -4I_2 c_1 \gamma_2^2 \left[ (I_1 - I_2) \gamma_2^2 + (I_1 - I_3) \gamma_3^2 - I_1 U_2 \right],
b_1 = 2I_2 \gamma_2^2 \left[ 2c_2 (I_2 - I_1) \gamma_3^3 + 2c_3 (I_2 - I_1) \gamma_2 \gamma_3^2 + 2c_2 (I_3 - I_1) \gamma_2 \gamma_3^2 + 2c_3 (I_3 - I_1) \gamma_3^3 
+ (I_1 - I_2) U_3 \gamma_2^2 + (I_1 - I_3) U_3 \gamma_3^2 + 2I_1 c_2 U_2 \gamma_2 + 2I_1 c_3 U_2 \gamma_3 + U_1^2 - I_1 U_1 U_3 \right].
\]
According to Proposition 4.3, if \( \tilde{\delta} = 0 \) then \( b_0 = b_1 = 0 \) because \( \Gamma \notin \mathbb{C}(\gamma_2, \gamma_3) \). \( b_0 = 0 \) is possible either if \( I_1 = I_2 = I_3 \) and \( U_2 = 0 \) which is a particular case of the kinetic symmetry or when \( c_1 = 0 \).

Let \( c_1 = 0 \). We consider \( b_1 = 0 \). As \( c_1 = 0 \) we should have \( (c_2, c_3) \neq (0, 0) \) to avoid the Euler case. First let us suppose that \( c_2 \neq 0 \). Then the annulment of the coefficients of \( \gamma_2^3 \) and \( \gamma_2 \gamma_3^2 \) of \( b_1 \) leads to the kinetic symmetry case. Let us suppose now that \( c_3 \neq 0 \). Then the coefficients of \( \gamma_3^3 \) and \( \gamma_2^2 \gamma_3 \) lead to the same case. Consequently the sought partial first integral of type 1 does not exist.
**Type 2.** Let us study the existence of a first integral of type 2. That means to look for a first integral of system (9.6) which does not depend on $\gamma_2$, i.e. $F(\omega_3, \gamma_3)$.

In fact the investigations go along the same lines but, of course, the expressions are different. Now we have

\[ \frac{dF}{dt} = \frac{d\omega_3}{dt} \frac{\partial F}{\partial \omega_3} + \frac{d\gamma_3}{dt} \frac{\partial F}{\partial \gamma_3} = Y_1(F) = 0, \quad (9.12) \]

where $Y_1$ is the corresponding vector field defined on $\Omega$.

Equation (9.12) should be an identity with respect to all three variables $(\omega_3, \gamma_2, \gamma_3)$. As function $F$ does not depend on $\gamma_2$ then its partial derivatives will not depend on $\gamma_2$ too. Thus if we differentiate identity (9.12) with respect to $\gamma_2$ we shall obtain again a linear partial differential equation for function $F$.

\[ \frac{\partial Y_1(F)}{\partial \gamma_2} = \frac{\partial}{\partial \gamma_2} \left( \frac{d\omega_3}{dt} \frac{\partial F}{\partial \omega_3} + \frac{d\gamma_3}{dt} \frac{\partial F}{\partial \gamma_3} \right) = Y_2(F) = 0, \quad (9.13) \]

where $Y_2$ is the corresponding vector field defined on $\Omega$.

Equations (9.12) and (9.13) can be considered as a system of two homogeneous linear algebraic equations with unknowns grad $F = \left( \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_3} \right)$, which do not vanish identically, because $F$ is non-constant on any open subset of its domain of definition.

Thus, if integral $F$ exists, system (9.12)–(9.13) has a non-zero solution grad $F$. This is possible if and only if determinant $\Delta(R)$ composed of the coefficients of this system satisfies identity $\Delta(R) \equiv 0$ provided that $R$ is a root of equation (9.4).

We compute this determinant and obtain a long expression which we do not show here. We only mention that $\Delta(R)$ has a non-zero denominator $I_2^2 I_3^2 \gamma_2 \Gamma$ and we note

\[ \Delta(R) = \frac{\hat{\Delta}(R)}{I_2^2 I_3 \gamma_2 \Gamma}. \]

Thus $\Delta(R) = 0$ is equivalent to $\hat{\Delta}(R) = 0$.

$\hat{\Delta}(R)$ depends on $\frac{\partial R}{\partial \gamma_2}$. To determine this derivative we use the same steps as in the case of the first integral of type 1 and obtain

\[ \frac{\partial R}{\partial \gamma_2} = -\frac{\frac{\partial A}{\partial \gamma_2} R^2 + \frac{\partial B}{\partial \gamma_2} R + \frac{\partial C}{\partial \gamma_2}}{2AR + B}. \]

We put it in the expression for $\hat{\Delta}(R)$. After this substitution the non-zero expression $2AR + B$ appears as a denominator of $\hat{\Delta}(R)$ and we note

\[ \hat{\Delta}(R) = \frac{\hat{\Delta}(R)}{2AR + B}. \]

