

OpenSpyrit: an Ecosystem for Reproducible Single-Pixel Hyperspectral Imaging: supplement

1. OVERVIEW OF THE SPIHIM ACQUISITIONS

Here, we provide a list of acquisitions available in the open-access [SPIHIM](#) collection. The collection is stored in PILoT, our data warehouse based on the Girder web-based data management platform. Each acquisition is associated with a unique identifier (ID). The ID is a hyperlink that provides direct access to the folder containing the raw and reconstructed data files as well as the associated metadata. The `/overview/` folder contains several representations of the reconstructed hypercubes. A list of the objects that were imaged is given in Sec. [A](#). A list of the acquisitions that were performed is given in Sec. [B](#). A summary of the metadata is given in Sec. [C](#).

A. Objects

The following objects have been imaged:

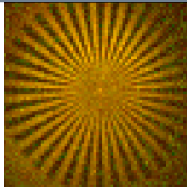

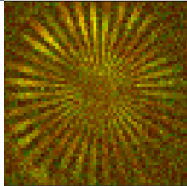

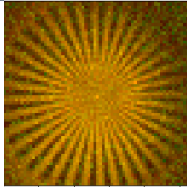

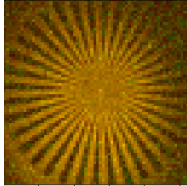

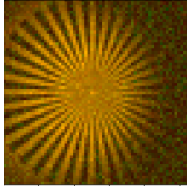

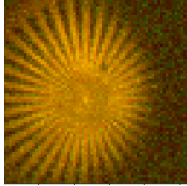

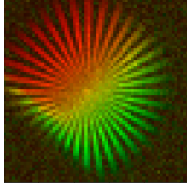

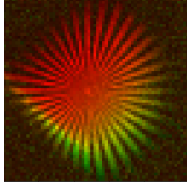

- **Star Sector**: a Siemens star resolution target (Thorlabs, R1L1S2P)
- **Cat**: a cat image from the STL-10 test set printed on a plastic sheet
- **PpIX**: Protoporphyrin IX diluted in a PBS solution
- **Color checker**: a color gauge micro target (more details [here](#))
- **USAF**: a spatial resolution target (Edmund, USAF 1951 38256)
- **Colored Star Sector**: a colored Siemens star printed on a plastic sheet
- **No object**: the DMD is directly illuminated by the source
- **Tomato slice**: a thin slice (few hundreds of μm) of a cherry tomato
- **Horse**: a horse image from the STL-10 test set printed on a plastic sheet
- **White spot**: a pinhole that allows light through
- **Thorlabs box**: a well-known box
- **Blob**: a dry physarum polycephalum
- **Tree leaf**: a leaf from the *Salix purpurea* tree
- **Lamb brain**: an ex-vivo lamb brain
- **Apple**: a McIntosh apple

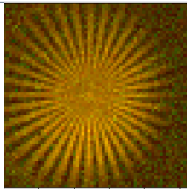

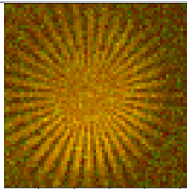

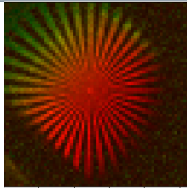

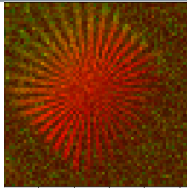

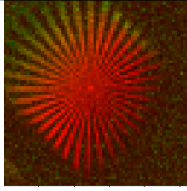

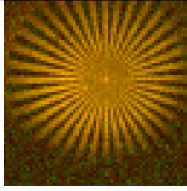

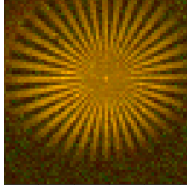

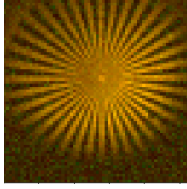

B. Acquisition list

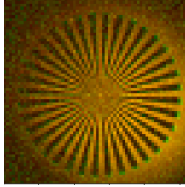

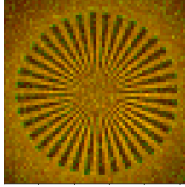

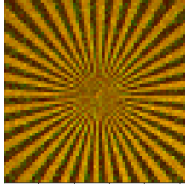

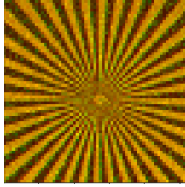

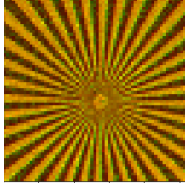

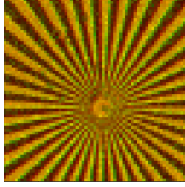

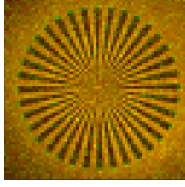

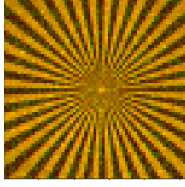

All acquisitions available in the SPIHIM collection are listed in the Table below. The six columns of the Table provide the following information:

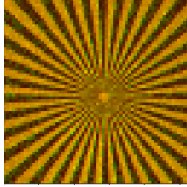

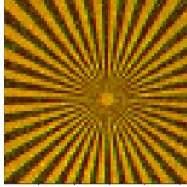

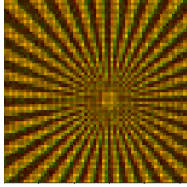

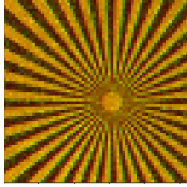

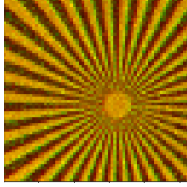

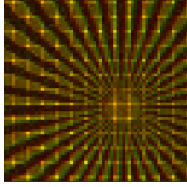

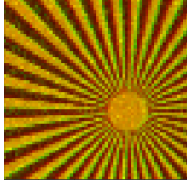

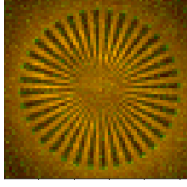

- **ID**: unique identifier of the acquisition.
- **Setup**: setup version, more details are available in the collection description [here](#).
- **Source**: illumination source, chosen among
 - **WLL**: a cold white LED array Light Source from Thorlabs (LIUCWHA).

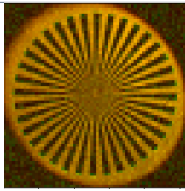

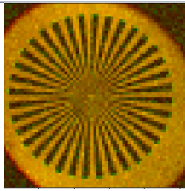

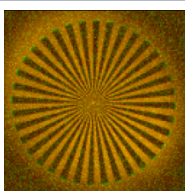

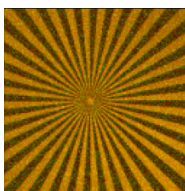

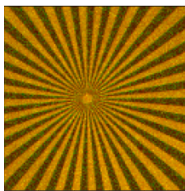

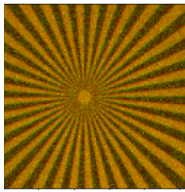

- **WLB**: a white lamp from Bioblock Scientific equipped with a halogen bulb (Philips 14501 150W GX5.3 20V).
- **WLZ**: a white lamp (KL 2500 LCD) from Zeiss.
- **405nm**: a laser MDL III405 working at 405 nm with a maximal power of 50 mW.
- **HgAr**: a Mercury-Argon spectral calibration lamp (Ocean Optics HG-1).
- **Leica**: a white source coming from the Leica surgical microscope.
- **Filter**: filter placed between the object and the DMD, chosen among
 - **Diffuser**: ground glass diffuser from Thorlabs (N-BK7).
 - **OD**: optical density.
 - **LinearColor**: a linear variable filter (Ocean Optics, LVF-HL).
- **Info**: complementary information such as
 - **Signal**: maximum signal found in the `/overview/*sum_wavelength_binning.png` figure.
 - **ti**: integration time of the spectrometer. If not specified, $t_i = 1$ ms.
 - **zoom xX**: digital zoom realized by the DMD, where $X \in \mathbb{N}$. If not specified, $\text{zoom} = x1$.
 - **RasterScan**: a group of micromirrors is scanned, as opposed to the Hadamard-Walsh pattern scanning. Mathematically, the pattern matrix \mathbf{P} (see Eq. (1) of the main article) is chosen as the identity.
 - **[x mol/L]**: concentration of the solution.
 - **obj xX**: microscope objective where xX is the magnification.
 - **circular/square/Diag motion**: corresponds to different displacement trajectories of a diaphragm placed in front of the source.
 - **open/close**: is a succession of opening and closing of a diaphragm placed in front of the source.
 - **motion: x mm**: is the mechanical translation of a piston
- **Overview**: RGB representation of the full hypercube following the CIE.

Table S15. List of acquisition data for the object: Apple

C. Metadata

The metadata of each acquisition are visible in each acquisition folder directly and also present in the *_metadata.json file. They can be divided into four categories:

- **EXP:** metadata related to the experiment (e.g., object, source, filters).
- **ACQ:** metadata related to the acquisition parameters (e.g., image size, acquisition time).
- **SPECTRO:** metadata related to the spectrometer (e.g., integration time, saturation).
- **DMD:** metadata related to the digital micromirror device (DMD), e.g., number of patterns, micromirror tilt time.

2. DC-NET RECONSTRUCTIONS

For each object in the list of Sec. A, we consider the reconstruction of:

- Four spectral *channels* at $\lambda = 557.7, 611.0, 661.2,$ and 707.8 nm.
- Four spectral *bins* that are obtained by summation of the spectral channels. The central wavelengths of the spectral bins are also $\lambda = 557.7, 611.0, 661.2,$ and 707.8 nm, while their widths are $54.7, 51.7, 48.3,$ and 44.6 nm, respectively.

A. List of objects

We consider the following samples

1. USAF $\times 2$ zoom (see Sec. B).
2. USAF $\times 12$ zoom (see Sec. C).
3. Star Sector $\times 2$ zoom (see Sec. D).
4. Star Sector $\times 12$ zoom (see Sec. E).
5. Colored Star Sector (see Sec. F).
6. Off-centered Star Sector (see Sec. G).
7. Tomato slice $\times 2$ zoom (see Sec. H).
8. Tomato slice $\times 12$ zoom (see Sec. I).
9. Cat (see Sec. J).
10. Colored cat (see Sec. K).
11. Horse (see Sec. L).
12. Apple (see Sec. M).
13. Color checker (see Sec. N).
14. Tree leaf (see Sec. O).
15. Thorlabs box (see Sec. P).