The identity $\hat{\Delta}(R) = 0$ is equivalent to $\hat{\Delta}(R) = 0$ but $\hat{\Delta}(R)$ depends on the functions $A$, $B$ and $C$ from (9.5) and their derivatives with respect to $\gamma_2$. We put these functions in the expression for $\Delta(R)$ and obtain that $\hat{\Delta}(R)$ has a denominator $\Gamma$. We note

\[ \tilde{\Delta}(R) = \frac{\delta(R)}{\Gamma}. \]

The identity $\tilde{\Delta}(R) = 0$ is equivalent to $\delta(R) = 0$. We know that if $Q(R) = 0$, then if in addition some supplementary first integral $F(\omega_3, \gamma_3)$ of system (9.6) exists,
then also \( \delta(R) = 0 \). Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring \( \mathbb{K}[x] \), where \( \mathbb{K} = \text{Alg}(\omega_3, \gamma_2, \gamma_3) \), the polynomial \( Q(x) \) divides the polynomial \( \delta(x) \).

Using MAPLE we divide \( \delta \) by \( Q \) and obtain a remainder which is a polynomial \( r \) of the form

\[
r = r_0 x + r_1, \quad [(I_2 - I_1)\gamma_2^2 - I_1\gamma_3^2 + I_1U_2]^2,
\]

where

\[
r_0 = r_{01}\Gamma + r_{02} \quad \text{and} \quad r_1 = r_{11}\Gamma + r_{12},
\]

Here \( r_{01}, r_{02}, r_{11} \) and \( r_{12} \) are polynomials of variables \( \omega_3, \gamma_2, \gamma_3 \) and parameters \( Ic \) and \( U_i, 1 \leq i \leq 3 \).

According to Propositions 4.2 we have \( r_0 = r_1 = 0 \). Then by Propositions 4.3 we conclude that \( r_{01} = r_{02} = r_{11} = r_{12} = 0 \) because \( \Gamma \notin \mathbb{C}(\gamma_2, \gamma_3) \). It turns out that for our aims equation \( r_{11} = 0 \) is sufficient. Equation \( r_{11} = 0 \) will be identically satisfied if and only if all the coefficients of polynomial \( r_{11} \) are zero. The coefficients of \( r_{11} \) are

\[
109.
\]

We should find all values of the parameters \( Ic \) and \( U_i, 1 \leq i \leq 3 \), for which the 109 coefficients are zero. At the fourth consecutive simplification we obtain the reduced system of only three very simple equations:

\[
I_1 - I_2 = 0, \quad c_1 = 0, \quad c_2 = 0
\]

and the values of \( U_i, 1 \leq i \leq 3, I_2, I_3 \) and \( c_3 \) are arbitrary. It is clear that this is the Lagrange case.

Thus the sought partial first integral of type 2, \( F(\omega_3, \gamma_3) \) does not exist.

**Type 3.** Let us consider the existence of a first integral of type 3, i.e. \( F(\omega_3, \gamma_2) \). Now we have

\[
\frac{dF}{dt} = \frac{d\omega_3}{dt} \frac{\partial F}{\partial \omega_3} + \frac{d\gamma_2}{dt} \frac{\partial F}{\partial \gamma_2} = Y_1(F) = 0, \quad (9.14)
\]

where \( Y_1 \) is the corresponding vector field defined on \( \Omega \).

Equation \((9.14)\) should be an identity with respect to all three variables \( (\omega_3, \gamma_2, \gamma_3) \). As function \( F \) does not depend on \( \gamma_3 \) then its partial derivatives will not depend on \( \gamma_3 \) too. Thus if we differentiate identity \((9.14)\) with respect to \( \gamma_3 \) we shall obtain again a linear partial differential equation for function \( F \).

\[
\frac{\partial Y_1(F)}{\partial \gamma_2} = \frac{\partial}{\partial \gamma_3} \left( \frac{d\omega_3}{dt} \right) \frac{\partial F}{\partial \omega_3} + \frac{\partial}{\partial \gamma_3} \left( \frac{d\gamma_2}{dt} \right) \frac{\partial F}{\partial \gamma_2} = Y_2(F) = 0, \quad (9.15)
\]

where \( Y_2 \) is the corresponding vector field defined on \( \Omega \).

Equations \((9.14)\) and \((9.15)\) can be considered as a system of two homogeneous linear algebraic equations with unknowns \( \text{grad} F = \left( \frac{\partial F}{\partial \omega_3}, \frac{\partial F}{\partial \gamma_2} \right) \), which do not vanish identically, because \( F \) is non-constant on any open subset of its domain of definition.

Thus, if integral \( F \) exists, system \((9.14)-(9.15)\) has a non-zero solution \( \text{grad} F \). This is possible if and only if determinant \( \Delta(R) \) composed of the coefficients of this system satisfies identity \( \Delta(R) \equiv 0 \) provided that \( R \) is a root of equation \((9.4)\).
We compute this determinant and obtain
\[ \Delta(R) = \frac{\tilde{\Delta}(R)}{I_2 I_3 \gamma_2 \Gamma}, \]
where
\[ \tilde{\Delta}(R) = \left[ -2I_1(I_1 - I_2)\omega_3 \Gamma^2 \frac{\partial R}{\partial \gamma_3} R - I_2 c_1 \gamma_2 \gamma_3 \frac{\partial R}{\partial \gamma_3} + (I_1 - I_2) U_1 R^2 - I_2 c_1 \gamma_2 R \right] \Gamma 
+ I_1(I_1 - I_2) \gamma_3 \Gamma^2 \frac{\partial R}{\partial \gamma_3} R^2 + \Gamma^2 [I_3(I_2 - I_1)\omega_3^2 \gamma_3 + (I_1 - I_2) U_1 \omega_3 + I_2 c_2 \gamma_2 \gamma_3] \frac{\partial R}{\partial \gamma_3} 
+ [I_3(I_1 - I_2)\omega_3^2 \gamma_2^2 - I_3(I_1 - I_2) U_2 \omega_3^2 + (I_1 - I_2) U_1 \omega_3 \gamma_3 + I_2 c_2 \gamma_2 (-\gamma_2^2 + U_2)] R 
- I_1(I_1 - I_2)(-\gamma_2^2 + U_2) R^3 - I_2 c_1 \omega_3 \gamma_2^2 \gamma_3. \]
Thus \( \Delta(R) = 0 \) is equivalent to \( \tilde{\Delta}(R) = 0 \).
\( \tilde{\Delta}(R) \) depends on \( \frac{\partial R}{\partial \gamma_3} \). To determine this derivative we use the same steps as in the case of the first integral of type 1 and obtain
\[ \frac{\partial R}{\partial \gamma_3} = \frac{\partial A}{\partial \gamma_3} R^2 + \frac{\partial B}{\partial \gamma_3} R + \frac{\partial C}{\partial \gamma_3} \]
We put it in the expression for \( \tilde{\Delta}(R) \). After this substitution the non-zero expression \( 2AR + B \) appears as a denominator of \( \tilde{\Delta}(R) \) and we note
\[ \hat{\Delta}(R) = \frac{\tilde{\Delta}(R)}{2AR + B}. \]
The identity \( \hat{\Delta}(R) = 0 \) is equivalent to \( \tilde{\Delta}(R) = 0 \) but \( \tilde{\Delta}(R) \) depends on the functions \( A, B \) and \( C \) from \([9,5]\) and their derivatives with respect to \( \gamma_3 \). We put these functions in the expression for \( \Delta(R) \) and obtain that \( \tilde{\Delta}(R) \) has a denominator \( \Gamma \). We note
\[ \hat{\Delta}(R) = \frac{\delta(R)}{\Gamma}, \]
where \( \delta(R) \) is a polynomial of \( R \) of degree four.

The identity \( \hat{\Delta}(R) = 0 \) is equivalent to \( \delta(R) = 0 \). We know that if \( Q(R) = 0 \), then if in addition some supplementary first integral \( F(\omega_3, \gamma_3) \) of system \([9,6]\) exists, then also \( \delta(R) = 0 \). Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring \( \mathbb{K}[x] \), where \( \mathbb{K} = \text{Alg}(\omega_3, \gamma_2, \gamma_3) \), the polynomial \( Q(x) \) divides the polynomial \( \delta(x) \).

Using Maple we divide \( \delta \) by \( Q \) and obtain a remainder which is a polynomial \( r \) of the form
\[ r = \frac{r_0 x + r_1}{[(I_2 - I_1)\gamma_2^2 - I_1 \gamma_3^2 + I_1 U_2]^3}, \]
where
\[ r_0 = r_{01} \Gamma + r_{02} \text{ and } r_1 = r_{11} \Gamma + r_{12}, \]
Here \( r_{01}, r_{02}, r_{11} \) and \( r_{12} \) are polynomials of variables \( \omega_3, \gamma_2, \gamma_3 \) and parameters \( \mathcal{I}c \) and \( U_i, 1 \leq i \leq 3 \).

According to Propositions 4.2 we have \( r_0 = r_1 = 0 \). Then by Propositions 4.3 we conclude that \( r_{01} = r_{02} = r_{11} = r_{12} = 0 \) because \( \Gamma \notin \mathbb{C}(\gamma_2, \gamma_3) \). It turns out that for
our aims equation \( r_{11} = 0 \) is sufficient. Equation \( r_{11} = 0 \) will be identically satisfied if and only if all the coefficients of polynomial \( r_{11} \) are zero. The coefficients of \( r_{11} \) are 179. We should find all values of the parameters \( Tc \) and \( U_i, 1 \leq i \leq 3 \), for which the 179 coefficients are zero. At the three consecutive simplification we obtain the reduced system of seven equations:

\[
I_1 - I_2 = 0, \quad c_2 c_3 = 0, \quad (I_2 - I_3)c_2 = 0, \quad c_2 U_3 = 0, \\
c_2 U_2 = 0, \quad c_2 U_1 = 0, \quad c_1^2 + 2c_2^2 = 0.
\]

We solve this system by the \textsc{Maple} command \texttt{solve} and obtain two solutions. The first of them gives the Lagrange case \( I_1 = I_2, c_1 = 0, c_2 = 0 \) and the second - a particular case of the kinetic symmetry case.

Thus the sought partial first integral of type 3, \( F(\omega_3, \gamma_2) \) does not exist.

### 9.3. Elimination of \( \gamma_1, \gamma_2, \gamma_3 \).

Using the \textsc{Maple} command \texttt{solve} we determine variables \( \gamma_1 \) and \( \gamma_2 \) from equations \( H_1 = U_1 \) and \( H_3 = U_3 \) (see (9.1)). Then we put the obtained values of \( \gamma_1 \) and \( \gamma_2 \) in the equation \( H_2 = U_2 \) from where we determine \( \gamma_3 \). In this way we obtain the following solution:

\[
\begin{align*}
\gamma_1 &= \frac{I_2 \omega_2(I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2 - U_3) + 2c_2 U_1 + 2(I_2 c_3 \omega_2 - I_3 c_2 \omega_3)R}{2(I_1 c_2 \omega_1 - I_2 c_1 \omega_2)}, \\
\gamma_2 &= -\frac{I_1 \omega_1(I_1 \omega_1^2 + I_2 \omega_2^2 + I_3 \omega_3^2 - U_3) + 2c_1 U_1 + 2(I_1 c_3 \omega_1 - I_3 c_1 \omega_3)R}{2(I_1 c_2 \omega_1 - I_2 c_1 \omega_2)}, \tag{9.16}
\end{align*}
\]

\( \gamma_3 = R, \)

where \( R = R(\omega_1, \omega_2, \omega_3) \) is a root of equation

\[
Q(x) = Ax^2 + Bx + C = 0,
\]

that is

\[
Q(R) = AR^2 + BR + C = 0, \tag{9.17}
\]

and \( A = A(\omega_1, \omega_2, \omega_3), B = B(\omega_1, \omega_2, \omega_3) \) and \( C = C(\omega_1, \omega_2, \omega_3) \) are the following polynomials:

\[
A = 4I_1^2(c_3^2 + c_2^2)\omega_1^2 - 8I_1I_2c_1c_2\omega_1\omega_2 - 8I_1^2I_3c_1c_3\omega_1\omega_3 \\
+ 4I_2^2(c_1^2 + c_2^2)\omega_2^2 - 8I_2I_3c_2c_3\omega_2\omega_3 + 4I_3^2(c_1^2 + c_2^2)\omega_3^2,
\]

\[
B = 4I_3^2c_3\omega_1^4 - 4I_1^2I_3c_1\omega_1^3\omega_3 + 4I_1I_2(I_1 + I_2)c_3\omega_1^2\omega_2^2 - 4I_1I_2I_3c_2\omega_1^2\omega_2\omega_3 \\
+ 4I_2^2I_3c_3\omega_3^2\omega_1^2 - 4I_1I_2I_3c_1\omega_1\omega_2\omega_3 - 4I_1^2I_3c_1\omega_1^3\omega_3 + 4I_2^2c_3\omega_4^4 \\
- 4I_2^2I_3c_3\omega_1^2\omega_3^2 + 4I_2^2I_3c_3\omega_2^2\omega_3^2 - 4I_2I_3c_2\omega_2\omega_3^2 - 4I_1^2c_3U_3\omega_1^2 \\
+ 4I_1I_2c_1U_3\omega_1\omega_3 - 4I_2^2c_3U_3\omega_2^2 + 4I_2I_3c_2U_3\omega_3 \\
+ 8I_1c_1c_3U_1\omega_1 - 8I_2c_2c_3U_1\omega_1 - 8I_3(c_1^2 + c_2^2)U_1\omega_3,
\]

\[
C = I_1^4\omega_1^6 + I_1^2I_2(2I_1 + I_2)\omega_1^4\omega_2^2 + 2I_1^3I_3\omega_1^4\omega_3^2 + I_1I_2^2(I_1 + 2I_2)\omega_1^2\omega_2^4 \\
+ 2I_1I_2I_3(I_1 + I_2)\omega_1^2\omega_2^2\omega_3^2 + I_1^2I_3^2\omega_1^2\omega_3^4 + I_1^2\omega_1^6 + 2I_1^2I_3\omega_1^2\omega_3^2 + I_3^2I_2^2\omega_3^4 \\
- 2I_1I_2U_3\omega_1^4 - 2I_1I_2(I_1 + I_2)U_3\omega_1^2\omega_3^2 - 2I_1^2I_3U_3\omega_1^2\omega_3^2 - 2I_2^2U_3\omega_2^4 \\
- 2I_1^2I_3U_3\omega_2^2\omega_3^2 + 4I_1^2c_1U_3\omega_3^3 + 4I_1I_2c_2U_1\omega_1^2\omega_2 + 4I_1I_2c_1U_1\omega_1\omega_2^2.
\]
The Euler-Poisson equations; partial integrability

+ 4I_1I_3c_1U_1\omega_1^2 + 4I_2^2c_2U_1\omega_2^2 + 4I_2I_3c_2U_1\omega_2\omega_3 - I_1^2(4c_1^2U_2 - U_3^2)\omega_1^2 \\
+ 8I_1I_2c_1c_2U_2\omega_1\omega_2 - I_2^2(4c_1^2U_2 - U_3^2)\omega_2^2 \\
- 4I_1c_1U_1\omega_3 - 4I_2c_2U_1U_3\omega_2 + 4(c_1^2 + c_2^2)U_1^2.

Putting the values of \(\gamma_1, \gamma_2\) and \(\gamma_3\) from (9.16) in the Euler-Poisson equations (1.1) and removing the last three equations we obtain the following system of three equations in unknowns \(\omega_1, \omega_2\) and \(\omega_3\):

\[
\frac{d\omega_i}{dt} = \frac{M_i}{2I_i(I_1c_2\omega_1 - I_2c_1\omega_2)}, \quad 1 \leq i \leq 3,
\]

(9.19)

where \(M_1, M_2\) and \(M_3\) are polynomials of \(\omega_j, \gamma_j, I_j, c_j, U_j, 1 \leq i \leq 3\), and of \(R\). The system (9.19) is correctly defined only if

\[
(c_1, c_2) \neq (0, 0).
\]

(9.20)

Let us suppose first that the condition (9.20) is satisfied.

As we are going to study the first integrals of system (9.19) we can multiply its right-hand sides by the non-zero factor \(2I_1I_2I_3(I_1c_2\omega_1 - I_2c_1\omega_2)\). In this way we come to the following system:

\[
\frac{d\omega_1}{dt} = -I_2I_3\left\{2[I_1(c_2^2 + c_3^2)\omega_1 - I_2c_1c_2\omega_2 - I_3c_1c_3\omega_3]R \\
+ I_2^2c_3\omega_1^3 + I_1I_2c_3\omega_1\omega_2^2 - 2I_1(I_2 - I_3)c_2\omega_1\omega_2\omega_3 + I_1I_3c_3\omega_1\omega_3^2 \\
+ 2I_2(I_2 - I_3)c_1\omega_2^3\omega_3 - I_1c_3U_3\omega_1 + 2c_1c_3U_1 \right\},
\]

\[
\frac{d\omega_2}{dt} = I_1I_3\left\{2[I_1c_1c_2\omega_1 - I_2(c_1^2 + c_3^2)\omega_2 + I_3c_2c_3\omega_3]R \\
- I_1I_2c_3\omega_1^2\omega_2 - 2I_1(I_1 - I_3)c_2\omega_1^2\omega_3 + 2I_2(I_1 - I_3)c_1\omega_1\omega_2\omega_3 \\
- I_2^2c_3\omega_2^3 - 2I_2I_3c_3\omega_2\omega_3^2 + I_2c_3U_3\omega_2 - 2c_2c_3U_1 \right\},
\]

\[
\frac{d\omega_3}{dt} = I_1I_2\left\{2[I_1c_1\omega_1 + I_2c_2c_3\omega_2 - I_3(c_1^2 + c_2^2)\omega_3]R \\
+ I_2^2c_1\omega_1^3 + I_1(2I_1 - I_2)c_2\omega_1^2\omega_2 - I_2(I_1 - 2I_2)c_1\omega_1\omega_2^2 + I_1I_3c_1\omega_1\omega_3^2 \\
+ I_2^2c_2\omega_2^3 + 2I_2I_3c_2\omega_2\omega_3^2 - I_1c_3U_3\omega_1 - I_2c_2U_3\omega_2 + 2(c_1^2 + c_2^2)U_1 \right\}.
\]

We study the existence of a first integral of system (9.21) that depends on at most two variables among the variables \((\omega_1, \omega_2, \omega_3)\). There are three possible types of such a first integral:

1. \(F(\omega_1, \omega_2)\), (case(iv))
2. \(F(\omega_1, \omega_3)\), (case(iv))
3. \(F(\omega_2, \omega_3)\), (case(iv))

As all the three types of first integrals belong to case (iv) it suffices to study only the first type.

**Type 1.** We consider a first integral \(F\) of system (9.21) of type 1, i.e. \(F(\omega_1, \omega_2)\). We
have
\[
\frac{dF}{dt} = \frac{d\omega_1}{dt} \frac{\partial F}{\partial \omega_1} + \frac{d\omega_2}{dt} \frac{\partial F}{\partial \omega_2} = Y_1(F) = 0,
\]
(9.22)
where \( \frac{d\omega_1}{dt} \) and \( \frac{d\omega_2}{dt} \) are taken from (9.21) and \( Y_1 \) is the corresponding vector field defined on \( \mathbb{C}^3(\omega_1, \omega_2, \omega_3) \).

This equation should be identically equal to zero with respect to variables \( \omega_1, \omega_2 \) and \( \omega_3 \). As function \( F \) does not depend on \( \omega_3 \) then its partial derivatives will not depend on \( \omega_3 \) too. Thus if we differentiate identity (9.22) with respect to \( \omega_3 \) we obtain again a linear partial differential equation for \( F \)
\[
\frac{\partial Y_1(F)}{\partial \omega_3} = \frac{\partial}{\partial \omega_3} \left( \frac{d\omega_1}{dt} \right) \frac{\partial F}{\partial \omega_1} + \frac{\partial}{\partial \omega_3} \left( \frac{d\omega_2}{dt} \right) \frac{\partial F}{\partial \omega_2} = Y_2(F) = 0,
\]
(9.23)
where \( Y_2 \) is the corresponding vector field defined on \( \mathbb{C}^3(\omega_1, \omega_2, \omega_3) \).

Equations (9.22) and (9.23) can be considered as a system of two homogeneous linear algebraic equations with unknowns \( \text{grad} F = \left( \frac{\partial F}{\partial \omega_1}, \frac{\partial F}{\partial \omega_2} \right) \). This linear system admits a non-zero solution if and only if its determinant \( \Delta(R) \) vanishes identically with respect to variables \( \omega_1, \omega_2 \) and \( \omega_3 \) provided that \( R \) is a root of equation (9.17).

We compute \( \Delta(R) \), remove its non-zero factor \( 2I_1I_2I_3^2(I_1c_2\omega_1 - I_2c_1\omega_2) \) and obtain
\[
\Delta(R) = \frac{\Delta(R)}{2I_1I_2I_3^2(I_1c_2\omega_1 - I_2c_1\omega_2)} = -2I_3c_3(c_1^2 + c_2^2 + c_3^2)R^2
\]
\[
- \left[ I_1(2I_3c_2^2 - 2I_1c_2^2 - 2I_2c_3^2 + 3I_3c_3^2)\omega_1^2 + 2(2I_1I_2 - I_1I_3 - I_2I_3)c_1c_2\omega_1\omega_2 \right.
\]
\[

\]

Like in Sec. 9.2 we should obtain \( \Delta(R) \) as a polynomial of \( R \) that is we should determine \( \frac{\partial R}{\partial \omega_3} \) as a function of \( R \). For the purpose we use equation (9.17) where polynomials \( A(\omega_1, \omega_2, \omega_3), B(\omega_1, \omega_2, \omega_3) \) and \( C(\omega_1, \omega_2, \omega_3) \) are taken from (9.18). We differentiate
(9.17) with respect to $\omega_3$ and obtain
\[ \frac{\partial Q(R)}{\partial \omega_3} = \frac{\partial A}{\partial \omega_3} R^2 + \frac{\partial B}{\partial \omega_3} R + \frac{\partial C}{\partial \omega_3} + \frac{dQ}{dR} \frac{\partial R}{\partial \omega_3} = 0. \tag{9.25} \]

The determination of $\frac{\partial R}{\partial \omega_3}$ from (9.25) is possible if and only if $\frac{dQ}{dR} = 2AR + B$ is not zero when $R$ is a root of polynomial $Q$. Then we obtain
\[ \frac{\partial R}{\partial \omega_3} = -\frac{\frac{\partial A}{\partial \omega_3} R^2 + \frac{\partial B}{\partial \omega_3} R + \frac{\partial C}{\partial \omega_3}}{2AR + B}. \]

Let us prove that $\frac{dQ}{dR}$ is not zero. We use Proposition 4.1. Let $R$ be a root of equation $Q(R) = 0$. We consider the resultant $\rho$ of $Q$ and $\frac{dQ}{dR}$ and prove that it can never be identically zero with respect to $\omega_1$, $\omega_2$ and $\omega_3$. We have
\[ \rho = A(4AC - B^2) \]
and as $A$ never vanishes identically we do not consider $\rho$ but $\hat{\rho} = 4AC - B^2$ instead. Putting in $\hat{\rho}$ the expressions for $A$, $B$ and $C$ from (9.18) we obtain
\[ \hat{\rho} = 16(I_1c_2\omega_1 - I_2c_1\omega_2)^2\tilde{\rho}. \]
As we consider the case (9.20), then the first factor never vanishes identically. The second one, i.e. $\tilde{\rho}$ is a long polynomial of $\omega_1$, $\omega_2$ and $\omega_3$ that has 35 monomials. Among them is the monomial $I_1^2\omega_1^6$ and therefore $\hat{\rho}$ never vanishes identically. Consequently $\rho$ never vanishes identically either.

We put the value of $\frac{\partial R}{\partial \omega_3}$ obtained from equation (9.25) in (9.24) and find $\hat{\Delta}(R)$. After this substitution the non-zero expression $2AR + B$ appears as a denominator of $\hat{\Delta}(R)$ and we note
\[ \hat{\Delta}(R) = \frac{\delta(R)}{2AR + B}, \]
where $\delta(R)$ is a polynomial of $R$ of degree three.

It is clear that $\hat{\Delta}(R) = 0$ is equivalent to $\delta(R) = 0$. We know that if $Q(R) = 0$, then if in addition some supplementary first integral $F(\omega_1, \omega_2)$ of system (9.21) exists, then also $\delta(R) = 0$. Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring $\mathbb{K}[x]$, where $\mathbb{K} = \text{Alg}(\omega_1, \omega_2, \omega_3)$, the polynomial $Q(x)$ divides the polynomial $\delta(x)$.

Using the MAPLE command rem we compute the remainder of the division of polynomial $\delta$ by $Q$ and obtain a remainder $r$ of the form:
\[ r(x) = \frac{4(I_1c_2\omega_1 - I_2c_1\omega_2)}{(I_1c_2\omega_1 - I_2c_1\omega_2)^2 + (I_1c_3\omega_1 - I_3c_1\omega_3)^2 + (I_2c_3\omega_2 - I_3c_2\omega_3)^2}(r_0 x + r_1), \]
where $r_0$ and $r_1$ are polynomials of $\omega_1$, $\omega_2$ and $\omega_3$.

It is easily seen that when $(c_1, c_2) \neq (0, 0)$ the fraction in the above equality is non-zero on open dense subset of $\mathbb{C}^3(\omega_1, \omega_2, \omega_3)$.

Thus $r_0 = r_1 = 0$ identically with respect to $\omega_1$, $\omega_2$ and $\omega_3$. Below we consider only $r_0 = 0$ which turns out sufficient for our needs.

As $r_0$ has a non-zero factor $I_3$ we remove it. The obtained polynomial has 74 coefficients. To find all values of the parameters $Ic$ and $U_i$, $1 \leq i \leq 3$, for which these
coefficients are zero we apply simplification and after four consecutive simplifications we obtain the reduced system of five equations:

\[ c_2c_3 = 0, \quad c_1c_3 = 0, \quad (I_1 - I_2)c_3 = 0, \quad (I_1 - I_3)c_2 = 0, \quad (I_2 - I_3)c_1 = 0. \]

Solving it by the MAPLE command \texttt{solve} we obtain the following five solutions:

\[ c_1 = 0, \quad c_2 = 0, \quad c_3 = 0 \text{ with arbitrary } I_1, I_2, I_3, U_1, U_2, U_3, \]
\[ I_1 = I_2, \quad c_1 = 0, \quad c_2 = 0 \text{ with arbitrary } I_2, I_3, c_3, U_1, U_2, U_3, \]
\[ I_2 = I_3, \quad c_2 = 0, \quad c_3 = 0 \text{ with arbitrary } I_1, I_3, c_1, U_1, U_2, U_3, \]
\[ I_1 = I_3, \quad c_1 = 0, \quad c_3 = 0 \text{ with arbitrary } I_2, I_3, c_2, U_1, U_2, U_3, \]
\[ I_1 = I_3, \quad I_2 = I_3, \quad c_3 = 0 \text{ with arbitrary } I_3, c_1, c_2, U_1, U_2, U_3. \]

As \((c_1, c_2) \neq (0, 0)\) we remove the first and second solutions. Third and fourth solutions give the Lagrange case and fifth one – the kinetic symmetry case. Thus the sought partial first integral of type 1, i.e. \(F(\omega_1, \omega_2)\) does not exist when \((c_1, c_2) \neq (0, 0)\).

Let us suppose now that \((9.20)\) is not fulfilled, i.e. \((c_1, c_2) = (0, 0)\). To avoid the Euler case we suppose that \(c_3 \neq 0\). Solving equations \((9.1)\) with respect to \(\gamma_1, \gamma_2\) and \(\gamma_3\) by the MAPLE command \texttt{solve} we obtain

\[ \gamma_1 = \frac{I_1I_3\omega_1^2\omega_3 + I_2I_3\omega_2^2\omega_3 + I_3^2\omega_3^2 - I_3U_3\omega_3 + 2c_3U_1 - 2I_2\omega_2 R}{2I_1c_3\omega_1}, \]
\[ \gamma_2 = \frac{R}{c_3}, \quad \gamma_3 = \frac{-I_1\omega_1^2 + I_2\omega_2^2 + I_3\omega_3^2 - U_3}{2c_3}, \]

where \(R = R(\omega_1, \omega_2, \omega_3)\) is a root of equation

\[ Q(x) = Ax^2 + Bx + C = 0, \]

that is

\[ Q(R) = AR^2 + BR + C = 0. \]

Here \(A = A(\omega_1, \omega_2), \quad B = B(\omega_1, \omega_2, \omega_3)\) and \(C = C(\omega_1, \omega_2, \omega_3)\) are the following polynomials:

\[ A = 4(I_1^2\omega_1^2 + I_2^2\omega_2^2), \]
\[ B = -4I_2\omega_2(I_1I_3\omega_1^2\omega_3 + I_2I_3\omega_2^2\omega_3 + I_3^2\omega_3^2 - I_3U_3\omega_3 + 2c_3U_1), \]
\[ C = I_1^4\omega_1^6 + 2I_1^3I_2\omega_1^4\omega_2^2 + I_1^2I_3(2I_1 + I_3)\omega_1^2\omega_3^2 + I_1^2I_2^2\omega_1^2\omega_2^4 \]
\[ + 2I_1I_2I_3(I_1 + I_3)\omega_1^2\omega_2^2\omega_3 + I_1I_3^2(I_1 + 2I_3)\omega_1^2\omega_3^4 + I_2^2I_3^2\omega_2^4\omega_3^2 \]
\[ + 2I_2I_3^2\omega_2^2\omega_3^4 + I_3^2\omega_3^6 - 2I_1^2I_2U_3\omega_1^4 - 2I_1^2I_3U_3\omega_1^2\omega_3^2 - 2I_1I_3(I_1 + I_3)U_3\omega_1^2\omega_3^2 \]
\[ - 2I_2I_3^2U_3\omega_2^2\omega_3^2 - 2I_3^2U_3\omega_3^4 + 4I_1I_3c_3U_1\omega_1^2\omega_3^2 + 4I_2I_3c_3U_1\omega_2^2\omega_3^2 \]
\[ + 4I_3^2c_3U_1\omega_3^3 - I_1^2(4c_3^2U_2 - U_2^2)\omega_1^2 + I_3^2U_3^2\omega_2^4 - 4I_3c_3U_1U_3\omega_3 + 4U_1^2c_3. \]

After substitution of \(\gamma_1, \gamma_2\) and \(\gamma_3\) from \((9.26)\) in the first three Euler-Poisson equa-
tions (1.1) we obtain the following system for $\omega_1$, $\omega_2$ and $\omega_3$:

$$
\begin{align*}
\frac{d\omega_1}{dt} &= \frac{R + (I_2 - I_3)\omega_2\omega_3}{I_1}, \\
\frac{d\omega_2}{dt} &= \frac{2I_2\omega_2 R - I_1(2I_1 - I_3)\omega_1^2\omega_3 - I_2I_3\omega_2^2\omega_3 - I_3^2\omega_3^3 + I_3U_3\omega_3 - 2c_3U_1}{2I_1I_2\omega_1}, \\
\frac{d\omega_3}{dt} &= \frac{(I_1 - I_2)\omega_1\omega_2}{I_3}.
\end{align*}
$$

(9.29)

Like in case (9.20) we examine only the type 1 of first integrals of system (9.29).

**Type 1.** As in the case when $(c_1, c_2) \neq (0, 0)$ we define the vector fields $Y_1$ and $Y_2$ by $Y_1(F) = \frac{dF}{dt}$ (see (9.22)) and $Y_2(F) = \frac{\partial Y_1(F)}{\partial \omega_3}$ (see (9.23)) but now $\frac{d\omega_1}{dt}$ and $\frac{d\omega_2}{dt}$ are taken from (9.29).

Determinant $\Delta(R)$ of linear system (9.22) and (9.23) should vanish identically with respect to variables $\omega_1$, $\omega_2$ and $\omega_3$ provided that $R$ is a root of equation (9.27).

We compute $\Delta(R)$. It has a non-zero denominator $2I_1^2I_2\omega_1$. We note

$$
\begin{align*}
\Delta(R) &= 2I_1^2I_2\omega_1 \Delta(R) = -\left[I_1(2I_1 - I_3)\omega_1^2 + I_2(2I_2 - I_3)\omega_2^2 + 3I_3^2\omega_3^2 - I_3U_3\right]R \\
&\quad + \left[I_1(2I_1 - I_3)\omega_1^2\omega_3 + I_2(2I_2 - I_3)\omega_2^2\omega_3 + I_3^2\omega_3^3 - I_3U_3\omega_3 + 2U_1c_3\right] \frac{\partial R}{\partial \omega_3} \\
&\quad - 2(I_2 - I_3)(I_3^2\omega_3^3 - U_1c_3)\omega_2.
\end{align*}
$$

(9.30)

In order to obtain $\Delta(R)$ as a polynomial of $R$ we determine $\frac{\partial R}{\partial \omega_3}$ using equation (9.27) where polynomials $A(\omega_1, \omega_2)$, $B(\omega_1, \omega_2, \omega_3)$ and $C(\omega_1, \omega_2, \omega_3)$ are taken from (9.28). After differentiating (9.27) with respect to $\omega_3$ we obtain

$$
\frac{\partial Q}{\partial \omega_3} = \frac{\partial B}{\partial \omega_3} R + \frac{\partial C}{\partial \omega_3} + \frac{dQ}{dR} \frac{\partial R}{\partial \omega_3} = 0.
$$

(9.31)

In the same way as in the case $(c_1, c_2) \neq (0, 0)$ we prove by Proposition 4.1 that $\frac{dQ}{dR}$ is not zero and determine $\frac{\partial R}{\partial \omega_3}$ from (9.31). Then we put it in (9.30) and find $\Delta(R)$. After this substitution the non-zero expression $2AR + B$ appears as a denominator of $\Delta(R)$ and we note

$$
\Delta(R) = \frac{\delta(R)}{2AR + B},
$$

where $\delta(R)$ is a polynomial of $R$ of degree two.

It is clear that $\Delta(R) = 0$ is equivalent to $\delta(R) = 0$. We know that if $Q(R) = 0$, then if in addition some supplementary first integral $F(\omega_1, \omega_2)$ of system (9.29) exists, then also $\delta(R) = 0$. Thus all assumptions of Proposition 4.2 are fulfilled. Consequently in polynomial ring $\mathbb{K}[x]$, where $\mathbb{K} = \text{Alg}(\omega_1, \omega_2, \omega_3)$, the polynomial $Q(x)$ divides the polynomial $\delta(x)$.

The remainder $r(x)$ of the division of polynomial $\delta(x)$ by polynomial $Q(x)$ is a polynomial of $x$ of degree one

$$
r(x) = r_0 x + r_1,
$$

where $r_0$ and $r_1$ are polynomials of $\omega_1$, $\omega_2$ and $\omega_3$ which, by Proposition 4.2 should be
identically equal to zero. We consider only the leading coefficient of $r(x)$

$$r_0 = -8I_1I_3(I_1 - I_2)\omega_1^2\omega_2(I_3^2\omega_3^2 - c_3U_1) = 0.$$ 

It is easily seen that $r_0$ vanish identically if and only if $I_1 = I_2$ which together with restriction $c_1 = c_2 = 0$ considered now leads to the Lagrange case. Thus the sought partial first integral of type 1, $F(\omega_1, \omega_2)$ does not exist.

This concludes our study.
